Claim.—1. In a velocipede, the combination of a circular rim provided with an annular track on its inner face, a frame traveling in said track, a driving-wheel mounted on said frame directly over the tread of the rim, a shaft mounted on the frame, sprocket-wheels mounted on said shaft and frame, a sprocket chain on said wheels, a seat mounted above the shaft over the tread of the wheel, a guide-wheel outside said rim, rods *k* and *k'*, connecting said wheel with the frame, handle-rods pivoted to the frame, a horizontal arm attached to the rod of the guide-wheel, rods 24, connecting the handle-bars with the horizontal arm, a fan mounted in the frame between the connecting-rods *k*, and a shield inclosing said fan, substantially as described.

2. In a velocipede, a rim A, provided with a track B, in combination with a frame C, provided with wheels D, working in said track, and a fan-blower actuated by one of the said wheels for directing an air-current onto said rim.

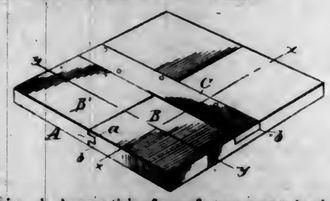
479,793. COMMUTATOR. WILLIAM H. ELKINS, Cambridge, Mass. Filed Jan. 26, 1892. Serial No. 419,261. (No model.)

Claim.—1. The combination, with an armature having a series of coils wound on a core and rotating in a field of force, of a commutator having insulated segments equal in number to the armature-coils and connected to said coils, the contact portions of alternate segments being in two different series in different planes of rotation, and a brush or brushes engaging with both said series of contacts.

2. The combination, with an armature having a series of coils wound on a core and rotating in a field of force, of a commutator having two series of contacts in different planes of rotation and connected successively and alternately to said coils and a brush or brushes bearing on said contacts and making or breaking with contacts of the two series alternately.

3. The combination, with an armature having a series of coils, of a commutator having two series of insulated contacts connected succes-

ively and alternately to said coils and a brush or brushes engaging with contacts of the two series successively.

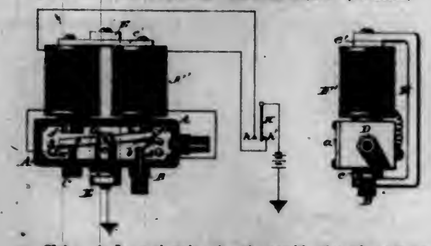


4. A rotary commutator having a number of individually-insulated segments and alternate segments having contact portions in different planes of rotation.

5. A rotary commutator having a number of individually-insulated segments, a portion of the top of each segment being covered with insulation, such insulation being offset in alternate segments, leaving two series of contact portions in different planes of rotation.

6. A rotary commutator having a number of individually-insulated segments, a portion of the top of each segment being covered with insulation, such insulated portions being offset and overlapping in alternate segments, leaving two series of contact portions in different planes of rotation, with an intermediate insulating-space.

7. The combination, with an armature having a series of coils, of two series of contacts connected successively and alternately to said coils and arranged alternately with their contact portions out of line with one another in the direction of rotation and a brush or brushes extending along the commutator and engaging with both series of contacts and making and breaking with contacts of the two series alternately.



479,794. CRATE-HEAD. JOSEPH L. EMPIE, Orlando, Fla. Filed Aug. 31, 1891. Serial No. 404,314. (No model.)

Claim.—1. As an article of manufacture, a crate-head composed of strips of material joined by tongues and grooves at their contiguous edges and a batten sunk in the surface of the strips, said batten extending transversely of the joint, substantially as set forth.

2. As an article of manufacture, a crate-head composed of sections joined at their contiguous edges by tongues and grooves and a batten dovetailed in the sections and extending transversely of the joint, substantially as set forth.

479,795. VALVE-CONTROLLER. CHARLES L. FORTIER, Milwaukee, Wis. Filed Mar. 5, 1892. Serial No. 423,820. (No model.)

Claim.—1. In an electric valve, the combination of two magnets arranged to mutually act upon each other, one being movable and provided or connected with the valve or the part to be shifted and one having coils wound in reverse directions, substantially as and for the purposes set forth.

2. In an electric valve, the combination of a valve-case having supply and exhaust connections, an armature within said case, provided with valves controlling said connections, pole-pieces in proximity with said armature, and magnets connected with said pole-pieces and armature, one of said magnets having a differential winding, whereby its polarity may be reversed, substantially as and for the purposes set forth.

3. In an electric valve, the combination of two magnets arranged to mutually act upon each other, one being movable and provided or connected with the valve or part to be shifted and the other having two pole-pieces arranged in proximity therewith, one of said magnets being differentially wound, so as to change its polarity when the current is shifted from one coil through the other, and a circuit-breaker operated by the movable magnet to shift the current alternately through said coils, substantially as and for the purposes set forth.

4. In an electric valve, the combination, with two magnets arranged to mutually act upon each other, one of said magnets being movable and provided or connected with the valve or part to be shifted and one having coils wound in opposite directions, so as to change its polarity, of a circuit-controlling device, the contact-points of which are connected with terminals of said coils, and a circuit-breaker operated by the movable magnet and connected with the other terminals of said coils, substantially as and for the purposes set forth.

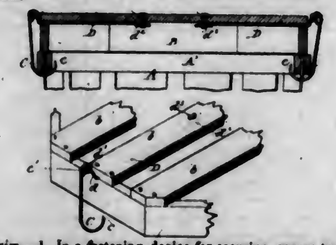
5. In an electric valve, the combination of a permanent magnet having a movable armature provided or connected with a valve and mounted upon one leg and two pole-pieces upon the other leg and coils wound in opposite directions on said pole-pieces, substantially as and for the purposes set forth.

6. In an electric valve, the combination of a suitable case provided with supply and exhaust connections, a permanent magnet provided on one leg with two pole-pieces projecting into said case and on the other leg with a movable armature within said case, coils wound in opposite directions on said pole-pieces, and a circuit-breaker by which the circuit is closed alternately through said coils, substantially as and for the purposes set forth.

7. In an electric valve, the combination of a suitable case, a permanent magnet having three pole-pieces projecting into said case, one of said pole-pieces having a movable part provided or connected with the valve or part to be shifted and the other two pole-pieces having coils wound thereon in opposite directions, contact-pieces with which terminals of said coils are connected, arranged to be engaged alternately by the movable part of the magnet, and a circuit-controlling device arranged to direct the current through either of said coils, substantially as and for the purposes set forth.

8. In an electric valve, the combination of a valve-case having induction and eduction connections, an armature provided with a valve or valves controlling said connections, a pole-piece in proximity with said armature, and a differentially-wound coil arranged to reverse the polarity of said pole-piece, substantially as and for the purposes set forth.

9. In an electric valve, the combination of a valve-case having suitable connections, a permanent magnet outside of said case having a pole or poles projecting into the same, a movable magnet provided or connected with a valve, and means for changing the polarity of one of said magnets, substantially as and for the purposes set forth.

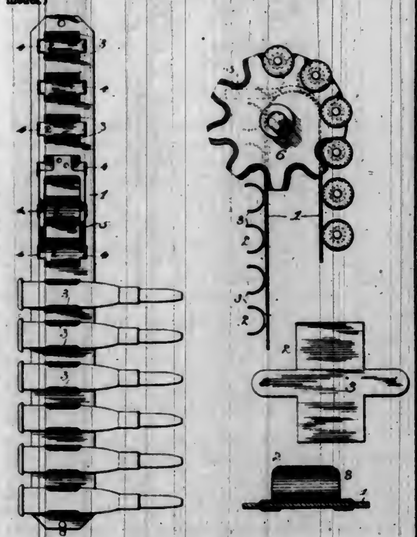


10. In an electric valve, the combination of a valve-case having suitable connections and one or more valves controlling said connections, a permanent magnet outside of said case, a movable magnet within the case, connected with and arranged to operate said valve or valves and located in the field of said permanent magnet, and means for changing the polarity of one of said magnets.

479,796. TOOTH-BRUSH. LEWIS T. FOSS, Boston, Mass. Filed Sept. 19, 1891. Serial No. 406,234. (No model.)

Claim.—The combination of a tooth-brush and blade held together by means of a dovetail and screw, a back spring *g*, hollow handle-case, door, and retention-spring *h*, all as shown, and for the purposes set forth.

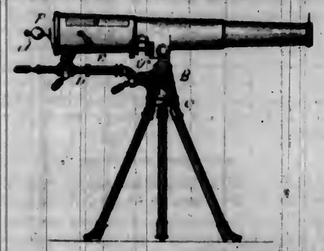
479,797. FASTENING FOR BASKET-COVERS. GEORGE C. GARRAPER, Watervliet, N. Y. Filed Feb. 3, 1892. Serial No. 420,146. (No model.)



Claim.—1. In a fastening device for securing covers to baskets, the combination, with a hook, of the elastic arm adapted to be twisted and having in its outer end the lever *d*, provided in a loop or eye by which said hook is jointed with the said arm and having in its opposite or inner end a holding device d^3, provided with means described for rigidly securing it with the cover, substantially as and for the purposes set forth.

2. In a fastening device for securing covers to baskets, the combination, with the arm D, having in its inner end the means for effecting a secure holding of the said arm with the cover when said arm is subjected to a twisting or torsional strain and having integral with its outer end lever *d*, provided with an eye or loop, of the hook C, having its bow provided with the sharp point *c*, for operation substantially as and for the purposes set forth.

3. The combination, with a basket having a top rim and a cover calculated to be seated on said rim, of the arms D D, provided at their outer ends with levers *d* and having their inner ends rigidly secured to the cover, and the hooks C, jointed, respectively, with said arms by the said levers *d*, with the said arms adapted to be twisted when their levers are turned about their axes, substantially as and for the purposes set forth.



479,798. AMMUNITION-BELT. FRANK M. GARLAND, New Haven, Conn., assignor of two-thirds to Ebenezer B. Beecher, William A. Pockett, and Frederick P. Newton, same place, and Thomas H. Sherman, Washington, D. C. Filed Sept. 19, 1891. Serial No. 406,257. (No model.)

Claim.—1. An ammunition-belt consisting of a flexible web bearing upon one face a number of cups for firmly grasping the cartridges, open on one side, so that the cartridges may be removed therefrom laterally, and provided with projecting wings on the edges to afford a bearing for the cartridge-removing device, substantially as specified.

2. An ammunition-belt consisting of a flexible web bearing upon one face a number of cups for firmly grasping the cartridges, open on one side, so that the cartridges may be removed therefrom laterally, and provided with projecting wings on the edges to afford a bearing for the cartridge-removing device, the ends of said wings passing through the web and clinched on the opposite face, substantially as specified.

479,799. MACHINE-GUN. FRANK M. GARLAND, New Haven, Conn., assignor of two-thirds to Ebenezer B. Beecher, William A. Pockett, and Frederick P. Newton, same place, and Thomas H. Sherman, Washington, D. C. Filed Oct. 10, 1891. Serial No. 408,321. (No model.)

Claim.—1. In a machine-gun, in combination with the loading and firing mechanism, feeding mechanism consisting of a pair of wheels having pocketed peripheries mounted upon shafts on each side of the shell beneath the barrels, the shafts being connected with and alternately rotated by the driving-shaft, guides adjacent to the feed-wheels, adapted to receive the heads of the cartridges as they pass from the wheels, and combs attached to the shell adjacent to the wheels for stripping the cartridges from the belts, substantially as specified.

2. In a machine-gun, in combination with the loading and firing mechanism, feeding mechanism consisting of a pair of wheels having pocketed peripheries mounted upon shafts on each side of the shell beneath the barrels, the said shafts bearing ratchets, pawls for rotating the ratchets, racks for driving the pawls, pinions for reciprocating the racks, slides bearing racks for driving the pinions, and levers in contact with cams upon the driving-shaft for moving the slides, substantially as specified.

3. In a machine-gun, in combination, cams loosely mounted upon the driving-shaft, ratchets adjacent to the cams, with one piece secured to the shaft and the complementary pieces secured to the cams, bolts movable into and out of the path of the pawls, feeding mechanism connected with and driven by the cams, loading mechanism reciprocated by the cams, and firing mechanism released by the rotation of the cams, substantially as specified.

4. In a machine-gun, in combination, cams bearing pawls loosely mounted upon the driving-shaft, ratchet-disks secured to the shaft adjacent to the cams and adapted to engage the pawls, bolts projecting through the shell for releasing the pawls from the ratchets, feeding mechanism connected with and driven by the cams, loading mechanism reciprocated by the cams, and firing mechanism released by the rotation of the cams, substantially as specified.

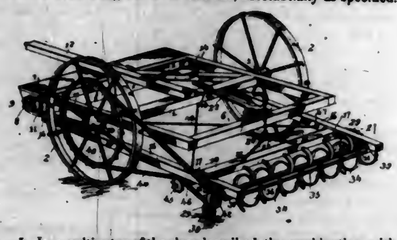
5. In a machine gun, in combination, cams bearing pawls loosely mounted upon the driving-shaft, ratchet-disks secured to the shaft adjacent to the cams, adapted to engage the pawls, bolts projecting through the shell for releasing the pawls from the ratchets, feeding mechanism consisting of wheels mounted upon shafts intermittently rotated through the means of levers oscillated by the cams, reciprocating loading-spindles, jointed levers operated by the cams attached to the loading-spindles, firing mechanism, and slides moved into and out of contact with the firing mechanism by contact with the pawls upon the cam-blocks as they revolve, substantially as specified.

6. In combination, in the herein-described machine-gun, reciprocating spindles, cams on the driving-shaft connected by levers with the spindles, each of said spindles having a longitudinal mortise, a firing-pin held in said mortise, plates covering said mortise, and a button having an eccentric base for holding each plate in place, substantially as specified.

7. In combination, in the herein-described machine-gun, reciprocating spindles, cams on the driving-shaft connected by levers with the spindles, each of said spindles having a longitudinal mortise, a firing-pin held in said mortise, a cocking-roll secured to the spindle, and a hammer in the path of the cocking-roll, whereby when the spindles are moved rearward the hammers are cocked, substantially as specified.

8. In combination with the shell of the herein-described machine-gun, a frame consisting of plates having ways for supporting the reciprocating spindles and plates for supporting the hammers and triggers, said frame being connected with the shell at one end by means of dowel-pins that pass into sockets in a part secured to the shell and at the opposite end by a button, a support rising from the shell holding the button, reciprocating spindles supported by the ways, and hammers and triggers supported by the frame, whereby a turn of the button releases the frame, allowing it with the hammers and triggers to be freely removed, substantially as specified.

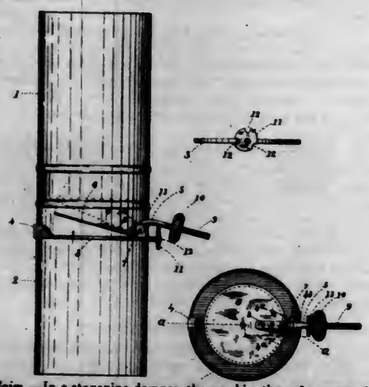
479,800. ROTARY CULTIVATOR. SANFORD GARNER, Trout Creek, Mich. Filed Mar. 30, 1892. Serial No. 427,080. (No model.)



Claim.—1. In a cultivator of the class described, the combination, with the axle, wheels, and main frame, of the opposite side bars loosely connected at their front ends to the main frame, opposite boxes loosely connected to the side bars and adapted to oscillate and provided with bearings, a transverse cultivator-shaft, cultivators mounted thereon, and means for operating said shaft, substantially as specified.

2. In a cultivator of the class described, the combination, with the axle, ground-wheels, and main frame, of the opposite side bars loosely connected at their front ends to the main frame, the transversely-opposite bearing-boxes provided at their opposite sides with trunnions, bearing-eyes depending upon the side bars and loosely receiving the trunnions, a transverse cultivator-shaft terminating in bearing ends mounted in the bearings of the boxes, and means for rotating the shaft, substantially as specified.

3. In a cultivator of the class described, the combination, with the wheels, axle, and main frame, of opposite side bars pivotally connected at their front ends to the frame, opposite bearing-boxes mounted for oscillation at the under side of the side bars and provided with bearings, a transversely-disposed tooth-carrying cultivator-shaft, means for

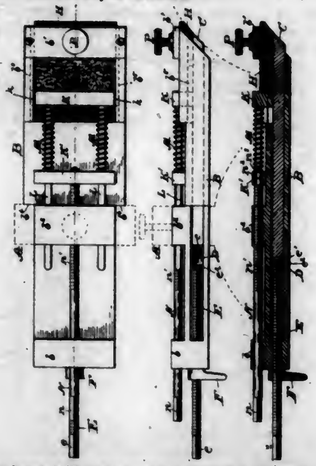


rotating the shaft, a hand-lever pivoted on the main frame, a transverse connecting-bar between the two side bars, pivotal connections between the side bars and the ends of the transverse bars, and a chain connected to the lever and to the transverse bar, substantially as specified.

4. In a cultivator of the class described, the combination, with the wheels, axle, and main frame supported on the latter, of the opposite side bars loosely connected at their front ends to the main frame, the opposite bearing-boxes loosely suspended and adapted to oscillate under the side bars, the transverse cultivator-shaft mounted for rotation in said boxes, the opposite plates secured to the inner sides of the side bars and provided with central recesses and opposite bearing-eyes, the transverse bar terminating in the recesses, the pivoting-pins passed through the eyes and bar, the lever fulcrumed on the main frame, and the chain connecting the lever and bar, substantially as specified.

5. In a cultivator of the class described, the combination, with the axle, wheels, and main frame, of the opposite cultivator-bars loosely connected at their front ends to the main frame, the transverse bar loosely pivoted at its ends to said bars, the loosely-suspended oscillating bearing-boxes, the transverse cultivator-shaft journaled therein, means for operating said shaft, the front and rear eyes secured, respectively, near the front and rear ends of the side bars, the diagonally-disposed rods, the lever, and the chain connecting the lever with the cross-bar, substantially as specified.

479,801. SELF-ACTING WIND-PROOF DAMPER. AUGUSTUS J. GUNTHER, Buffalo, N. Y. Filed Nov. 30, 1891. Serial No. 413,467. (No model.)



Claim.—In a stovepipe-damper, the combination of a supporting-ring provided with a projecting lug 4 for the purpose described, two upwardly-projecting lugs or ears 4^a on the same face at the opposite side of the ring, a projecting piece from the periphery of the ring back of the ears or lugs 4^a, upon which is pivoted an adjusting thumb-piece 11, having a series of notches of varying distances from the center for adjusting the height the damper shall rise, a damper 6, having a curved handle 5 pivoted between the ears 4^a and provided with a screw portion, upon which is mounted an adjusting-weight adapted to screw back and forth on said handle, substantially as and for the purposes described.

479,802. BRUSH-HOLDER. FRANCIS J. HASELER, U. S. Navy. Filed Nov. 5, 1891. Serial No. 410,902. (No model.)

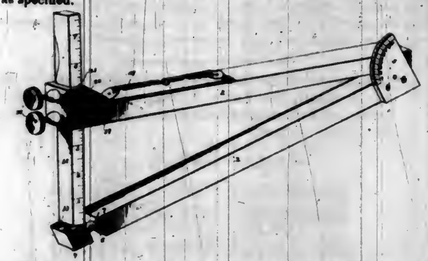
Claim.—1. In a brush-holder, the combination, with a frame, of a copper brush fitted in said frame, a carbon brush in contact with said copper brush and normally pressed forward by a plurality of springs, and a regulating-screw passing through the rear end of said frame and adapted to adjust the tension uniformly on all of said springs, substantially as described.

2. In a brush-holder, the combination, with a frame, of a copper brush fitted in said frame, a carbon brush in contact with said copper brush and normally pressed forward by a plurality of springs, and a regulating-screw passing through the rear end of said frame and adapted to adjust the tension uniformly on all of said springs, and a clamp-screw set in said frame and adapted to clamp said carbon brush when desired, substantially as described.

3. In a brush-holder, the combination, with a carrier-block, of a frame having shoulders adapted to bear against said carrier-block, a copper brush fitted in said frame, a carbon brush in contact with said copper brush and normally pressed forward by a plurality of springs, and a regulating-screw passing through the rear end of said frame and adapted to adjust the tension uniformly on all of said springs, substantially as described.

4. In a brush-holder, the combination, with a carrier-block, of a frame having shoulders adapted to bear against said carrier-block, a copper brush sliding in said frame, a regulating-screw revolubly attached to the rear end of said copper brush and screwing into the rear end of said frame, a carbon brush sliding in said frame and normally pushed forward by a plurality of springs, and a regulating-screw fitted in said frame and adapted to increase simultaneously and uniformly the tension on all of said springs, substantially as described.

5. In a brush-holder, the combination, with the carrier-block, of a frame having shoulders adapted to bear against said carrier-block, a copper brush adapted to slide in said frame, with means of regulating the said brush, a carbon brush adapted to slide in said frame above and in contact with said copper brush, springs for pressing said carbon brush forward in said frame, and means for regulating said springs, substantially as described.



6. In a brush-holder, a device for regulating the tension upon a brush, consisting of a cross-piece at the rear of said brush, a plurality of guide-rods or plungers rigidly attached to said cross-piece and moving in suitable guides, spiral springs inclosing the said guide-rods or plungers, a cross-piece in rear of said springs and sliding on said plungers, and a regulating-screw for moving said rear cross-piece backward or forward and so adjusting the tension of said springs, substantially as and for the purposes described.

7. In a brush-holder, a device for regulating the tension upon a brush, consisting of a suitable frame, a cross-piece at the rear of said brush, having two guide-lugs sliding in grooves in said frame, two guide-rods or plungers rigidly attached to said cross-piece and moving in guides in said frame, spiral springs inclosing the said guide-rods or plungers, a cross-piece in rear of said springs and sliding on said plungers, and a regulating-screw for moving said rear sliding cross-piece backward or forward and so adjusting the tension of said springs, substantially as and for the purposes described.

479,803. GRADE-MEASURE. JOHN M. HAHN, Florence, Ohio. Filed Sept. 11, 1891. Serial No. 405,621. (No model.)

Claim.—1. In an instrument of the class described, the combination, with the two members or bars hinged together at their rear adjacent corners, the lower member being extensible, of a gage-plate of quadrant shape having degrees of a circle indicated thereon, a gage-bar connecting the outer ends of the two members, and means for locking the bar, substantially as specified.

2. In an instrument of the class described, the combination, with the opposite members, the upper one of which is provided with a slot or opening and the lower one with a longitudinal bore, and a hinge connecting the rear adjacent corners of said members, of a graduated gage-bar mounted in the bore of the lower member and a graduated bar mounted in the slot of the upper member and adjustable therein, the two bars having their meeting ends loosely connected, substantially as specified.

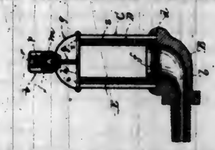
3. In an instrument of the class described, the combination, with the opposite members hinged together at their adjacent rear corners, the upper member having a slot and the lower member longitudinally bored, of gage-bars mounted in the slot and in the bore and hinged at their adjacent ends and a coiled spring interposed between the lower gage-bar and the end of the bore, substantially as specified.

4. In an instrument of the class described, the combination, with the opposite members hinged together at their adjacent corners, the lower member being bored and the upper member terminating in a slotted box, of a gage-bar mounted in the slot of the box, set-screws mounted in the box for binding upon the gage-bar, a shaft mounted transversely in the box, provided at its center with a toothed wheel for engaging teeth formed upon the gage-bar and at its ends terminating in milled nuts, a gage-bar mounted in the bore of the lower member and terminating at its outer end in a head flush with the outer surface of said lower member, and a hinge connecting the upper surface of the said head with the lower end of the gage-bar of the upper member, substantially as specified.

5. An instrument of the class described, the same consisting of two bars of the same length, hinged at their rear extremities, the upper bar being provided with a spirit-level, a loop or box at the free end of the upper member, a set-screw in said loop or box, and a rigid strip, bearing a scale of inches, flexibly connected at its lower end to the free end of the lower bar, passing through the loop or box, and impinged upon by the screw, substantially as specified.

6. An instrument of the class described, the same consisting of two bars of the same length, hinged at their rear extremities, the upper bar being provided with a spirit-level, a loop or box at the free end of the upper member, a set-screw in said loop or box, and a rigid strip, bearing a scale of inches, flexibly connected at its lower end to the free end of an extensible bar which has bearings in the lower bar, passing through the loop or box, and impinged upon by the screw, substantially as specified.

479,804. ELECTRO-MAGNET BOBBIN. EDWARD B. HATCH and CHARLES A. COLTON, Hartford, Conn., assignors to the Johns-Pratt Company, same place. Filed Jan. 13, 1892. Serial No. 417,921. (No model.)



Claim.—In an electro-magnet, in combination, a metallic core, a bobbin with projecting flanges of partially-vulcanized india-rubber and asbestus composition in a single piece, and helices of wire wound about the bobbin between the flanges, substantially as specified.

479,805. VENTILATED SHOE. WILLIAM M. HELBACH, Chicago, Ill. Filed May 8, 1891. Serial No. 392,132. (No model.)

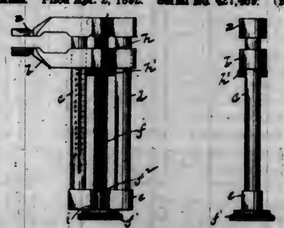
Claim.—The combination, with a shoe having perforations in its insole and a channel between its inner sole and outer sole and having its heel formed with a chamber communicating with said channel and formed with ports *d*, of a spring C within said chamber in the heel, a tube D, having its end inserted, with said ports bowed or bent upward within said chamber and formed in its upper side with a longitudinal opening D′, and longitudinal springs within the channel between the insole and the outer sole, said springs being closely coiled at their rear ends and gradually opened and flattened as they extend toward the toe of the shoe, substantially as described.

479,806. AUTOMATIC RELIEF-VALVE FOR RADIATORS. ALBERT S. HODGE, Boston, Mass., assignor of one-half to J. Henry Hodge, same place. Filed Feb. 29, 1892. Serial No. 423,191. (No model.)

Claim.—1. A relief-valve mechanism for radiators, comprising a casing, a connection opening into the bottom thereof from the radiator, a tube of expansible material disposed around the mouth of said connection, a flanged float supported by said tube, having air openings in said flange, a valve-seat in the top of said casing, and a valve on said float, adapted to engage said seat, all being arranged to operate substantially as described.

2. In a relief-valve for radiators, a cylinder of heat-expansible material disposed within the valve-casing around the inlet, a valve-seating in said casing, and a float secured to said valve and pendent within said cylinder, said float being so disposed that air expelled from the radiator may pass between it and said cylinder, substantially as described.

3. The connection B, provided with the duct *b*, a casing supported on said connection and provided with the relief-valve seat, a cylinder of expansible material disposed within the casing around the mouth of said duct, and a float pendent within said cylinder and bearing a valve adapted to engage said seat, substantially as described.

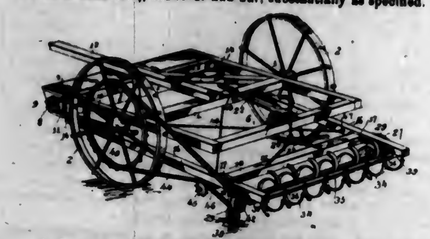


4. In a device of the character described, the connection, a casing provided with the adjustable plug *j*, and the valve-seat *n* and port *p*, in combination with the expansible cylinder and the pendent float therein bearing a valve adapted to engage said seat, all being arranged to operate substantially as described.

5. The connection and casing provided with the adjustable valve-seat, in combination with the hard-rubber cylinder D, and the float E, pendent therein and bearing a valve adapted to engage said seat, substantially as described.

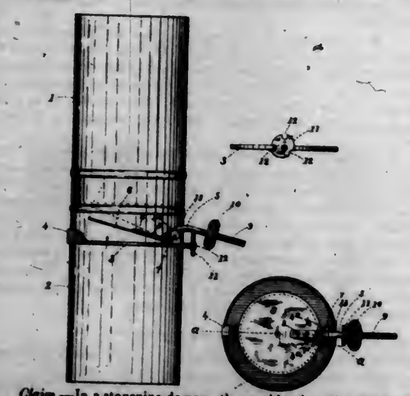
6. The connection and casing provided with the adjustable valve-seat, in combination with the expansible cylinder D, and the closed float E, having the notched supporting-flange *h* and bearing a valve adapted to engage said seat, all being arranged to operate substantially as specified.

7. In a device of the character described, the connection and casing, in combination with the adjustable plug *j* in said casing, provided with the valve-seat and port, the expansible cylinder disposed around the inlet in said connection, the closed float E, disposed within said cylinder and provided with the flange *h*, having the notches *i*, and the valve *q* on said float, adapted to engage said seat, substantially as described.



479,807. MICROMETER-CALIPERS. EDWIN L. HOLCOMB, Springfield, Mass. Filed Apr. 2, 1892. Serial No. 427,469. (No model.)

Claim.—1. The micrometer-calipers herein described, comprising a fixed jaw and end piece, two guide-rods extending between said jaw and end piece, a movable jaw having a sliding bearing upon both of said rods, and a leading-screw journaled at its ends in said fixed jaw

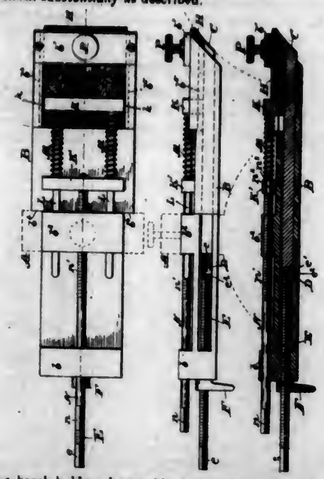


rotating the shaft, a hand-lever pivoted on the main frame, a transverse connecting-bar between the two side bars, pivotal connections between the side bars and the ends of the transverse bars, and a chain connected to the lever and to the transverse bar, substantially as specified.

4. In a cultivator of the class described, the combination, with the wheels, axle, and main frame supported on the latter, of the opposite side bars loosely connected at their front ends to the main frame, the opposite bearing-boxes loosely suspended and adapted to oscillate under the side bars, the transverse cultivator-shaft mounted for rotation in said boxes, the opposite plates secured to the inner sides of the side bars and provided with central recesses and opposite bearing-eyes, the transverse bar terminating in the recesses, the pivoting-pins passed through the eyes and bar, the lever fulcrumed on the main frame, and the chain connecting the lever and bar, substantially as specified.

5. In a cultivator of the class described, the combination, with the axle, wheels, and main frame, of the opposite cultivator-bars loosely connected at their front ends to the main frame, the transverse bar loosely pivoted at its ends to said bars, the loosely-suspended oscillating bearing-boxes, the transverse cultivator-shaft journaled therein, means for operating said shaft, the front and rear eyes secured, respectively, near the front and rear ends of the side bars, the diagonally-disposed rods, the lever, and the chain connecting the lever with the cross-bar, substantially as specified.

479,801. SELF-ACTING WIND-PROOF DAMPER. AUGUSTUS J. GIFFORD, Buffalo, N. Y. Filed Nov. 30, 1891. Serial No. 413,467. (No model.)



Claim.—In a stovepipe-damper, the combination of a supporting-ring provided with a projecting lug 4 for the purpose described, two upwardly-projecting lugs or ears 4^a on the same face as the opposite side of the ring, a projecting piece from the periphery of the ring back of the ears or lugs 4^a, upon which is pivoted an adjusting thumb-piece 11, having a series of notches of varying distances from the center for adjusting the height the damper shall rise, a damper 6, having a curved handle 5 pivoted between the ears 4^a and provided with a screw portion, upon which is mounted an adjusting-weight adapted to screw back and forth on said handle, substantially as and for the purposes described.

479,802. BRUSH-HOLDER. FRANCIS J. HASSELER, U. S. Navy. Filed Nov. 5, 1891. Serial No. 410,908. (No model.)

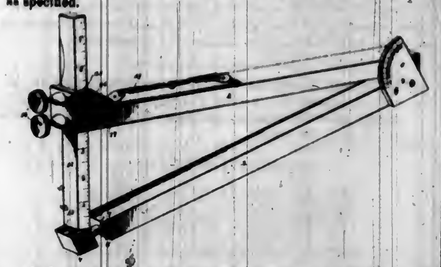
Claim.—1. In a brush-holder, the combination, with a frame, of a copper brush fitted in said frame, a carbon brush in contact with said copper brush and normally pressed forward by a plurality of springs, and a regulating-screw passing through the rear end of said frame and adapted to adjust the tension uniformly on all of said springs, substantially as described.

2. In a brush-holder, the combination, with a frame, of a copper brush fitted in said frame, a carbon brush in contact with said copper brush and normally pressed forward by a plurality of springs, and a regulating-screw passing through the rear end of said frame and adapted to adjust the tension uniformly on all of said springs, and a clamp-screw set in said frame and adapted to clamp said carbon brush when desired, substantially as described.

3. In a brush-holder, the combination, with a carrier-block, of a frame having shoulders adapted to bear against said carrier-block, a copper brush fitted in said frame, a carbon brush in contact with said copper brush and normally pressed forward by a plurality of springs, and a regulating-screw passing through the rear end of said frame and adapted to adjust the tension uniformly on all of said springs, substantially as described.

4. In a brush-holder, the combination, with a carrier-block, of a frame having shoulders adapted to bear against said carrier block, a copper brush sliding in said frame, a regulating-screw revolubly attached to the rear end of said copper brush and screwing into the rear end of said frame, a carbon brush sliding in said frame and normally pushed forward by a plurality of springs, and a regulating-screw fitted in said frame and adapted to increase simultaneously and uniformly the tension on all of said springs, substantially as described.

5. In a brush-holder, the combination, with the carrier-block, of a frame having shoulders adapted to bear against said carrier-block, a copper brush adapted to slide in said frame, with means of regulating the said brush, a carbon brush adapted to slide in said frame above and in contact with said copper brush, springs for pressing said carbon brush forward in said frame, and means for regulating said springs, substantially as described.



6. In a brush-holder, a device for regulating the tension upon a brush, consisting of a cross-piece at the rear of said brush, a plurality of guide-rods or plungers rigidly attached to said cross-piece and moving in suitable guides, spiral springs inclosing the said guide-rods or plungers, a cross-piece in rear of said springs and sliding on said plungers, and a regulating-screw for moving said rear cross-piece backward or forward and so adjusting the tension of said springs, substantially as and for the purposes described.

7. In a brush-holder, a device for regulating the tension upon a brush, consisting of a suitable frame, a cross-piece at the rear of said brush, having two guide-lugs sliding in grooves in said frame, two guide-rods or plungers rigidly attached to said cross-piece and moving in guides in said frame, spiral springs inclosing the said guide-rods or plungers, a cross-piece in rear of said springs and sliding on said plungers, and a regulating-screw for moving said rear sliding cross-piece backward or forward and so adjusting the tension of said springs, substantially as and for the purposes described.

479,803. GRADE-MEASURE. JOHN M. HAINE, Florence, Ohio. Filed Sept. 11, 1891. Serial No. 405,421. (No model.)

Claim.—1. In an instrument of the class described, the combination, with the two members or bars hinged together at their rear adjacent corners, the lower member being extensible, of a gage-plate of quadrant shape having degrees of a circle indicated thereon, a gage-bar connecting the outer ends of the two members, and means for locking the bar, substantially as specified.

2. In an instrument of the class described, the combination, with the opposite members, the upper one of which is provided with a slot or opening and the lower one with a longitudinal bore, and a hinge connecting the rear adjacent corners of said members, of a graduated gage-bar mounted in the bore of the lower member and a graduated bar mounted in the slot of the upper member and adjustable therein, the two bars having their meeting ends loosely connected, substantially as specified.

3. In an instrument of the class described, the combination, with the opposite members hinged together at their adjacent rear corners, the upper member having a slot and the lower member longitudinally bored, of gage-bars mounted in the slot and in the bore and hinged at their adjacent ends and a coiled spring interposed between the lower gage-bar and the end of the bore, substantially as specified.

4. In an instrument of the class described, the combination, with the opposite members hinged together at their adjacent corners, the lower member being bored and the upper member terminating in a slotted box, of a gage-bar mounted in the slot of the box, set-screws mounted in the box for binding upon the gage-bar, a shaft mounted transversely in the box, provided at its center with a toothed wheel for engaging teeth formed upon the gage-bar and at its ends terminating in milled nuts, a gage-bar mounted in the bore of the lower member and terminating at its outer end in a head flush with the outer surface of said lower member, and a hinge connecting the upper surface of the said head with the lower end of the gage-bar of the upper member, substantially as specified.

5. An instrument of the class described, the same consisting of two bars of the same length, hinged at their rear extremities, the upper bar being provided with a spirit-level, a loop or box at the free end of the upper member, a set-screw in said loop or box, and a rigid strip, bearing a scale of inches, flexibly connected at its lower end to the free end of the lower bar, passing through the loop or box, and impinged upon by the screw, substantially as specified.

6. An instrument of the class described, the same consisting of two bars of the same length, hinged at their rear extremities, the upper bar being provided with a spirit-level, a loop or box at the free end of the upper member, a set-screw in said loop or box, and a rigid strip, bearing a scale of inches, flexibly connected at its lower end to the free end of an extensible bar which has bearings in the lower bar, passing through the loop or box, and impinged upon by the screw, substantially as specified.

479,804. ELECTRO-MAGNET BOBBIN. EDWARD B. HATCH and CHARLES A. COLTON, Hartford, Conn., assignors to the Johns-Pratt Company, same place. Filed Jan. 13, 1892. Serial No. 417,981. (No model.)

Claim.—In an electro-magnet, in combination, a metallic core, a bobbin with projecting flanges of partially-vulcanized india-rubber and asbestus composition in a single piece, and helices of wire wound about the bobbin between the flanges, substantially as specified.

479,805. VENTILATED SHOE. WILLIAM M. HELBACH, Chicago, Ill. Filed May 8, 1891. Serial No. 392,132. (No model.)

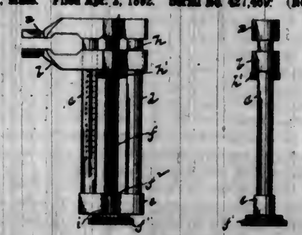
Claim.—The combination, with a shoe having perforations in its insole and a channel between its inner sole and outer sole and having its heel formed with a chamber communicating with said channel and formed with ports *d*, of a spring C within said chamber in the heel, a tube D, having its end inserted, with said ports bowed or bent upward within said chamber and formed in its upper side with a longitudinal opening D′, and longitudinal springs within the channel between the insole and the outer sole, said springs being closely coiled at their rear ends and gradually opened and flattened as they extend toward the toe of the shoe, substantially as described.

479,806. AUTOMATIC RELIEF-VALVE FOR RADIATORS. ALBERT S. HODGE, Boston, Mass., assignor of one-half to J. Henry Hodge, same place. Filed Feb. 20, 1892. Serial No. 422,191. (No model.)

Claim.—1. A relief-valve mechanism for radiators, comprising a casing, a connection opening into the bottom thereof from the radiator, a tube of expansible material disposed around the mouth of said connection, a flanged float supported by said tube, having air openings in said flange, a valve-seat in the top of said casing, and a valve on said float, adapted to engage said seat, all being arranged to operate substantially as described.

2. In a relief-valve for radiators, a cylinder of heat-expansible material disposed within the valve-casing around the inlet, a valve-seating in said casing, and a float secured to said valve and pendent within said cylinder, said float being so disposed that air expelled from the radiator may pass between it and said cylinder, substantially as described.

3. The connection B, provided with the duct *b*, a casing supported on said connection and provided with the relief-valve seat, a cylinder of expansible material disposed within the casing around the mouth of said duct, and a float pendent within said cylinder and bearing a valve adapted to engage said seat, substantially as described.



4. In a device of the character described, the connection, a casing provided with the adjustable plug *j*, and the valve-seat *n* and port *p*, in combination with the expansible cylinder and the pendent float therein bearing a valve adapted to engage said seat, all being arranged to operate substantially as described.

5. The connection and casing provided with the adjustable valve-seat, in combination with the hard-rubber cylinder D, and the float E, pendent therein and bearing a valve adapted to engage said seat, substantially as described.

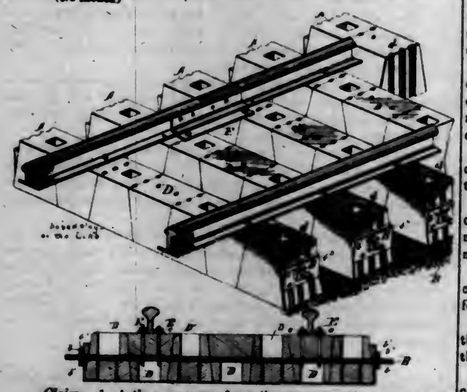
6. The connection and casing provided with the adjustable valve-seat, in combination with the expansible cylinder D, and the closed float E, having the notched supporting-flange *h* and bearing a valve adapted to engage said seat, all being arranged to operate substantially as specified.

7. In a device of the character described, the connection and casing, in combination with the adjustable plug *j* in said casing, provided with the valve-seat and port, the expansible cylinder disposed around the inlet in said connection, the closed float E, disposed within said cylinder and provided with the flange *h*, having the notches *i*, and the valve *q* on said float, adapted to engage said seat, substantially as described.

479,807. MICROMETER-CALIPERS. EDWIN L. HOLCOMB, Springfield, Mass. Filed Apr. 2, 1892. Serial No. 427,469. (No model.)

Claim.—1. The micrometer-calipers herein described, comprising a fixed jaw and end piece, two guide-rods extending between said jaw and end piece, a movable jaw having a sliding bearing upon both of said rods, and a leading-screw journaled at its ends in said fixed jaw

and end piece, respectively, between said rods and operatively engaging said movable jaw, combined and operating substantially as set forth.



2. The micrometer-calipers herein described, consisting of a fixed jaw, an end piece, two parallel guide-rods secured at their ends in said jaw and end piece, respectively, a movable jaw having a sliding bearing upon both of said rods, and a leading-screw supported at its ends in conical bearings on said fixed jaw and end pieces, respectively, and operatively engaging said movable jaw, one of said conical bearings being adjustable to compensate for wear of said screw, substantially as described.

3. The micrometer-calipers herein described, consisting of a fixed jaw, an end piece, two parallel guide-rods supported at their ends in said jaw and end piece, respectively, a movable jaw embracing both of said rods and having therein a slightly-tapered threaded hole to receive a bushing, an externally and internally threaded tapered bushing adapted to enter the hole in said jaw, said bushing being split longitudinally to render it compressible, and a leading-screw journaled at its ends in said fixed jaw and end piece, respectively, and engaging between its ends the internal threads of said bushing, said screw carrying a milled head to enable it to be revolved manually, substantially as set forth.

4. In micrometer-calipers, the combination, with a fixed jaw, an end piece, and two parallel rods extending between the same, one of said rods having graduations marked thereon, of a movable jaw embracing both of said rods, and a leading-screw journaled at one end in said fixed jaw and having its opposite end extended through said end piece and provided with a milled head for turning the same, which head is also provided with peripheral graduations, said screw operatively engaging between its ends said movable jaw, arranged and operating substantially as described.

5. In micrometer-calipers, the combination, with fixed jaw *a*, rods *c d*, end piece *e*, and jaw *b*, movable upon said rods, of leading-screw *f*, having one end thereof passed through said end piece and having a beveled shoulder engaging a beveled surface at the inner side of said end piece, and conically-pointed screw *g*, passing through said fixed jaw and engaging a conical socket in the opposite end of said leading-screw, substantially as set forth.

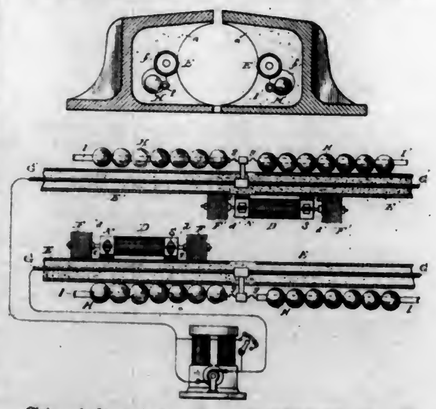
479,808. TRACK CONSTRUCTION FOR RAILWAYS. THOMAS W. HUTCHINS, Wyoming, Pa. Filed Mar. 10, 1892. Serial No. 424,609. (No model.)

Claim.—1. A tie or support for railway-track rails, composed of a series of abutting sections of mineral substances united by a tie-rod passing way through the same, substantially as described.

2. A tie or support for railway-track rails, composed of a series of abutting sections of mineral substances united by a tie-rod passing through the same, the sections upon which the rails rest being wedge shape, whereby the pressure of the rails on the larger ends distributes the strain throughout the tie, substantially as described.

3. A tie or support for railway-track rails, composed of a series of abutting wedge-shaped sections united by a tie-rod, adjacent sections being reversed, substantially as described.

4. A tie or support for railway-track rails, composed of a series of abutting wedge-shaped sections united by a tie-rod, adjacent sections being reversed and the abutting faces corrugated or formed with channels, substantially as described.



5. A tie or support for railway-track rails, composed of a series of abutting sections united by a tie-rod with central vertical apertures in said sections, substantially as described.

6. The combination, with the series of abutting wedge-shaped sections, of the tie-rod passing through said sections, and the washers at the ends of the rod thicker at one edge than at the other to compensate for the inclination of the faces of the end sections, substantially as described.

7. The combination, with the series of abutting sections and tie-rod passing through the same, of the track-rail fasteners passing in through the sections and connected to the tie-rod, substantially as described.

8. The combination, with the series of abutting sections and tie-rod passing through the same, of the eyebolts through which the rod passes, extending out through the top of the sections and adapted to secure the track-rails in place, substantially as described.

479,809. CLOSED CONDUIT FOR ELECTRIC RAILWAYS. EDWARD H. JOHNSON, New York, N. Y., assignor to the Sprague Electric Railway and Motor Company, same place. Filed Feb. 10, 1887. Serial No. 227,139. (No model.)

Claim.—1. In an electric railway, the combination, with a car, of two contact-carriers carried thereby, two separate conduits in which such carriers travel, and a working conductor in each of such conduits, substantially as set forth.

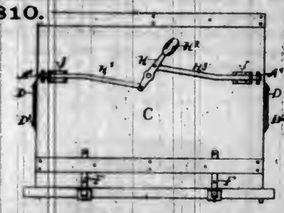
2. In an electric railway, the combination, with the working conductors normally disconnected from the source of electrical energy, of iron balls or rollers and a magnet on the car moving such balls or rollers by a magnetic attraction into position to connect the working conductors in circuit as it passes over them, substantially as set forth.

3. In an electric railway, the combination, with the working conductors, of the main conductors, the auxiliary main conductors, and the magnetic balls, substantially as set forth.

4. In an electric railway, the combination, with the working conductors, of the main conductors, the auxiliary main conductors connected with the main conductors through safety-catches, and the magnetic balls, substantially as set forth.

5. In an electric railway, the combination, with a hollow working conductor, of a main conductor inclosed thereby, substantially as set forth.

6. In an electric railway, the combination, with a hollow sectional working conductor, of a continuous main conductor inclosed thereby, substantially as set forth.



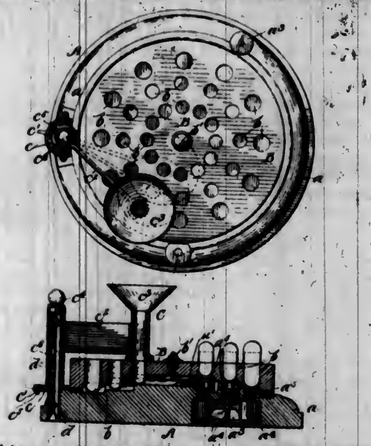
7. In an electric railway, the combination, with a conduit, of a contact-carrier traveling therein and plungers of insulating material forming part of such carrier, said plungers bearing on all sides in the conduit and keeping the carrier central therein, substantially as set forth.

8. In an electric railway, the combination, with the conduit and the working conductors, of the electro-magnetic contact-carriers having contact-brushes bearing on such working conductors and the plungers maintaining the central position of such contact-carriers, substantially as set forth.

479,810. WAGON END-GATE. GEORGE H. JOHNSON, Jamaica, Iowa. Filed Aug. 15, 1891. Serial No. 402,702. (No model.)

Claim.—An improved end-gate-locking device comprising a lever pivoted to the rear end of an end-gate, two arms or bolts pivotally connected with the lever on opposite sides of the fulcrum and extended horizontally in opposite directions, perforated plate secured to the wagon-bed and adapted to receive the ends of said arm-bolts, and a weight secured to the free end of the lever, adapted when the end-gate is being locked to pass a vertical line and remain at an incline and securely hold the said arms or bolts outward by means of the said weight, substantially as set forth.

479,810.



479,811. WHIP-SOCKET. GEORGE A. L. JOHNSON, Lincoln, Nebr. Filed Nov. 27, 1891. Serial No. 413,344. (No model.)

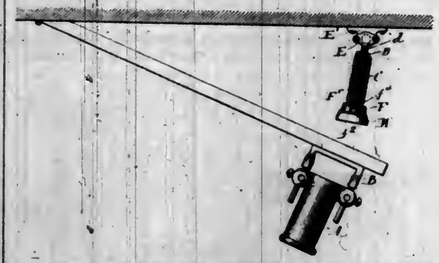
Claim.—The combination, with a whip-socket formed with an opening at one side, of a lock consisting of a plate formed with parallel channels and a central screw-threaded opening, a clamp B, having a concave vertical face and parallel horizontal arms extending into the channels of the plate A, and a shank *c*, loosely secured to the clamp at one end, shaped to receive a key at its other end, and screw-threaded to turn within the opening of the plate A, substantially as described.

479,812. CAPSULE-FILLING MACHINE. WILLIAM K. JOHNSTON, Cordova, Ill. Filed Nov. 12, 1891. Serial No. 411,803. (No model.)

Claim.—1. A machine for filling capsules, comprising a stationary base provided with a raised incline, an auxiliary capsule-ejector, a revolving capsule-carrying plate, and a filler, which latter is adjusted over capsules to be filled, substantially as described.

2. A machine for filling capsules, comprising a stationary base, a revoluble capsule-carrying plate having a plurality of rows of holes, a horizontally-swinging and vertically-sliding filler, and means whereby the filler can be adjusted to register with any one of a plurality of rows of holes in the revoluble capsule-carrying plate, substantially as described.

3. In a capsule-filling machine, the combination of the stationary base, the revoluble capsule-carrying plate having stop-notches on its under side, a catch working in conjunction with said notches and adapted for holding and releasing the revoluble plate, and a filler, substantially as described.



4. A capsule-filling machine comprising a stationary base, revoluble capsule-carrying plate, and a filler, substantially as described.

5. In a capsule-filling machine, the combination of the capsule-carrying plate provided with capsule-cap receptacles, a horizontally-swinging and vertically-sliding filler, adjusting-holes whereby the filler may be made to register with the holes in any one of the rows of receptacles in the plate and hold in such position, a spring depression cap or plug for keeping the parts of the filler together and holding it down on the top of the plate, substantially as described.

6. In a capsule-filling machine, the combination of the stationary base, a platform for bringing the capsule close up to the filler, a revoluble capsule-carrying plate, and a swinging filler, substantially as described.

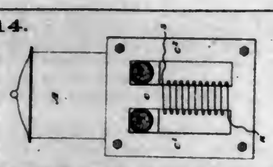
7. A machine for filling capsules, comprising a stationary base having a raised incline, a revolving capsule-carrying plate, and a filler, which latter is adjusted over the holes in the capsule-carrying plate, substantially as described.

479,813. DOOR-CHECK. JOSEPH KEESE, Chicago, Ill., assignor to the Chicago Spring Butt Company, same place. Filed Nov. 3, 1891. Serial No. 410,690. (No model.)

Claim.—1. In a door-check, the combination, with an open-ended cylinder or casing, of a piston-head, said parts being constructed the one for attachment to the door and the other for stationary attachment and so that the two may entirely separate by the withdrawal of the piston-head from the cylinder, and a flexible body or carrier for sustaining the piston-head in manner permitting it to be entirely withdrawn from and to re-enter the open-ended cylinder, substantially as described.

2. In a door-check, the combination, with an open-ended cylinder or casing, of a piston-head, said parts being constructed the one for attachment to the door and the other for stationary attachment and so that the two may entirely separate by the withdrawal of the piston-head from the cylinder, and a flexible body or carrier for sustaining the piston-head in manner permitting it to be entirely withdrawn from and to re-enter the open-ended cylinder, said flexible body or carrier having one end fixed to the piston-head and having its opposite end rigidly fixed to a bracket for attachment to the door or casing, substantially as described.

3. In a door-check, the combination, with an open-ended cylinder or casing, of a piston-head, said parts being constructed the one for attachment to the door and the other for stationary attachment and so that the two may entirely separate by the withdrawal of the piston-head from the cylinder, and a flexible connection or support for sustaining the piston-head in manner permitting it to be entirely withdrawn from and to re-enter the open-ended cylinder, said connection consisting of a coiled spring, substantially as described.

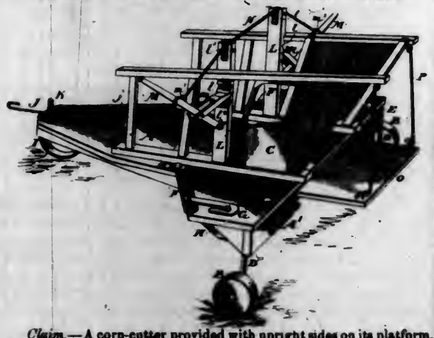


4. In a door-check, the combination, with the open-ended cylinder or casing, of a piston-head, said parts being constructed the one for attachment to the door and the other for stationary attachment and so that the two may entirely separate by the withdrawal of the piston-head from the cylinder, and an elastic flexible connection or support for sustaining the piston-head in manner permitting it to be entirely withdrawn from and to re-enter the open-ended cylinder, and means for attaching said support to the door or lintel and for adjusting it in different positions, substantially as described.

5. A door-check comprising the combination, with a suitable cylinder and casing, of a piston-head, a suitable flexible support for said piston-head, comprising a coiled spring, a suitable plug or attachment D for the inner end of said coiled spring, said plug having a stem or extension, and suitable clamp-plates for engaging with the head or end of said stem or extension and within which plates the position of said plug can be adjusted, substantially as described.

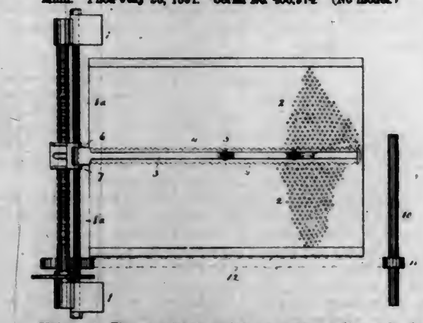
479,814. ELECTRICAL WATER-HEATER. RANKIN KENNEDY, Kilmarnock, Scotland. Filed Apr. 1, 1891. Serial No. 388,436. (No model.)

Claim.—1. In apparatus for heating by electricity, the combination of a magnetizing-coil and a source of alternating or pulsatory electric currents with an iron core and one or more chambers, tubes, or other receptacles for containing liquid to be heated inclosed wholly or in part by said core and having walls of conducting material, within which secondary currents are induced and caused to generate heat substantially as set forth.



479,814.

2. The combination of an endless tubular core with a magnetizing-coil and a source of alternating or pulsatory electric currents.



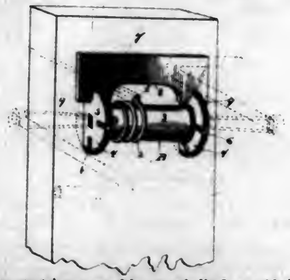
3. In apparatus for heating by electricity, the combination of a magnetizing-coil and a source of alternating or pulsatory electric currents with an endless iron core surrounding or inclosing a receptacle for containing a liquid to be heated.

479,815. CORN CUTTER OR HARVESTER. JOHN KIPP, Sr., Piqua, Kans. Filed Feb. 3, 1892. Serial No. 420,183. (No model.)

Claim.—A corn-cutter provided with upright sides on its platform, ratcheted standards L L, with pulleys at the top, the levers M M, carrying the pawls *m m*, and the tie-cord N', whereby the fodder may be securely held and transported, as set forth.

479,816. WHEAT-SEPARATOR. ALVA H. KIRK, Fergus Falls, Minn. Filed July 28, 1891. Serial No. 400,974. (No model.)

Claim.—1. The combination, with a screening medium, of a cleaning device arranged to sweep its surface and consisting of a bar having its sides beveled and serrated, substantially as set forth.



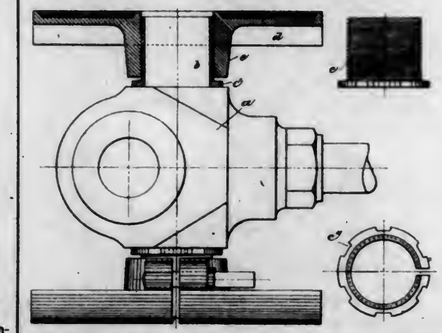
2. The combination, with a reciprocating screening medium, of a cleaning device for sweeping its surface and consisting of a bar rigid laterally and yielding vertically and having serrated beveled sides, substantially as set forth.

3. In a grain-cleaning machine, the combination, with a shaking screening medium, of a cleaning device consisting of a bar having its under surface smooth and its sides serrated, and means for reciprocating it on such medium, substantially as set forth.

4. In a grain-cleaning machine, the combination, with a shaking screening medium, of a cleaning device consisting of a laterally-reciprocating bar composed of hinged sections having their under surface smooth and their sides serrated, substantially as set forth.

479,817. WIRE-FENCE STRETCHER. WILLIAM KRAMER, Chicago, Ill., assignor of one-half to Charles Opitz, same place. Filed Apr. 4, 1892. Serial No. 427,940. (No model.)

Claim.—1. A wire-stretcher comprising a spindle 3, provided at its end with openings 5, adapted to receive a suitable winding-tool, disks 4 at the ends of said spindle provided with radial cuts or slots 6, and a holding-plate 7, adapted to enter said radial cuts or slots 6, substantially as described.



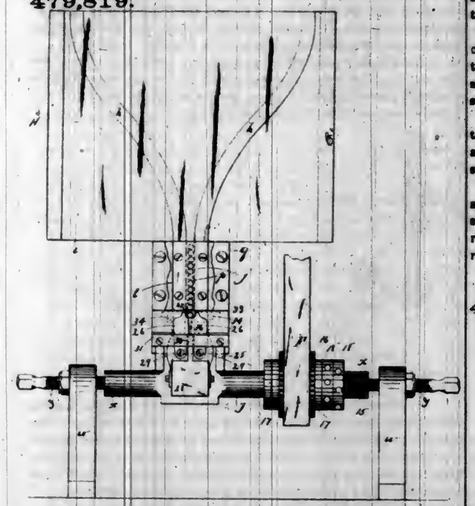
2. A wire-stretcher comprising a spindle 3, provided at its end with openings 5, adapted to receive a suitable winding-tool, disks 4 at the ends of said spindle provided with radial cuts or slots 6, and a holding-plate 7, provided with a cut-away portion 8 and end lugs 10, said end lugs 10 being adapted to enter said radial cuts or slots 6, substantially as described.

3. A wire-stretcher comprising a spindle 3, provided at its end with openings 5, adapted to receive a suitable winding-tool, disks 4 at the ends of said spindle provided with radial cuts or slots 6, and a holding-plate 7, adapted to enter said radial cuts or slots 6 and provided with toes 9, located to embrace the ends of said spindle, substantially as described.

4. A wire-stretcher comprising a spindle 3, provided at its end with openings 5, adapted to receive a suitable winding-tool, disks 4 at the ends of said spindle provided with radial cuts or slots 6, and a holding-plate 7, provided with a cut-away portion 8 and end lugs 10, having toes 9, said lugs being adapted to enter said slots and said toes being located to embrace the ends of said spindle, substantially as described.

479,818. CROSS-HEAD. WILLIAM LAYCOCK, Chicago, Ill., assignor to the Chandler & Taylor Company, Indianapolis, Ind. Filed Apr. 1, 1892. Serial No. 427,409. (No model.)

Claim.—1. The combination, with a cross-head and trunnions carried thereby, of bushes mounted upon said trunnions and gibs screwed upon said bushes, substantially as described.



2. The combination, with a cross-head and trunnions carried thereby, of split bushes mounted upon said trunnions and gibs screwed upon said bushes, substantially as described.

3. The combination, with a cross-head and trunnions carried thereby, of split bushes mounted upon said trunnions, and gibs, each of said gibs having a boss adapted to screw upon said bushes, and slits in said bosses, substantially as described.

4. The combination, with a cross-head and trunnions carried thereby, of split bushes mounted upon said trunnions, gibs *d*, each of said gibs having a boss *e*, adapted to screw upon said bushes a slit *d'* in each of said bosses, and a bolt for contracting said slit, substantially as described.

479,819. ATTACHMENT FOR CARTRIDGE-PRIMING MACHINES. JOHN G. LIDDELL, New Haven, Conn. Filed Mar. 24, 1892. Serial No. 426,231. (No model.)

479,819.

Claim.—1. In a cartridge-priming machine, the priming-plunger, in combination with a raceway, a shaft rocked by the movement of said plunger, and spring-tensioned clamping-fingers on said shaft adapted to receive a cap from the raceway, substantially as described.

2. In a device of the character described, the combination of a cap-raceway arranged at an angle to the cartridge-holder and a rock-shaft actuated by the priming-plunger, with a cap-carrier mounted on said shaft and adapted to receive a cap from the race and deliver said cap over the shell in position to be struck by the plunger-tool, all in operative connection, substantially as described.

3. A cap-race for cartridge-priming machines, comprising two rigidly-supported parallel plates separated by curved bars, the lower ends of which converge into parallelism, forming a race proper, in combination with a cap-carrier for delivering caps from said race to the cartridge, substantially as described.

4. A cap-race for cartridge-priming machines, comprising two vertically-inclined glass plates separated by curved bars, the lower ends of which converge into parallelism and project beyond said plates, forming a race proper, in combination with a cap-carrier for receiving caps from said race and delivering them to the cartridge, substantially as described.

5. A cap-race for cartridge-priming machines, comprising two vertically-inclined parallel plates separated by curved bars, the lower ends of which converge into parallelism, forming a race proper, in combination with a spring-pushed block operating at right angles to said race at its mouth and forming a cut-off, and a cap-carrier adapted to move said block to release a cap from said race, substantially as described.

6. In a device of the character described, the raceway H, comprising vertically-inclined plates separated by converging bars *h*, forming the race proper *p*, in combination with the spring-pushed cut-off 33 and the cap-carrier K', arranged to operate substantially as described.

7. In a cartridge-priming machine, the rock-shaft J and actuating mechanism, in combination with the cap-carrier K, mounted on said shaft, and a cap-race for feeding caps to said carrier, substantially as described.

8. In a cartridge-priming machine, the plunger bearing a rack-bar, in combination with a rock-shaft bearing a cap-carrier and a friction-pinion on said shaft meshing with said rack, whereby the shaft may be driven during a determined portion of the plunger movement.

9. In a cartridge-priming machine, the plunger and rack-bar, in combination with the rock-shaft, a cap-carrier thereon, the pinion 16, loose on the said shaft, and the tension mechanism for said pinion, all in operative connection, substantially as described.

10. The cap-race and cut-off, in combination with the rock shaft and actuating mechanism, and the carrier K on said shaft provided with clamping-fingers 26, adapted to depress said cut-off and receive a cap from said race, all in operative connection, substantially as described.

11. In a cartridge-priming machine, the shaft and actuating mechanism, in combination with the cap-carrier secured to said shaft, a stop for limiting the movement of the carrier toward the delivery-point, a cap-race for feeding caps to said carrier, and a cut-off for said race adapted to be released by contact of said carrier, substantially as described.

12. The carrier K, comprising the block 25 and spring-pushed clamping-fingers pivoted thereon, in combination with the rock-shaft to which said block is fast and connecting mechanism for rocking said shaft from the movement of the plunger of a cartridge-primer, substantially as described.

13. The rigidly-supported cap-race and an automatic cut-off therefor, in combination with the cap-carrier mounted on a rock-shaft and adapted to engage said cut-off and actuating mechanism for said shaft, substantially as described.

14. The plunger and rack, in combination with the rock-shaft and frictionally-held pinion therein, the cap-carrier on said shaft, stops limiting the movement of the carrier in either direction, a cap-race, and an automatic cut-off therefor opened by contact of the carrier, all in operative connection, substantially as described.

479,820. APPARATUS FOR DELIVERING CARDS AND OTHER ARTICLES FOR ADVERTISING PURPOSES. ROBERT H. LITTLE, Chicago, Ill., assignor of two-thirds to Henry H. Heimerdinger and Isaac Meyer. Filed Nov. 24, 1890. Serial No. 372,460. (No model.)

Claim.—1. In apparatus of the class described, the combination, with a compartment for holding the cards, of a vertically-movable plunger or support for sustaining the cards, a slide provided with one or more pivoted ejecting-pawls and fingers, and suitable mechanism for operating said slide, substantially as described.

2. In apparatus of the class described, the combination, with a compartment for holding the cards, of a vertically-movable plunger or support for sustaining the cards, and a slide provided with one or more vertically-movable ejecting-fingers, and suitable mechanism for operating said slide, substantially as described.

3. In apparatus of the class described, the combination, with a compartment for holding the cards, of a vertically-movable plunger or support for sustaining the cards, a slide provided with one or more pivoted pawls, and ejecting-fingers and toggle mechanism for operating said slide, substantially as described.

4. In apparatus of the class described, the combination, with a compartment for holding the cards, of a vertically-movable plunger or support for sustaining the cards and a reciprocating vertically-adjustable ejecting-finger for forcing the cards from the compartment, substantially as described.

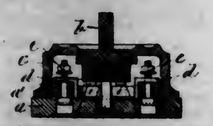
5. In apparatus of the class described, the combination, with a compartment A' for holding the cards, of a reciprocating slide-plate H, pivoted pawls K, provided with ejecting-fingers K', one of said pawls being arranged at each side of said slide-plate, and toggle-levers G G' for operating said slide-plate, substantially as described.

6. In apparatus of the class described, the combination, with a compartment for holding the cards, of a vertically-movable plunger or support for sustaining the cards and differential weight mechanism for feeding said cards upward, said weight mechanism comprising

means for throwing portions of the lifting-weight out of action as the stack of cards decreases, substantially as described.

7. In apparatus of the class described, the combination, with a compartment for holding the cards, of a vertically-movable plunger or support for sustaining the cards, a cord connected to said plunger or support, a series of weights carried by said cord, and a weight-box provided with projections adapted to successively throw said weights out of action, substantially as described.

8. In apparatus of the class described, the combination, with a movable arm and suitable means for operating it, of a hand provided with a movable thumb and with a finger, said thumb having an extension and said finger being provided with a recess adapted to receive said extension, substantially as described.



9. In apparatus of the class described, the combination, with a movable arm, of a rotatable shaft for swinging said arm, suitable connections leading from said shaft to the motive power, a stop or check mechanism connected with said rotary shaft to arrest its movement, a hand provided with a movable part—such, for example, as a thumb—a lever adapted to be moved by said thumb, a spring of sufficient power to move said thumb and said lever, and a suitable mechanical connection between said lever and said stop or check mechanism, whereby when said thumb is shifted under the force of said spring said lever will be moved to shift said mechanical connections and release the stop mechanism, substantially as described.

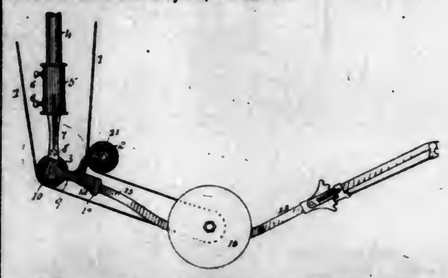
10. In apparatus of the class described, the combination, with a movable arm, of a shaft *r*, connected with said arm, a rocking lever S, attached to said shaft and suitably connected with the motive power, an arm X and a shaft *x*, sustained by said lever S, an arm 61, connected to said shaft *x* and provided with a stop or roller 62, a pivoted check-pawl V, a cord 50, connected to said arm X, a lever W, a delivery-hand P', by which said lever W is sustained, and a movable spring-actuated thumb 25, substantially as described.

11. In apparatus of the class described, the combination, with a movable arm and a shaft for swinging said arm and to which said arm is connected, of a swinging stop or roller 62, connected to said shaft, a pivoted check-pawl V for arresting said stop or roller 62, a delivery-hand P', provided with a movable spring-actuated thumb 25, and a suitable connecting mechanism between said thumb 25 and said stop or roller 62, whereby when the card is removed from the grasp of said thumb the stop or roller 62 will be thrown out of engagement with said pawl V, substantially as described.

12. In apparatus of the class described, the combination, with a movable arm P, of a shaft *r* for swinging said arm, said shaft being suitably connected with the motive power, a stop or roller 62, connected with said shaft, a pivoted pawl V for engagement with said stop or roller 62, an arm 61 for carrying said stop or roller 62, and suitable means for sustaining said arm 61, and a movable deflecting-plate Y, substantially as described.

479,821. ELECTRIC SWITCH. ANDREAS P. LUNDBERG, London, England. Filed Dec. 29, 1891. Serial No. 416,487. (No model.) Patented in England Oct. 24, 1891, No. 18,260.

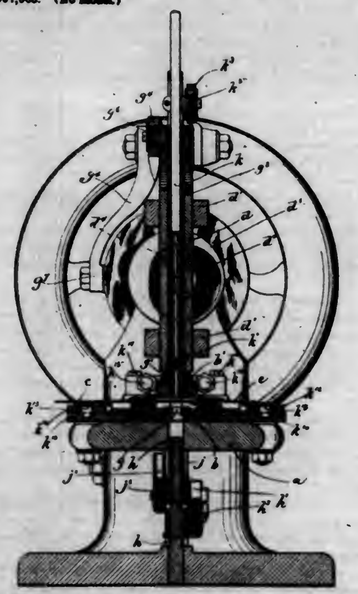
Claim.—1. In an electric switch, the combination of a recessed base, combined with binding-posts and contact-plates fastened to the sides of the recess of the base, a rotary spindle carrying coiled contact-springs, and bearings for the spindle, formed by the beveled cover and the recessed base.



2. The combination of a squarely-recessed base, angular contacts fastened by the binding-posts to the base and projecting into the several sides of the recess, a rotary spindle, coiled contact-springs mounted on split pins carried by the spindle, and the base and cover forming bearings for said spindle, substantially as described.

479,822. GRINDING AND POLISHING MACHINE. ALBERT MARKS, Cerro Gordo, Ill. Filed Oct. 10, 1891. Serial No. 408,351. (No model.)

Claim.—1. In grinding and polishing machines, the combination of hanger 4, having bracket 7, frame 9, pivotally connected with the bracket and having idlers 2 and 3 so located that the nearer surface of idler 2 and the farther surface of idler 3 are equidistant from the pivot, wheel-driving pulley 21, carried by side bars connected with frame 9, and belt 1, extending around the pulley and bearing against the idlers, as set forth.



2. In grinding and polishing machines, the combination of the side bars having the manipulating-handles, the wheel-carrying frame connected with the side bars in a manner permitting motion in different directions, and the spring tending to hold the wheel-carrying frame in a certain position relative to the side bars, as set forth.

3. In grinding and polishing machines, the combination of the side bars, the frame pivotally connected with the side bars, the yoke connected pivotally with the frame, and the spring-rod connected with the side bars and with the yoke, as set forth.

4. The combination of the side bars, the frame pivotally connected with the side bars, the yoke carrying the wheels and having a boss extending through a hole in the frame, an angular bolt extended through a corresponding hole in the boss and connecting the frame and yoke together, and a spring-rod extending through the head of the bolt and connecting with a cross-piece of the side bars, as set forth.

479,823. MACHINE FOR MAKING SHEET-METAL BUTTONS. JOSEPH MATHEWS, Somerville, Mass. Filed June 26, 1891. Serial No. 397,605. (No model.)

Claim.—1. In a machine for making pronged buttons from sheet metal, the combination of blank-cutting dies, feeding mechanism arranged to feed a strip of sheet metal to said dies, a plunger and anvil for shaping the central portion of the blank, and dies for bending the ends of the blank to form the prongs.

2. In a machine for making pronged sheet-metal buttons, the combination of a fixed female cutting-die, a reciprocating male cutting-die, feeding mechanism for feeding a strip of sheet metal between said dies, and blank folding and forming mechanism comprising a fixed annular die located under the female cutting-die in position to receive a blank from the latter, a reciprocating plunger arranged to pass through both cutting-dies and co-operate with the annular die in imparting the preliminary shape to the blank, the anvil arranged to co-operate with the plunger in forming the button-head, the shank-forming dies arranged to act on the arms of the blank at a point between the anvil and plunger, the mandrel arranged to enter the space between the said arms and co-operate with the shank-forming dies in forming the shank, and the tubular holder surrounding the anvil and adapted to hold and prevent the displacement of the margin of the button-head during the operation of forming the shank, as set forth.

3. In a machine for making pronged sheet-metal buttons, the combination of an annular die and a plunger formed to enter said die, and co-operate therewith in imparting a cup shape to the central portion of the blank hereinbefore described and laterally-movable dies to co-operate with the annular die and plunger in bending the arms or wings of said blank to form prongs, as set forth.

4. In a machine for making pronged sheet-metal buttons, the combination of an annular die, a plunger formed to enter said die and partially form the button-head, and an anvil formed to co-operate with said plunger in perfecting the top of the button-head, and laterally-movable dies for forming the arms of the blank into prongs, as set forth.

5. In a machine for making sheet-metal buttons, the combination of an annular die, a plunger formed to enter said die and partially form the button-head, an anvil formed to co-operate with said plunger in perfecting the button-head, and a tubular holder surrounding the anvil and vertically movable relatively thereto, whereby it is adapted to co-operate with the plunger and anvil in shaping the marginal portion of the button-head, and mechanism for operating said plunger, anvil, and holder, as set forth.

6. In a machine for making sheet-metal buttons, the combination, with devices for holding a sheet-metal blank consisting of a concavo-convex head or central portion and arms or wings standing parallel with each other at opposite sides of said head, of a mandrel adapted to enter the space between said arms, shank-forming dies formed to co-operate with said mandrel in converting portions of said arms into a substantially tubular two-part shank, and mechanism for operating said mandrel and dies, as set forth.

7. In a machine for making sheet-metal buttons, the shank-forming dies adapted to close upon the two arms of the blank hereinbefore described and form portions of said arms into a shank, combined with the slotted arm-engaging plates yieldingly mounted on said dies and engaged with guides on the dies, as set forth.

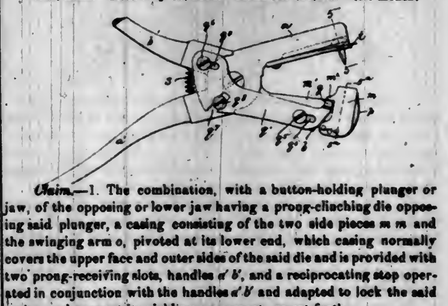
8. In a machine for making sheet-metal buttons, the combination of a fixed annular die, a reciprocating plunger formed to enter said die and partially form the button-head, a reciprocating anvil which co-operates with the plunger in perfecting the button-head, the mandrel which enters the space between the arms of the blank, the shank-forming dies which are closed upon the arms of the blank at a point between the anvil and plunger and co-operate with the plunger and mandrel in forming the shank c^4 and shoulders c^5 of the button, and mechanism for operating said plunger, anvil, mandrel, and dies, as set forth.

9. In a machine for making pronged sheet-metal buttons, the combination of a fixed female cutting-die, a reciprocating male die formed to co-operate with the female die in cutting blanks of the form shown from sheet metal, a fixed annular die arranged to support the central portion of the said blank, a reciprocating plunger movable in a guide or way formed for it in said male die, said plunger being arranged to pass through the female die and enter the annular die, and thereby force the central portion of the blank into the annular die, laterally-movable dies for bending the ends of the blank into prongs, and mechanism for reciprocating said male die and plunger, as set forth.

10. The combination of a fixed female cutting-die, a reciprocating male cutting-die, a fixed annular die arranged in line with the central portions of said dies, a reciprocating plunger movable in a guide or way in the male cutting-die and adapted to enter said annular die, a reciprocating mandrel movable in a guide or way in said plunger and adapted to project below the latter, a reciprocating anvil arranged to co-operate with the plunger in forming a button-head, a pair of reciprocating shank-forming dies arranged to act on the arms of a blank at a point between the annular die and the anvil, and mechanism for operating said reciprocating parts, as set forth.

11. The combination of the fixed female die, the movable male die, a carrier supporting the male die, means for reciprocating said carrier, the fixed annular die below the female die, the plunger movable in a way in the male die and carrier, the lever L^3, rod L^4, and cam L^5 for operating said plunger, and the laterally-movable dies L^6, as set forth.

12. The combination, with the male and female cutting-dies, the fixed annular die, the plunger, and means for operating said male die and plunger, of the reciprocating anvil *k*, the tubular holder *j*, surrounding said mandrel, the levers *k'* *j'*, rods k^4 j^4, and cams k^7 j^7, whereby said anvil and holder are operated, the shank-forming dies arranged between the anvil and the plunger, and means for operating said dies, as set forth.



13. The combination of the fixed female die, the movable male die, a carrier supporting the male die, means for reciprocating said carrier, the fixed annular die below the female die, the plunger movable in a way in the male die and carrier, means for operating said plunger, the rod *l*, movable in a way in said plunger and provided at its lower end with the mandrel *k'*, the lever L^3, rod L^4, and cam L^5, whereby said rod and mandrel are operated, the shank-forming dies arranged to co-operate with the mandrel, and means for operating said dies, as set forth.

14. The combination, with the anvil and the plunger for holding a partly-formed blank composed of a concavo-convex head and two parallel arms thereon, of the shank-forming dies arranged to bend portions of said arms inwardly, the bell-crank levers L^{12} L^{13}, engaged with said dies, the movable slide or frame engaged with said levers, and means for reciprocating said slide, as set forth.

15. The combination, with the cutting-dies and button-forming mechanism co-operating therewith, of the reel-support o^3, the swinging arm p^3 on said support, having the jaw *p*, the jaw *p'*, pivotally connected to said arm, a rod p^4, connecting the jaw *p'* with a lever or arm reciprocated by the operation of the machine, whereby the arm p^3 is oscillated, and a stop carried by the arm p^3 to limit the backward movement of the jaw *p*, as set forth.

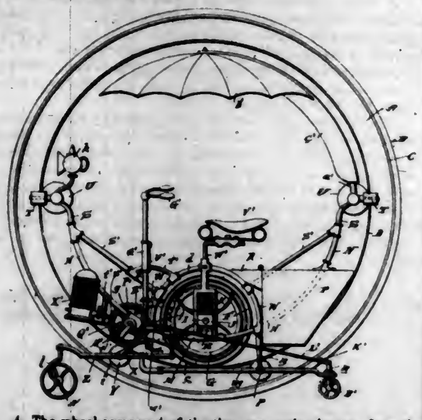
16. The combination, with the cutting-dies and button-forming mechanism co-operating therewith, of the reel-support o^3, the swinging arm p^3 on said support, having the jaw *p*, the jaw *p'*, pivotally connected to said arm, a rod p^4, connecting the jaw *p'* with a lever or arm reciprocated by the operation of the machine, whereby the arm p^3 is oscillated, and a stop carried by the arm p^3 to limit the backward movement of the jaw *p*, and a pair of jaws, such as o^4 and o^5, whereby the strip is prevented from moving loosely backward, as set forth.

479,824. BUTTON-SETTING TOOL. JOSEPH MATHEWS, Somerville, Mass. Filed July 13, 1891. Serial No. 399,264. (No model.)

Claim.—1. The combination, with a button-holding plunger or jaw, of the opposing or lower jaw having a prong-clinching die opposing said plunger, a casing consisting of the two side pieces *m m* and the swinging arm *o*, pivoted at its lower end, which casing normally covers the upper face and outer sides of the said die and is provided with two prong-receiving slots, handles *a' b'*, and a reciprocating stop operated in conjunction with the handles *a' b'* and adapted to lock the said casing and prevent its yielding movement, as set forth.

2. The combination, with a button-holding jaw or plunger, of an opposing or lower jaw having a prong-clinching die, a casing which normally covers the upper face and outer sides of the said die, the upper portion of the said casing being provided with two prong-receiving slots, handles *a' b'*, and a movable stop operated in conjunction with the handles *a' b'* and consisting of the arm *q'*, movably supported by the lower jaw and the handle *b'* and having an upwardly-turned end *q* and adapted to lock said casing to the jaw and prevent its yielding movement, as set forth.

3. The combination, with a button-holding jaw, of an opposing or lower jaw having a yieldingly connected prong-clinching die, a casing which normally covers said die and is provided with prong-receiving slots over the die, a movable stop adapted to lock said casing to the jaw and prevent its yielding movement, an arm supporting said stop and having a sliding connection with the lower jaw, and a stud or projection connected with the upper jaw and engaged with said arm, whereby the stop is automatically moved by the opening and closing of the jaws, as set forth.



4. The combination, with a button-holding jaw, of a lower jaw having the clinching-die rigidly affixed to it, combined with the independently-movable die-covering casing comprising an arm, such as *m'*, pivotally connected with said jaw, side pieces affixed to said arm and located at opposite sides of the block, said pieces having prong-receiving slots, and an arm, such as *o*, pivoted to the arm *m'* and pressed by a spring into the space between the side pieces, as set forth.

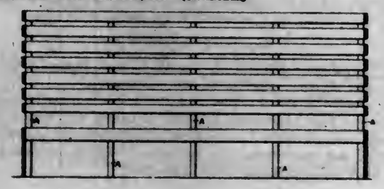
479,825. MONOCYCLE. JAMES D. MATTHEW, Saginaw, Mich. Filed Sept. 25, 1891. Serial No. 406,795. (No model.)

Claim.—1. The combination, with a wheel, of a frame sustained therein, a base roller frame vertically adjustable with respect to the wheel, a semi-rotatable bar connected with a handle-bar, and rods connecting said semi-rotatable bar with wheels of the roller-frames so as to guide the same, substantially as specified.

2. The combination, with a wheel, of a frame sustained therein, the rack-bar, the upright pivoted handle-post, the two vertically-adjustable rollers A', and levers connecting the same with the handle-post, the sleeve on said handle-post having the curved arms, the steering wheels or rollers, the levers pivotally connecting the same with the handle-post, and the guide-rods connecting said wheels with the sleeve on the handle-post, substantially as specified.

3. In a monocycle, the combination, with a wheel, of a suitable frame sustained therein, a pivoted post, a forked sleeve arranged on said post, guide-wheels, rods connecting said guide-wheels with the branches of the sleeve, and a suitable handle for manipulating the post, substantially as specified.

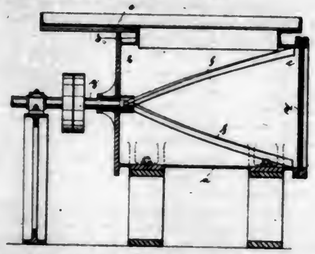
4. The wheel composed of the tire-seat section bent to form the circumferential tire-seat and having separated parallel branches on its inner side, the section D, having the lapped edges, and the connecting-web having one edge received in the lapped portions of the section D and the opposite edge or edges secured between the parallel flanges of the tire-seat sections to serve substantially as specified.



5. In a monocycle, the combination, with a wheel having an inner band, of a frame sustained therein, a drive-wheel yieldingly sustained in said frame and adapted to engage the inner band of the wheel, said wheel also having one or more ratchet-wheels, an endless belt or chain, and suitable means for imparting motion to the same, substantially as specified.

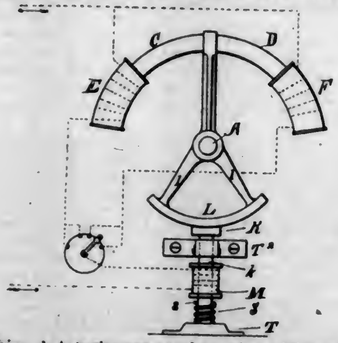
6. In a monocycle, the combination, with a wheel, of the frame sustained therein by friction-rollers, the hanger-frame having vertical guideways and carrying a seat, the spring-backed bearing arranged in said ways, the shaft sustained in the bearings, a drive-wheel fixed to said shaft and having one or more sprocket-wheels formed thereon, and a felt or other suitable ring set in the face of the drive-wheel and adapted to contact with the inner band of the main wheel, and means for imparting motion to the main wheel, substantially as specified.

7. In a monocycle, the combination, with a wheel having an inner friction-band, as described, of a frame arranged therein and friction-rollers for engaging the inner and outer sides of said band and also the lateral edges thereof, said frame being adapted to support driving mechanism, and a vertically-movable roller base-frame, substantially as specified.



8. In a monocycle, the combination, with the wheel having the inner friction-band, of the frame arranged therein and carrying friction-rollers engaging the inner and outer sides of said band and also the lateral edges thereof, and the roller-frame connected with the first frame, and devices for raising and lowering the latter frame, whereby said roller-frame may be let down and present a broad base for sustaining the main wheel when not in use, substantially as specified.

479,826. HAY-RACK. JOHN F. MOORE, Crowell, Nebr. Filed June 29, 1891. Serial No. 397,983. (No model.)

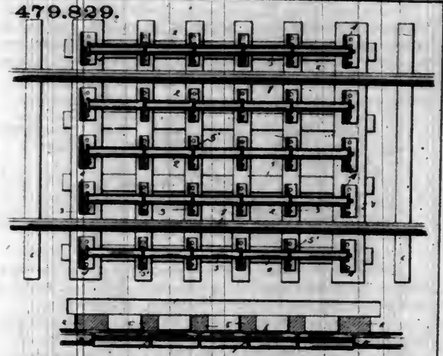


Claim.—The herein-described combined hog-house and hay-rack, comprising a lower housing closed upon three sides and having a solid deck provided with a central latticed portion extending longitudinally from end to end, in combination with a crib forming part of said housing and extending above said central latticed portion, so as to leave a suitable space between said deck and crib, said crib extending from said central latticed portion, the whole of said deck being surrounded by a guard, all substantially as and for the purpose set forth.

479,827. APPARATUS FOR KNEADING DOUGH AND SHAPING IT INTO LOAVES. WILHELM J. MÜLLER, Ehrenberg, Germany. Filed Dec. 30, 1891. Serial No. 416,578. (No model.)

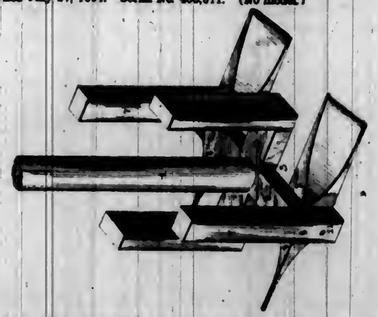
Claim.—In a machine for kneading and shaping loaves of dough, the combination, with the cylindrical casing open at one end and having the hopper at the top, of the power-shaft journaled in the closed end of the cylinder, the kneader or agitator carried by said shaft and having the arms projecting toward the open end, and the cut-off lid or door working across and closing the open end of the cylinder, whereby the dough may be severed into loaves and the dough retained in the casing when requiring extra kneading, substantially as described.

479,828. ELECTRIC STEERING-GEAR. EDGAR H. MUNFORD, Detroit, Mich. Filed Aug. 20, 1891. Serial No. 403,196. (No model.)



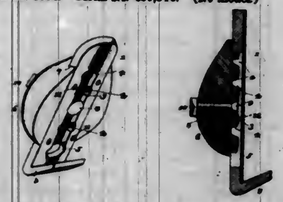
Claim.—1. A steering apparatus for vessels, consisting of a rudder and rudder-post, a tiller, and a curved arm of magnetic material attached thereto concentric to said rudder-post, and a solenoid fixed to the body of the vessel, arranged to receive within its coils a portion of said curved arm and to move it around its central support through the force of an electric current passing through said solenoid, substantially as and for the purpose described.

2. In a steering apparatus, the combination of a rudder, rudder-post, tiller-arm, a circular arm of magnetic material attached at its middle point to said tiller-arm and extending in either direction therefrom into a curved solenoid, a line in electric connection with an electric generator, and a switch adapted to switch the circuit into either or both of said solenoids or to break connection with either or both, substantially as and for the purpose specified.



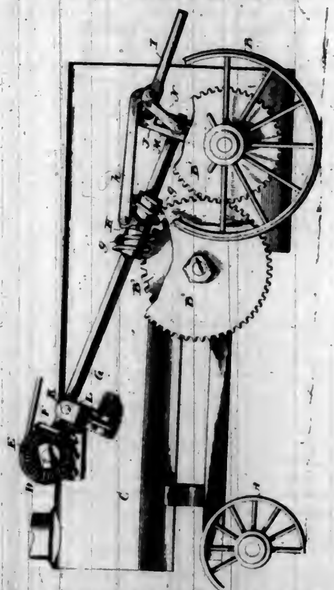
3. In a steering apparatus, the combination of the rudder, rudder-post, tiller, electrically-controlled arms projecting from the tiller, an electric brake, solenoids operating said tiller-arms, solenoids operating said brake, and a switch mechanism and conducting-wires whereby the electrical force is directed at will through the tiller-arm, solenoids, or the brake-solenoids, substantially as and for the purpose described.

479,829. RAILROAD-CROSSING. JOHN MCCARTHY, Manistique, Mich. Filed Nov. 21, 1891. Serial No. 412,606. (No model.)



Claim.—The herein-described crossing for railroads, the same consisting of sleepers located below and at right angles to the ties, larger ties at the sides of the crossing, closed bearings supported on said larger ties, open bearings on the ties intervening, and rollers journaled in said bearings parallel with the rails and between and outside of the same, as and for the purpose hereinbefore set forth.

479,830. CHURN-DASHER. FRANCIS L. MCCOY, Enkridge, Kans. Filed July 27, 1891. Serial No. 400,811. (No model.)



Claim.—The combination of a vertically-reciprocating dasher-rod and a rotating dasher arranged at the lower end of the dasher-rod and comprising the horizontal bars centrally secured together and crossing each other and arranged at right angles and pivoted at the lower end of the dasher-rod, one of the bars being longer than the other, the vertical blades 6 and 7, secured at the ends of the horizontal bars, the blade 7 being arranged at the ends of the longer bar, and having their lower ends depending therefrom, and horizontal propelling-blades secured intermediate of their ends to the ends of the longer bar and to the depending portions of the vertical blades and having their ends disposed at an angle or inclined, said vertical blades being adapted to cause an agitation of the liquid and the propelling-blades to cause a rotation of the dasher, substantially as described.

479,831. TOE-WEIGHT. CHARLES M. MCMILLAN, Red Cloud, Nebr. Filed Oct. 20, 1891. Serial No. 409,310. (No model.)

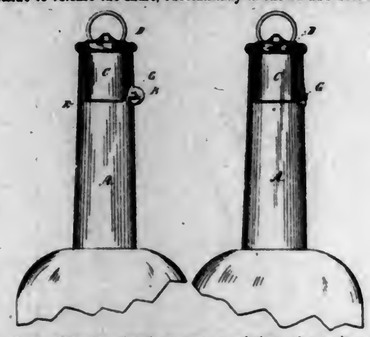
Claim.—The combination, with the standard 1, having opposite dovetailed edges, a lower bent end 2, and a longitudinal slot 3, having beveled edges, said slot being provided at its lower end with an enlarged opening 5 and at intervals above the same with countersunk recesses 4, of the weight 6, the rear face of which is provided with the dovetailed recess 7, mounted for sliding upon the standard, the bolt provided with a head at its inner end, passed through a perforation flared at its rear end and formed in the weight and through the slotted standard, the head of the bolt being adapted to be withdrawn through the hole 5 of the standard, and the nut upon the outer end of the bolt, substantially as specified.

479,832. TRACTION-ENGINE. PETER T. NEUHAUS, Galion, Ohio. Filed Apr. 16, 1892. Serial No. 429,688. (No model.)

Claim.—1. In combination with the main shaft of a motor and a worm-wheel, a second shaft driven from said main shaft, the double worm on said second shaft in mesh with said wheel, and means for raising said shaft to lift one part of said worm out of mesh with its wheel and for shifting said worm and then lowering the shaft to place another portion of the worm in mesh with the wheel, substantially as shown and described.

2. In combination with the main shaft of a motor and a worm-wheel, a second shaft driven from said main shaft and journaled at one end in a pivoted box or bearing, the double worm slidable on said second shaft to mesh with said wheel, and the pivoted lever connected to said worm and to its shaft to move the latter on its pivot and to slide the worm, substantially as shown and described.

3. In combination with the main shaft of a motor and a worm-wheel, a second shaft driven from the main shaft, the pivoted box journaling it at one end, the sliding block journaling it at its other, the worm on such second shaft meshing with said wheel, the pivoted lever, and links connecting the same with said worm and with said sliding journaling-block.



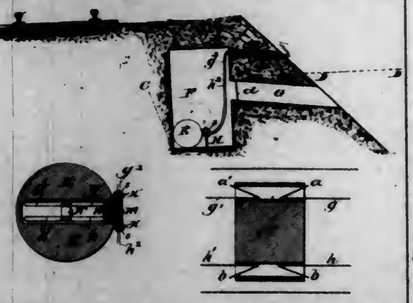
4. In combination, the main shaft of a traction-engine, the bevel-gear thereon, the traction-wheel, the worm-wheel geared to the latter, the second shaft having a bevel-gear meshing with the gear of the main shaft, and a double worm to mesh with said worm-wheel, the pivoted box journaling one end of said second shaft, the slidable block journaling the other, and the pivoted lever connected to said block and to said double worm, as shown and described.

5. In combination, the main shaft of a traction-engine, the bevel-gear thereon, the traction-wheel, the worm-wheel geared to the latter, the second shaft having a beveled gear meshing with the gear of the main shaft, the double worm to mesh with said worm-wheel, the collar thereon, the pivoted box journaling one end of said second shaft, the slidable block journaling the other end, the slotted standard in which said block is movable, the lever pivoted to said standard, links connecting said lever, and the collar on the worm, all substantially as shown and described.

479,833. BOTTLE-STOPPER. JOHN R. ORR, Covington, Ky., assignor to Richard P. Ernst, same place. Filed Aug. 5, 1891. Serial No. 401,751. (No model.)

Claim.—1. In a bottle-stopper, the combination, with the stopper and spring-bolt therein, of a destructible groove or recess in the neck of the bottle to receive said bolt, whereby said stopper is locked until the groove or recess is destroyed, substantially as shown and described.

2. In a bottle-stopper, the combination of a spring-bolt attached to the stopper and a thin hollow teat in the neck of the bottle, opening inwardly to receive the bolt and adapted to be broken from the outside to release the same, substantially as shown and described.



3. A self-locking bottle-stopper consisting of a cork or stopper provided with a spring-bolt, a thin hollow teat in the bottle to receive said bolt and adapted to be broken from the outside to release the bolt, and plates on either end of the stopper, connected by a rod, substantially as shown and described.

4. A bottle-stopper consisting of a cork reinforced by end plates joined by a rod passing through the cork and a spring-bolt with a destructible recess in the neck of the bottle to receive same, substantially as shown and described.

5. In combination with a stopper provided with a bolt, a bottle constructed with a thin hollow teat opening internally to receive said bolt and adapted to be broken on the outside to release the bolt, substantially as and for the purpose described.

479,834. DEVICE FOR INDICATING WASHOUTS IN RAILROAD-BEDS. JOSÉ O. Y HERNOSA, Mexico, Mexico. Filed Oct. 23, 1891. Serial No. 409,591. (No model.)

Claim.—1. A chamber F with inclined inlet-pipe G, embedded in and opening through the side of the railroad embankment, in combination with a float arranged in the bottom of said chamber and containing a movable circuit-breaker and one or more electric circuits adapted to be broken by the change in the position of the float, substantially as shown and described.

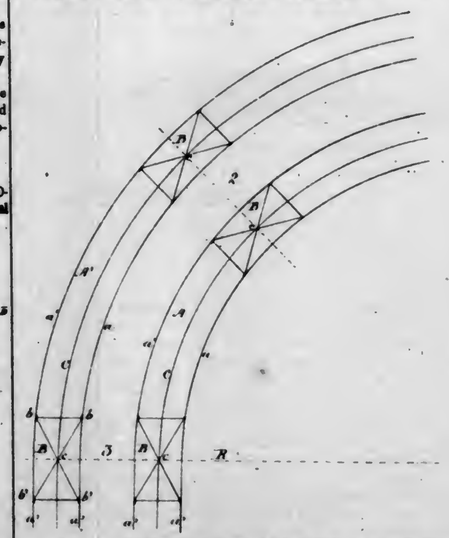
2. The float E, having a central chamber, in combination with a tightly-fitting screw-plug *n m*, having parallel wire terminals and trunnion extensions and a circuit-breaker sliding on said parallel wire terminals and connecting the latter, substantially as shown and described.

3. The combination, with the standards H, having eyes or journal-bearings, of the float E, having a central chamber and a screw-plug *n m*, sliding said chamber and having trunnioned ends fitting in the eyes or journal-bearings of the standards, substantially as shown and described.

4. The sliding circuit-breaker M, having one or more holes through it provided with a metal lining, in combination with wire terminals arranged in line and having their ends bent back upon themselves to form springs and also act as stops to prevent the closing of the circuit again when once broken, as substantially shown and described.

5. The combination of the chamber F with pipes or tubes M G, standards H, arranged in the bottom of the chamber, the float E, hinged on its standards and provided with circuit-breaking devices, and circuit-wires extending through the trunnions and out through pipe M to the stations, substantially as shown and described.

479,835. STORAGE-BATTERY PLATE. HARRY G. OSBURN, Chicago, Ill. Filed Nov. 21, 1891. Serial No. 412,663. (No model.)

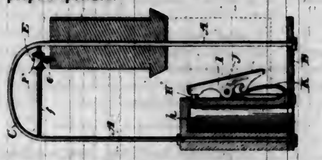


Claim.—1. In a secondary-battery electrode, a grid or plate consisting of longitudinal webs and the transverse ribs or bars deflected alternately in opposite directions, substantially as described.

2. In a secondary-battery electrode, a grid or plate having a multiplicity of connected ribs or bars which are deflected in opposite directions and form open receptacles for active material, substantially as described.

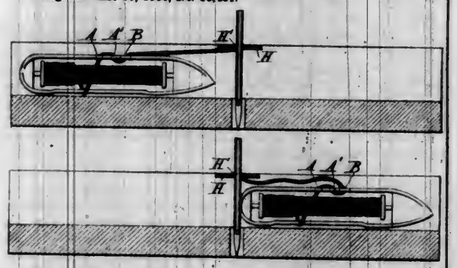
3. In a secondary-battery electrode, a grid or plate having the longitudinal webs *d* and the transverse ribs or bars *e e'* integral therewith and deflected alternately in opposite directions to form a series of open receptacles for the reception and exposure of active material, substantially as described.

479,836. RAILWAY-TRACK. CHARLES W. PARKS, Troy, N. Y. Filed May 14, 1891. Serial No. 392,654. (No model.)



Claim.—1. In combination with a straight three-rail or three-way track having the central way equidistant from each side way, and a curved track having its intermediate way nearer to the inner rail of the curve by approximately the product of the radius or curvature and the versed sine of the angle formed by two radii of the curve, one such radius passing through an axle of the car upon the curve and the other passing midway between the axles of said car, as set forth.

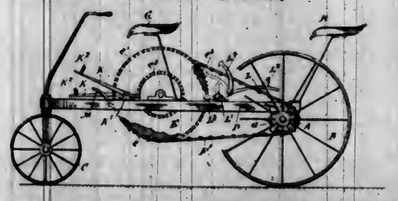
2. In combination with a straight three-rail or three-way track having the central way equidistant from each side way, a curved track having its intermediate way nearer to the inner rail of the curve by approximately the versed sine of the angle formed by two radii of the curve, one such radius passing through an axle of the car upon the curve and the other passing midway between the axle of said car, and an intermediate way having a curve in one direction gradually approaching the center way of the straight track and in the other direction the off center way of the curved track, substantially as described.



479,837. DETONATING FIRE-ALARM. LEVI PARSLEY, Bonney, Ark. Filed Apr. 18, 1892. Serial No. 429,653. (No model.)

Claim.—1. In a detonating alarm of the character described, in combination, the gravity-casting, the suspending-cord therefor, and a system of pulleys over which the cord is passed, the chamber for containing the powder, said cylinder having an outlet at its lower end and at its upper end provided with a cone to receive the discharge-cap, a pivoted hammer held normally by the tension of a spring in contact with the cap, and the lower end of the said lever inclined outwardly and in the path of the gravity casting, substantially as described, and for the purpose specified.

2. The combination, with the base-plate, of the wire or rod having its ends attached thereto and formed into an arch with vertical sides, the gravity-casting sleeved upon one side of said arch, the lower end of the casting being provided with a beveled flange or extension, as described, the cord for suspending said casting, the pulleys over which the cord is passed, the cylinder H, having an interior chamber opening at its lower end through the plate B and at its upper end provided with a cone to receive the firing-cap, and the hammer pivoted at its center between lugs upon the outer face of the cylinder, with the lower end of the hammer held normally in the path of the gravity-casting by the action of a spring, substantially as described.

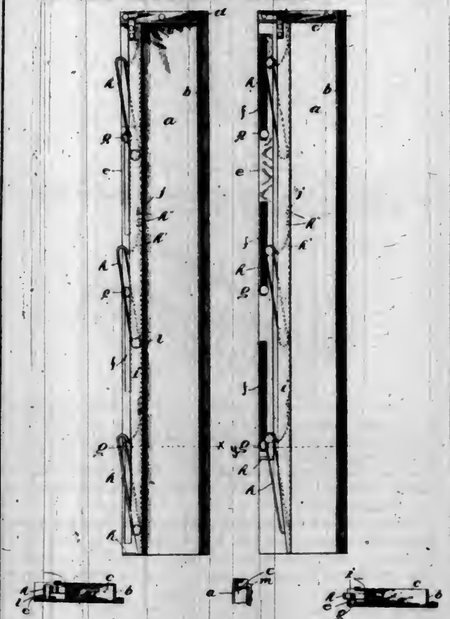


479,838. SEWING-MACHINE. MARSHALL H. PEARSON, Leicester, England, assignor to the John O'Flaherty Company, Montreal, Canada. Filed Oct. 30, 1891. Serial No. 410,345. (No model.) Patented in England June 26, 1889, No. 10,481.

Claim.—1. The combination, in a sewing-machine, of a frame or plate having a needle-opening, a shuttle provided with a hole for the delivery of the thread, and mechanism, substantially such as shown and described, for imparting motion to said shuttle and adapted to carry the thread-delivery hole of the latter to a greater distance in rear of the needle-hole than in front of the same, whereby the thread required to form a stitch is drawn from the shuttle during the backward movement of the latter.

2. In a sewing-machine, the combination, with a frame or plate H, provided with a needle-hole H', of a reciprocating shuttle provided with a thread-delivery hole B, and means, substantially such as shown and described, for actuating the shuttle and carrying its thread-delivery hole B farther to the rear side of the needle-hole H' than to the other side.

479,839. VELOCIPEDE. JOHN PFLEGER, Minneapolis, Minn. Filed Nov. 17, 1891. Serial No. 412,129. (No model.)



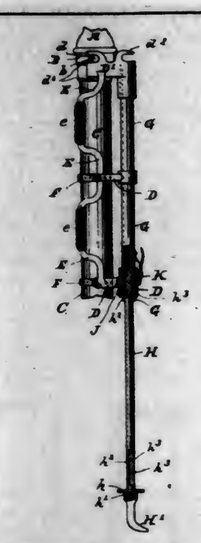
Claim.—1. In a velocipede, the combination, with a driving-wheel provided with annular ratchets arranged for moving the wheel in opposite directions, of ratchet-levers engageable with either set of said ratchets at the will of the operator, substantially as described.

2 In a velocipede, the combination, with a drive-wheel supported on the main frame free from the ground and provided with annular ratchets, some of which have their teeth arranged for forward and others for backward motion, of seats for two operators, and two sets of foot-power ratchet-levers arranged for action on said ratchets at opposite points of the driving-wheel, substantially as described.

3. In a velocipede, the combination, with the drive-wheel supported on the main frame free from the ground and provided with annular ratchets, of the foot-power ratchet-levers and a foot-power brake operating on said drive-wheel, substantially as described.

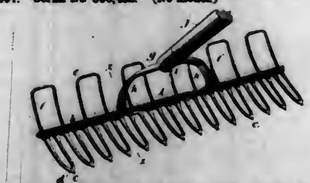
4. In a velocipede, the combination, with a drive-wheel supported on the maip frame free from the ground and provided with annular ratchets, some of which have their teeth arranged for forward and others for backward motion, of seats for two operators, arranged one to the front and the other to the rear of the driving-wheel, and two sets of foot-power ratchet-levers arranged for action on said ratchets at opposite points of the said driving-wheel for either forward or backward motion, substantially as described.

479,840. GALLEY-LOCK. JOHN PRELAN, Pittsburg, Pa., assignor of two-thirds to William Trimble and Jacob H. Jones, same place. Filed Nov. 10, 1891. Serial No. 411,472. (No model.)



Claim.—1. In a galley-lock, a galley having the usual side and end walls, in combination with a side-stick provided with slots having yielding walls extending obliquely to the plane of the side-stick and a locking-bar carrying studs movable in the slots, as set forth.

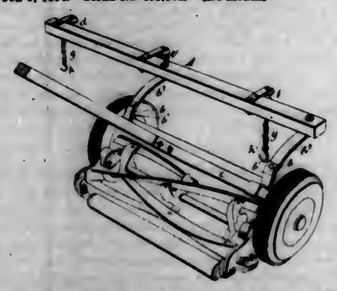
2. In a galley-lock, the combination of a galley having the usual side and end walls, a laterally-movable quoin provided with a guide-lip to prevent longitudinal movement, a series of oblique spring-bearings, and a locking-bar carrying fixed pins movable in bearings, all arranged and adapted to operate in the manner and for the purpose substantially as described.



479,841. HOSE-NOZZLE HOLDER. CYRUS B. ROBINSON, East Concord, N. H. Filed Jan. 23, 1892. Serial No. 418,983. (No model.)

Claim.—In a fire-hose support upon which metal brackets and straps are used for attaching the hose, the herein described tubular connection, upon which said brackets are mounted, an extension-rod mounted in said tubular connection provided with a longitudinal groove adapted to receive a screw or pin projecting interiorly from its bearing, a spring-locking device for securing said rod in an extended position, or vice versa, a suitable crooked tip or point threaded to the outer end of said extension-rod, and the insulated handles formed upon side-bars connecting the said hose-brackets, all substantially for the purpose set forth.

479,841.



479,842. RAKE. JACOB V. ROWLETT, Richmond, Ind. Filed June 16, 1891. Serial No. 396,482. (No model.)

Claim.—1. In a rake, the combination, with a head, of a series of teeth formed integrally therewith and arranged in pairs, each tooth of each pair converging at its outer end toward the other, short solid points arranged at the intersection of each pair, and the hood constituted of a series of fingers integral with the head and extending outwardly therefrom and connected in pairs, all substantially as and for the purposes set forth.

2. In a rake, the combination, with the head or central portion formed with upwardly-extending lugs or projections adapted to be upset, of a handle-brace constituted of arms united at one end with a sleeve for the handle, the other ends having sockets formed by flanges, said sockets having apertures therein engaging with the lugs and the flanges with the rake-head, substantially as described.

479,843. LAWN-MOWER. JACOB V. ROWLETT, Richmond, Ind. Filed Oct. 6, 1891. Serial No. 408,072. (No model.)

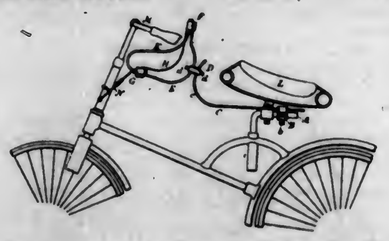
Claim.—1. In combination with a hand lawn-mower, a horse-attaching device therefor comprising a draft bar and accessories, substantially as described, and supporting-arms connected at one end to said bar and at the other end to the mower at a point to the rear and above the axle of the drive-wheel, for the purpose set forth.

2. In a lawn-mower, a horse-attaching device consisting of a draft-bar and supporting-arms therefor having clamps in their ends for connection with the handle-brace, as described.

3. In combination with a hand lawn-mower, a horse-attaching device therefor comprising a draft-bar and accessories, substantially as described, supporting-arms connecting said bar with the mower at a point to the rear and above the axle of the drive-wheel, a set of rollers arranged on said bar, and a draft-chain adapted to pass around said rollers, and operating in the manner and for the purpose set forth.

4. In a horse-attaching device for lawn-mowers, the combination, with the draft-bar, of the supporting-arms therefor having connection with the handle-brace, and the rollers *d e f*, and the draft-chain adapted to pass around said rollers and provided with hooks for connection with the traces, all substantially as described.

479,844. STOVEPIPE-FASTENER. CHRISTIAN ROSCH, Milwaukee, Wis., assignor of one-half to Friedrich C. Hamm, same place. Filed Dec. 4, 1891. Serial No. 413,993. (No model.)



Claim.—1. The combination, with a pipe-thimble, of a flexible metallic strap attached at one end to one side of the thimble and extending around on the inside of the thimble about one half of its circumference and a cylindrical cam journaled eccentrically on the thimble in a recess therefor at one side of the pipe-aperture through the thimble, which eccentric is provided with an axial keyhole adapted to receive a key for rotating it, substantially as described.

2. The combination, with a stovepipe-thimble having a recess in its wall near its outer end at one side of its pipe-aperture, of a flexible metallic strap secured at one end to the thimble at one side and extending half around the thimble on the inside, terminating at its other end in a loop, and a cylindrical cam about which the loop at the end of the strap passes and against which it bears, which cam is journaled in the walls of the recess, its axis being parallel with the axis of the thimble, substantially as described.

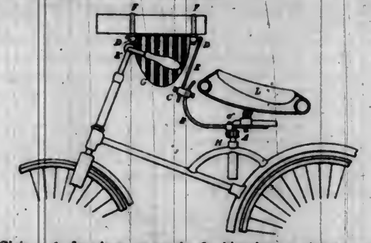
3. The combination of a stovepipe-thimble having its circumference at diametrically-opposite points bent out angularly to form recesses, a cam within one of the recesses, a removable plate forming the outer wall of the cam-recess, a part of the plate projecting out laterally at a point above an indented portion of the thimble, whereby a socket is formed, an inclined catch or lug within the opposite recess, a flexible strap having one end connected to a pin within said recess and its opposite end looped upon the cam in the opposite recess, and an angular guard adapted to be placed against the end of the thimble, so as to completely cover the same, provided with an aperture registering with the thimble-aperture and also with depending hooks, one of which is adapted to engage the inclined lug and the other the socket of the thimble, substantially as set forth.

479,845. SEAT FOR BICYCLES. JAMES H. SAGER, Rochester, N. Y., assignor to Rich & Sager, same place. Filed Oct. 19, 1891. Serial No. 409,224. (No model.)

Claim.—1. The combination, with a bicycle, of a spring-support consisting of a bar or bars partly straight and partly bent in a regular curve, means of adjustably clamping said straight part horizontally, or nearly so, to the frame of the bicycle, a seat, and means of adjustably fastening the same to said curved part, substantially as and for the purpose set forth.

2. The combination, with a bicycle, of a spring-support consisting of a pair of parallel bars having straight portion and portions bent in a regular curve, means of adjustably fastening said straight parts horizontally, or nearly so, to the frame of the bicycle, a seat, and means of adjustably fastening the same to said curved portions, substantially as and for the purposes set forth.

3. The seat herein described, consisting of a back cross-piece and a front cross-piece, a seat connecting the same, a seat-support connected to said back and front pieces and passing underneath and back of said seat, and suitable means of attaching the same to a bicycle, substantially as set forth.



4. The seat herein described, consisting of a back cross-piece and a front cross-piece, a seat connecting the same, a seat-support consisting of a pair of parallel rods connected to said back and front pieces and passing underneath and back of said seat, and suitable means of attaching the same to a bicycle, substantially as set forth.

5. In a supplementary seat for bicycles, the combination of a back cross-piece, a front cross-piece, a seat connecting the same, rods connecting said back and front pieces outside of said seat, and a spring-support attached to the main frame of the bicycle and to said rods, substantially as set forth.

6. In a supplementary seat for bicycles, the combination of a back cross-piece, a front cross-piece, a seat connecting the same, parallel curved rods connecting said back and front pieces and passing underneath and back of said seat, and a spring-support attached to the main frame of the bicycle and to said rods, substantially as set forth.

7. In a supplementary seat for bicycles, the combination of a back cross-piece, a front cross-piece, a seat connecting the same, a pair of parallel curved rods connecting said back and front pieces and passing underneath and back of said seat, and a spring-support consisting of a pair of parallel bars in part straight and in part bent in a regular curve, means of attaching said straight part to the main frame of the bicycle, and means of attaching said curved part adjustably to said rods and movable with reference to the same, substantially as set forth.

479,846. LUGGAGE-CARRIER FOR BICYCLES. JAMES H. SAGER, Rochester, N. Y., assignor to Rich & Sager, same place. Filed Oct. 19, 1891. Serial No. 409,225. (No model.)

Claim.—1. In a luggage-carrier for bicycles, a main support and a clamp adapted to fix said support to a bicycle, in combination with luggage-supporting rods and transverse strap-bars fixed thereon, as by set-screws, and a clamp attaching said rods to said support and in which said rods and said support are each movable and adjustable, substantially as described.

2. In a luggage-carrier for bicycles, a main support and a clamp adapted to fix said support to a bicycle, in combination with luggage-supporting rods clamped to said support and adjustable vertically with reference thereto and transverse strap-bars fixed to said rods, as by set-screws, substantially as described.

3. In a luggage-carrier for bicycles, a main support and a clamp adapted to fix said support to a bicycle and wherein the same is adjustable horizontally, in combination with a luggage-supporting frame clamped to said support and adjustable vertically with reference thereto, substantially as described.

4. In a luggage-carrier for bicycles, a main support having a portion clamped to a bicycle and adjustable horizontally and an upwardly-curved portion, in combination with a vertically-adjustable luggage-supporting frame clamped to the upwardly-curved portion, whereon the frame is adjustable at different angles to a horizontal plane, substantially as described.

5. In a luggage-carrier for bicycles, a main support consisting of a pair of parallel rods having a portion straight and a portion curved, a luggage-supporting frame fixed to a pair of rods depending therefrom, and a clamp adjustably connecting the depending rods to the curved portion of the rods first mentioned, together with a clamp adapted to fasten said first named rods to a suitable part of the bicycle, substantially as described.

6. In a luggage-carrier for bicycles, the combination of a main support, a clamp adapted to fix said support to a bicycle, a luggage-supporting frame fixed upon said support and composed of a pair of horizontal parallel rods having depending ends and connected by such depending ends to such support, a pair of transverse supporting-bars fixed upon said rods, provided with pairs of transverse and longitudinal slots, substantially as described, in the ends of said bars, and straps passing through said slots, for the purposes described, substantially as described.

7. In a luggage-carrier for bicycles, an adjustable support, of goose-neck form, composed of a main support having a horizontal portion and an upwardly-curved portion, a luggage-supporting frame having a depending portion, an adjustable clamp connecting said main support and said frame, and a clamp adapted to connect said main support to a bicycle, substantially as described.

8. In a luggage-carrier for bicycles, supporting-bars having pairs of transverse and longitudinal slots, substantially as and for the purposes described.

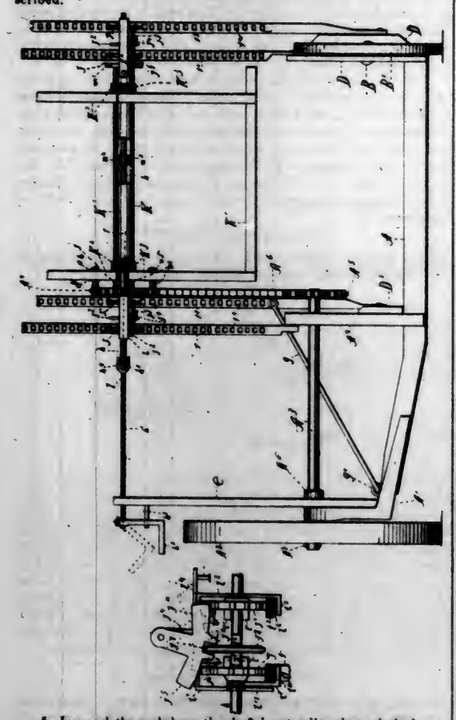
9. A clamp for devices of the class described, consisting of two sections, one provided with two arms having perforations therethrough and set-screws to clamp rods in said perforations, the two arms joined by a suitably-shaped connection, the other section having depressions of different contours on opposite sides thereof, and means for clamping the two sections together with either of said depressions opposed to the first section, substantially as set forth.

10. A clamp for devices of the class described, consisting of two sections, one *a* provided with two arms *c c*, having therethrough cross-perforations *d d* at right angles with each other and joined by a connecting-piece *a'*, integral therewith and having a concavity on one side, and set-screws *c' c'* to clamp rods in said perforations, the other section *b* having depressions of different contours on opposite sides, and means, as bolts *e e*, for clamping the two sections together with either of said depressions opposed to the first section, substantially as shown and described.

479,847. REIN-BUTTON. WILLIAM H. SANBORN, Rutland, Vt. Filed Feb. 3, 1892. Serial No. 420,228. (No model.)

Claim.—As an improved article of manufacture, a rein-holder consisting of a body of shell-like form with rear extensions and curved contour to provide a grip for the fingers and having a channel extending therethrough between a lower table and an upper wall, both of which are horizontally arranged and opening from one side, and a detent mounted in the upper portion and in rear of the body, adapted to be operated by an extension thereof projecting upward, against which a spring has bearing to hold the detent normally closed, the said table extending entirely through the holder, substantially as described.

479,848. MECHANISM FOR HARVESTER-REELS. GEORGE SCHUESSLER, Walnut, Tex. Filed Aug. 24, 1891. Serial No. 403,567. (No model.)



Claim.—1. In a reel, rack-bars pivoted to the harvester-frame and extending with their upper ends through a frame or housing pivoted on the shaft *h*, pinions journaled on the shaft *h* in the housing, adapted to engage with the rack-bars, a dog j^3, pivoted to the housing and adapted to engage with the pinions, a disk secured to the shaft *h* between the pinions and provided with projections f^1 to engage with corresponding notches on the pinions and with its periphery engaging the dog j^3, and means to rotate the shaft *h*, substantially as described.

2. In a reel, rack-bars pivoted to the harvester-frame and extending with their upper ends through a frame or housing journaled on the shaft *h*, pinions J and J', journaled on the shaft *h* in the housing, adapted to engage with the rack-bars, a dog j^3, pivoted to the housing and adapted to engage with the pinions J and J', a disk secured to the shaft *h* between the pinions J and J' and provided with projections f^1 to engage with corresponding notches on the pinions J and J' and with its periphery engaging the dog j^3, the rack-bar f^2, secured in position by the brace *g*, lugs i^2 and i^3 in the housing, and a shaft *h'*, connected to the shaft *h* by a universal coupling and provided with a crank, as shown, and for the purpose described.

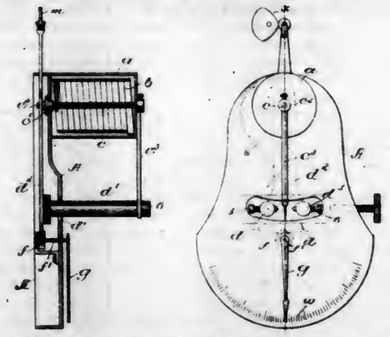
3. In a reel, rack-bars pivoted to the harvester-frame and extending with their upper ends through a frame or housing journaled on the shaft *h*, a bracket i^9, journaled on the shaft *h*, with its lower end bent at an angle, and a bar i^{10} secured thereto, the bracket i^9 turned at a right angle i^7 and a bar i^8 secured thereto, pinions J and J', journaled

on the shaft A in the housing, adapted to engage with the rack-bars, a disk secured to the shaft A between the pinions J and J' and provided with projections i^6 to engage with corresponding notches on the pinions J and J' and with its periphery engaging the dog j^3, the rack-bar f^2, secured in position by the brace g, lugs i^3 and i^5 in the housing, a dog j^3, pivoted to the housing, adapted to engage with its ends with one or both of the pinions J and J', and means to rotate the shaft A, as shown, and for the purpose described.

4. In a reel, a housing constructed of the brackets i' and i^3, journaled on the shaft A and having the projections i^3 and i^5 and rigidly secured to a bar i^4 a proper distance apart, the end i^{12} of the bracket i' projecting beyond the shaft, as shown, the lower end of the bracket i^3 provided with a bar i^9, a bracket i^8, journaled on the shaft A with its lower end provided with a bar i^{10}, a bracket j^5, secured to the bar i^4, and a dog j^3, pivoted to the bracket j^5 in position to engage or disengage with the pinions J and J', as shown, and for the purpose described.

5. In a reel, the rack-bars, the shaft A, extending through the housings i and i^{11}, pinions having clutch-faces mounted loosely on the said shaft and engaging the said rack-bars, the dog pivoted to the housing between the pinions, and a disk fixed to the shaft between the pinions, said disk engaging with the dog and having a clutch-face on each side, engaging the clutch-faces on the pinions, substantially for the purpose described.

6. In a reel, a shaft A, extending through the housings i and i^{11}, a support for said housings, a hollow reel-shaft K, provided with flanges m and m' on each end, the housing provided with a bar projecting over said flanges m and m' and provided with rollers to operate on the rear of the flanges, and bearings secured in the hollow reel-shaft and journaled on the shaft A, substantially as shown, and for the purpose described.



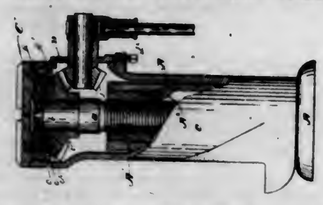
479,849. THERMOSTAT. THOMAS W. SHEPHERD, Peabody, Mass. Filed Aug. 6, 1891. Renewed June 27, 1892. Serial No. 438,065. (No model.)

Claim.—1. In a thermostat, a contact-arm and a lamina to move the same, combined with a movable contact, a cam to move the same, and a time mechanism geared to and to move the said cam, substantially as described.

2. In a thermostat, a pivoted contact-arm and a coiled lamina to move the same, combined with a sector the pivotal point of which coincides or is in line with the pivotal center of said contact-arm, and coil-contacts carried by said sector, and a pivoted indicating-arm actuated by said sector, substantially as described.

3. In a thermostat, a pivoted contact-arm and a lamina to move the same, combined with a sector, contacts carried thereby, a spring acting to move the sector in one direction, and adjusting means to move the sector in the opposite direction, substantially as described.

4. In a thermostat, a staff, a coiled lamina surrounding and to rotate the same, and a contact-arm fast upon said staff at one side of the said lamina, combined with a sector arranged at the opposite side of the said lamina and with its pivotal center coincident with the axis of the said staff, adjustable contacts carried thereby, and means to move the said sector, substantially as described.



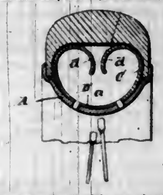
5. In a thermostat, a staff, a lamina to rotate the same and a contact-arm fast to one end of said staff, combined with a toothed sector placed at the opposite end of said staff, with its pivotal center coincident with the axis of the staff, contacts carried thereby, a pinion rotated by said sector, and an indicating-arm moved thereby, substantially as described.

6. The back A, case a, a lamina therein, and a staff rotated by said lamina, and a contact-arm fast on said staff, combined with a sector d^3 and means to move it, contacts thereon to co-operate with said contact-arm, the shaft f', pinion f, indicating-arm g, and scale w, substantially as described.

7. In a thermostat, a contact-arm and a lamina to move the same, combined with a sector b^3, contacts carried thereby between which said contact-arm normally moves, the cam m, acting against and to move said sector, and a time mechanism geared to and to rotate said cam, substantially as described.

479,850. SCREW-JACK. FRANCIS H. SLEEPER, Waterville, assignor to Arthur Osmore Norton, Coaticook, Canada. Filed Sept. 30, 1889. Renewed Jan. 21, 1892. Serial No. 418,747. (No model.)

Claim.—1. The combination of the stand and screw and means for revolving said screw with the sleeve C, provided with a head having a bearing for said screw, composed of a plate, and a train of balls interposed between said plate and the screw for sustaining said screw against lateral displacement, substantially as described.

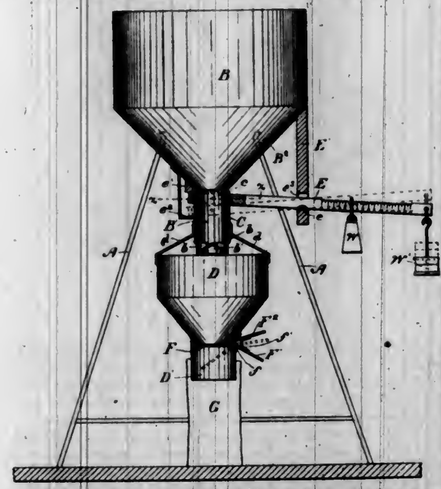


2. The combination of the stand and the screw and means for rotating the said screw with the sleeve and its head, plates a a', a number of concentric rings interposed between said plates, and trains of balls arranged between the plates and rings, substantially as described, and for the purpose set forth.

3. The combination, with the stand, screw B, sleeve C, head C', plate a, and trains of steel balls b, and mechanism for turning the screw, of the plate a', rings c c c, and the trains of steel balls filling the annular spaces between the said rings, substantially as described, and for the purpose set forth.

4. The combination of the stand, screw, nut in said stand through which the screw is raised and lowered by axial rotation therein, means to rotate the screw, a sleeve carried by the screw, a head applied to said sleeve, a bearing for said screw in said head, and a train of balls interposed laterally immediately between the end of the screw and the bearing in the head, substantially as described.

5. The combination, with the stand A, screw B, sleeve C, having a head, and means, substantially as described, for revolving the screw within the said sleeve, of the cap D and adjusting-screw d^3, substantially as and for the purpose set forth.

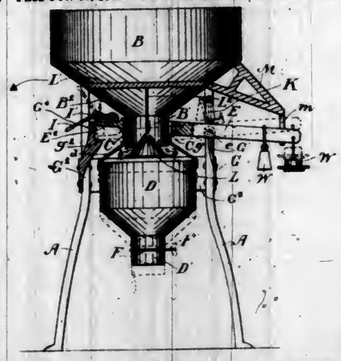


479,851. SPRING-TIRE. WILLIAM C. SMITH, Goshen, Ind. Filed Sept. 4, 1891. Serial No. 404,759. (No model.)

Claim.—1. The combination, with an elastic tire having a concave inner face and with the felly having a groove or seat therein, of a series of springs interposed between said felly and tire and seating in the concavity of the latter and in the groove or seat of the former, and a band or belt of flexible material within the concavity of the tire and extended downwardly into the seat of the felly at its side edges, substantially as specified.

2. The combination, with the felly and an elastic tire secured thereto, of a series of springs interposed between said tire and felly, said springs consisting each of a metal plate bent into semicircular form and having its free ends bent inwardly and downwardly, and a flexible band or belt within the concavity of the tire for the purpose of equalizing the action of said springs, said band bearing against the end portions of the springs, substantially as specified.

479,852. WEIGHING-MACHINE. EPHRIAN W. SPEAR, Boston, Mass. Filed Dec. 7, 1891. Serial No. 414,213. (No model.)



Claim.—1. In an automatic weighing-machine, a stationary receptacle provided with a spout having a suitable outlet, in combination with a movable receptacle having yielding connection with said stationary receptacle and a sleeve connected with said movable receptacle, said sleeve being movable over said spout to open and close said outlet, substantially as described.

2. In an automatic weighing-machine, a stationary receptacle having a spout closed at the bottom, but provided with openings around its sides, in combination with a movable receptacle, a sleeve connected thereto and movable over said spout, and a weight-operated scale-beam fulcrumed to a connection of the stationary receptacle and connected to said sleeve, all arranged and operating substantially as and for the purposes described.

3. In an automatic weighing-machine, a stationary receptacle B, provided with the spout B', closed at the bottom, but having openings b around the sides thereof, in combination with the sleeve C, movable over said spout, the receptacle D, hung from said sleeve and movable therewith, the weight-operated graduated scale-beam E, fulcrumed at e to a connection of the stationary receptacle and pivoted at c to said sleeve, and stops c' c^2, limiting the motion of said scale-beam, substantially as described.

4. In an automatic weighing-machine, a stationary receptacle having a spout closed at the bottom, but provided with a series of openings around the sides thereof, in combination with a sleeve movable over said spout, a second receptacle hung from said sleeve and movable therewith, said movable receptacle being provided with a suitable dumping device at the bottom, and a weight-operated scale-beam fulcrumed to a connection of said stationary receptacle and connected to said sleeve, substantially as described.

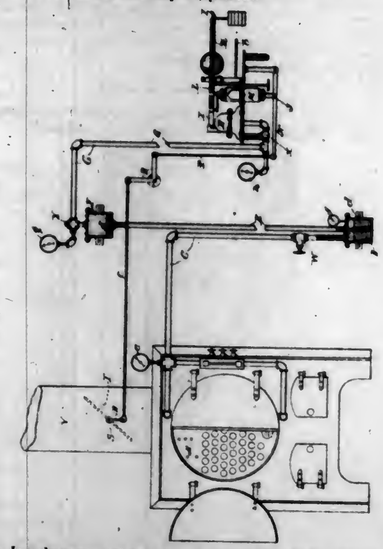
479,853. WEIGHING-MACHINE. EPHRIAN W. SPEAR, Boston, Mass. Filed Feb. 17, 1892. Serial No. 421,836. (No model.)

Claim.—1. In an automatic weighing-machine, a stationary receptacle having a spout at the bottom, in combination with a separate bottom-forming piece rigidly held beneath said spout, whereby a continuous outlet is formed between said spout and said piece, a weight-operated scale-beam, a sleeve movable over said spout and outlet, and a movable receptacle connected to said sleeve, substantially as described.

2. In an automatic weighing-machine, a stationary receptacle having a spout B' open at the bottom, in combination with a separate cone-shaped piece L, rigidly held beneath said spout, but not directly connected thereto, whereby a continuous outlet b is formed, a weight-operated scale beam, a sleeve C, movable over said spout and outlet, pivotally connected to said beam, and a movable receptacle connected to said sleeve, all arranged and operating substantially as described.

3. In an automatic weighing-machine, a stationary receptacle having a spout provided with a suitable outlet, in combination with a movable receptacle, a sleeve connected to said movable receptacle and movable over said spout, a suitably-fulcrumed weight-operated scale-beam having its motion confined between certain limits, and an upwardly-extending frame secured to said scale-beam above the fulcrum thereof, provided with a weight hung within said frame, arranged and operating substantially as and for the purpose described.

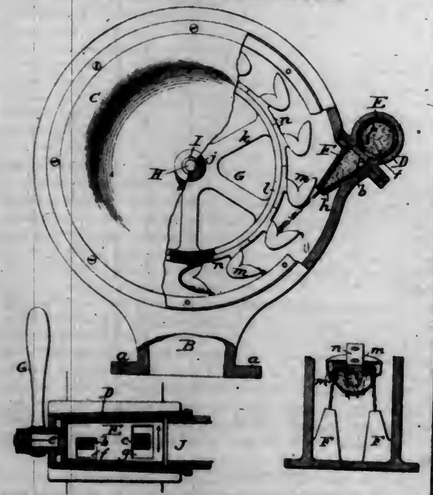
4. In an automatic weighing-machine, a stationary receptacle provided with a spout having a suitable outlet, in combination with a movable receptacle, a sleeve connected to said movable receptacle and movable over said spout, a suitably-mounted weight-operated scale-beam having a connection pivoted to said sleeve and provided with a projection opposite said scale-beam, and an operating handle-lever engaging with said projection, substantially as and for the purpose described.



5. In an automatic weighing-machine, a stationary receptacle provided with a spout having a suitable outlet, in combination with a movable receptacle, a sleeve connected to said movable receptacle and movable over said spout, a suitably-mounted weight-operated scale-beam and connection E E^2, provided with the projection E^3 and pivotally connected to the sleeve, and a handle-lever I, provided with the weighted arm I', overbalancing the handle-arm of the lever, said weighted arm engaging with said projection, whereby the scale-beam is automatically locked with the spout-outlet closed, substantially as described.

479,854. DAMPER-REGULATOR. JOHN E. SPENCER, Salem, Mass. Filed Feb. 20, 1890. Serial No. 341,158. (No model.)

Claim.—1. The combination, with a boiler, a damper, and a damp-



er-regulator connected with the boiler and arranged to control the damper, of a body of mercury interposed in the conduit between the boiler and said regulator and arranged to receive and resist a portion of the boiler-pressure and to transmit to the damper-regulator the balance of the boiler-pressure, substantially as specified.

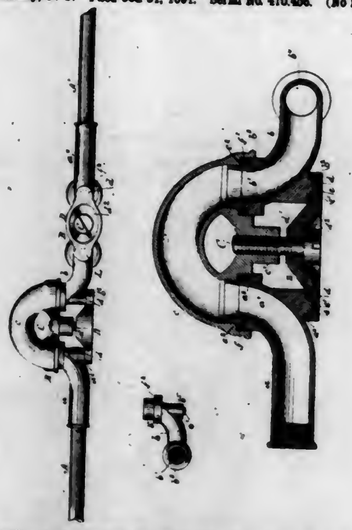
2. The combination of a boiler, as A, a damper-regulator having a conduit connection with said boiler, a receptacle, as D, with a body of mercury arranged therein and interposed in said conduit, and a second receptacle, as F, arranged above said receptacle D and in the line of said conduit, substantially as specified.

3. In a damper-regulator, the combination of a boiler, a damper-regulator connected by conduit with the boiler, a receptacle, as D, arranged in said conduit with a body of mercury therein, and a second receptacle, as F, arranged in said conduit above receptacle D and connected therewith by a pipe whose lower orifice is near the bottom of the latter receptacle, substantially as specified.

479,855. FLUID-MOTOR. HENRY C. STILWELL, Dayton, Ohio. Filed July 28, 1891. Serial No. 400,941. (No model.)

Claim.—1. In combination with a suitable casing and with a bucket-wheel mounted and arranged to rotate therein, nozzles arranged to deliver water or fluid to the buckets of the wheel, and a controlling valve or gate for said nozzles, consisting of barrel D, having openings *b* and *c*, communicating with the respective nozzles, and tubular plug E, provided with openings *f* and *g*, adapted to be brought into and out of register with the openings *b c*, the opening *g* being longer in the direction of movement of the plug than the opening *f*, substantially as and for the purpose set forth.

2. In combination with shell or casing A, provided with nozzles F, detachable barrel D, applied to the exterior of the shell or casing, and tubular valve plug or gate E, arranged within said barrel, all substantially as described and shown.



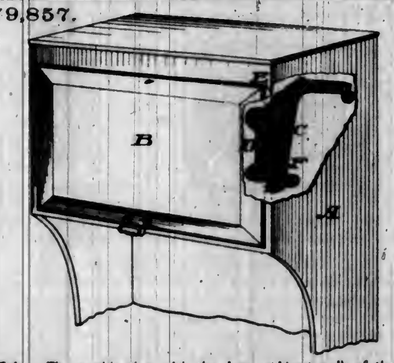
3. A motor-wheel provided with buckets comprising lateral receiving-wings and a central discharge-lip.

4. In a motor, a wheel provided with buckets, each comprising two lateral wings or impact surfaces, and a central discharge-lip, said discharge-lip being farther removed from the center of the wheel than the wings or impact surfaces.

5. In combination with shell or casing A, provided with nozzle F, a removable lining applied to said nozzle, and a valve-barrel D, applied to the shell or casing and serving both to contain a regulating-valve and to retain the nozzle-lining in place.

6. In combination with a water-wheel having buckets provided with lateral receiving-wings and an intermediate discharge-lip, two nozzles arranged to deliver the water simultaneously upon said wings, whence it is directed toward and discharged over the intermediate discharge-lip.

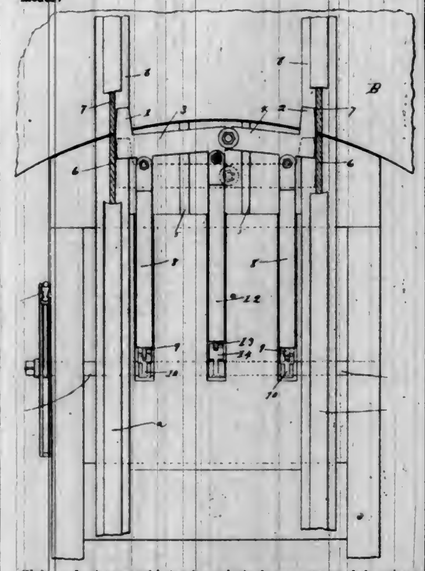
479,856. FLEXIBLE COUPLING FOR PIPES. JOHN SUYDAM, Albany, N. Y. Filed Oct. 31, 1891. Serial No. 410,456. (No model.)



Claim.—1. A coupling for pipes, comprising two sections, each formed with a lateral neck and a bearing in line with the neck, in combination with a connecting-pipe formed with a bridge and a yoke and bolt for holding the said lateral necks and the ends of the connecting pipe firmly together, substantially as shown and described.

2. The connecting-pipe *c*, formed with a bridge *c'* and with open ports and seats for packing, the yoke D, formed with seats *d*, and the bolt C, in combination with the sections *a b*, formed with lateral necks and seats for packing, and bearings in line with the necks and fitted in the ports of the connecting-pipe, substantially as described.

3. The couplings B B, connected with pipes A A' by sections *a' a*, in combination with the intermediate section *b*, formed at the ends with lateral necks arranged at different angles and formed with bearings in line with the necks, substantially as described.

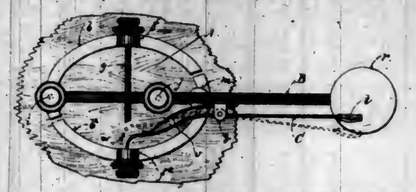


4. The section *a*, formed with a lateral neck *a'* and with a stud *c'*, and the section *b*, also formed with a lateral neck and with a stud, in combination with the yoke D, formed with recesses *e*, the bolt C, and the connecting-pipe *c*, formed with a bridge *c'* and with open ports to receive the lateral necks of the said sections *a b*, substantially as described.

479,857. RANGE HOT-CLOSET DOOR. JOHN TETTELBACH, Cleveland, Ohio. Filed May 2, 1892. Serial No. 431,575. (No model.)

Claim.—The combination, with the door and end walls of the closet, of the grooved angle-iron C and the angle-iron D, having wide and narrow projections E F, provided with pins riding in the groove of iron C, substantially as and for the purpose set forth.

479,858. TURN-TABLE. NICHOLAS W. THILLMAN and CHRISTIAN W. FIRME, Chicago, Ill. Filed Aug. 17, 1891. Serial No. 402,886. (No model.)



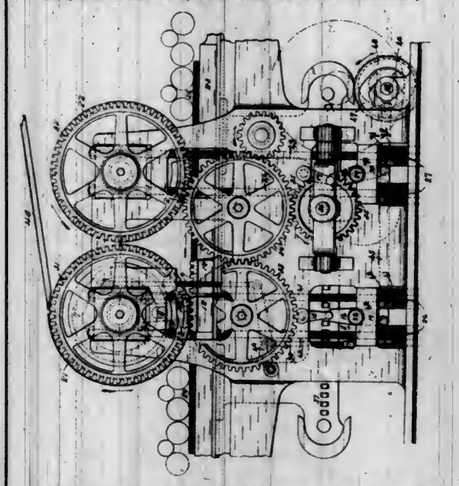
Claim.—1. A turn-table having relatively movable wedging-shoes located between the rails thereon and means for operating the same practically as described, so that said wedging-shoes will be thrown outward against the rails and retracted therefrom, respectively.

2. A turn table having relatively-pivoted wedging-shoes located between the rails thereon and means for operating the same practically as described, so that each of said wedging shoes will be turned on its pivot and thrown outward against the rails and retracted therefrom, respectively.

3. A turn-table having wedging-shoes located between the rails thereon and mounted upon arms 3 and 4, said arms being pivoted together, a rod 12, pivotally connected with said arms near their pivotal connection, rods 8, connected with said arms near their outer ends, and devices for moving said arm 12 to a greater extent than said arms 8.

4. A turn-table having wedging-shoes located between the rails thereon and mounted upon arms 3 and 4, said arms being pivoted together, rods 8, pivotally connected with the outer end portions of said arms 3 and 4 and with the arms 10 and rock-shaft 11, and a rod 12, pivotally connected with said arms 3 and 4 adjacent to their pivotal connection and with an arm 14, carried by said rock-shaft, said arm 14 being longer than said arms 10.

479,859. TELEGRAPH-KEY. ALBERT F. TUCKER, Auburndale, Mass. Filed Mar. 24, 1892. Serial No. 426,236. (No model.)



Claim.—1. In a telegraph-instrument, two disconnected plates respectively in electrical contact with the line wires, a telegraph-key pivoted on said plates and insulated from one thereof, contact-points on said key in position to alternately engage said plate, and a spring-pushed switch pivoted to the key and normally in contact with said insulated plate, substantially as described.

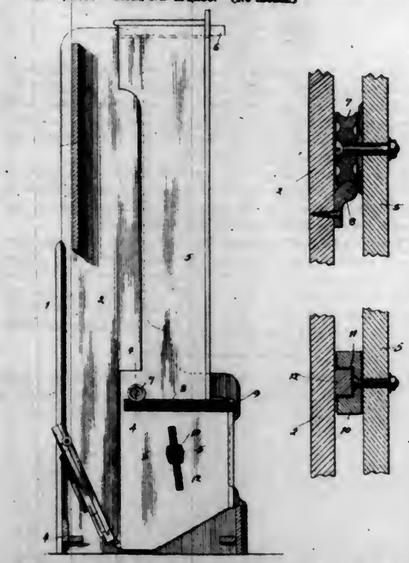
2. In a telegraph-instrument, the combination of the plates, as b b^3, respectively connected with the contact-wires, and the key B, insulated from the plate b^3 of the switch C, normally in electrical contact with the plate b^3, substantially as described.

3. In a telegraph-instrument, the combination, with the plates b b^3 and mechanism for attaching them, respectively, to the conducting-wires, of the key B, pivoted on said plates and insulated from one thereof, contact-points on said key for alternately engaging said plates, and the spring-tensioned switch C, pivoted to said key and normally in contact with said insulated plate, substantially as described.

479,860. REGISTERING MECHANISM FOR DOUBLE-CYLINDER FLAT-BED PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed Feb. 2, 1892. Serial No. 420,133. (No model.)

Claim.—1. The combination, with companion impression-cylinders, of a fixed registering toothed segment carried by one cylinder, a movable registering toothed segment carried by the other cylinder, and means for protruding and withdrawing the latter toothed segment, substantially as described.

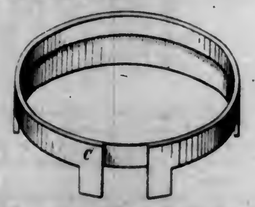
2. The combination, with two companion impression-cylinders, one carrying a fixed registering toothed segment and the other carrying a movable registering toothed segment, of the cam 7 and means for automatically adjusting the same to cause the timely movements of said movable toothed segment, substantially as described.



3. The combination, with two impression-cylinders and a reciprocating type-bed, of the fixed registering toothed segment upon one cylinder, the moving registering toothed segment upon the other cylinder, and coacting bed-racks, substantially as described.

4. The combination, with two impression-cylinders driven by independent gearing from the bed-driving shaft and provided with means for raising and lowering them, of registering toothed segments, one of which is movable and made to intermesh with the companion toothed segment during the operation of transferring the sheet from one cylinder to the other, substantially as described.

5. The combination, with two impression-cylinders, each driven

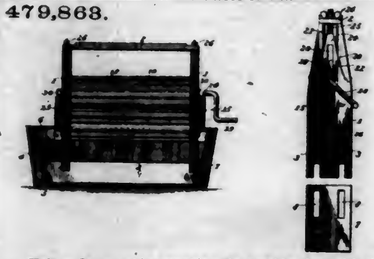


by an independent train from the driving-shaft, provided with means for raising it out of printing relation to the type-bed and carrying a registering toothed segment, of a type-bed and registering rack thereon and means for withdrawing and protruding one of said registering toothed segments for co-operation with each other and with the bed-rack, substantially as described.

479,861. FOLDING BED. CASPER M. WAGNER, Chicago, Ill. Filed Mar. 8, 1892. Serial No. 424,235. (No model.)

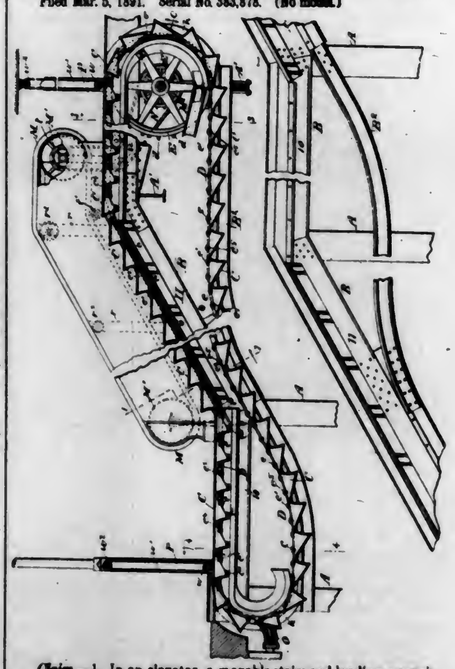
Claim.—The combination, with the stationary frame 1, the folding-bed portion 5, the horizontal rails 8, secured to the stationary frame, and the rollers 7, mounted on the folding-bed portion to traverse the rails, of the guide-blocks 10, swiveled to the folding frame beneath the said rollers and each provided with a groove 11, and the guide-stripe 12, rigidly secured to the stationary frame beneath the horizontal rails and movable in the grooves of the guide-blocks, said folding-bed portion being detachable from the stationary frame by raising it and lifting the guide-blocks from the guide-stripe, substantially as described.

479,862. DEVICE FOR CENTERING KNITTING-MACHINE CYLINDERS. CHARLES E. WAKEMAN, Pontiac, Mich. Filed Jan. 26, 1892. Serial No. 419,101. (No model.)



Claim.—1. In a circular knitting machine, the combination of a needle-cylinder, a cam-cylinder, and means attached thereto for centering the needle-cylinder, substantially as described.

2. In a circular-knitting machine, the combination of the needle-cylinder B, the cam-cylinder A, and the collar C for centering the needle-cylinder within the cam-cylinder, substantially as described.



3. In a circular-knitting machine, the combination of a needle-cylinder, a bearing adapted to grip and hold the bottom end of said needle-cylinder, and a guiding-collar adapted to center and hold in place the upper end of said needle-cylinder, substantially as and for the purposes described.

479,863. WASHING-MACHINE. JEFFERSON W. WATSON, Chariton, Iowa. Filed Nov. 27, 1891. Serial No. 413,295. (No model.)

Claim.—In a washing-machine, the combination, with the frame-work, whose end pieces are provided with vertical slots having longitudinal tongues on their opposite faces, a top bar connecting said pieces, and a lower roller journaled between these end pieces, of blocks mounted in said slots and having grooves engaging said tongues, the bodies of said blocks having longitudinally-slotted bearings and their upper ends being reduced and extended through said top bar, threads on said ends, nuts on said threads, an upper roller whose shaft is journaled in said bearings and extended at one end into a crank-handle, and springs bearing this roller normally toward the lower roller, substantially as hereinbefore set forth.

479,864. ELEVATOR. GEORGE A. WHEELER, New York, N. Y. Filed Mar. 5, 1891. Serial No. 383,878. (No model.)

Claim.—1. In an elevator, a movable stairs and landing comprising a connected series of trucks, in combination with a track or guideway having an incline and a horizontal or approximately horizontal portion, the trucks at the incline being in the form of steps and those lying on the horizontal portion of the guideway having their upper surfaces in alignment and forming a movable level landing of practically unbroken continuity and which is a continuation of the movable stairs, substantially as described.

2. In an elevator, a movable stairs and landing comprising an endless series of trucks, in combination with a track or guideway having an inclined and a horizontal or approximately horizontal portion, such horizontal portion extending in a straight direction, the trucks at the incline being in the form of steps and those at the horizontal portion of the track lying with their upper surfaces in alignment, the juxtaposed edges of the several trucks lying in the same horizontal plane and forming a level movable landing, substantially as described.

3. An elevator having a series of four-wheeled trucks that engage tracks on a supporting-frame and become steps on inclines of said frame, all the trucks connected by sprocket-chains and moved by sprocket-wheels, each truck having the journals of one pair of its wheels pivoted to links of the sprocket-chains, affording a flexing joint between the chains and the trucks, substantially as described.

4. An elevator having a frame provided with tracks on inclines of the frame and also on level places at the terminals of the inclines, movable trucks which form level landings when on the level portions of the tracks, and steps on the inclines thereof, and a transverse guard-roller on each landing actuated in a direction opposite to the movement of the trucks, substantially as described.

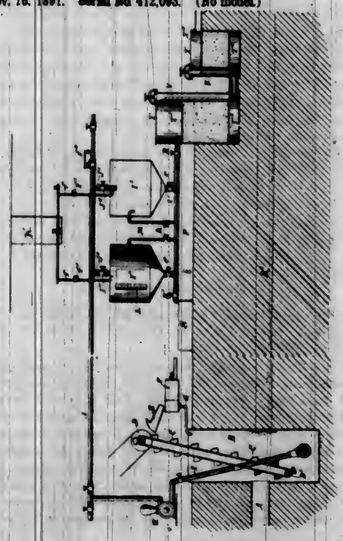
5. An elevator having a longitudinally-moving series of trucks which are adapted to become steps on portions of the frame and a transverse vertically-revolving guard-wall near a terminal of the elevator-frame above a landing formed by the trucks, substantially as described.

6. The combination, with an elevator, of a traveling hand-rail separate therefrom, substantially as described.

7. An elevator having an incline on its supporting-frame, furnished with steps that may be movable or stationary, and an endless hand-rail which is longitudinally movable and adapted to guard the side of the elevator, substantially as described.

8. An elevator having level portions and inclines produced on its frame, tracks thereon, an endless series of wheeled trucks on all the tracks, and mechanism adapted to move the trucks longitudinally on the frame and further provided with an endless longitudinally-movable hand-rail that is adapted to guard the side of the elevator, and a transverse movable guard-wall near each terminal of the elevator-frame, substantially as set forth.

9. An elevator having a frame provided with opposite inclines, level places below and above at ends of the inclines, tracks on the frame, trucks connected to endless chains and adapted to be moved thereby on the tracks, and pressure-rollers secured to the frame on the upper level portion thereof above the trucks and adapted to have contact with projections at the ends of the trucks, substantially as described.



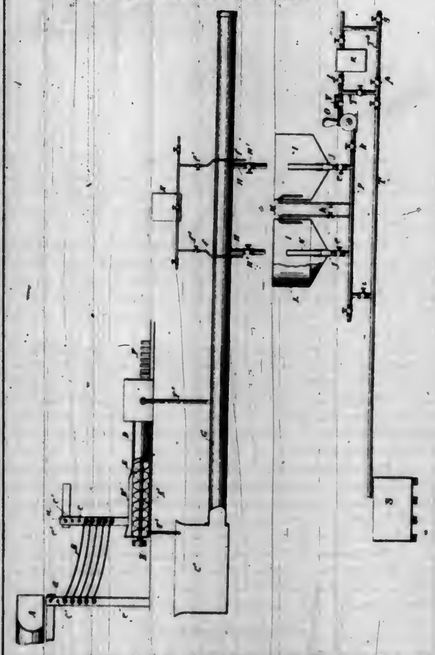
10. The combination, with an elevator, of a traveling continuous hand rail separate from the elevator, substantially as described.

11. The herein-described hand-rail, movable in a suitable guide-way, in combination with guards overlapping the same, substantially as described.

12. The herein-described hand-rail, consisting of an endless traveling band, and a cylindrical rail proper secured to and traveling with said band, substantially as described.

13. The herein-described hand-rail, consisting of an endless belt, and a cylindric rail proper secured to and traveling with the said belt and provided with a separate covering, serving as a means of uniting the rail to the belt, substantially as described.

479,865. APPARATUS FOR PURIFYING SEWAGE. JOHN WILSON, New York, N. Y., assignor to Roman Debes, same place. Filed Nov. 16, 1891. Serial No. 412,093. (No model.)



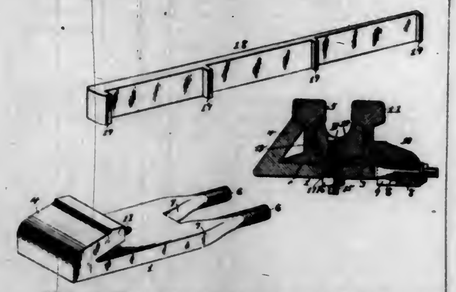
Claim.—1. A sewage-disposal plant comprising, in combination, the following devices: a series of inclined screens for receiving the sewage discharged from a main and upwardly curved at the ends remote from the discharge, a conveyer and press for receiving and compressing the solid matter, a conduit for carrying off the liquid separated and expressed from the solid matter, tanks into which said conduit discharges, outlets for said tanks at different levels therein for drawing off the liquid or the sludge, a pump connected with the outlets, and ducts or pipes therefrom to a discharging-filter and to a receptacle for the sludge, as set forth.

2. The combination, with a main tank or receptacle for containing the liquid separated and expressed from the solid matter of a sewerage system, of a series of tanks under independent discharge-pipes from the main tank, a reservoir for chemicals connected with the said discharge-pipes or the tanks thereunder, a conduit for liquid from each of the series of tanks, a pump and filter therein, and a discharge-pipe at a lower level for the sludge, as set forth.

3. The combination, in a sewage-disposal plant, with a series of settling or storage tanks for the liquid separated and expressed from the solid matter of the sewage, of a pipe connected with the outlets of said tank and a pump connected therein, a pipe or duct from said pump to and through a filter, another around said filter, another pipe T to a tank or receptacle for sludge, and a pipe or duct from the outlet of the tanks to the sludge tank direct, and cocks or valves for controlling said pipes or ducts, as herein set forth.

479,866. APPARATUS FOR PURIFYING SEWAGE. JOHN WILSON, New York, N. Y., assignor to Roman Debes, same place. Filed Nov. 16, 1891. Serial No. 412,094. (No model.)

Claim.—1. In apparatus for purifying and disposing of sewage, the combination, with a sewer-main and a tank or pit into which such main opens, of a support carrying a series of traveling perforated screening buckets for receiving the contents from the main, a press for receiving the solid matter from the buckets and provided with a pipe leading back to the pit, a delivery-chute between the buckets and press, a pipe leading to the bottom of the pit and provided with an enlarged lower end, and a pump connected to the upper end of said pipe, substantially as shown, and for the purpose set forth.



2. In apparatus for purifying and disposing of sewage, the combination, with a sewer-main and a tank or pit into which said main opens, of a support carrying a series of traveling perforated screening-buckets for receiving the contents from the main and elevating such contents to the top of the pit, a delivery-chute, a press receiving the material from said chute, a pipe leading to the bottom of the pit, two

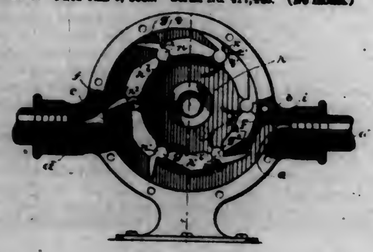
or more separate settling-tanks, and pipe connections between said settling-tanks and pumps and provided with suitable cocks and valves, substantially as and for the purpose described.

3. In apparatus for purifying and disposing of sewage of the character described, the combination, with the elevator, press, and pump, of the discharge-pipe leading from said pump, the settling-tanks, and the branch pipes connecting said discharge-pipe with said tanks, the reservoir, and the pipes leading from said reservoir and communicating with the branch pipes, each of the pipes named being provided with suitable cocks or valves, substantially as shown, and for the purpose set forth.

4. In apparatus for purifying and disposing of sewage, the combination, with the settling-tanks, of the pipe or conduit communicating therewith at the bottom and provided with suitable cocks or valves, the sludge-tank S, the siphon-pipes connecting said tanks with the conduit and controlled by cocks, and a suitable filter apparatus, substantially as described.

479,867. RAIL-CLAMP. HENRY R. WOLFERT, Lancaster, Pa. Filed Feb. 15, 1892. Serial No. 422,008. (No model.)

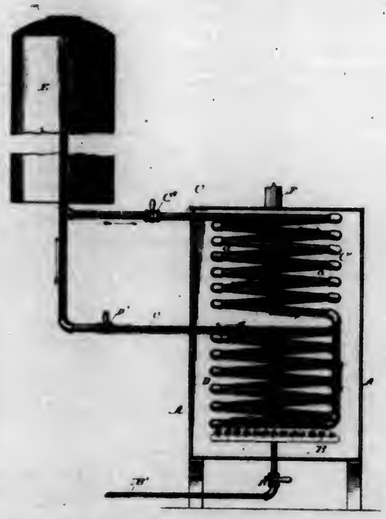
Claim.—1. The combination, with a clamp comprising a plate having a rigid jaw at one end and an adjustable jaw arranged at the other end of the plate, of a block designed to be interposed between two rails and a gage-plate tapering in thickness and adapted to vary the width of the block, substantially as described.



2. The combination, with a clamp comprising a plate having a rigid jaw at one end and an adjustable jaw arranged at the other end of the plate, of a block designed to be interposed between two rails and a tapering gage-plate provided at intervals with shoulders arranged to fit against the ends of the block, substantially as and for the purpose described.

3. The combination, with a clamp comprising a plate having an elongated opening and provided at one end with a rigid jaw and an adjustable jaw arranged at the other end of the plate, of a block provided with a vertical opening, a bolt arranged in the opening of the block and in the opening of the plate and securing the two parts together and a gage-plate tapering in thickness to vary the width of the block, substantially as described.

4. The combination of a clamp comprising a plate provided at one end with a flange forming a rigid jaw and arranged to engage a rail beneath the head of the same and an adjustable jaw arranged at the other end of the plate, a block secured to the plate, and a gage-plate to vary the width of the block, substantially as described.



5. The combination of a clamp comprising a plate provided at one end with a rigid jaw and having seats at different heights and an adjustable jaw arranged at the other end of the plate, a block secured to the plate, and a gage-plate, substantially as described.

479,868. HYDRAULIC MOTOR. WILLARD A. WOOD, Brooklyn, N. Y. Filed Jan. 9, 1892. Serial No. 417,443. (No model.)

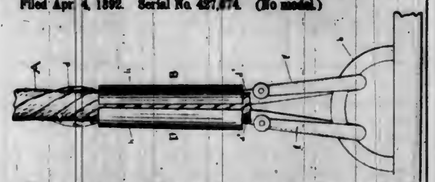
Claim.—In a hydraulic motor, the combination, with the inclosing case, whose inner surface is that of three arcs of circles, two being concentric and united by the third, of an inlet leading into and an outlet leading from the portion of said case having the greatest radius, said inlet being immediately adjacent to the portion of the case having the shortest diameter and said outlet being provided with a flaring opening from the case, a rotating disk having a radius equal to the shortest radius of the interior of the inclosing case, said disk being mounted in said case and adapted to rotate therein with its periphery in contact with the inner periphery of the case at the point thereof having the shortest radius and immediately above the inlet, and swinging gates attached to said rotating disk, said gates being provided with arms adapted to engage with a pin and to open to receive the impact of the liquid entering through said inlet, said gates being also provided with shoulders adapted to rest upon seats provided upon the periphery of said disk, whereby said gates are held to receive the impact of the liquid entering the inlet and said disk is caused to revolve, substantially as described.

479,869. GAS WATER-HEATER. WALTER S. WRIGHT, Chicago, Ill. Filed Aug. 25, 1890. Renewed June 25, 1892. Serial No. 437,962. (No model.)

Claim.—1. The combination of the upright chamber A, coil C', located in the upper portion of said chamber, coil D, located in the lower portion of said chamber, and a burner B, located within said chamber and beneath the coil D, said coil C' having an inlet at its upper portion and an outlet at its lower portion leading into the lower portion of the coil D, and the coil D having an outlet from its upper portion, substantially as shown and described.

2. The combination of the boiler E, the upright chamber A, the coil C', located in the upper portion of said chamber, the coil D, located in the lower portion of said chamber, and a burner B, located within said chamber and beneath the coil D, said coil C' having an inlet at its upper portion from the boiler E and an outlet from its lower portion leading into the lower portion of the coil D, and the coil D having an outlet from its upper portion to the boiler E, substantially as shown and described

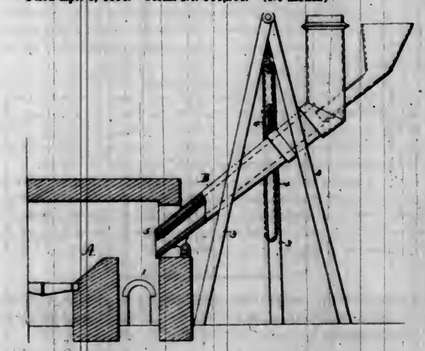
---



479,870. LOCOMOTIVE ATTACHMENT FOR SUPPLYING STEAM TO PUMPS. ROBERT ZIMMATER, Galion, Ohio. Filed Oct. 23, 1891. Serial No. 409,616. (No model.)

Claim.—The combination, with a locomotive water-supply tank and a steam-pump connected with said tank, of a steam-pipe connected with the steam-pump, said pipe having a hose or flexible tubing connected therewith, and a rack or suitable support located at the side of the track for holding the discharge end of said flexible tubing in an elevated position, substantially as indicated, said flexible tubing having suitable means connected therewith for normally holding the discharge end of said tubing against the rack or support aforesaid, said flexible tubing being adapted to be connected with the steam-supply of a locomotive, substantially as and for the purpose set forth.

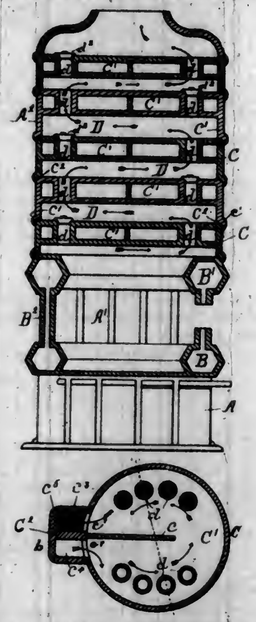
479,870.



479,871. GRAPPLE-HOOK. CHARLES W. ABBOTT, Albion, Me. Filed Apr. 4, 1892. Serial No. 427,574. (No model.)

Claim.—1. A grapple iron or hook comprising two pivoted diverging arms provided with hooks at their outer ends and two approximately semi-cylindrical members, each mounted longitudinally on the shank of one of said arms, said semi cylindrical members forming a clamping-socket which closes tightly as the hooks are sprung together under the strain of the load, substantially as set forth.

2. A grapple iron or hook comprising two pivoted diverging arms provided with hooks at their outer ends and two approximately semi-cylindrical corrugated members, each mounted longitudinally on the shank of one of said arms, said semi-cylindrical members forming a clamping-socket which closes tightly as the hooks are sprung together under the strain of the load, substantially as set forth.



479,872. PHOSPHATE-ROCK DRIER. WILLIAM B. CHISOLM, Charleston, S. C., assignor of one-half to Samuel Hughes, same place. Filed Apr. 9, 1891. Serial No. 388,261. (No model.)

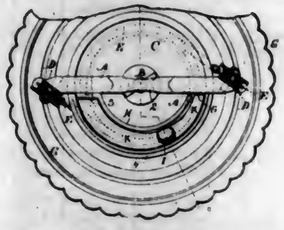
Claim.—1. The combination, with a furnace or other heater, of a non-rotary combined chimney and chute hinged in proximity to the furnace or heater and adapted to receive the products of combustion therefrom and carry the material being treated downward toward the furnace, substantially as set forth.

2. The combination, with a furnace or other heater, of a non-rotary chimney and chute hinged in position to receive the products of combustion from the furnace or heater, a hopper delivering into this chimney, and means for regulating the inclination of the chimney, substantially as set forth.

479,873. SECTIONAL WATER-BOILER. THOMAS DOHERTY, Sarnia, Canada. Filed Dec. 2, 1891. Serial No. 413,820. (No model.)

Claim.—1 In a water-boiler, a section consisting of an inclosed water-chamber, smoke-flues through said section, an annular flange on the walls of said section whereby a smoke chamber is provided within said flange and between the two sections when joined, a rear extension attached thereto containing two water-passages, one of which opens only into a lower adjacent section and the other of which opens only into an upper adjacent section, substantially as described, and also within and integral with said water-chamber, and a central perpendicular diaphragm extending from the division between the two water-passages centrally nearly across said water-chamber, as set forth.

2. In a sectional water-heater, the combination of a fire-pot, a basic water-chamber, sections C C C, adapted to be joined to form a heating-chamber, each containing central transverse diaphragms extending nearly across the water-chamber, and water-passages upon either side of the central diaphragm, one of which leads to the lower chamber and the other of which leads to the upper chamber, and a horizontal diaphragm at the junction of each section in said water-passages, preventing the water from circulating otherwise than through each section, and return-pipes, substantially as described.

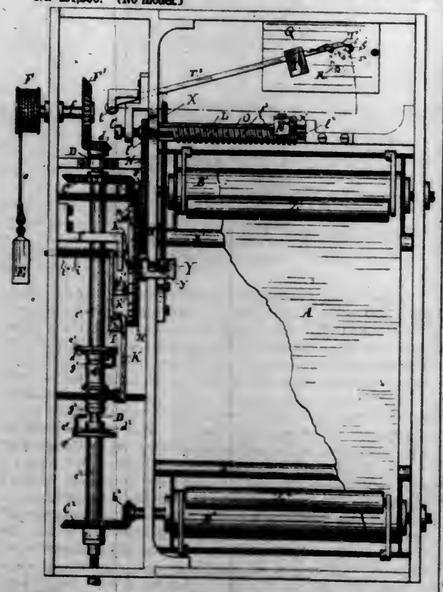


479,874. SUSPENSION DEVICE FOR LAMPS. FRANK G. BUNGE, Waterbury, Conn., assignor to the Plume & Atwood Manufacturing Company, same place. Filed Mar. 3, 1892. Serial No. 423,569. (No model.)

Claim.—1. The combination, with a spring-barrel and suspending devices, of a ball-stop within a horizontal recess that is narrower at one end than the other, one side of such recess being a portion of or connected with the spring-barrel and the other side a stationary eccentric or clamp, the suspending device allowing the surface on which the ball rests to be inclined to cause the ball to roll out of action, substantially as set forth.

2. The combination, with the spring-barrel and suspending devices,

of a yoke for receiving and sustaining the spring-barrel and its vertical axis, sheaves upon the yoke over which the suspending-chains pass, a rim upon the upper end of the spring-barrel, and an eccentric clamp connected with the yoke, and a ball-stop between the rim and the eccentric clamp, substantially as set forth.



3. The combination, in a suspending device for lamps, of a yoke, a spring-barrel and axis carried by such yoke, a rim upon the spring-barrel, a stationary eccentric clamp permanently fastened at one end the other end being allowed to yield, and a ball-stop between the eccentric clamp and the rim, substantially as set forth.

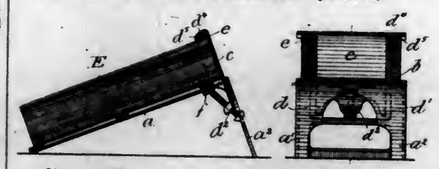
4. The combination, in a suspension device for lamps, of a spring-barrel and its axis, a yoke or frame for suspending such spring-barrel, an annular flange or rim upon the spring-barrel, an eccentric clamp, a ball between the eccentric clamp and the rim, and a shoe upon which such ball rolls, substantially as set forth.

479,875. APPARATUS FOR ROLLING UP STRIPS OR WEBS.

CHARLES FAURE, Neufchâtel, Switzerland. Filed Feb. 12, 1892. Serial No. 421,268. (No model.)

Claim.—1. The combination, with the web and the rollers upon which the same is wound, of a motor and gearing connecting the respective rollers to the motor, ratchet-wheels and pawls and a sliding coupling for disconnecting one pawl or the other, a lever for moving the sliding coupling, and a hammer and mechanism for raising the same and allowing it to drop in either one direction or the other to shift the coupling, substantially as set forth.

2. The combination, with the web and the rollers upon which it is wound, of a motor and gearing, substantially as specified, for giving motion to the rollers and web first in one direction and then the other, a screw and gearing connecting the same to one of the web-rolls, a nut moved by the screw, stops upon the screw, and a lever acting in connection with the stops upon the screw to arrest the movement of the parts, and mechanism, substantially as specified, controlled by a clock-movement for liberating the screw periodically and starting the rotation of the web and its rollers, substantially as set forth.



3. The combination, with the web and the rollers upon which it is wound, of mechanism for rotating the rollers and moving the web first in one direction and then in the other, a screw and gearing for connecting the same with one of the web-rolls, there being stops on the screw, a nut moved by the screw, and a lever carried by the nut for arresting the rotation of the screw by contact with either of the stops, a rocker to act upon the lever and liberate the stop of the screw, a hammer and means for raising the same, and an escapement, controlled by the clock-movement, for allowing the hammer to drop and act upon the rocker periodically, substantially as set forth.

4. The combination, with the web and the rollers upon which it is wound in either direction, of mechanism for rotating the web-rolls, a coupling box for changing the direction of rotation, a lever for moving the same, a hammer for acting upon the lever, and a wheel having a projection to act upon the hammer, the axis of the hammer being eccentric to the axis of the wheel, so that the projection on the wheel clears the projection on the hammer and allows the latter to drop, substantially as set forth.

5. The combination, with the web and the rollers upon which it is wound in either direction, of mechanism for rotating the web-rolls, a coupling-box for changing the direction of rotation, a lever for moving the same, a hammer for acting upon the lever, a wheel having a projection to act upon the hammer, the axis of the hammer being eccentric to the axis of the wheel, so that the projection on the wheel clears the projection on the hammer and allows the latter to drop, and a cam for moving the axis of the hammer endwise to allow the hammer to clear the lever upon the return movement, substantially as set forth.

479,876. CALENDAR-HOLDER.

WILLIAM E. GARY, Philadelphia, Pa. Filed Mar. 25, 1892. Serial No. 426,339. (No model.)

Claim.—1. The combination, with a calendar provided with stubs, of a holder provided with an adjustable clamping-plate adapted to engage the stub portion of the calendar, substantially as and for the purposes described.

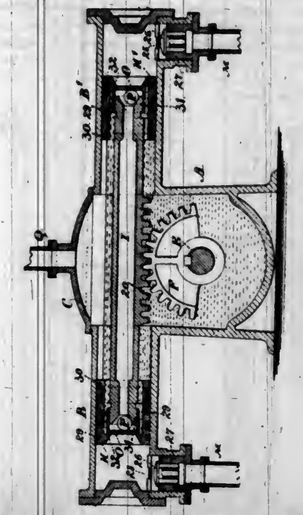
2. The combination, with a calendar, of a holder provided with a detachable clamping-plate adapted to engage the upper part of the calendar and means for securing the clamping-plate to the calendar, substantially as and for the purposes described.

3. The combination, with a calendar, of a holder provided with a detachable clamping-plate provided with an overhanging lip adapted to engage the upper portion of the calendar and means for securing the clamping-plate to said portion of the calendar, substantially as and for the purposes described.

4. The combination, with a stub-calendar, of a holder provided with an adjustable recessed clamping-plate provided with an overhanging lip having a knife-edge and means for clamping said plate to said calendar, substantially as and for the purposes described.

5. The combination of a skeleton holder, a detachable recessed clamping-plate fitting said holder and having an overhanging lip, a calendar provided with stubs, and means for clamping the stub portion of the calendar to said holder, substantially as and for the purposes described.

6. A skeleton holder for the reception of a calendar provided with stubs, said holder provided with legs and a slot for the insertion of a clamping-plate and means for adjustably securing said plate to position in contact with the stub portion of said calendar, substantially as described.



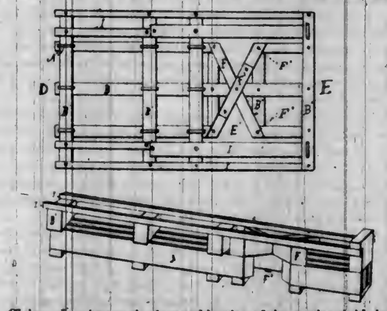
7. A holder for a calendar, comprising a frame provided with legs and a lug, a slot in the rear portion of said frame, a recessed clamping-plate provided with an overhanging lip, feet, and a bearing, and means adapted to be inserted through said bearing and engaging with the lug of said frame for holding said clamping-plate in position against said calendar, substantially as described.

8. A holder for a stub-calendar, comprising a skeleton frame with front and rear legs and a slot for the reception of a recessed plate provided with an overhanging lip having a sharp edge, and means for clamping said plate to position in contact with the stub portion of the calendar, substantially as described.

479,877. PUMP FOR REFRIGERATING APPARATUS.

MAX GRIMM, West Hoboken, N. J. Filed Dec. 30, 1891. Serial No. 416,517. (No model.)

Claim.—1. The circular valve-seat, in combination with a valve fitting such seat and having a cylindrical rear projection, a cylinder fitting within the cylindrical projection of the valve and having a conical recess, and a ball within such recess acting to press the valve toward its seat, substantially as specified.

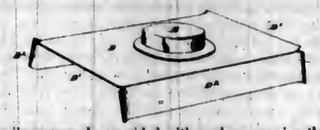


2. The combination, with the case and the pump-cylinders and the heads and caps, of a rock-shaft across the case, tubular bearings for such rock-shaft and packings for the same, a segmental gear on the rock-shaft, pistons within the pump-cylinders, a piston-rod connecting such pistons and provided with a rack engaging the segmental gear, and a crank upon the rock-shaft, a connecting-rod, crank-pin boxes, and springs at each side of the crank-pin boxes, substantially as set forth.

3. The combination, with the pump-cylinder, of a tubular piston having a valve-seat within one end thereof, a valve adapted to sit upon the valve-seat and made with a cylindrical rear projection, a cylindrical connection to the piston within the cylinder of the valve and formed with a conical recess at the end adjacent to the valve, and a valve-closing ball within the recess and acting against the inner side of the valve, substantially as set forth.

479,878. HAY-RACK.

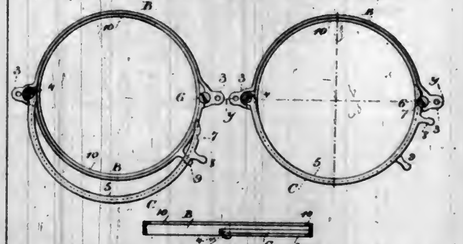
JAMES E. HAYNES and CHARLES B. HAYNES, Ames, Ill. Filed Apr. 12, 1892. Serial No. 428,903. (No model.)



Claim.—In a hay-rack, the combination of the sectional side beam A, the center beam B, the cross composed of two beams mortised together and provided with plates F^6 F^6, bolted together on the top and bottom, and a strengthening-plate H, bolted on the bottom of the beam B, thereby strengthening the connection between the parts D and E, substantially as described.

479,879. RAILWAY-TORPEDO.

EUGENE N. HILL, Buffalo, N. Y. Filed Dec. 11, 1891. Serial No. 414,652. (No model.)



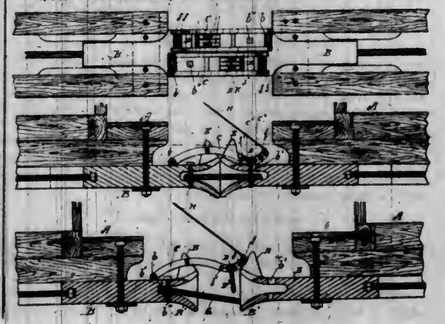
Claim.—1. The railway-torpedo described, having a box B, adapted to protect the fulminate, in combination with the shoe D, having sled-runner ends D′ and wings D^2, extending downward on each side, said ends and said wings being formed integral with the shoe, all arranged for joint operation, as herein set forth.

2. A railway-torpedo provided with a shoe carrying the fulminate and adapted to slide upon a rail and pass over the rail-joints without being displaced, said shoe having wings D^2, extending downward on each side, and upturned or sled-runner ends D′, substantially as described.

479,880. SUPPORTING-RING FOR LAMPS.

THOMAS HIPWELL, Long Island City, assignor to the Manhattan Brass Company, New York, N. Y. Filed Feb. 25, 1892. Serial No. 422,756. (No model.)

Claim.—1. The combination, with the complete ring B and the suspending or supporting device therewith connected, of a ring-section pivoted near one end to the ring B and having an inwardly-projecting flange and a beveled end to the ring-section, and a screw 6 for receiving and supporting the moving end of said ring-section, substantially as set forth.

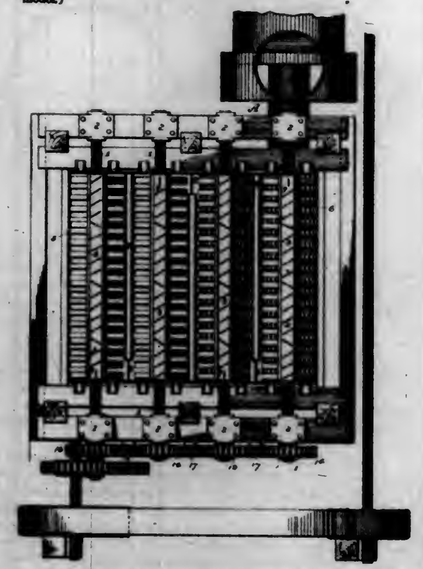


2. The combination, with the lamp suspending ring having an inwardly-projecting flange around the top edge thereof, of a ring-section, a pivot at one end thereof to connect it with the complete ring, a bevel at the other end, an inwardly-projecting flange at the lower edge, and an outwardly-projecting arm by which the ring-section is moved, substantially as set forth.

3. The combination, with a lamp-suspending ring, of a ring-section of substantially half the width of the main ring, a pivot at one end for connecting the ring section to the complete ring, an inwardly-projecting flange and a bevel at the end of the ring section, a supporting screw or head for the moving end of the ring section, and two projecting arms, one on the ring-section and the other on the ring for use in moving the ring-section in either direction, substantially as set forth.

4. The combination, with a lamp-suspending ring having projecting ears for the supporting or suspending devices, of a ring-section, a pivot for attaching the ring-section to the complete ring, such ring-section having an internal projecting flange, a support for the moving end of the ring-section, and a projection upon the ring-section by which it may be moved in opening or closing the same, substantially as set forth.

479,881. CAR-COUPLING.



ORIS HOOD, Onset, Mass. Filed Apr. 4, 1892. Serial No. 427,590. (No model.)

Claim.—1. The herein-described automatic car-coupler, consisting of draw-bars having flaring mouths and a link connected to one of the draw-bars combined with a shackle-frame pivoted to one of the draw-bars and having a yielding shackle bar and pin mounted in slots in said shackle-frame, one or more anti-friction rollers on the latter, and wedge-shaped projections and a locking-perforation on the opposite draw-bar, substantially as and for the purpose set forth.

2. The herein-described automatic car-coupler, consisting of a pair of flaring-mouthed draw-bars, each one having a link adapted to be connected to the opposite draw-bar, a pivoted shackle-frame, a yielding shackle bar and pin mounted in slots in said shackle-frame, one or more anti friction rollers on the latter, and wedges and a locking-perforation for automatically guiding the locking-pin on the shackle-frame through the locking-perforation and the link, the device on one draw-bar being arranged to one side of the corresponding mechanism on the opposite draw-bar, substantially as and for the purpose set forth.

479,882. APPARATUS FOR REMOVING IRON AND ALUMINA. SAMUEL HUGER, Charleston, S. C., assignor of one-half to William B. Chisolm, same place. Filed Apr. 13, 1891. Serial No. 388,620. (No model.)

Claim.—1. The combination, with a washer, of a débris-pump so located and arranged that the débris from the washer flows into it, substantially as set forth.

2. The combination, with a series of communicating compartments and rotary shafts therein, of a débris-pump into which the débris from the compartments flows, substantially as set forth.

3. In a washer, the combination, with a series of troughs, a part of which have closed bottoms and a part grated bottoms, of toothed shafts revolubly supported and adapted to operate in the troughs, means for supplying water to the several troughs, and a débris-pump into which the water passing through the grate is discharged, substantially as set forth.

4. In a washer, the combination, with a set of communicating compartments, a part of which have open-work bottoms, the alternate compartments communicating through corresponding ends, so that the material has a continuous passage from one end of the washer to the other, of rotary shafts located in said compartments and means for communicating motion to said shafts, substantially as set forth.

5. The combination, with suitable troughs having grated bottoms, rotary shafts, and means for discharging the débris from the troughs, of a débris-pump and means for conducting the débris from the washer into the pump, substantially as set forth.

479,883. FURNACE DRAWING AND CHARGING APPARATUS. THOMAS JAMES, Braddock, Pa. Filed Oct. 20, 1891. Serial No. 409,285. (No model.)

Claim.—1. In furnace charging or drawing apparatus, the combination of tongs adapted to grasp an ingot or bloom, a power-cylinder connected with the tongs and adapted to operate the same, a valve controlling said cylinder, and a stop whereby on motion of the apparatus the valve is engaged and shifted to operate the cylinder, substantially as and for the purposes described.

2. In furnace charging or drawing apparatus, the combination of tongs adapted to grasp an ingot or bloom, a power-cylinder connected with the tongs and adapted to operate the same, a valve controlling said cylinder, a stop whereby on forward motion of the apparatus the valve is engaged and shifted, and a second stop whereby the valve is engaged on rearward motion of the apparatus, substantially as and for the purposes described.

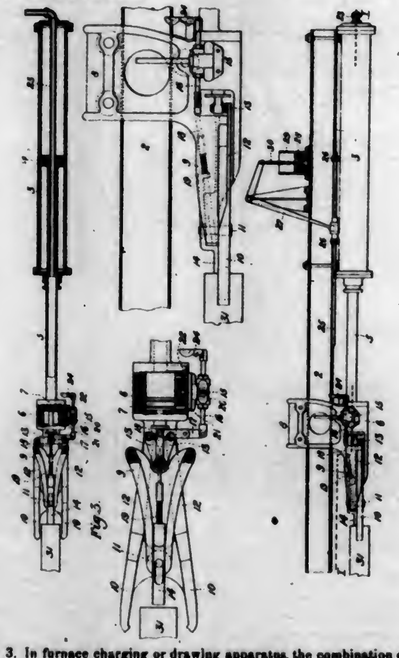


Fig. 3.

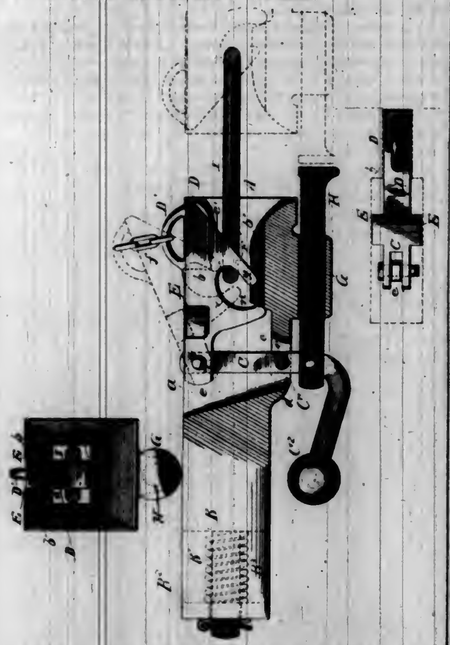
3. In furnace charging or drawing apparatus, the combination of tongs adapted to grasp an ingot or bloom, a power-cylinder connected with the tongs and adapted to operate the same, a valve controlling said cylinder, and a rod connected with the valve and adapted to engage the ingot or bloom to be seized, substantially as and for the purposes described.

4. In a furnace charging or drawing apparatus, the combination of tongs adapted to grasp an ingot or bloom, a power-cylinder connected with the tongs and adapted to operate the same, a valve controlling said cylinder, a rod connected with the valve and adapted to engage the ingot to be siezed, and an interposed spring, substantially as and for the purposes described.

5. In furnace charging or drawing apparatus, the combination of tongs adapted to grasp an ingot or bloom, a power cylinder connected with the tongs and adapted to operate the same, a valve controlling said cylinder, a stop whereby on forward motion of the apparatus the valve is engaged and shifted, a second stop whereby the valve is engaged on rearward motion of the apparatus, and a cushion for the second stop, substantially as and for the purposes described.



6. In furnace charging or drawing apparatus, the combination of tongs adapted to grasp an ingot or bloom, a power-cylinder connected with the tongs and adapted to operate them, a cylinder connected with the tongs and adapted to project them, a hollow piston-rod for the last-named cylinder, and a motive-fluid-supply pipe extending telescopically into the piston-rod and connected by the latter with the tongs-operating cylinder, substantially as and for the purposes described.

479,884. NECKTIE-FASTENER. BERNHARD KESSLING, Ovelgönne, Germany. Filed Mar. 28, 1892. Serial No. 426,705. (No model.)

Claim.—In a necktie-fastener, the combination, with the stud *a*, reamed conically at the front end *c* and having cavity c^2 at the rear end, the stem *d*, adapted to be inserted therein, said stem being split to form the spring catches d' d^2 and having hooks d^3, the plate *e* on which they are mounted, said plate being attached to the tie, substantially as set forth.

479,885. CAR-COUPLING. WILLIAM A. LEE, Winfield, Kans. Filed Mar 25, 1892. Serial No. 426,371. (No model.)

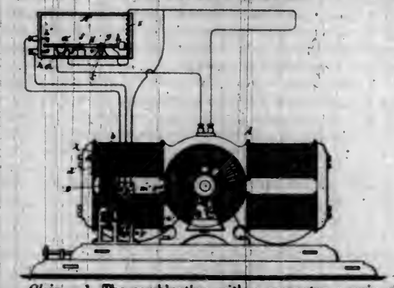
Claim.—1. The combination, with a draw-head having a slot in its top and shoulders or stops at each side of the slot, of a hook and stops on the hook rearward of the stops on the draw-head and out of engagement with said stops when the hook is in its upward or normally-elevated position, substantially as set forth.

2. The combination, with a draw-head having stops formed thereon, of a longitudinally-movable hook and stops thereon rearward of the stops on the draw-head in position to clear the stops on the draw-head when the hook is in its normal or elevated position and adapted to strike the stops on the draw-head when the hook is drawn out of its normal position, substantially as set forth.

3. The combination, with a draw-head and a longitudinally-movable hook, of a pivoted weighted lever pivotally connected to said hook, substantially as set forth.

4. The combination, with a draw-head having a groove therein, of a longitudinally-movable hook, said hook having a member adapted to enter said groove in the draw-head, substantially as set forth.

5. The combination, with a draw-head having a groove therein, of a longitudinally-movable hook, said hook having two depending members adapted to enter said groove in the draw-head, substantially as set forth.



6. The combination, with a draw-head having a groove in its lower portion and a slot in its upper portion, of a pivoted hook adapted to have a longitudinal movement, said hook having depending members adapted to enter said groove, and a loop or handle projecting from the top of said hook through the slot in the top of the draw-head, substantially as set forth.

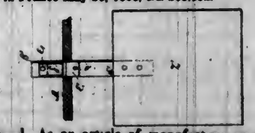
7. The combination, with a draw-head, of a longitudinally-movable hook therein, a pivoted weighted lever pivotally connected to said hook, and a sliding bar or bumper pivotally connected to said weighted lever at one side of its fulcrum, substantially as set forth.

8. The combination, with a draw-head, of a pivoted weighted lever projecting therein, a bar or buffer pivotally connected to said weighted lever at a point beneath the draw-head, and a longitudinally-movable hook pivotally connected to said weighted lever, substantially as set forth.

9. The combination, with a draw-head and a depending bracket, of a pivoted weighted lever, a sliding bar or bumper mounted in said depending bracket and pivotally connected to said weighted lever at a point below the draw-head, and a longitudinally-movable hook pivotally connected to said weighted lever, substantially as set forth.

479,886. ELECTRIC-CURRENT REGULATOR. ALVARO S. KROH, Defiance, Ohio, assignor of one-half to Andrew Sauer, same place. Filed Mar. 26, 1891. Serial No. 386,548. (No model.)

Claim.—1. The combination, with a generator, a main electric circuit, and a shunt-circuit, of a solenoid included in the shunt-circuit, an electro-magnetic device included in the main circuit and adapted to maintain said shunt-circuit normally open and determine the direction of current through the solenoid, said solenoid being composed of a series of coils, devices connecting the core of the solenoid with the generator, and means carried by said devices for automatically controlling the number of coils of the solenoid included in the shunt-circuit, substantially as set forth.



2. In a current-regulator, the combination, with a commutator-brush holder of a dynamo-electric machine, a main electric circuit, and a shunt-circuit, of a solenoid included in the shunt-circuit and composed of a series of coils, an electro-magnetic device included in the main circuit, a pivoted lever, said lever being connected at one end with the core of the solenoid and with the commutator-brush holder, and an arm carried by said lever and adapted to determine the number of coils to be included in the shunt-circuit, corresponding with the varying strengths of the current in said shunt-circuit, substantially as set forth.

3. In a current-regulator, the combination, with a generator, of a pivoted lever connected with a commutator-brush holder, means connected with said lever for varying the output of the generator, said means comprising a solenoid composed of a series of coils, a core for said solenoid, connected with said pivoted lever, electro magnetic devices included in the main line, and contacts therefor, said contacts being included in circuit with the solenoid, substantially as set forth.

4. In a current-regulator, the combination, with the commutator-brush holder of a dynamo-electric machine, of a solenoid composed of a series of coils of wire, means connecting the core of said solenoid with the commutator-brush holder of the dynamo, a commutator-bar to which the coils of the solenoid are connected, and a commutator brush or plate adapted to engage said commutator-bar and electro-magnetic devices, for causing the current to enter one or the other end of the solenoid, accordingly as the current in the main line exceeds or recedes from its normal strength, substantially as set forth.

5. The combination, with a movable commutator-brush holder and a solenoid, of stems projecting from said core, means for connecting one of said stems with the movable brush holder, and a friction-brake connected with the other stem to hold said core in its normal position, substantially as set forth.

479,887. GALVANIC BATTERY. FÉLIX DE LALANDE, Paris, France. Filed June 27, 1891. Serial No. 397,749. (No model.) Patented in France May 28, 1890, No. 205,952.

Claim.—1. As an article of manufacture, an electrode for galvanic batteries, consisting of an agglomerated mass of copper oxide having its surface reduced to a metallic state.

2. In a galvanic battery, an electrode and a support therefor, consisting of a frame having shoulders at the top and bottom to sus-

tain the electrode, and a removable spring extending between the shoulders, substantially as described.

3. A support for an electrode, consisting of a metallic plate having a cut-out central portion, supports B E, depending from the cover, flanges I K for sustaining the electrode, and springs passing through openings in the said flanges, substantially as described.

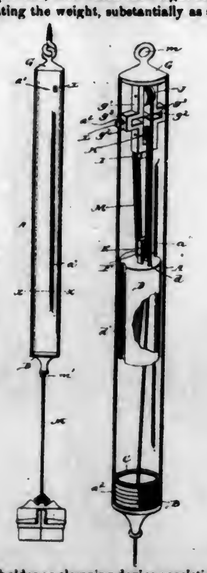
4. In a galvanic battery, an electrode Z', a blade supporting the same and extending through an opening in the cover, and a spring-support for said blade, resting on the top of the cover, substantially as described.

5. In combination with the electrode Z', a supporting-blade passing through an opening in the cover, a limiting-piece f', secured to the blade, and a spring-support for the blade, secured thereto and resting on the cover, substantially as described.

6. In combination with the zinc plates Z' and Z^2 and their supports, the electrode a and its support, and spacing-pieces T U T' U' of insulating material, secured to the support of the electrode a and adapted to keep the zinc plates apart, substantially as described.

479,888. BOOK-REST. JACOB R. LAWSER, Newark, N. J. Filed May 5, 1892. Serial No. 431,876. (No model.)

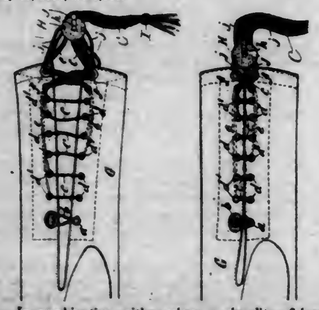
Claim.—1. In a book-rest, the combination of a support adapted to be secured to a chair or other article of furniture, a rod a, adjustably arranged in said support, a bracket or support fitted to the upper end of said rod, said bracket consisting, essentially, of a plate c', having ears c^3, a chambered portion c^4, a pivot-chamber c^5, and an opening c^7, a ratchet portion d', pivotally arranged between said ears and provided with a stem for arranging the same in a sleeve-like portion in said rod a, and a finger-piece e, adapted to engage with saw-cuts in said ratchet portion d', said finger-piece being pivotally arranged in said pivot-chamber c^5 and projecting through said opening c^7, and a spring arranged in said chamber c^5, engaging with the back of said finger-piece, substantially as and for the purpose set forth.



2. In a book-rest, the combination of a support adapted to be secured to a chair or other like article of furniture, a rod a, adjustably arranged in said support, a bracket or support fitted to the upper end of said rod, said bracket consisting, essentially, of a plate c', having ears c^3 and stop c^6, projecting from one of said ears, a ratchet portion d', pivotally arranged between said ears and provided with a stem for arranging the same in a sleeve-like portion in said rod a, a slot or cutaway portion d^2 in said ratchet portion d', into which said stop d' projects to limit the movement thereof, and a spring-actuated finger-piece adapted to engage with the saw-cuts in said ratchet portion d' to tilt the bracket at different angles, substantially as and for the purposes set forth.

3. In a book-rest, the combination of a support adapted to be secured to a chair or other article of furniture, a rod a, adjustably arranged in said support, a bracket or support consisting, essentially, of a plate c', having ears c^3, a stop c^6, projecting from one of said ears, a chambered portion c^4, a pivot-chamber c^5, and an opening c^7, a ratchet portion d', pivotally arranged between said ears and provided with a stem for arranging the same in a sleeve-like portion in said rod a, a slot or cutaway portion in said ratchet portion d', into which said stop c^6 projects, to limit the movement thereof, and a finger-piece e, adapted to engage with saw-cuts in said ratchet portion d', said finger-piece being pivotally arranged in said pivot-chamber c^5 and projecting through said opening c^7, and a spring arranged in said chamber c^5, engaging with the back of said finger-piece, substantially as and for the purposes set forth.

479,889. BILLIARD-CHALK HOLDER. GEORGE J. LECHNART, Ashland, Ohio. Filed Aug. 21, 1891. Serial No. 403,234. (No model.)



Claim.—1. In a chalk-holder for billiard-tables, pool-tables, and the like, the combination of an outer casing provided at diametrically-opposite points with inward projections or guides, a tubular weight provided at diametrically-opposite points with grooves or recesses engaged by the guides and having a closed top, said top provided with an aperture and having a bracket extending therefrom, a sheave or pulley journaled in said bracket, a top or cover for the casing, provided upon its upper side with means for attachment and having a bracket depending from its under side, said bracket provided with angular side extensions with screw-threaded apertures registering with similar apertures in the casing and adapted to receive retaining-screws, upper and lower sheaves journaled in said bracket, and an operating-cord, one end thereof attached to the weight-bracket and extending upward over the lower pulley of the cover-bracket, downward around the pulley of the weight-bracket, thence upward over the upper pulley of the cover-bracket, and finally downward through the weight and casing, its lower end having the chalk-clamp secured thereto, substantially as set forth.

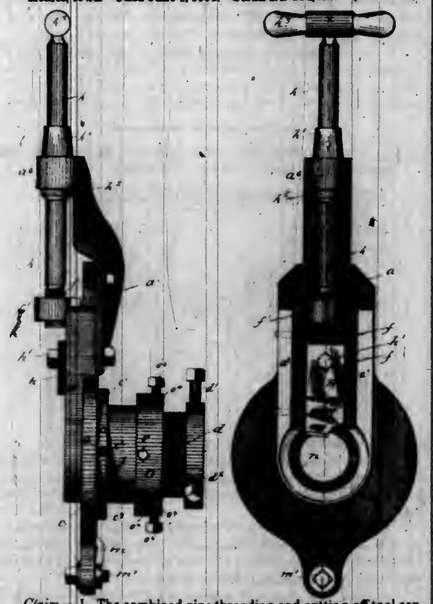
2. In a chalk-holder, the combination of a casing having its lower open end provided with interior threads, a weight having a vertical movement within the casing, an apertured screw-cap inserted in the threaded end of the casing, said screw-cap constructed to receive a washer in its upper end, with which the weight normally contacts, and a cord for operating the weight, substantially as set forth.

3. A chalk-holder or clamping device consisting of a blank having its edges turned downwardly to form clamping springs or flanges, the top of said blank provided with elongated angular slots to form a central web or strip, said web or strip being widest at its center and provided at such point with opposite recesses to receive the operating-cord, substantially as set forth.

479,890. GLOVE-FASTENING. JOHN LYE, Glasgow, Scotland. Filed Feb. 20, 1892. Serial No. 422,329. (No model.) Patented in England May 13, 1891, No. 8,188.

Claim.—In combination with a glove, a plurality of laces connected therewith, a clamp arranged to slide on the said laces, and the means for automatically operating the said clamp toward the glove as the laces are drawn upon, consisting of the cords $j\,j$, attached at one end to the clamp, passing thence through a pair of eyelets on the glove, the free ends of said cords being attached to the laces, substantially as described.

479,891. MOLD FOR THE MANUFACTURE OF ELECTRICAL SWITCHBOARDS. JOHN B. LYON, Brooklyn, N. Y. Filed Jan. 19, 1891. Renewed June 16, 1892. Serial No. 436,993. (No model.)



Claim.—1. In a mold for forming cards or sections of electrical switchboards, the combination of a frame, parts of which are removable, with devices for supporting the contact-pieces of the section, said devices being attached to or carried by the removable parts of the frame, substantially as described.

2. The combination, with the frame B, B', and B^2, of the plates $p\,p^2$, provided with the groove p', for the purpose set forth.

3. The combination, with a mold provided with removable sections, such as the plates $p\,p$, of a removable plate or plug shaped to fit a portion of the mold, for the purpose set forth.

4. A mold for forming cards or sections of electrical switchboards, consisting of a plate provided with a plurality of mandrels arranged in a row, a second plate provided with a plurality of supporting-pins, and a frame adapted to hold the two plates and itself, forming part of the mold, substantially as described.

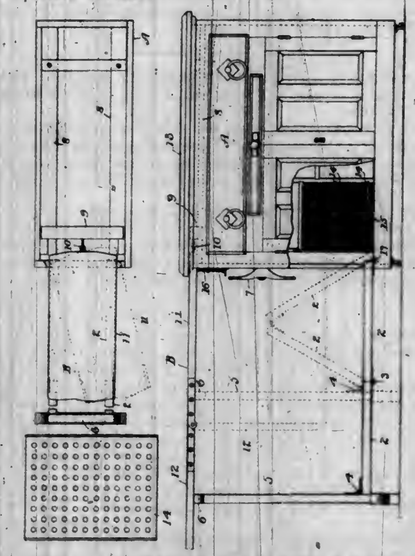
479,892. TOOL FOR CUTTING OFF PIPES. JOHN F. MASON, Des Moines, Iowa. Filed June 1, 1891. Serial No. 394,798. (No model.)

Claim.—1. The combined pipe threading and cutting-off tool consisting in the combination, with a threaded sleeve furnished with a clamping device for attaching it to the pipe, of a second threaded sleeve mounted thereon, a rotating plate, a cutting-tool carried thereby, a clamping device for fixing said rotating plate to said last-mentioned sleeve for cutting threads upon the pipe, and a clamping device for securing said threaded sleeves together in different positions for cutting off the pipe at any point desired, substantially as specified.

2. The combination, with a cutting-tool adapted to cut threads upon and to sever a pipe, of a rotating plate carrying said tool and two threaded sleeves, upon one of which said rotating plate is mounted, said rotating plate revolving on said sleeve in cutting off the pipe and with the sleeve in cutting threads on the pipe, substantially as specified.

3. The combination, with a rotating plate, of a threaded sleeve upon which it is mounted, a second sleeve screw-threaded with the first, a clamp-collar and screw for fixing said sleeves together, a set-screw for fixing said second sleeve to the pipe, a radially-adjustable knife carriage or slide mounted on said rotary plate, a knife or cutting-tool mounted in said carriage or slide, and a clamp for fixing said rotating plate to said first-mentioned sleeve, whereby said tool operates both to thread and to cut off the pipe, substantially as specified.

4. The combination, with rotating plate a, of knife carriage or slide f, mounted thereon, a screw-shaft for adjusting the same radially, a cutting-tool g, carried by said slide, a threaded sleeve b, upon which said plate a is journaled, a screw-threaded sleeve d, a clamp-collar o, fixed to said sleeve b and furnished with radially-movable threaded segment clamps for engaging the other sleeve d, a clamp or set-screw for fixing said sleeve d to the pipe, and a clamp for fixing said plate a to said sleeve b, substantially as specified.



5. The combination of two threaded sleeves $b\,d$ with a clamp-collar fixed to one of said sleeves and furnished with radially-movable threaded clamp-segments, substantially as specified.

6. The combination of two threaded sleeves $b\,d$ with a clamp-collar fixed to one of said sleeves and furnished with radially-movable threaded clamp-segments and set-screws for operating said clamp-segments, substantially as specified.

7. The combination, with a cutting-tool adapted to cut threads upon and to sever a pipe, of a rotating plate carrying said tool and two threaded sleeves, upon one of which said rotating plate is mounted, said rotating plate revolving on said sleeve in cutting off the pipe and with the sleeve in cutting threads on the pipe, said cutting-tool being secured to a radially-adjustable slide mounted upon said rotary plate, substantially as specified.

8. The combination, with a rotating tool-carrying plate, of two screw-threaded sleeves, one for fixing the implement to a pipe and the other carrying said rotating plate, a clamp device for fixing said plate to said last-mentioned sleeve, and a clamp device for fixing said sleeves together in different positions for cutting off the pipe where desired, substantially as specified.

479,893. COMBINED KITCHEN-CABINET AND IRONING-BOARD. ALEXANDER MERON, St. Paul, Minn. Filed Sept. 3, 1891. Serial No. 404,594. (No model.)

Claim.—1. The combination, with the cabinet, of the cross-bar sliding under the top thereof, the board also sliding underneath said top and having pivoted connection with said bar, the independent extensible frame connected to the cabinet and adapted to be drawn outward to support said board, and means for securing said frame to the cabinet when collapsed, substantially as described.

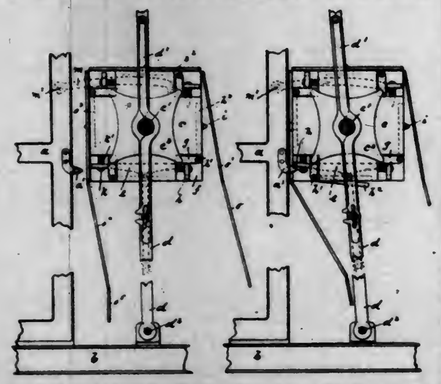
2. The combination of the cabinet, the board sliding under the top thereof, the standards for supporting the outer end of the board, the knuckle-jointed bars connecting said standards to said cabinet, and means for securing said standards to the cabinet when said bars are folded together, substantially as described.

479,894. BEDSTEAD-EXHIBITOR. JOHN R. MOORE, Louisville, Ky. Filed Jan. 26, 1892. Serial No. 419,602. (No model.)

Claim.—1. A bedstead-exhibitor having, in combination, the sills, a support above one of said sills, guide-rails connecting the sills and having the upturned ends, upper guide-rails connecting the support and

the upturned ends, and a brace-rod connecting the upturned ends, substantially as set forth.

2. A bedstead-exhibitor having, in combination, the sills, the support above one of said sills, the upper guide-rods, the lower guide-rods, and the shoes constructed substantially as described and operating in the manner set forth.



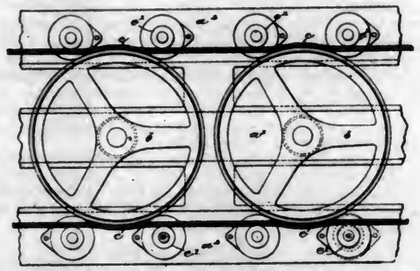
3. A bedstead-exhibitor comprising a support, guide-rods arranged above and below said support, the shoes for supporting the displayed article, consisting of a caster-block having a clamp thereon, substantially as and for the purpose described.

4. A bedstead-exhibitor comprising the sills, a support above one of said sills, the upper guide-rods, the lower guide-rods, and shoes for supporting the displayed article, consisting of a block mounted on casters, an upright on said block, and a clamp, all substantially as and for the purpose set forth.

5. In a bedstead-exhibitor, a shoe for supporting the displayed article, comprising a block having casters thereon, an upright brace for said upright, and a clamp constituted of a single rod bent to form the threaded ends and connecting-piece, confining-nuts, and a pad and a binding-plate, substantially as described.

479,895. CARD AND JACQUARD MACHINE PROTECTOR. SIMON MORGAN, Paterson, N. J. Filed Mar. 23, 1892. Serial No. 426,052. (No model.)

Brief.—Disengagement and removal of the card from the under face of the cylinder are effected on each movement of the cylinder toward the needles by means of levers pivoted in the edges of the cylinder, the projecting end of one of which engages a stud on the frame.

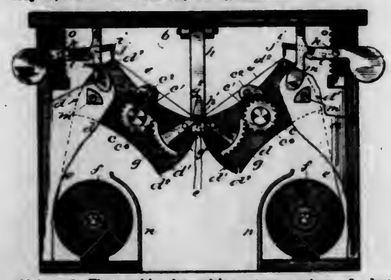


Claim.—1. In a Jacquard machine, the combination, with the frame, the oscillating cylinder, and its supporting-bar, of a lever pivoted to the said cylinder and a pin secured to the frame opposite said lever and adapted to operate said lever, whereby the pattern-card is removed from said cylinder, substantially as described and set forth.

2. In a Jacquard machine, the combination, with the frame, of a cylinder adapted to be oscillated in said frame and provided in or near its corners with grooves or recesses, levers pivotally arranged in said grooves, and a pin secured to the frame and adapted to operate said levers alternately, substantially as described and set forth.

3. In a Jacquard machine, the combination, with the frame, of a cylinder adapted to be oscillated in said frame and provided in or near each corner with a groove or recess, bearings arranged in said groove, a lever pivotally secured in said bearings, a pin secured to the frame and adapted to operate said lever, and a spiral spring controlling the return motion of said lever, all said parts substantially as described, and for the purposes set forth.

4. In a Jacquard machine, the combination, with the frame, of a cylinder adapted to be oscillated in said frame and provided in or near each corner with a groove or recess, a lever pivotally secured in said groove, a spiral spring holding said lever in its normal position, and means for operating said lever, substantially as described and set forth.



479,896. DEVICE FOR DRIVING SPINDLES. WALTER G. MORRISON, Willimantic, Conn. Filed Feb. 10, 1891. Serial No. 380,877. (No model.)

Claim.—1. In combination with a spindle-rail having a spindle-socket, a driving-belt located in a plane transversely of the axis of said socket, and a spindle having a hub eccentric to the axis of the spindle, said hub fitting the spindle-socket, all substantially as described.

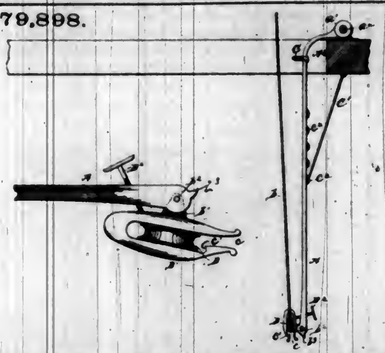
2. In combination in a spinning-frame, a spindle-rail having a line of spindle-sockets, a driving-belt supported in line by guide pulleys or idlers, and a series of spindles eccentrically supported in the respective sockets and in operative relation to the belt, all substantially as described.

479,897. COMMODE. DANIEL H. MURPHY, Hartford, Conn. Filed May 25, 1891. Serial No. 393,944. (No model.)

Claim.—1. The combination, with a rotary receiver, of a destructible lining passing over said receiver, and a knife for severing a portion of the lining before each rotation of the receiver, substantially as specified.

2. The combination, with a movable seat, of a receiver rotated by the movement of the seat, a destructible lining passing over said receiver, and a knife for severing a portion of the lining before each rotation of the receiver, substantially as specified.

3. The combination, with a movable seat, of a receiver connected with and rotated by the movement of the seat, a destructible lining passing from each side over the receiver, and a knife for severing a portion of the lining before each rotation of the receiver, substantially as specified.



4. A commode having a bottom formed of two rolls, a destructible lining passing over each of the rolls, and knives for severing portions of the lining before each movement of the rolls, substantially as specified.

5. A commode having a movable seat, a bottom formed in two parts connected with the seat, a destructible lining passing from each side over the parts, and knives connected with the seat for severing portions of the lining at each movement of the seat, substantially as specified.

479,898. DRYING-LINE SUPPORT. JOHN PAGLIUGHI and JOSEPH A. PAGLIUGHI, New York, N. Y., and FELIX DE CANTO, Union Hill, N. J. Filed Jan. 4, 1892. Serial No. 416,968. (No model.)

Claim.—1. In a line-support, the combination, with the swinging arm, of a pulley and a pulley-block arranged at one side of the outer end of the arm and having a pivotal connection with said arm, and a stop, as b^2, on the arm, substantially as specified.

479,898.

2. In a line-support, the combination, with the swinging arm, of the pulley, the pulley-block adjustable relatively to the said arm, and an adjustable stop for holding the said block in its adjusted position away from the arm, substantially as specified.

3. In a line-support, the combination, with an arm, of the pulley-block having the outward opening, one wall of said opening having a shoulder or hook portion, and a pulley within the block, substantially as specified.

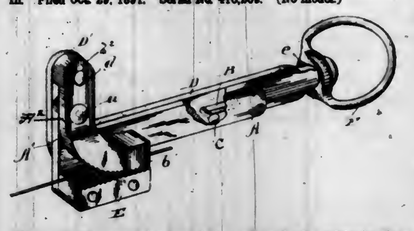
479,899. PYROTECHNIC SUIT. HENRY J. PAIN, New York, N. Y. Filed Mar. 23, 1892. Serial No. 426,659. (No model.)

Claim.—1. The combination, with a fire-proof suit adapted to being worn, of sockets attached to and supported by such suit and adapted to receive combustible fireworks to form lights upon such fire-proof suit that receive their motion from the party wearing the suit, substantially as set forth.

2. A fire-proof suit having an exterior surface of abestos or similar material and a foundation of canvas, to which the fire-proof surface is permanently attached, in combination with sockets and base-pieces connected with the sockets and fastened to the fire-proof suit and adapted to receive combustible materials into the sockets to form lights that move with the fire-proof suit by the movements of the person wearing such suit, substantially as set forth.

3. The combination, with a fire-proof suit adapted to be worn by a performer, of sockets for the reception of combustible materials, and frames connected to and moved by the person wearing the fire-proof suit for the production of animated fireworks, substantially as set forth.

479,900. STOP-WATCH. WILLIAM PIGUET, Sentier, Switzerland. Filed Dec. 8, 1891. Serial No. 414,431. (No model.)



Claim.—1. The combination, with the main and independent seconds-hands, of an arbor carrying the main seconds-hand, a tubular arbor surrounding the same, carrying the independent seconds-hand, and a stop-wheel connected with the tubular arbor, a heart-cam upon the arbor of the main seconds-hand, and a spring-lever on the stop-wheel acting against the heart-cam, a wheel surrounding the arbor of the independent seconds-hand, and a pin acting upon the lever of the heart-cam, and mechanism, substantially as specified, for holding the stop-wheel and independent seconds-hand and for moving the wheel and pin to separate the spring-lever from the heart-cam, substantially as set forth.

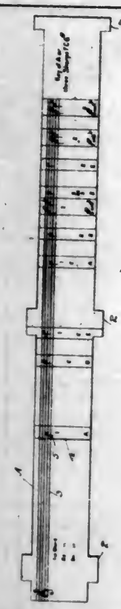
479,900.

2. The combination, with the main and independent seconds-hands and their arbors, of a heart-cam on the arbor of the main seconds-hand, a stop-wheel connected with the arbor of the independent seconds-hand, a spring-lever upon the stop-wheel acting against the heart-cam, a ratchet-wheel surrounding the arbor of the independent seconds-hand, and a pin on the same to act upon the heart-cam lever, spring-clamps for acting upon the stop-wheel, a wedge-lever for opening the spring clamps, a ratchet and lever for acting upon the ratchet-wheel and pin, and a push mechanism, ratchet-wheel, and cam-wheel for acting upon the wedge-lever and the ratchet-lever, respectively, substantially as set forth.

479,901. WIRE-STRETCHER. CHARLES F. STEINKAMP, Golconda, Ill. Filed Oct. 29, 1891. Serial No. 410,309. (No model.)

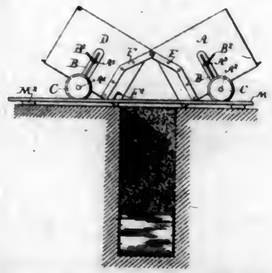
Claim.—A wire-stretcher consisting of an L-shaped body-plate A A', lying upon a similarly-formed handle plate D D', the arms A D being held to slide upon each other by a pin and slot, a stationary clamping jaw secured to the body-plate opposite arm A', and an eccentric jaw connected by separate pivots to arms A' D', all substantially as shown.

479,902. MUSIC-CHART. HARRY S. SUTTON, St. Paul, Minn., assignor of one-half to Ansen N. Hilger, same place. Filed July 11, 1891. Serial No. 399,170. (No model.)



Claim.—1. In a music-chart, a card-board formed to fit on edge on the keyboard of an instrument, having a music-bar and transverse vertical lines inscribed thereon, the spaces between the vertical lines standing immediately above the keys of the board beneath, musical notes comprising the several chords of a musical key inscribed upon the music-bar between the vertical lines and their corresponding letters of the alphabet, and designating-numerals for different chords inscribed within the spaces beneath the notes, substantially as and for the purposes set forth.

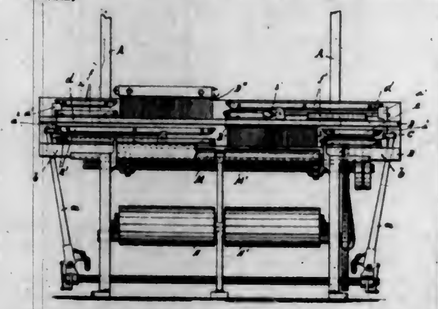
2. In a music-chart, the card-board having projections upon its edges to fit between the black keys of a keyboard, a music-bar inscribed longitudinally thereon, musical notes inscribed upon said bar comprising the chords of a selected musical key, and series of designating numerals for the notes belonging to different chords of the key, substantially as and for the purposes set forth.



3. In a music-chart, the card-board adapted to be placed upon the keyboard of the instrument, a music-bar inscribed thereon, notes upon said bar, and letters of the alphabet upon said card, indicating all the keys of the keyboard which are required to be struck to sound all the chords of a selected musical key, and designating-numerals upon said card indicating the keys of the instrument to be struck to sound the different chords of the musical key, substantially as and for the purposes set forth.

4. As an improved article of manufacture, a board adapted to be fitted upon the keyboard of a musical instrument and having imprinted thereon in proper relation to the keys of the keyboard the notes of a musical chord arranged upon a music-bar and their designating-letters of the alphabet, substantially as and for the purposes set forth.

479,902.

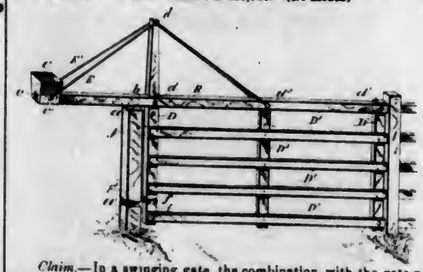


versely in its central portion, mounted upon wheels, the forward and rear parts thereof being hinged to each other at their upper meeting edges and detachably connected at their under meeting edges, and a tongue attached to the forward end of the device, substantially as set forth.

3. A dumping-car comprising a rectangular box open at its top and provided with a removable end piece divided transversely in its central portion, an axle having a flanged wheel on each end beneath each section, bolts projecting outwardly from the sides of the sections above the said axles, vertically-slotted upwardly-extending projections secured to the said axles and having the said bolts extended through the slots therein, nuts placed on the ends of the said bolts, hinges connecting the upper meeting edges of the said sections, and latches to connect the under meeting edges thereof, a tongue pivoted to the forward end thereof, and a bar adapted to be connected with the tongue and the rear section when it is placed on top of the forward section, all substantially as and for the purposes stated.

479,903. PICKER FOR LOOMS. LOUIS TEWELES and THOMAS A. ROBINSON, Paterson, N. J. Filed Dec. 14, 1891. Serial No. 414,944. (No model.)

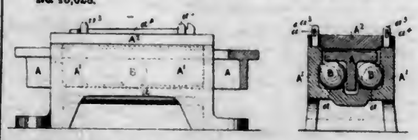
Claim.—1. The combination of a frame having an elevated raceway and adapted to be secured to the raceway of a loom parallel therewith, shuttle-boxes arranged on each of the raceways, shuttles operated from said boxes, a vertical arm having enlargements at its ends and connected to the picker-stick by a flexible strip, said arm resting on the raceway of the loom and extending up through the upper raceways, a pad on one end of the said arm, a horizontal arm secured to the other end of the same, a cross-head at the end of said horizontal arm, and a pad secured to the end of the horizontal arm and around the cross-head.



2. A picker for looms, consisting of a vertical arm having an extension at its lower end adapted to ride on the lower raceway, a flexible loop adapted to connect said vertical arm with the picker-stick, and a horizontal arm connected to the upper end of said vertical arm and extending along the upper raceway.

479,904. BURIAL APPARATUS. SAMUEL D. WAGER, Winterset, Iowa. Filed Apr. 28, 1892. Serial No. 431,096. (No model.)

Claim.—1. A dumping-car comprising a rectangular box divided transversely in its central portion, mounted on wheels in such a manner as to be vertically adjustable thereupon, the two parts so formed being hinged to each other at their upper meeting edges and detachably connected with each other at their under meeting edges, and means for advancing the same, substantially as set forth.



2. A dumping-car comprising a rectangular box divided trans-

479,905. SWINGING GATE. JOHN D. WHITE, Worthington, Iowa. Filed Mar. 19, 1892. Serial No. 425,520. (No model.)

Claim.—In a swinging gate, the combination, with the gate-post having a socket in its upper end and an annular groove around its base, of a gate having the top rail thereof projecting inwardly beyond the top of the post and its inner standard projecting upwardly beyond the top rail, a pivot on the under side of the top rail engaging in the socket in the post, a counterbalancing-weight on the inner end of the top rail, wire braces secured to the upper end of the upright, extending downwardly in opposite directions, and secured to the top rail, and a central bearing-plate having the arms *f* secured to the lower end of the upright and formed with the outward-extending curved arms F', engaging in the annular groove and partly encircling the post, substantially as described.

479,906. DEFLECTION-STAND FOR SWITCH AND SIGNAL RODS. HENRY WILLIAMS, Glasgow, Scotland. Filed Mar. 21, 1892. Serial No. 425,777. (No model.) Patented in England Sept. 10, 1888, No. 13,028.

Claim.—1. The combination comprising railway switch and signal operating rods, traveling spherical balls, and containing-housings, substantially as and for the purposes set forth.

2. The combination comprising a railway switch and signal operating rods A, traveling spherical balls B, and containing-housings

formed of a lower casing A', with ball-guide grooves *a*, and an upper inclosing cap A^2, substantially as and for the purposes set forth.

3. The combination comprising a railway switch and signal operating rods A, formed of T-section, traveling spherical balls B on each side of the central web of said rod A, and containing-housings A' A^2, substantially as and for the purposes set forth.

479,907. EYEGLASSES. JOHN CURRIN, Southbridge, Mass., assignor to the American Optical Company, same place. Filed Apr. 25, 1892. Serial No. 430,554. (No model.)

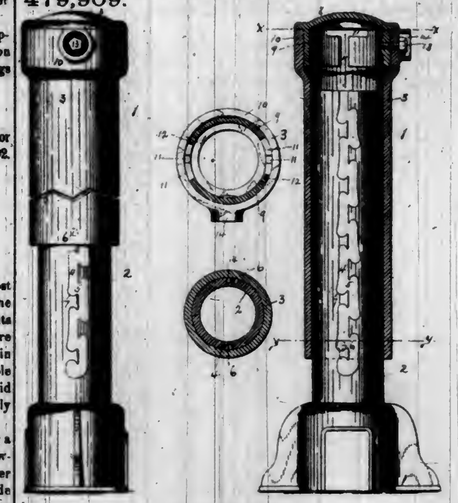
Claim.—1. In an eyeglass-frame, the combination, with the post having a depression in its outer end adapted to receive the end of the bowspring and the end of the nose-piece and having a groove in its inner end adapted to receive the ends of the eye-wire, of the eye-wire made separate from the post and having one end rigidly secured in the groove in the inner end of the post and the other end detachable from the post and provided with a lug adapted to extend into said groove, and means for holding said lug in said groove, substantially as set forth.

2. In an eyeglass-frame, the combination, with the post having a depression in its outer end adapted to receive the end of the bowspring and the end of the nose-piece and having a groove in its inner end adapted to receive the ends of the eye-wire, of the eye-wire made separate from the post and having one end rigidly secured in the groove in the inner end of the post and the other end detachable from the post and provided with a lug adapted to extend into said groove, and means for holding said lug in said groove, consisting of a screw turning in a threaded hole in the side of the post with its inner end adapted to extend into a notch in the lug on the free end of the eye-wire, substantially as set forth.

479,908. BILL-FILE. GEORGE W. HALL, Washington, D. C. Filed Oct. 7, 1890. Renewed Jan. 5, 1892. Serial No. 417,093. (No model.)

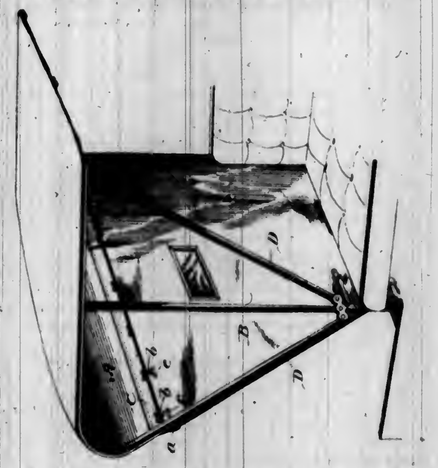
Claim.—1. The combination of the pointed hook having a reflex bend, as at E, a shoulder C, and a screw-threaded portion B, with a slotted spring F, having a bent portion along the slot, which embraces the hook, and having a perforation through which the screw-threaded portion of the hook passes, substantially as described.

2. The combination of the hook A, having a reflex portion E, with the perforated spring F, through which the base of the hook passes and having a reflex curve G, slotted lengthwise and embracing the reflex bend of the hook, substantially as described.



3. The combination, with a base-piece, of a sharpened spindle projecting therefrom, a plate-spring having a perforation through which said spindle passes and having a reflex bend slotted lengthwise and in position to straddle the spindle or needle, all substantially as described.

479,909. SERVICE-BOX FOR WATER OR GAS PIPES. JOSEPH M. HURLEY, Buffalo, N. Y. Filed Feb. 3, 1892. Serial No. 420,685. (No model.)

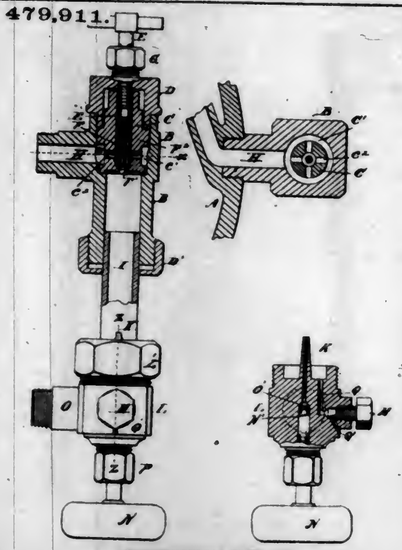


Claim.—1. A service-box consisting of a pipe having grooved ways on its outer surface for the reception of lugs upon a second pipe, which is adjustable over the same, the grooved ways being arranged in two vertical series, the grooves of one series overlapping those of the other series and connected with each other at the overlapping portions, and the lower overlapped portion of each alternate groove forming a rest or socket for the engaging lug, substantially as and for the purpose stated.

2. In a service-box, the combination of the inner pipe 2, having the grooved ways 4, connected to each other and forming the grooves 5, and the outer pipe 3, having the lugs 6 at or near its inner lower end, said lugs being adapted to travel within the grooves 4, and the cap 8, having the sleeve 9, in which are cut the grooved ways 11 for the reception of the lugs 12, the cap 8 being bolted to the pipe 3 by the horizontal bolt 13, substantially as shown and described.

479,909.

479,910. STORM-CURTAIN FOR VEHICLE-TOPS. PETER LUGENBELL, Greensburg, Ind., assignor of one-half to J. S. Lugenbell, Delaware, Ohio. Filed Oct. 27, 1891. Serial No. 409,986. (No model.)



Claim.—1. In a vehicle-top, the combination, with a quarter having its lower portion *a* free and a strip C attached to said portion *a*, of a storm-curtain constructed to be attached to said strip C and have its upper edge overlapped by the said portion *a*, substantially as shown, and for the purpose specified.

2. The combination, with a vehicle-top having the lower portion *a* of its quarter free and a strip C, secured near its upper edge to the portion *a*, of the storm-curtain and complementary fastenings provided on the said strip C and the upper edge of the storm-curtain, substantially as shown, for the purpose set forth.

479,911. LUBRICATOR. FRANK W. MARVIN and GEORGE B. HEBER, Detroit, Mich., assignors to the Michigan Lubricator Company, same place. Filed Nov. 16, 1891. Serial No. 412,028. (No model.)

Claim.—In combination with the sight-feed glass of a lubricator and oil induction and eduction tubes, a slip-joint check-valve capable of both automatic and positive movement placed in the oil-eduction from the sight-glass, and a blow-off conduit and plug in the fitting at the oil-induction end of the sight-glass for cleaning the glass when the oil is shut off, substantially as set forth.

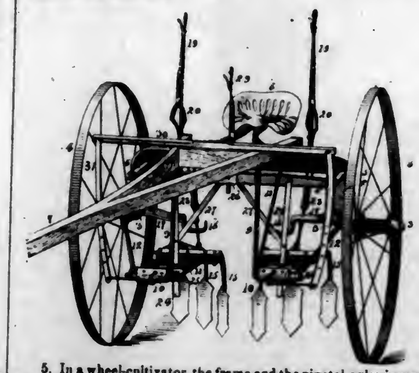
479,911.

479,912. HORSESHOE-PAD. NICHOLAS G. MOONEY, New York, N. Y. Filed Apr. 13, 1892. Serial No. 428,978. (No model.)

Claim.—1. A protecting-pad for horses' hoofs, composed of several layers, cushioning-springs arranged in the socket-holes at the rear ends of the pad and projecting above the pad, and covering or protecting layers extending over the cushioning-springs, substantially as set forth.

2. A protecting-pad for horses' hoofs, composed of a base layer of leather, an intermediate layer of cork, and a top layer of felt, said pad being provided with cushioning-springs set into socket-holes at the rear ends of the pad, said springs projecting above the pad, and with covering or protecting layers extending over the springs, substantially as set forth.

3. A protecting pad for horses' hoofs, composed of a bottom layer of sole-leather, an intermediate layer of cork, and a top layer of absorbent material, cushioning-springs arranged in socket holes at the rear ends of the pad, covering-layers for said cushioning-springs, a retaining-catch attached to the front part of the pad, and elastic plates or calks attached to the under side of the base-layer at the front and rear ends of the pad, substantially as set forth.



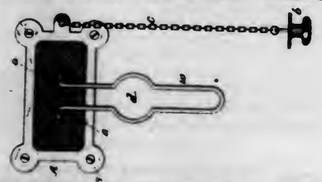
479,913. WHEEL-CULTIVATOR. ALBERT R. MOREY, Akron, Ohio, assignor to The Akron Tool Company, same place. Filed Dec. 14, 1891. Serial No. 414,962. (No model.)

Claim.—1. In a wheel-cultivator, the combination, with pivotal axles and means for rocking them, of cultivator-gangs arranged to be simultaneously rocked by intermediate mechanism connected with said axles, the blades of each gang being arranged to maintain when swung in either direction the same relative position to the axial line of said vehicle, substantially as shown and described.

2. In a wheel-cultivator, the combination, with a cross-beam mounted on pivotal axles and means for rocking said axles, of sets of gangs arranged to be rocked laterally by said axles through intermediate connecting mechanism, the blades of each gang being arranged to maintain the same relative distance from each other with reference to a line at right angles with the axial line of said vehicle, substantially as shown and described.

3. In a wheel-cultivator, the combination, with the cross-beam mounted on pivotal axles and means for rocking said axles, of two sets of gangs arranged to be rocked laterally by mechanism connected with said axles, the separate blades of each gang being arranged to constantly maintain the same relative position to the axial line of the vehicle and the same distance from each other with reference to a line at right angles to said axial line, and means for causing said gangs to approach and recede from each other, substantially as shown and described.

4. In a wheel-cultivator, the combination, with the supporting-frame and the pivotal axles having lever-arms connected by a cross-bar, of two fixed trees rigidly attached to said frame, and two movable trees severally united with the fixed trees by parallel bars, and cultivator-blades attached directly to said movable trees, substantially as shown and described.

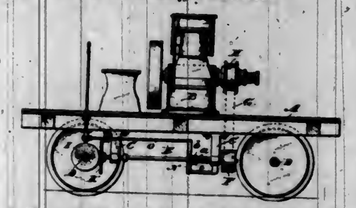


5. In a wheel-cultivator, the frame and the pivotal axles journaled therein, having lever-arms united by a cross-bar, and means for rocking said axles, combined with the fixed and movable trees severally united by parallel draft-bars, and cultivator-blades attached to said movable trees, and intermediate mechanism for causing said movable trees to rock in unison with said axles, substantially as shown and described.

6. The pivotal axles having lever-arms, and the cross-bar uniting said arms, and the fixed and movable trees, and the parallel draft-bars severally uniting said fixed and movable trees, combined with depending rods attached to said cross-bar and passing through links pivotally connected between pairs of said draft-bars, substantially as shown and described.

7. In a cultivator of the class designated, the combination, with the fixed trees, the draft-bars, the movable trees, and the pivoted links interposed between said draft-bars, of the depending rods passing through said draft-bars and the diagonal links connected with said depending bar and united in a yoke arranged to be raised and lowered by a lever, substantially as shown, and for the purpose specified.

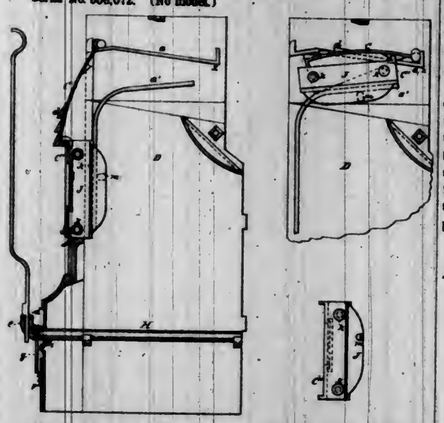
479,914. CLOTH-HOLDER. GEORGE McG. MORRIS, Cincinnati, Ohio. Filed Dec. 26, 1891. Serial No. 416,149. (No model.)



Claim.—In a cloth-holder, the combination of a plate or bracket provided with screw-holes for attachment to a wall, counter, or other permanent support and with lugs projecting from its face, a wire loop having a lower bight with parallel sides opening into an enlargement and having its free ends turned oppositely outward, engaging pivotally in the lugs and retained by the outward spring of the wire, a grooved button adapted to enter the enlargement of the loop and pass downward into the lower bight and engage the parallel sides by means of its groove, and a flexible cord or chain connecting the button with the supporting-bracket, substantially as set forth.

479,915. DRIVING MECHANISM FOR CARS. JACOB V. MOTTER, Brooklyn, N. Y. Filed Mar. 31, 1892. Serial No. 427,193. (No model.)

Claim.—1. The combination, with a propelling-shaft and a friction-wheel feathered so as to slide thereon, of a friction-disk for said wheel, means for shifting said wheel, means for disengaging the contact of said wheel and disk when the former is at or near the center of the latter, and a single lever for operating both of said means, substantially as described.



2. The combination of the axle D, the friction-wheel I, feathered thereon, the lever J with connections for shifting said wheel, a friction-disk for said wheel I, the shaft E, carrying said disk, and a motor for driving the shaft E, substantially as described.

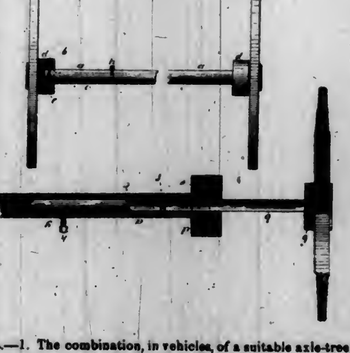
3. The combination of the axle D, having the friction-wheel I feathered thereon, means for shifting said wheel, the shaft E, a friction-disk on said shaft for the friction-wheel, the spring *a* for the shaft E, and a motor for driving said shaft, substantially as described.

4. The combination of the axle D, having the friction-wheel I feathered thereon, the shaft E, carrying the friction-disk, the shifter M for the wheel I, having the cam *m*, the lever N, and link O, connected to the shaft E, and the lever J, connected to the shifter M, whereby when the wheel I approaches the center of the disk K from either direction the cam *m* engages the link O and disengages the disk K from the wheel I, substantially as described.

479,916. OPEN FIRE-GRATE. JOHN H. McILVAIN, Camden, N. J., assignor to Charles F. Bartlett, Philadelphia, Pa. Filed July 8, 1890. Serial No. 358,072. (No model.)

Claim.—1. The segmental covers C C', constructed as herein shown and described, in combination with the jambs D, having the cleats and guides *a a'* formed upon their surfaces, substantially as and for the purpose set forth.

2. The cover C', having the plates J, provided with the lugs *m*, bolted to its ends or side portions for the purpose of preventing said cover from being drawn outward from connection with the cleats *a'* of the jambs D during the upward or downward movements of the said cover, substantially in the manner herein shown and described.



3. The combined mechanism for open fire-grate or fireplace, consisting of the portions C C', plate J, bolted to the portion C', and the jambs D, having the cleats *a a'* cast upon their surfaces and adapted for the right and left hand sides of the fireplace, substantially as herein shown and described.

479,917. ADDRESSING ATTACHMENT FOR PRINTING-PRESSES. IRA W. NEWMAN, Toledo, Ohio. Filed Aug. 3, 1891. Serial No. 401,462. (No model.)

Claim.—1. A chase or type-frame for printing-presses provided with a rotary shaft or bar journaled therein, substantially as shown and described, for the purpose specified.

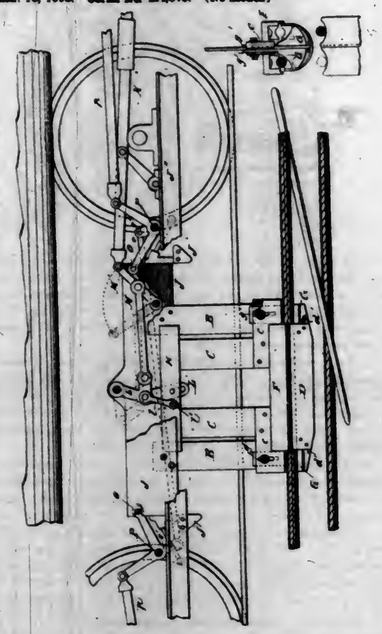
2. A chase or type-frame for printing-presses, having a rotary shaft or bar journaled therein, in combination with means for rotating said shaft or bar in harmony with the movement of the platen and ink-rollers of the press, substantially as shown and described, for the purpose specified.

3. A chase or type-frame for printing-presses, having a mortise with a shaft or bar journaled therein, in combination with a pawl and ratchet on said shaft, substantially as shown and described, for the purpose specified.

4. A chase or type-frame for printing-presses, having a mortise with a shaft or bar journaled therein, in combination with a pawl and ratchet on said shaft and an arm engaging the ink-rolls of the press and adapted to actuate said pawl and ratchet intermittently between the successive impressions of the press, substantially as shown and described, for the purpose specified.

5. In an addressing attachment for printing-presses, a chase having a shaft therein, provided with means for rotating said shaft, journaled between the successive impressions of the press, and a flexible type-band having upon its face the characters from which impressions are to be taken and adapted to travel upon said shaft, substantially as shown and described, for the purpose specified.

6. An addressing attachment for printing-presses, comprising in its construction a chase having a shaft journaled therein, provided with means for rotating said shaft between the successive impressions of the press, and a series of plates having upon their faces the characters from which impressions are to be taken, suitably attached to one or more flexible ribbons or bands, forming a flexible type-band, said type-band traveling upon said shaft and having suitable reels adapted to pay out and to take up said flexible type-band as it is fed to the press, substantially as shown and described, for the purpose specified.



479,918. WAGON-AXLE. NEIL OLSEN, Portland, Oreg. Filed Feb. 20, 1892. Serial No. 422,326. (No model.)

Claim.—1. The combination, in vehicles, of a suitable axle-tree or axle-trees provided with tubular recesses or sockets in which to receive the axle-sections of the respective wheels, said tubular sockets being provided with fixed butting-collars *c* and caps *d*, adapted to be secured on the hubs of the wheels, and wheels having fixed axle-sections *b* for revolving in said tubular sockets, the hubs *b'* of which wheels are adapted to abut against said collars *c* and to be held in place by said caps *d*, substantially as set forth.

2. The combination, in vehicles, of a suitable axle-tree or axle-trees provided with tubular recesses or sockets in which to receive the axle-sections of the respective wheels, said tubular sockets being pro-

vided with fixed butting-collars *e* and set-screws *h* and caps *d*, adapted to the purposes specified, and wheels having fixed axle sections *b* for revolving in said tubular sockets, the hubs *b'* of which wheels are adapted to abut against said collars *e* and to be held in place by said caps and said axle-sections being also provided with annular grooves *f*, in which to receive the set-screws *h* as additional means for holding the wheels in place, all substantially as described.

479,919. CABLE RAILWAY. JOHN H. PENDLETON, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed Mar. 10, 1892. Serial No. 424,375. (No model.)

Claim.—1. In combination, in a gripper apparatus for cable railways, jaws and jaw-supports for the cable or cables, mechanism for raising and lowering the said jaws, mechanism for opening and closing the said jaws relatively to each other, deflecting-shoes operated by the relative movement of the jaws to throw out the cable or cables from the said jaws, an actuating hand-lever for the said mechanism for opening and closing the said jaws, a connecting-rod therefor secured to the said lever by a sliding connection, and a controlling-link for the said sliding connection, substantially as and for the purposes set forth.

2. In combination, in a gripper apparatus for cable railways, jaws and jaw-supports for the cable or cables, mechanism for raising and lowering the said jaws, mechanism for gripping the said jaws upon the cable or cables, and a supplemental link pivotally secured to the last said mechanism and operated thereby to open the said jaws, and deflecting-shoes operated by the relative movement of the said jaws to throw the cables therefrom, substantially as and for the purposes set forth.

3. In combination, in a gripper apparatus for cable railways, jaws and jaw-supports for the cable or cables, mechanism for gripping the said jaws upon the cable or cables, a supplemental link pivotally secured to and operating with the said mechanism to open the said jaws, and deflecting-shoes operated by the relative movement of the said jaws to throw out the cable or cables therefrom, substantially as and for the purposes set forth.

4. In combination, in a double gripper for cable railways, jaws and jaw-supports for the cables, mechanism for gripping the said jaws, a supplemental link pivotally secured to and operating with the said mechanism to open the said jaws, and means operated by the relative motion of the jaws to throw out the cable or cables therefrom, substantially as and for the purposes set forth.

5. In combination, in a gripper for cable railways, jaws for gripping the cable or cables and one or more shoes for throwing out the cable or cables, operated by the movement of the said jaws, into or out of operative position to the jaws on one side alone or on both sides, substantially as and for the purposes set forth.

6. In combination with a gripper for cable railways, one or more vertically-adjustable deflecting-shoes for throwing the cable or cables from the said gripper and means for raising and lowering the said shoes into or out of operative relation to the said gripper upon one side alone or upon both sides, substantially as and for the purposes set forth.

7. In combination with a double gripper for cable railways, one or more deflecting-shoes G upon each side of the said gripper and means for bringing the said shoes at will either upon one or upon both sides of the said gripper into operative relation thereto, substantially as and for the purposes set forth.

8. In combination with a double gripper provided with two pairs of co-operating jaws, one or more deflecting-shoes G for each of said pairs of jaws, adjustable into and out of operative relation to one or to both the said pairs of jaws, and a lip *f* for preventing the entrance of the cable into one pair of jaws while the other pair are in position to receive the cable, substantially as and for the purposes set forth.

9. In combination with a double gripper provided with two pairs of co-operating jaws, one or more deflecting-shoes G for each of said pairs of jaws, vertically adjustable by the opening and closing of the said jaws into and out of operative relation to one or to both the said pairs of jaws, and a lip *f* for preventing the entrance of the cable into one pair of jaws while the other pair are in position to receive the cable, substantially as and for the purposes set forth.

10. In combination, in a double gripper for cable-railways, a pair of co-operating jaws upon each side of the said gripper, one or more deflecting-shoes G, secured to the upper jaw of each pair by a slot and pin, stops for the said shoes upon the lower jaws, the said slots and pins being so arranged that the shoe or shoes of one pair of jaws come into action by the opening of the jaws before those of the other pair, and a lip upon the latter pair preventing the entrance of the cable thereinto while the other jaws are in position to receive the cable, substantially as and for the purposes set forth.

11. In combination with the co operating jaws of a cable grip, a cable-deflecting shoe carried by one jaw thereof and sliding thereon and stops for each of the said jaws to limit its travel thereon, substantially as and for the purposes set forth.

12. In combination with the mechanism for closing a cable-gripper, a link-motion arranged to independently open the same, substantially as and for the purposes set forth.

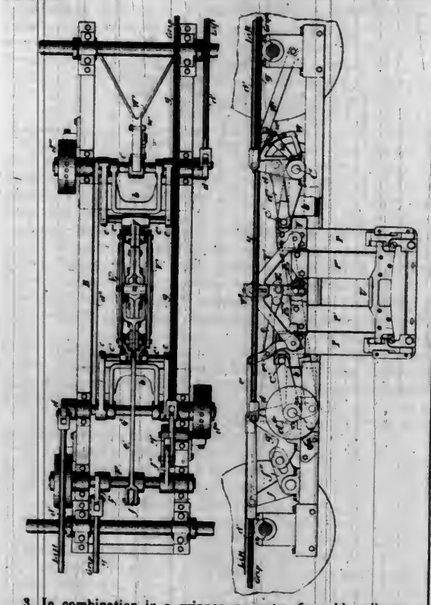
13. In combination with the toggles or other mechanism for closing the jaws of a cable-gripper, one or more links *l* for opening the said jaws, substantially as and for the purposes set forth.

14. In combination, in a cable-gripper, toggles for closing the gripper and a link *l* for opening the said gripper, secured to and operating by the said toggles, the said toggles and the said link being arranged to permit the independent action of the toggles in closing and the link in opening the said gripper, substantially as and for the purposes set forth.

15. In combination, in a cable-gripper, toggles for closing the gripper and a link *l*, pivotally secured at one end to the said toggles and at its other end connected by a pin and slot with the movable jaw of the said gripper, whereby the said toggles may be utilized in closing and the said link in opening the said gripper, substantially as and for the purposes set forth.

16. A mechanism for exerting varying power upon the operating parts of a cable-gripper, consisting of a hand-lever R, a connecting-rod N, secured to the said lever by a sliding pivotal connection, and a controlling device *v* for altering the position of the said sliding connection as the said lever is moved, substantially as and for the purposes set forth.

17. In combination with the other parts of a cable-gripper, a connecting-rod for operating the same, a hand-lever, a frame to which the said lever is fulcrumed, a sliding pivotal connection between the said rod and the said lever, and a link *v*, fulcrumed in the said frame and pivotally secured to the said sliding connection, substantially as and for the purposes set forth.



18. In combination with the mechanism for gripping and for dropping the cable of a cable railway, a pawl and rack for securing the mechanism in position, mechanism for raising and lowering the said gripper, and a slide-plate or segment for detaching the said pawl from the said rack, actuated by the movement of the said raising and lowering mechanism, substantially as and for the purposes set forth.

19. In combination with the mechanism for gripping and for dropping the cable of a cable railway, a pawl and rack for securing the mechanism in position and a slide-plate or segment for detaching the said pawl from the said rack, actuated by the rise and fall of the gripper, substantially as and for the purposes set forth.

479,920. CABLE RAILWAY. JOHN H. PENDLETON, Brooklyn, assignor to the Rapid Transit Cable Company, New York, N. Y. Filed June 18, 1892. Serial No. 436,482. (No model.)

Claim.—1. In combination, in a gripper apparatus for cable railways, a frame therefor, a pair of cranks mounted upon the said frame and provided with supporting-shafts *c*, parallel with their axes, a gripper provided with channels for the said shafts, connections between the said cranks for causing them to turn equally and together, and one or more torsion-springs inclosed in suitable casings upon the axes of the said cranks, substantially as and for the purposes set forth.

2. In combination, in a gripper apparatus for cable railways, a frame therefor, a pair of cranks *c*, mounted upon the said frame and provided with supporting-shafts *c'*, parallel to their axes, a gripper provided with channels for the said shafts, connections between the said cranks for causing them to turn equally and together, and one or more levers *D'* and connecting-rods *d* for operating the said cranks to raise and lower the gripper, substantially as and for the purposes set forth.

3. In combination, in a gripper apparatus for cable railways, a frame therefor, a pair of cranks *c*, mounted upon the said frame, a gripper independently suspended from each of the said cranks, and one or more connections between the said cranks for causing them to turn equally and together, substantially as and for the purposes set forth.

4. In combination, in a gripper apparatus for cable railways, a frame therefor, a pair of cranks *c*, independently mounted upon the said frame, a gripper suspended from the said cranks, and one or more springs upon the axes of the said cranks, substantially as and for the purposes set forth.

5. In combination, in a gripper apparatus for cable railways, a frame therefor, a pair of cranks *c*, mounted upon the said frame and provided with supporting-shafts *c'*, parallel to their axes, a gripper provided with channels for the said shafts, connections between the said cranks for causing them to turn equally and together, one or more operating-rods for the said cranks, a cam W, turning with the said cranks, a catch W' for engaging the said cam when the gripper is in its normal position, and a detaching device for the said catch arranged to be adjusted by the rise of the gripper above normal to interfere with the said catch, substantially as and for the purposes set forth.

6. In combination with a raising and lowering mechanism for a cable-gripper, a shaft C, moving therewith and provided with a cam W, a hook or catch W', pivoted to the frame of the mechanism and arranged to engage the said cam when the gripper is in its normal position, a detaching-block *w*, pivoted to the said cam, stops to restrict its motion upon the said cam, and a stud or lug *w'* upon the said catch, substantially as and for the purposes set forth.

7. In combination with a raising and lowering mechanism for a cable-gripper, a catch for engaging the moving parts of the said mechanism and retaining the gripper in its raised position, a detaching-block therefor carried upon the said moving parts, and stops for the said detaching-block, between which it may be free to travel, the said block being so formed that when the gripper has been raised above a certain position the said detaching-block on the lowering of the gripper may interfere with said catch and prevent it from engaging the said moving parts, substantially as and for the purposes set forth.

8. In combination with a pair of upper and lower jaws of a cable-gripper and a shank P for the lower jaw, a cable-deflecting shoe O, constructed to slide upon the said shank and provided with guideways *o o'* of limited length, a guide upon the said shank for one of the said guideways, and a guide moving with the upper jaw and traveling in another of the said guideways, whereby the said shoes may be allowed a limited travel relatively to each of the said jaws, substantially as and for the purposes set forth.

9. A cable-deflecting shoe O for the purposes set forth, provided with guideways *o o'*, terminating in stops for limiting travel within such guideways, substantially as set forth.

10. A cable-deflecting shoe O for the purposes set forth, consisting of a sliding plate provided with guideways *o o'*, and a toe-piece detachably secured to the said sliding plate.

11. In combination with a pair of upper and lower jaws of a cable-gripper apparatus and a shank P for the lower jaw, a cable-deflecting shoe O, constructed to slide upon the said shank and provided with guideways *o o'* of limited length, a guide upon the said shank for one of the said guideways, and a guide moving with the upper jaw and traveling in another of the said guideways, whereby the said shoe may be allowed a limited travel relatively to each of the said jaws, one or more lugs or ears U upon the upper jaw of the said gripper, and one or more rails U', arranged to pass under the said lugs or ears, and thereby automatically raise the said upper jaw, substantially as and for the purposes set forth.

12. In combination with the stationary jaw or jaws and jaw-shanks of a cable apparatus and for the purposes set forth, a pair of head-blocks V, secured to the said shanks and provided with supporting-channels, and a pair of side frames V', secured to the said heads, substantially as set forth.

13. In combination, in a cable-gripper apparatus, an equalizer for the gripping mechanism thereof, consisting of a pair of levers *h*, a pair of operating-rods *g*, extending from the centers of the said levers to the platforms of the car, a frame H, to which is pivotally secured one end of each said levers, and connecting-rods *e' h'*, connecting the remaining ends of the said levers, respectively, with the gripper and gripper mechanism, sockets G for a hand-lever and to which the said operating-rods *g* are connected, and one or more catch-hooks K for locking the said sockets in position, substantially as and for the purposes set forth.

14. In combination, for the purposes described, a hand-lever socket G, a frame J, to which the said socket is fulcrumed, a catch-hook K, pivoted to the said socket and arranged to engage with the said frame, and an operating-rod *g*, pivotally secured to the said socket, substantially as set forth.

15. In combination, for the purposes described, a lever-socket G, a frame J, to which the said socket is fulcrumed, a catch-hook K, pivoted to the said socket and arranged to engage with the said frame, and a lever fitting the said socket, provided with a shoulder constructed to disengage the said catch-hook from the said frame when the said lever is placed in the said socket, substantially as set forth.

16. In combination with the operating-rods *d'* for the raising and lowering mechanism and the operating-rod *g* of the gripping mechanism, of a cable-gripper apparatus, a hand-lever socket G, to which is pivoted the said rod *g*, a frame J, to which the said socket is fulcrumed, a catch-hook for locking the said socket in position, and a hand-lever socket D, to which is pivoted the said rod *d'*, arranged to interfere with the said catch-hook in certain positions, and thereby disconnect it, substantially as for the purposes set forth.

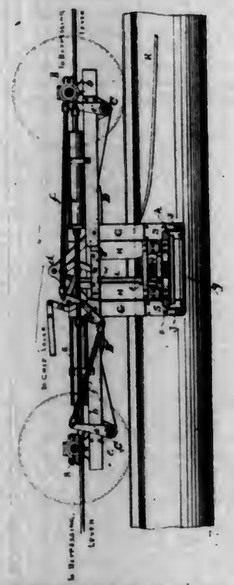
17. In combination with the operating-rods *d'* for the raising and lowering mechanism and the operating-rods *g* of the gripping mechanism, of a cable-gripper apparatus, a lever-socket G, to which is pivoted the said rod *g*, a catch-hook K, pivoted to the said socket, and a second hand-lever socket D, to which the said rod *d'* is pivoted, provided with one or more inclined faces formed to run under and disconnect the said catch-hook, substantially as and for the purposes set forth.

18. In a compound lever for the purposes described, consisting of link M, provided with a rack, a hand-lever L, pivoted to the said link at the center of curvature of the said rack, a pawl pivoted upon the said hand-lever and provided with a detent formed to fit in a notch upon the said link, and a fulcrum-hook N, pivoted to the said hand-lever and engaging with the said pawl when the said detent is in the said notch, whereby the said fulcrum-hook may be disconnected and the said lever and said link operated as a simple lever, substantially as set forth.

19. A compound lever for the purposes described, consisting of a link M, a hand-lever L, pivoted to the said link M, a detent pivoted on the said lever and arranged to lock the link and said lever, a fulcrum-hook N, pivoted to the said lever, and means for controlling the said detent and the said fulcrum-hook, substantially as set forth.

20. A compound lever for the purposes described, consisting of a hand-lever L and a link or lower lever M and means for independently fulcruming the said hand-lever, substantially as set forth.

21. In combination with a pair of crossing cables, a cable-trench for the lower of said cables, provided with a deepened portion extending a sufficient distance from the crossing to permit the descent of the gripper thereinto to follow the dip of the cable as it approaches the crossing, substantially as set forth.



22. In combination with a pair of crossing cables, a cable-trench for the lower of said cables, provided with a deepened portion to permit the descent of the gripper thereinto, and one or more depressing rails secured within the said trench, substantially as set forth.

23. In combination with a pair of crossing cables, a gripper for the lower of said cables, one or more lugs or ears U on the said gripper, and a rail adjacent to the crossing cables, constructed to co-operate with the said lugs or ears to depress the said gripper as it approaches the crossing and then to elevate the said gripper to clear the upper of the said cables, substantially as and for the purposes set forth.

24. The method of crossing the gripper-car of a cable railway over the overlying cables of a crossing cable railway, which consists of in first depressing the gripper to follow the descent of the cable under the crossing, releasing the cable therefrom, and then raising the gripper to pass clear of the said overlying cable, substantially as and for the purposes set forth.

25. The method of crossing the gripper-car of a cable railway over the overlying cable of a crossing cable railway, which consists in automatically depressing the gripper and releasing the cable as the gripper approaches the crossing and then automatically elevating the said gripper to pass clear of the overlying cable, substantially as and for the purposes set forth.

479,921. CABLE RAILWAY. JOHN H. PENDLETON, Brooklyn, and ANDREW BRYSON, New York, assignors to the Rapid Transit Cable Company, New York, N. Y. Filed May 28, 1892. Serial No. 434,754. (No model.)

Claim.—1. In combination, in a gripper for cable railways, a lower jaw, one or more supporting plates or shanks therefor, an upper jaw movable relatively to the said lower jaw, one or more supporting plates or shanks therefor, one or more sliding shoes for the said lower jaw arranged to be raised in position to shield the said lower jaws from the cable, a carrier movable upon the said upper jaw and arranged to raise the said deflecting-shoes with the said upper jaw and with or without lost motion between the said jaw and the said shoes, according to the position of the said carrier, and means for controlling the position of the said carrier, substantially as and for the purposes set forth.

2. In combination with the double jaws and jaw-supports of a double gripper, one or more deflecting-shoes for each of the said lower jaws for shielding them from the cables, pins and slots or other stops to limit the downward travel of the said shoes relatively to the said lower jaws, a carrier moving with and adjustable relatively to the said upper jaws and constructed to raise the said deflecting-shoes on one side simultaneously with the said upper jaws, but upon the other side to permit lost motion between the said shoes and the said jaws, the said carrier being adjustable to transfer the said lost motion from one side of the gripper to the other, and means for adjusting the said carrier, substantially as and for the purposes set forth.

3. In combination, in a gripper apparatus for cable railways, jaws and jaw-supports, deflecting-shoes relatively movable to both upper and lower jaws, but attached to the upper jaw by a lost-motion connection, and means for permitting or preventing such lost motion, substantially as and for the purposes set forth.

4. In combination, in a gripper for cable railways, a lower jaw, an upper jaw movable relatively to the said lower jaw, stops to limit the travel of the said shoes relatively to the said lower jaw, a carrier moving with the said upper jaw and constructed to raise the said shoes with the said upper jaw, but adjustable thereon to permit or prevent lost motion between the said shoes and the said upper jaw, and means for adjusting the said carrier, consisting of a plate L, provided with a slot inclined to its line of motion, a pin upon the said carrier traveling in the said inclined slot, a crank for actuating the said plate pivotally secured to and moving with the said upper jaw, and means for turning the said crank, substantially as and for the purposes set forth.

5. In combination, in a mechanism for raising and lowering a gripper for cable railways, one or more bell-crank levers, from which the said gripper is suspended, one or more rods *e*, sliding in suitable guides and connected to one or more of the arms of the said bell-crank levers, springs E for the said rods, counterbalancing the weight of the said gripper, and a connection between the bell-crank levers for causing them to turn equally, substantially as and for the purposes set forth.

6. In combination, in a gripper apparatus for cable railways, a gripper-head provided with horizontal channels for receiving supporting-shafts, a frame for the said gripper apparatus, a pair of shafts C, mounted upon the said frame, one or more lever-arms *c* upon each of the said shafts terminating in a horizontal rod or shaft *c'*, fitting within one of the said horizontal channels in the gripper-head, one or more lever-arms *c'* upon the said shaft C, one or more sliding rods connected with the said lever-arms *c'*, and springs for the said sliding rods, substantially as and for the purposes set forth.

7. In combination with a spring-supported gripper for cable railways, one or more laterally-projecting depressing lugs or ears Q for the said gripper, pivotally secured thereto, depressing-rails arranged at suitable positions for engaging with the said lugs, and a sliding carrier K, provided with inclined faces for altering the position of the said lugs to cause them to project from either side of the said gripper, substantially as and for the purposes set forth.

8. In combination with a gripper for cable railways, a sliding carrier K, one or more depressing lugs or ears Q, having a pivoted support extending through an opening in the said carrier, the said opening being so formed that its adjustment will cause the said support to turn and to alter the position of the said lugs, substantially as and for the purposes set forth.

9. In combination, in a gripper for cable railways, a lower jaw, one or more supporting plates or shanks therefor extending through the slot, an upper jaw movable relatively to the said lower jaw, one or more supporting-plates therefor, one or more sliding deflecting-shoes for the said lower jaw, arranged to be raised in position to shield the said lower jaw from the cable, a sliding carrier arranged to raise the said deflecting-shoes with the said upper jaw and with or without lost motion between the said jaw and the said shoes, according to the position of the said carrier, means for controlling the said carrier, and one or more depressing lugs or ears Q, adjustable by the movement of the said carrier, substantially as and for the purposes set forth.

10. In combination with the frame, jaws, and jaw-supports of a gripper apparatus, a crank mounted upon the supports of the movable jaw, a hand-rod for turning the said crank, mounted upon the said frame and adapted to engage with the said crank when the gripper is in its normal position, a spring for withdrawing the said rod from the said crank, and a vertically-sliding plate for operating certain attachments of the said gripper, provided with a horizontal slot for the crank-pin of the said crank, substantially as and for the purposes set forth.

11. In combination with the supporting-frame and the jaws and jaw-shanks of a gripper apparatus, and all arranged substantially as and for the purposes described, a crank mounted upon the shanks of the movable jaw or jaws, a rod for turning the said crank, mounted upon the said supporting-frame, and a vertically-reciprocating plate L, actuated by the said crank.

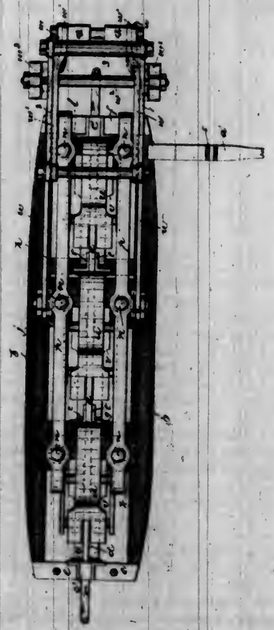
479,922. INVERTED BURNER FOR GAS-LAMPS. DAVID W. SUGG, London, England. Filed Feb. 21, 1887. Serial No. 228,285. (No model.) Patented in France Mar. 26, 1886, No. 167,948; in Italy June 1, 1886, No. 20,030, and in England Dec. 15, 1886, No. 16,467.

Claim.—An inverted burner having a head of externally-convex form and having in said head a chamber *a* of concave form of larger

479,922.

diameter than its inlet, said head being provided with holes *b*, opening through the side walls of said chamber in a downward direction and tangentially to an imaginary circle concentric to the axis of the burner, substantially as and for the purpose herein set forth.

479,928. WATCH-MOVEMENT. ERNST H. THIEL, Ruhla, Germany. Filed Mar. 23, 1892. Serial No. 426,062. (No model.)



Claim.—1. The combination, with the front and back plates of a watch-movement, said plates being connected by bent-up flanges retained by locking-keys, of a bridge attached to one flange of the back plate for supporting the inner end of the winding-stem, substantially as set forth.

2. In a watch-movement, the combination of a back plate having bent-up flanges at diametrically-opposite points, said flanges having recessed lugs at their free ends, with a top plate having openings through which the lugs can pass, and wedge-shaped key-plates inserted in the recessed lugs of the flanges and resting on the top plate for the purpose of locking said plates together, substantially as set forth.

3. In a watch, the combination, with a top plate having openings at diametrically-opposite points, of a dial-plate provided with depressions and bushings, the latter fitting into the openings of the top plate, substantially as set forth.

4. In a watch, the combination, with the winding-stem and its pinion, of a winding-wheel located between the back plate of the movement and a cap-plate secured to the same, said winding-wheel carrying the mainspring, the outer end of which is connected to the winding-wheel, while the inner end is secured to a disk of the first wheel-arbor, substantially as set forth.

479,924. PROPELLING MECHANISM FOR ROW-BOATS. GUSTAV VOGEL, Orange Valley, N. J. Filed Mar. 11, 1892. Serial No. 424,511. (No model.)

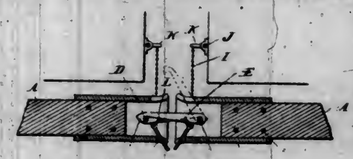
Claim.—1. A propelling mechanism for a row-boat, consisting of a frame adapted to be secured in said boat, a carriage mounted upon said frame and having a forward and backward movement thereon, a series of posts mounted upon said carriage, each post being provided with a slot to receive the inner ends of the oars, guides arranged to engage with said ends of the oars and impart thereto the requisite upward and downward motions, and means for imparting to said carriage a forward-and-backward movement, as described, and for the purposes set forth.

2. The combination, with the frame, of the bar *d*, carried thereby, the guides *s*, carried by said bar, the carriage mounted upon said frame and provided with means to receive the inner ends of the oars, and means for shifting said oars from one side to the other of said guides and for imparting to said carriage a forward-and-backward movement, as described, and for the purposes set forth.

3. In a propelling mechanism for row-boats, the combination of a bar *d*, guides *s*, arranged in pairs and carried thereby, two springs *w* and *v* for each pair, said springs being located between the guides and one of them being above and the other one below the bar, and mechanism for holding the oars with their inner ends between the springs and for moving them back and forth, whereby the inner ends may be made to engage with one side of guides when they are moved in one direction and with the other side when they are moved in the opposite direction, substantially as set forth.

4. In a propelling mechanism for operating row-boats, the combination of a reciprocatory carriage, slotted posts rotatably secured thereto and movable therewith and adapted to receive the inner ends of the oars, and mechanism between the posts for engaging with the ends of the oars and moving them vertically at the limits of the reciprocations of the frame, substantially as set forth.

5. In a propelling mechanism for operating row-boats, the combination, with a frame, of an upright secured to each end thereof, a bar secured to the uprights and extending longitudinally of the frame, guides and supports secured to the bar, a spring secured to each of the end supports for the bar, and two springs secured to each of the supports upon the bar, said springs being arranged in pairs, the free ends of the springs below the bar normally pressing upwardly and the ends of the springs above the bar normally pressing downwardly, and reciprocating oar-operating mechanism within the frame adapted to engage the inner ends of the oars and cause each of them to engage with one side of its respective guide when the carriage is moved in one direction and with the opposite side of the guide when moved in the opposite direction, substantially as set forth.

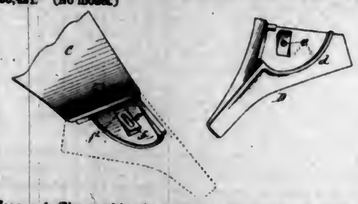


6. In a propelling mechanism for operating row-boats, the combination, with a frame having a longitudinal guide-supporting bar arranged longitudinally thereof, of a reciprocatory carriage upon the frame, comprising a longitudinal bar, a cross-bar, and cross-heads, said cross-bar and cross-heads being provided with grooves or recesses at their ends and centers which fit upon the frame, posts secured to the carriage and provided with means for engaging with the inner ends of the oars, and means for moving the carriage and causing said ends of the oars to engage with the guides upon the bar of the frame, substantially as set forth.

7. In a propelling mechanism for operating row-boats, the combination, with a frame provided with means for moving the inner ends of the oars vertically and a reciprocatory carriage mounted upon said frame for moving the oars forward and back, of a spiral spring secured to the carriage at one end and to the frame at the other, a lever at one end of the frame, and connecting-rods secured to the lever and to the carriage, substantially as set forth.

479,925. DOUBLE SALTS OF FLUORIDE OF ANTIMONY AND SULPHATE OF AMMONIA. CARL WACHENDORFF, Oestrich, Germany, assignor to Rudolph Koepp & Co., same place. Filed Nov. 23, 1891. Serial No. 412,839. (Specimens.) Patented in Germany Apr. 6, 1890, No. 57,615.

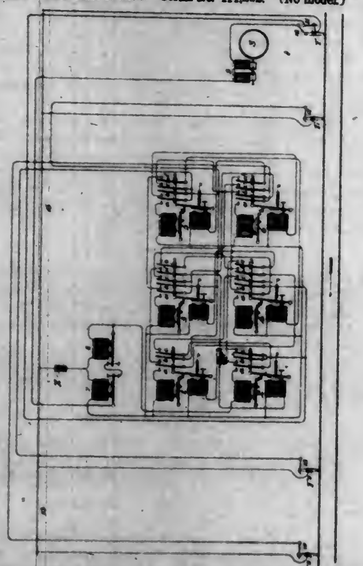
Claim.—As an article of manufacture, the double compound of fluoride of antimony and sulphate of ammonia having the formula $(SbFl_3)_2.H(NH_4)_2SO_4$, substantially as set forth.



479,926. CAR-COUPLING. JAMES E. WALKER, Detroit, Mich., assignor of two-thirds to Lafayette Griffith and Charles F. Hunt, same place. Filed Mar. 18, 1892. Serial No. 425,488. (No model.)

Claim.—1. In a car coupler, the combination of the draw-bar, a box-shaped draw-head thereon, a transverse shaft journaled therein, a hook secured at one side of said shaft, the portion G of said shaft forming a hook-bar, and the laterally-extending lugs L, and means for disengaging said hooks, substantially as described.

2. In a car-coupler, the combination of the draw-bar, a box-shaped draw-head thereon, a transverse shaft D, journaled in the head and carrying the forwardly-extending hook, the draw-head provided with a notch N, into which the hook may be turned, and the link M, pivoted below the hook, and the notches O in the draw-head, in which said link is adapted to engage, substantially as described.



479,927. PLOW. FREDERICK WIARD, Batavia, N. Y., assignor of one-half to John W. Pratt, same place. Filed May 18, 1892. Serial No. 433,421. (No model.)

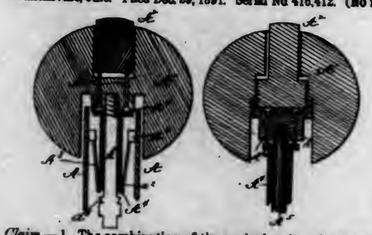
Claim.—1. The combination, with the plow-standard having an incline and an elongated opening arranged lengthwise of said incline, of a plow-point provided on its under side with an incline bearing against the incline of the standard, and a fastening-bolt passing through the point and the elongated opening of the standard, whereby the plow-point is drawn rearwardly upon tightening the bolt, substantially as set forth.

2. The combination, with the plow-standard having an inclined lug and an elongated opening arranged lengthwise in said lug, of a plow-point provided on its under side with an inclined lug bearing against the corresponding lug of the standard and having a bolt-hole extending through said lug and a fastening-bolt passing through said bolt-hole and the elongated opening of the standard, said inclined lugs being capable of lengthwise movement upon each other, substantially as set forth.

479,928. ELECTRIC SIGNALING APPARATUS. ADONIRAM J. WILSON, Port Chester, N. Y., assignor to the Hall Signal Company, of Maine. Filed Nov. 9, 1891. Serial No. 411,292. (No model.)

Claim.—1. In a permissive block-signal system, a signaling-circuit operating or controlling the operation of a signal guarding a given section of track, in combination with a series of branch circuits and a corresponding series of multiple-circuit instruments controlling said branch circuits, all arranged to be operated in succession in one direction by trains successively entering the guarded section of track, one set by the first train, a second set by the second train, a third set by the third train, and so on, and all arranged to be operated in reverse succession and direction by said trains on their subsequently successively leaving the guarded section of track, the last to be restored by the first train to leave, the next to the last to be restored by the next train to leave, and so forth, whereby a train entering the guarded section of track throws the signal to "danger" but does not clear said signal on leaving the guarded section if another train or trains have meantime entered the guarded section behind it and does clear said signal if such be not the case, substantially as and for the purposes set forth.

2. In a permissive block-signal system applied to overlapping blocks, a signaling-circuit operating or controlling the operation of a signal guarding a given section of track, consisting of one block and an overlap on the next succeeding block, in combination with a series of double sets of branch circuits and a series of double sets of multiple-circuit instruments controlling said branch circuits, all arranged to be operated in succession in one direction by trains entering the overlap and leaving the overlap in succession, and to be operated in reverse succession and direction by said trains on their subsequently and one after another entering the overlap of the next succeeding block and on their leaving the same, substantially as and for the purposes set forth.



479,929. UMBRELLA-STICK. GEORGE C. WOLFE, Chippewa Falls, Wis., assignor of two-thirds to William H. Stafford, same place, and Thomas F. Frawley, Eau Claire, Wis. Filed Apr. 7, 1891. Serial No. 388,034. (No model.)

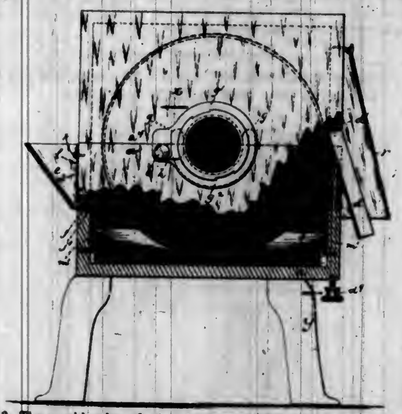
Claim.—1. The combination, in an umbrella, of an extensible stick or handle and the runner and the pin and the locking-ring to secure the parts of the handle in a projected position and fasten the runner on the stick, substantially as described.

2. In an umbrella, the combination, with the handle and the pin M, projected from the handle, of the runner having slot *m* and having the annular ribs I and having the pin *k* between the said ribs and to one side of the said slot *m*, and the locking-ring held on the runner between the ribs I and having a portion cut away at K to receive the pin *k* and having channel *l* on its inner side for the pin M to pass through, substantially as and for the purpose described.

479,930. WATCH-CASE PENDANT. EVERTON J. ARRICK, MacConnellsville, Ohio. Filed Dec. 29, 1891. Serial No. 416,412. (No model.)

Claim.—1. The combination of the conical spring, the crown having a stem provided with a cone, a spreader on said stem, and a push-button in the crown for operating said spreader.

2. The combination of a conical spring, the crown having a stem provided with a cone, a spreader on said stem, a push-button in the crown, and screws connecting the spreader and push-button.



3. The combination of the crown having annular recesses, a push-button having a shoulder and located in the upper recesses, a plug for holding said push-button in place, a stem having a cone and secured to said plug, a conical spring, and a spreader operated by said push-button.

4. The combination of the crown having annular recesses, a push-button having a shoulder and located in the upper recesses, a plug for holding said push-button in place, a stem having a cone and secured to said plug, a conical spring, a spreader operated by said push-button, and screws connecting said spreader and push-button.

479,931. ICE-CREAM FREEZER. HENRY W. ATWATER, East Orange, N. J. Filed June 6, 1891. Serial No. 395,417. (No model.)

Claim.—1. The process herein described of manufacturing ice-cream, water-ices, and the like, which consists in freezing a coating upon the ice-cream or water-ice freezing devices prior to freezing said ice-cream or water-ice thereon, the said preliminary coating being of a harder texture than said ice-cream or water-ice, and then freezing said cream, water-ice, or similar product upon said preliminary coating, substantially as set forth.

2. The process herein described, which consists in freezing a layer of ice of one degree of hardness upon a suitable surface and then freezing upon the frozen ice a mixture which when congealed is softer than said ice and removable from said ice without materially affecting the same.

3. The combination of a freezing-cylinder *b*, adapted to contain a freezing mixture, a scraper, and a rod d^3, interposed between the scraper and freezing-surface and movable away from said freezing-surface with said scraper to force the scraper edge from contact with the cylinder, the opposite ends of said rod being free to be grasped by the hand to give the desired movement, substantially as set forth.

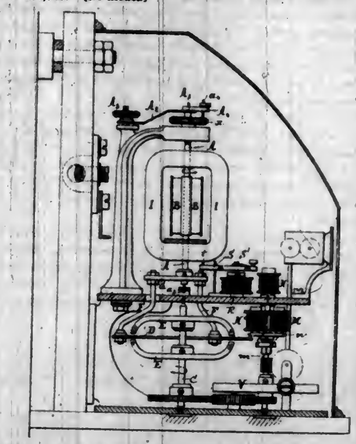
4. The combination, with the case *a* and freezing-cylinder, of a chute *d*, held into engagement with said cylinder by spring-power, and a rod d^3, having bearings at the opposite sides of said case and extending between the chute and cylinder into engagement with said chute and adapted to be grasped by the hands and moved against the power of the springs in said bearings to force the chute from scraping-contact with the cylinder, substantially as set forth.

5. In combination with the case, freezing-cylinder, and scraper, a rod d^3, having bearings in said case and engaging said scraper to move the latter from scraping-contact with the cylinder, said rod being longitudinally removable from its bearings, substantially as and for the purposes set forth.

6. In combination with a suitable case or inclosure having on opposite sides thereof slots admitting of a lateral movement of a rod therein and providing bearings to hold said rod, so that the same will hold the scraper away from contact with the freezing-cylinder, said cylinder, scraper, and rod, the last being arranged in said slots and both laterally and longitudinally movable therein, substantially as set forth.

7. In combination with the case *a*, having angular slots and bearings to hold the rod d^3 in position to hold the scraper away from the cylinder, and a scraper-holding rod arranged in said slots, substantially as set forth.

8. In combination with the freezing-cylinder *b*, a chute *d*, and its scraper d^2, carried by spring supports or bearings d^3, and adjusting-screws d^3, substantially as set forth.



9. In an ice-cream freezer, the combination, with the case-sections a^3 a^4, of plates *g*, secured to one of said sections, providing journal-bearings for the freezing-cylinder and projecting into engagement with the other of said sections to prevent lateral displacement, substantially as set forth.

10. In an ice-cream freezer, the combination, with sections a^3 a^4 of the case *a*, having apertures for the freezing-cylinder journals, of said freezing-cylinder having said journals and outer plates g^1 g^2, secured to the said sections at said apertures, one of which overlaps the other, and set-screws for holding or binding the plates together, all arranged and operating substantially as set forth.

11. In an ice-cream freezer, the combination, with case-sections a^3 a^4, of cylinder *b*, adjustable chute and scraper *d*, pan *f*, and supply-funnel, and plates d^5, secured to one of said sections over holes therein and provided with slots to receive a separator-rod, and said rod adapted to separate and hold the scraper from the freezing-surface, substantially as set forth.

12. In an ice-cream freezer, a cylinder having shallow recesses at the opposite ends thereof, the bottoms of which are in vertical planes and serve as seats or bearings against which the journal-flanges are fastened, and journals having said flanges conforming to said recesses, so as to be centered thereby and fastened in said recesses, substantially as and for the purposes set forth.

479,932. ELECTRIC METER. LUCIEN V. BELLIER, Paris, France, assignor to the Compagnie Anonyme Continentale pour la Fabrication des Compteurs à Gaz et Autres Appareils. Filed Oct. 2, 1891. Serial No. 407,545. (No model.)

Claim.—1. An electric meter consisting of the combination of an electro-dynamometer, an electromotor, and a retarder consisting of two relatively-movable members, the one connected to the dynamometer to be oscillated thereby and the other connected to the motor to be rotated thereby and the two being relatively constructed to cause the rotative one to exert a propulsive effort upon the other, which is resisted by said dynamometer.

2. An electric meter consisting of the combination of an electro-dynamometer, an electromotor, a retarder consisting of two relatively-movable members, the one connected to the dynamometer to be oscillated thereby and the other connected to the motor to be rotated thereby, and a current regulator for controlling said motor operated by the dynamometer.

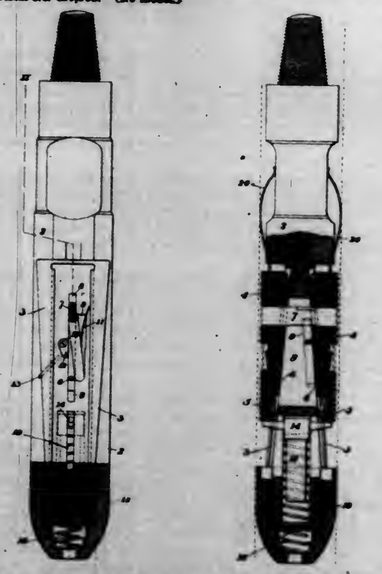
3. An electric meter consisting of the combination of an electro-dynamometer, an electromotor, and a magnetic retarder consisting of a movable magnet and a movable closed armature rotative relatively to the magnet in the field thereof, the one connected to the dynamometer to be oscillated thereby and the other connected to the motor to be rotated thereby and both influenced, but oppositely to each other, by the current to be measured.

4. An electric meter consisting of the combination of an electro-dynamometer, an electromotor, and a magnetic retarder consisting of a movable magnet and a movable closed armature rotative relatively to the magnet in the field thereof, the one connected to the dynamometer to be oscillated thereby and the other connected to the motor to be rotated thereby, and a current-regulator for controlling the speed of the motor operated by the dynamometer.

5. An electric meter consisting of the combination of an electro-dynamometer, an electromotor, and a magnetic retarder consisting of a movable magnet and a movable closed armature rotative relatively to the magnet in the field thereof, the one connected to the dynamometer to be oscillated thereby and the other connected to the motor to be rotated thereby, and a current-regulator for controlling the speed of the motor, operated by the dynamometer and consisting of a circuit-closer and a resistance, the former constructed to first introduce and then short-circuit the resistance when moved by an increase of current through the dynamometer and to first introduce the resistance and then break the circuit when moved by a decrease of current.

6. An electric meter consisting of the combination of an electro-dynamometer, an electromotor, and a magnetic retarder consisting of a movable magnet and a movable closed armature rotative relatively to the magnet in the field thereof, the one connected to the dynamometer to be oscillated thereby and the other connected to the motor to be rotated thereby, and a current-regulator for controlling the speed of the motor, operated by the dynamometer and consisting of a circuit-closer and two resistances, the circuit-closer constructed when moved by an increase of current through the dynamometer to first introduce one resistance in series with the motor, then both in

derivation, and finally to short-circuit both, and vice versa, when moved by a decrease of current.



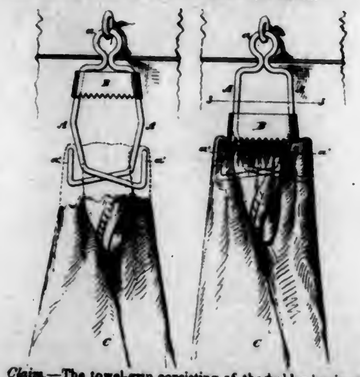
7. An electric motor consisting of the combination of an electro-dynamometer, an electromotor, and a magnetic retarder consisting of magnets carried by an axis rotated by the motor and a disk armature in the field of said magnets carried by an axis oscillated by the dynamometer, whereby the rotation of the magnets by the motor at varying speeds exerts a proportionally-varying effort against said armature, and hence against the dynamometer.

8. An electric meter consisting of the combination of an electro-dynamometer, an electromotor, and a magnetic retarder consisting of electro-magnets carried by an axis rotated by the motor and a disk armature in the field of said magnets carried by an axis oscillated by the dynamometer, said magnets having normally undersaturated cores and excited by a current varying proportionately to the variations in the current being measured.

9. The combination, with an electro-dynamometer and an electromotor, of a current-regulator for the latter, consisting of a movable part actuated by the former, two resistances, fixed contacts, contact-springs carried by said movable part in separate branch circuits, and circuit-breaking contacts between said movable part and dynamometer located in one of said branch circuits, substantially as and to the effect specified.

10. A speed indicator or regulator consisting of a rotative axis driven at or proportional to the speed to be measured, magnets carried thereby, a closed armature in the field thereof, and an oscillative axis carrying said armature and oscillating against a resisting force, whereby the degree of its oscillation is proportional to the speed of the magnets.

479,933. CASING-SPEAR. JOHN CARRUTHERS, Harmony, Pa., assignor of one-half to Myron J. Peters, same place. Filed Apr. 18, 1892. Serial No. 429,562. (No model.)



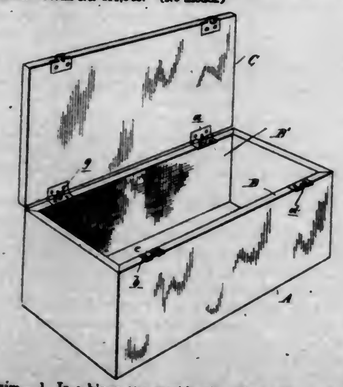
Claim.—1. In a casing-spear, the combination, with the tool-stock, of two contrarily-acting sets of wedge-slips, one set being mounted upon inclined guideways on the stock and the second set being mounted upon similar oppositely-inclined guideways upon the first set, and a pawl for locking the first set in retracted position, substantially as and for the purposes described.

2. In a casing-spear, the combination, with the tool-stock, of a set of wedge-slips mounted in inclined guideways thereon, a cross-bar connecting the slips and moving in a slot passing through the stock, a spring-pawl arranged to engage said cross-bar, and a second set of contrarily-acting wedge-slips mounted in reversely-inclined guideways upon the first set, substantially as and for the purposes described.

3. In a casing-spear, the combination, with the tool-stock, of a set of wedge-slips mounted in inclined guideways thereon, a cross-bar connecting the slips and moving in a slot passing through the stock, a spring-pawl arranged to engage said cross-bar, a second set of contrarily-acting wedge-slips mounted in reversely-inclined guideways upon the first set, a cross-head moving in a second slot passing through the stock, and a spiral spring surrounding the stem supporting said cross-head, substantially as and for the purposes described.

4. In a casing-spear, the combination, with the tool-stock, of a set of wedge-slips mounted in inclined guideways thereon, a cross-bar connecting the slips and moving in a slot passing through the stock, a spring-pawl arranged to engage said cross-bar, a trigger arranged to engage the spring-pawl, a hole extending from said trigger to the exterior of the casing, and a second set of contrarily-acting wedge-slips mounted in reversely-inclined guideways upon the first set, substantially as and for the purposes described.

479,934. TOWEL-GRIP. GEORGE S. CHAMBERLIN, New York, N. Y. Filed July 24, 1891. Serial No. 400,523. (No model.)



Claim.—The towel-grip consisting of the holder having the outwardly-bowed opposite spring sides whose lower free ends curve inward toward and across each other, combined with the slide closely encompassing and adapted to have a sliding motion on said spring sides, substantially as and for the purposes set forth.

479,935. SOLUTION OF MYRRH-RESIN AND MODE OF MAKING THE SAME. ADOLF FLÜCKE, Frankfort-on-the-Main, Germany. Filed May 13, 1892. Serial No. 432,860. (Specimens.) Patented in France Nov. 11, 1890, No. 208,436, and in England Apr. 13, 1891, No. 6,308.

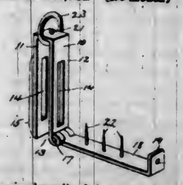
Claim.—1. The process of manufacturing a solution of myrrh-resin in castor-oil, consisting in first dissolving myrrh in alcohol and castor-oil, next filtering the solution from the constituents of the myrrh, which are insoluble in alcohol, and finally driving off the alcohol, substantially as set forth.

2. As a new article of manufacture, a clear solution of myrrhic resin in castor-oil.

479,936. HINGE. LEBBEUS H. FOSTER, Adrian, Mich. Filed Nov. 9, 1891. Serial No. 411,349. (No model.)

Claim.—1. In a hinge, the combination of the plates *a b*, the pin *d* upon one plate, the hook *f* upon the other plate, the oscillating finger *g*, engaged in an aperture in the plate *a*, and the crank-arm *h* upon the opposite side of said plate for actuating said finger, substantially as described.

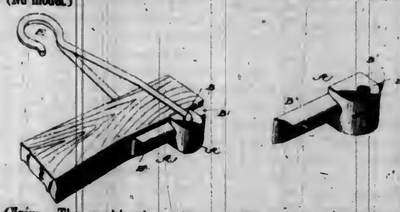
2. In a hinge, the combination, with the plates *a b*, of the sockets *c* on one plate, the pin *d*, engaging said sockets and spanning the cut-away portion *e* of said plate *b* of the inwardly-curved hook *f* on the plate *a*, the oppositely-extended finger *g*, pivoted in an aperture in said plate, the crank-arm *h* upon the opposite side of said plate, and the shoulder *j*, the parts arranged and operating substantially as and for the purpose described.



3. A hinge consisting of two members, one of which is provided with a pintle or pin and the other formed with an extended hook arranged to engage said pin and having a movable finger extending over the hook when the same is in engagement with the pin, substantially as described.

479,937. SPATULA. CLARENCE W. FOX, Saugus, Mass. Filed May 19, 1892. Serial No. 433,616. (No model.)

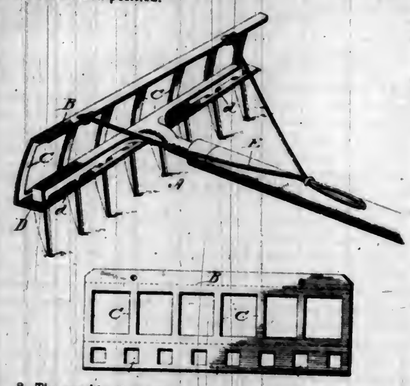
Claim.—The spatula herein described, composed of a blade of rubber having a broad thin steel core and a handle, substantially as described.



479,938. CLASP. JOSEPH L. FREDLIEF, Porterville, Cal. Filed Mar. 26, 1892. Serial No. 426,544. (No model.)

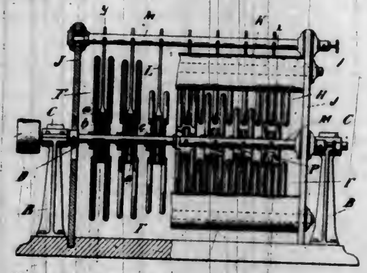
Claim.—1. The herein-described improved clasp, the same consisting of the inverted-U-shaped rigid metal body slotted transversely from its lower end to near its upper end, forming front and rear walls, the former having a slot in its front face, the swinging member hinged in the lower end of the slot of the front wall and provided on its inner face with needles inwardly disposed and adapted to enter cavities formed in the front face of the rear wall, and means for removably locking said swinging member in a closed position, substantially as specified.

2. The herein-described improved clasp having the inverted-U-shaped body forming the front and rear walls, each provided with a slot, a reinforcing or backing wall located in rear of the slot of the back wall and provided with cavities, and the inverted-L-shaped hinged member 18, pivoted, as at 17, to the lower end of the front wall and having the spurs 22 for engaging the cavities of the back wall, the upper angular end of the member having a perforation 20, adapted to spring over a locking-lug 21, located upon the upper end of the clasp body, substantially as specified.



479,939. WHIFFLETREE-HOOK. ALFRED N. GREEN, Lewistown, Ohio. Filed Jan. 12, 1891. Renewed June 14, 1892. Serial No. 436,675. (No model.)

Claim.—The combination, with a whiffletree, of a plate secured thereto and in a longitudinal plane therewith, and a boss formed integral with the plate and projecting beyond the outer upper and lower sides thereof, for the purpose described, said boss being provided with an eye at right angles to the plate, and a link or hook of approximately triangular shape having its straight vertical side mounted loosely within the eye, substantially as and for the purpose set forth.



479,940. COMBINED GUARD AND CLEANER FOR LAWN-RAKES. JOHN H. HALDEMAN, Marietta, Pa. Filed Sept. 19, 1891. Serial No. 406,260. (No model.)

Claim.—1. The combination, with a rake, of a combined guard and cleaner consisting of the plate D, perforated at intervals to correspond with and receive the rake-teeth, the plate B, parallel with and connected at intervals by means of the strips C with the said plate D, the said strips C forming the guard, substantially as and for the purpose described, and a spring for holding and returning the attachment to a normal position.

2. The combination, with a rake, of the hereinbefore shown and described combined guard and rake, consisting of a single piece of sheet metal having a portion along its top and bottom edges bent to form the plates B and D and having the intermediate portion perforated at intervals to form the strips C, the plate D being perforated at intervals to correspond with and receive the rake-teeth, and a spring E, substantially as and for the purpose specified.

479,941. INFLUENCE-GENERATOR OF ELECTRICITY. WILLIAM HENRY, Detroit, Mich. Filed May 29, 1891. Serial No. 394,519. (No model.)

Claim.—1. In an electric generator, the combination of two groups of insulated metallic bodies, one forming a statically-electrified field of positive and negative inductors and the other group adapted to become polarized at intervals by moving in inductive relation to said inductors, and an exterior work-circuit having connecting devices electrically connecting the induced bodies receding from a negative inductor and approaching to a positive inductor, with the induced bodies receding from a positive inductor and approaching to a negative inductor during their polarizations, substantially as described.

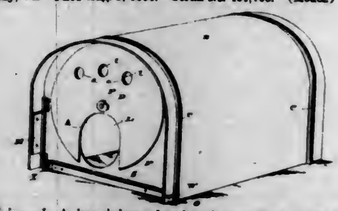
2. In an electric generator, the combination of two groups of insulated metallic sectors, one statically electrified to form positive and negative inductors and the other adapted to move in inductive relation thereto, the sectors of the two groups being arranged in relatively different inductive proximity to each other, whereby polarization takes place in the induced sectors at different moments of time, substantially as described.

3. The combination, in an electric generator, of two groups of insulated metallic sectors arranged radially around a common axis, one adapted to form a statically-electrified field of positive and negative electrification and the other adapted to revolve within said field, the two groups of sectors being arranged in alternating planes parallel with each other and equidistant apart and with portions of the sectors of the two groups in relative different inductive proximity to each other, a commutator and brushes for each portion of moving sectors having the same relative inductive proximity to the inducing-sectors and forming the positive and negative poles thereof during their phases

of polarization by the inducing-sectors, and an exterior circuit electrically connecting all the brushes, substantially as described.

4. In an electrical generator, the combination of a group of insulated metallic sectors arranged radially around a central axis and adapted to form a stationary electrified field of positive and negative inductors, an armature arranged to revolve within said field and composed of a shaft, and a series of sector-wheels adjustably grouped upon said shaft and consisting of an insulating-hub and metallic sectors radially secured thereto in planes at right angles to the shaft, substantially as described.

5. In an electrical generator, the combination of a group of insulated metallic sectors arranged radially around a central axis and adapted to form a statically-electrified field of positive and negative inductors, an armature adapted to revolve within said field and composed of a group of like sectors secured to insulating-hubs upon the shaft of said armature and forming sector-wheels adapted to be independently adjusted upon said shaft, and commutators, one for each sector-wheel, formed upon the hub of each sector-wheel, substantially as described.

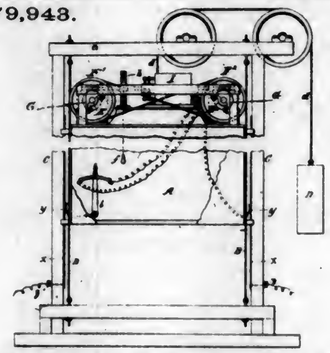


6. In an electrical generator, the combination of a group of stationary inducing-sectors of positive and negative statical electrification, a group of movable sectors secured to a revolving shaft in alternating planes between said stationary sectors, commutator and brushes forming the positive and negative poles of the movable sectors during their phases of polarization, an exterior work-circuit connecting such poles, and a governor for regulating the inductive influence of the inducing-sectors, substantially as described.

7. In an electrical generator, the combination of stationary inducing-sectors of positive and negative statical electrification, movable sectors secured by insulating hubs to a revolving shaft and forming sector-wheels spirally grouped upon said shaft in inductive relation between the stationary sectors, a commutator and brushes for each sector-wheel and forming the positive and negative poles thereof at coincident phases of polarization, an exterior work-circuit connecting such poles, and a governor for regulating the inductive influence of the stationary sectors, substantially as described.

8. In an electrical generator, the combination of stationary sectors of positive and negative statical electrification, movable sectors secured to a revolving shaft in inductive relation between the stationary sectors, connecting devices whereby the differently-induced movable sectors are electrically united during coincident phases of polarization, and connecting devices between a portion of the stationary and movable sectors for maintaining the electrification of the inducing-sectors, substantially as described.

9. In an electrical generator, the combination of the revolving shaft, the sector-wheels adjustably secured upon said shaft, a commutator for each sector-wheel, a pair of brushes for each commutator, an exterior work-circuit connecting all the brushes, stationary sectors radially and adjustably secured in inductive proximity between the sector-wheels, and a governor for regulating the inductive influence in the stationary sectors, said governor being connected into an exterior circuit, substantially as described.



479,942. KNOCKDOWN HEN-HOVEL. JOHN M. HOLLADAY, Holladay, Va. Filed Aug. 5, 1891. Serial No. 401,763. (Model.)

Claim.—1. A knockdown hen-hovel comprising a flexible roof and end walls hinged each at one side to the body member, said roof extending over the side and upper edges of the end walls and forming the top and sides of the hen-hovel and the sides of said end members which are not hinged to the roof being detachably secured to the same, substantially as described.

2. A knockdown hen-hovel comprising a flexible roof provided with creases C and walls, each hinged at one side to the roof and provided with means for detachably securing its other side to the roof, the body member being extended over the end walls to form the top and sides of the hovel and having the edges of the end walls arranged in its creases, substantially as described.

479,943. ELEVATOR. LEWIS M. HOSEA, Cincinnati, Ohio. Filed Aug. 21, 1891. Serial No. 403,271. (No model.)

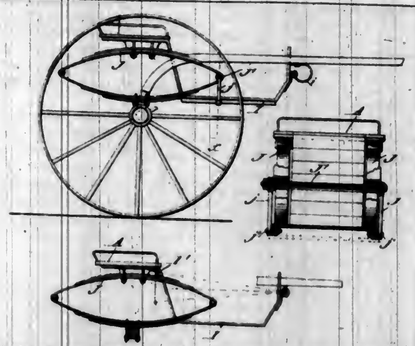
Claim.—1. In an elevator, the combination of the cab, two interconnected carrying-sheaves of equal diameter journaled thereon, one or more fixed suspension-ropes secured at the top of the runway and wound in reverse over the sheaves, thereby suspending the cab, and means for rotating said sheaves simultaneously in relatively-opposite directions, substantially as set forth.

2. In an elevator, the combination of suspension-ropes secured at opposite ends to the top and bottom of the runway, a cab provided with two equal sheaves journaled thereon to rotate in a common plane and engaging the suspension-ropes in opposite bights formed by reversed winding over the sheaves as a pair, right-and-left worm-gears, and a right-and-left worm-shaft connecting and driving said sheaves in relatively-opposite directions, substantially as set forth.

3. The combination, in an elevator, of one or more fixed suspension-ropes, a cab provided with carrying-sheaves suspending the cab in bights of the suspension-ropes, worm-wheels to operate the carrying-sheaves, worms engaging the worm-wheels, an electric motor upon the cab engaging and driving said worms, a moving connection for delivering the electric current to said motor, and controlling devices upon the cab for regulating the delivery and action of the current, substantially as set forth.

4. The combination, in an elevator or lift, of the cab or platform, the suspension-ropes, the carrying-sheaves, the right-and-left worm-wheels, the right-and-left worm-shaft, and the electric motor, substantially as set forth.

5. The combination, in an elevator, of the cab, the suspension-ropes, the carrying-sheaves, the worm-wheels, the electric motor, the motor shaft having screws engaging the worm-wheels, and the brake upon the motor-shaft, substantially as set forth.

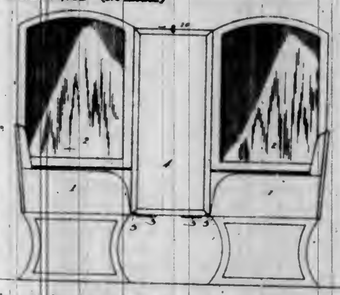


6. In an elevator of the character described, the combination of the cab, two equal interconnected sheaves arranged to rotate in a common plane at opposite sides upon the cab, each sheave having peripheral grooves, and two or more fixed suspension-ropes forming suspending-bights by winding each from above under its primary sheave, and thence over and around under the opposite sheave, and thence back over its primary sheave and downward, substantially as set forth.

7. In an elevator of the character indicated, the combination of two opposite parallel shafts journaled upon the cab, two sheaves upon each shaft of equal diameter each with each throughout and arranged in parallel planes in pairs of opposites, a worm-wheel upon each shaft between its sheaves, a cross-shaft having right-and-left worms, respectively, engaging the worm-gears, four suspending-ropes fixed in the elevator-runway in outer tangential relations with the sheaves, respectively, and engaging the same by reversed winding-bights, as shown, a rotating armature carried by said cross-shaft, field-magnets carried upon the cab-frame surrounding said armature and constituting with it an electric motor, and electrical connections with said motor for driving the same, substantially as set forth.

8. In an elevator of the character indicated, the combination of a cab provided with interconnected propelling-sheaves, two or more ropes secured at the top of the runway and winding over said sheaves, forming bights in which the cab is suspended and extended thence to the bottom of said runway, and take-up devices for said ropes at their top and bottom holdings for adjusting and maintaining the ropes in proper relation and taking up the slack, substantially as set forth.

479,944. ROAD-CART. SAMUEL B. IRWIN, West Hebron, N. Y. Filed Mar. 30, 1891. Serial No. 386,962. (No model.)



Claim.—1. In a road-cart or other vehicle, the combination of the body I, the seat A, consisting of a flat horizontal surface, the vehicle-axle, transverse elliptical springs J J, supported on said axle and sustaining thereon the seat, the hinges or joints I', connecting the seat

with the aforesaid body at a point near the front edge of the seat-surface and directly beneath said edge, and the springs i, which connect the forward end of the vehicle-body with the cross-bar of some other corresponding part of the thills, substantially as described.

2. In a road-cart or other vehicle, the combination of seat A, vehicle-body I, transverse elliptical springs J J, supported on said axle and sustaining thereon the seat, the pivoted links or connections j j, which connect the forward ends of the elliptical springs with the bottom edge of the body A, the hinges or joints I', connecting the seat directly with the body at a point near the front edge of the seat-surface and directly beneath said edge, and the yielding springs, which connect the forward end of the body I with the cross-bar or some other corresponding part of the thills, substantially as described.

479,945. CAR. HENRY M. JOHNS, Denver, Colo., assignor to the Jones Vestibule Sleeping Car Company, same place. Filed Mar. 30, 1891. Serial No. 387,044. (No model.)

Claim.—1. In a lower berth for sleeping-cars, the combination, with two seats facing each other, of a leaf or panel hinged to the wall of the car and adapted to be let down between the seats of the section, in which position it is supported by suitable stays, substantially as and for the purpose set forth.

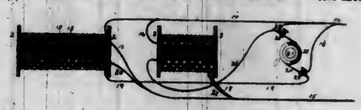
2. An upper berth for sleeping-cars, consisting of a suitable body supported by the depending rods flexibly secured to the ceiling of the car and also to each end of the body of the berth, which is provided with grooves upon its upper surface to receive two of the rods when folded, or those located at one end of the berth, whereby the berth may be swung up against the ceiling of the car, covering the rods at one end which enter the grooves, the rods at the opposite end being exposed and lying to one side of the berth, substantially as described.

3. In a vestibule-car, the combination, with the platform-floor having a recess formed beneath the same, of a sliding leaf adapted to enter said recess, whereby it is concealed within the same, and capable of being drawn out, so as to cover the side steps leading to the platform, and suitable means for supporting said sliding leaf in the extended position, substantially as described.

479,946. VEHICLE-WHEEL. EMMIT G. LATTA, Friendship, N. Y. Filed Jan. 21, 1892. Serial No. 418,902. (No model.)

Claim.—1. The combination, with a wheel-rim having a concave or grooved face, of an inflatable tire consisting of an inner air-tube, a removable envelope inclosing the air-tube and having meeting edges located within the concave face of the wheel-rim, and a detachable lacing-cord connecting the meeting edges of the envelope and adapted to be removed from the openings in said meeting edges for obtaining access to the air-tube, the lacing-cord being arranged within the concave face of the rim and the tire being capable of removal from the rim without unlacing its envelope, substantially as set forth.

2. The combination, with the tire consisting of an air-tube and a surrounding envelope having its meeting edges separably connected, of a supporting-rim provided in its face with a circumferential groove or depression which receives the meeting edges of the envelopes, substantially as set forth.



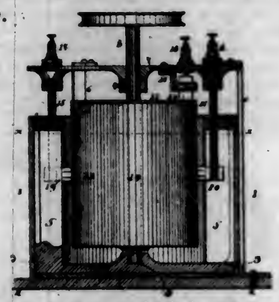
3. A wheel-rim having a concave face and composed of a strip of sheet metal having its lateral portions doubled inwardly toward its concave face, the inner edges of such doubled portions being flattened against the central portion of the concave rim-face, rendering the center of the rim solid, while the outer edges of such doubled portions are rounded and separated from the inner thickness of the rim by an intervening space, substantially as set forth.

479,947. HARNESS-SUPPORT. JOHN LEININGER, Canton, Ohio. Filed Oct. 17, 1891. Serial No. 409,063. (No model.)

Claim.—In a harness-support, the combination of the head B, provided with the ledge or stop *a'*, the hook C, provided with the extended arm D, pivotally attached to said head, the apertures *b* and *b'*, the detachable pin E, and means for supporting said head, substantially as and for the purpose set forth.

479,948. RECIPROCATING ELECTRIC DRILL. FRANK F. LOOMIS, Akron, Ohio. Filed Apr. 11, 1891. Serial No. 388,587. (No model.)

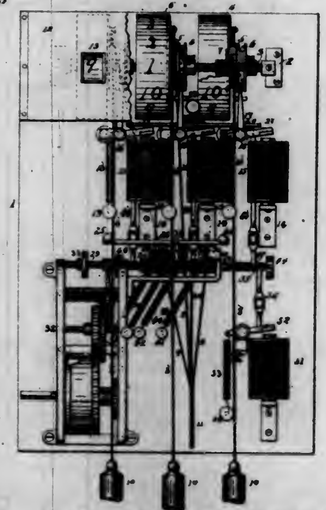
Claim.—1. In an electric reciprocating drill of the class designated, the combination, with two duplex-wound solenoids arranged in alignment, one wire of each connected with the direct and return circuit of a dynamo and the second wires of each connected with branches from said direct and return currents, of a circuit-breaker interposed in said branch direct current and arranged to alternately connect said second wires therewith, substantially as shown and described.



2. In a reciprocating drill of the class designated, the combination, with a duplex-wound solenoid having one wire connected with the direct and return current of a dynamo and the other wire connected with a branch direct and return current and a circuit-breaker interposed in said branch direct current and arranged to intermittently break and close the circuit, of an oppositely-disposed solenoid connected with said direct and return currents and adjusted to overcome the attraction of the duplex-wound solenoid, reduced by the current in one wire thereof, substantially as shown and described.

479,949. ELECTRIC SWITCH. FRANK F. LOOMIS, Akron, Ohio. Filed July 31, 1891. Serial No. 401,336. (No model.)

Claim.—1. In a revolving electric switch, a tank and a revolving non-conducting cylinder mounted therein and partially covered with a conducting-plate, and brushes arranged to rest on said cylinder, combined with an acid-metallic solution, substantially as shown and described, and for the purpose specified.



2. In a revolving electric switch, a tank and a non-conducting cylinder partially covered with conducting material, combined with oppositely-disposed brushes arranged to alternately engage said con-

479,949.

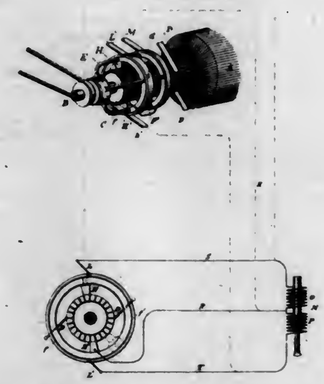
ducting material, and a brush arranged to be in constant connection with said conducting material, and an acid-metallic solution in said tank, substantially as shown and described, and for the purpose specified.

479,950. FIRE-ALARM-TELEGRAPH INDICATOR. FRANK F. LOOSER, Akron, Ohio. Filed Dec. 1, 1891. Serial No. 413,651. (No model.)

Claim.—1. In a fire-alarm indicator to be operated by the opening and closing of the circuit from a fire-alarm box, the combination, with indicating-wheels normally forced to revolve to present successive numbers and to be successively operated and a like number of electro-magnets having armatures arranged to operate escapement-wheels to permit a partial revolution of one of said indicating-wheels at each closing of the circuit, of a like number of studs electrically interposed one between one end of the main line and the first magnet and the others between the first and second and the second and third magnets, and a like number of contact-plates electrically interposed between the said magnets, the last connecting with the opposite end of the main line, and vibrating blades connected with said studs and arranged to successively engage said contact-plates, substantially as shown, and for the purpose specified.

2. The combination, with the studs 35, contact-plates 28, and vibrating blades 37, of the insulated sleeve having screw-threads 31, and intermediate spaces and a motor for driving said sleeve, substantially as shown and described, and for the purpose specified.

3. The combination, with the studs 35, contact-plates 28, and vibrating blades 37, normally drawn in one direction by the spring 40, of the rocking arms 50, arranged to be operated by the armatures 16, and rods 48 to raise said blades from the screw-threads as the circuit is broken, substantially as shown and described.



4. The combination, with escapement-actuating magnets arranged to be successively placed in circuit, and vibrating blades, and contact-plates arranged to successively place them in circuit, and guide-screws, of the rocking bar arranged to simultaneously raise said vibrating blades from the guide-screws, substantially as shown and described, and for the purpose specified.

5. The combination, with the escapement-actuating magnets and their armatures, and the vibrating blades, and guide-screws, and the contact-plates, of the loosely-mounted sleeves severally united with said armatures by connecting-rods and provided with crank-arms to raise said blades to restore them to their normal position, substantially as shown and described.

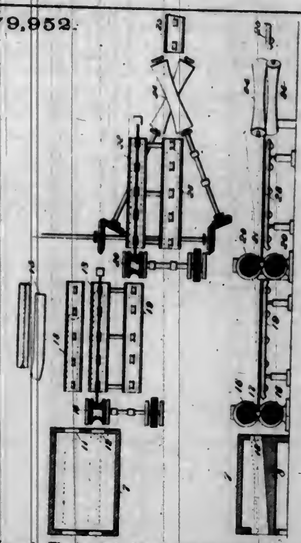
6. The combination, with the escapement-actuating magnets and their armatures, and the vibrating blades, and guide-screws, and contact-plates, and a driving-train, of a separate electro-magnet provided with an armature to release the driving-train to operate said guide-screws when placed in circuit, substantially as shown and described.

7. In an apparatus for placing successively in circuit electro-magnets to operate escapement mechanism for indicating-wheels in a fire-alarm indicator, the combination, with a motor, of a series of vibrating blades and contact-plates to create short circuits about said magnets, and a separate electro-magnet to operate releasing mechanism, and a non-conducting sleeve arranged to be operated by said motor and provided with screw-threads and intermediate spaces for said vibrating blades and having a separate screw-thread and a vibrating blade arranged to run therein, the last-mentioned blade and screw-thread being provided with pins to engage and stop said mechanism when the alarm has been given.

479,951. PULSATING-CURRENT GENERATOR. HARRY H. MARVIN, Schenectady, N. Y. Filed Dec. 3, 1891. Serial No. 413,885. (No model.)

Claim.—1. The combination, with the commutator of a continuous-current armature, of bearing blocks or brushes capable of rotating about the commutator and means for establishing connection alternately between said brushes and the two coils or circuits of a drill or drill system, as set forth.

2. The combination, with the commutator of a continuous-current armature, of two rotary brushes, contact-terminals in electrical connection with the two rotary brushes, respectively, and collecting-brushes adapted for connection with the conductors of two drill-circuits and taking the currents from the said terminals alternately, as herein set forth.

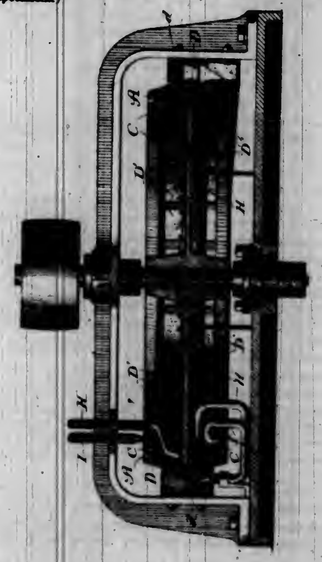


3. The combination, with the commutator of a continuous-current armature, of rotating brushes and means for connecting the same alternately with two working circuits, said brushes being capable of adjustment or varying angular displacement, as and for the purposes set forth.

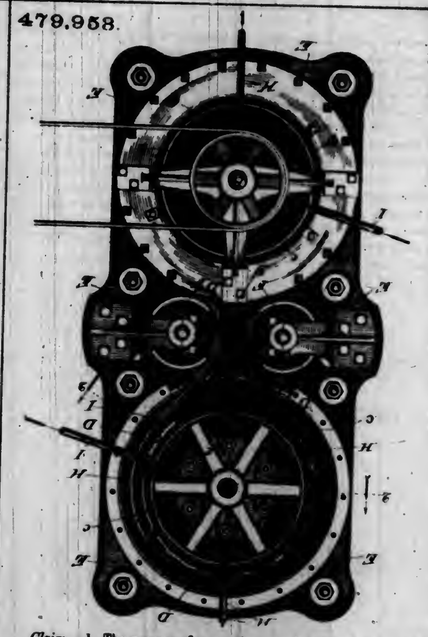
4. The combination, with the commutator of a continuous-current armature, of an independently-rotable frame or structure surrounding the commutator, brushes carried thereby and bearing on the commutator, a metallic continuous ring and a metallic segment on the frame, to which the said brushes are respectively connected, a single brush bearing on the continuous ring, and two brushes bearing alternately on the half-ring, the said brushes forming the terminals of two working circuits, as herein described.

5. The combination, with the rotating commutator of a continuous-current armature, of rotating collecting-brushes connected or adapted for connection with a working or translating device, said brushes being capable of adjustment or varying angular displacement with respect to each other and the line of commutation, as and for the purpose set forth.

479,952. PROCESS OF MAKING METAL PIPES OR TUBES. WILLIAM S. MCMANUS, South Chester, assignor to Joseph D. Potts, trustee, Philadelphia, Pa. Filed Feb. 5, 1891. Serial No. 380,374. (No specimens.)



479,952.



Claim.—1. The hereinbefore-described method of welding metallic tubes and pipes, which consists in the following continuous operation, to wit: first, introducing the heated skelp into the end of the welding-furnace adjacent to the welding-rolls, whereby the end of the skelp which is to first enter the rolls is preserved in better condition to undergo the subsequent steps of the operation; second, passing it at a welding heat in a reverse direction from the furnace to and over a ball and through welding-rolls, and, third, passing it from these rolls having elliptical passes at a lower heat, but without reheating, to and over a ball and through rolls having cylindrical passes.

2. In the art of welding metallic tubes and pipes, the improvement which consists in passing a heated skelp at a welding heat over a ball and through rolls having elliptical passes and then passing it from these rolls at a lower heat, but without reheating, to and over a ball and through rolls having cylindrical passes.

479,953. PROCESS OF SEPARATING POWDERED OR FINELY-DIVIDED PARTICLES. ORRIN B. PECK, Chicago, Ill., assignor to Melinda Peck, same place. Filed Jan. 11, 1892. Serial No. 417,683. (No specimens.)

479,953.

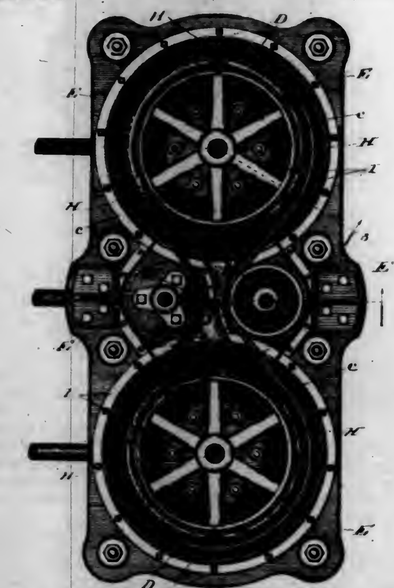
Claim.—1. The process of separating powdered or finely-divided particles containing mineral-bearing substances of different degrees of specific gravity, which consists in depositing the material to be separated on the separating-surface of a traveling belt and first subjecting them to the action of centrifugal force in a direction toward the separating-surface of the belt and afterward subjecting the particles adhering to the belt to the action of centrifugal force in an opposite direction to throw them off from the separating surface, substantially as described.

2. The process of separating powdered or finely-divided particles containing mineral-bearing substances of different degrees of specific gravity, which consists in depositing the particles of material to be treated on the surface of a belt where it is traveling in a circular direction and carrying the particles which adhere to the belt to a point where it ceases to travel in a circular course, where they are thrown off by the reversal of the direction of action of the centrifugal force, substantially as described.

3. The process of separating powdered or finely-divided particles containing mineral-bearing substances of different degrees of specific gravity, which consists in causing the lighter particles to be carried by the action of centrifugal force across the surface of a belt where it is traveling in a circular direction to a point of discharge and carrying the heavier particles on the belt to a point where it ceases to travel in a circular course, where they are moved, substantially as described.

479,954. CENTRIFUGAL ORE-SEPARATOR. ORRIN B. PECK, Chicago, Ill., assignor to Melinda Peck, same place. Filed Jan. 11, 1892. Serial No. 417,684. (No model.)

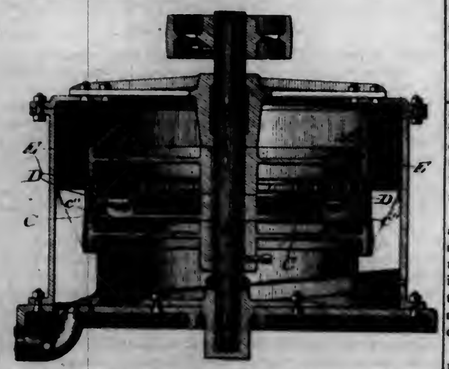
Claim.—1. In centrifugal ore-separators, the combination of rotatable pulleys and a belt provided with a separating-surface and traveling around such pulleys during a portion of its course and at a tangent to a circle in another portion of its course, substantially as described.



2. In centrifugal ore-separators, the combination of rotatable pulleys and a belt provided with a separating-surface and traveling around such pulleys in a circle during a portion of its course and at a tangent to a circle in another portion of its course, substantially as described.

3. In centrifugal ore-separators, the combination of rotatable pulleys, a belt provided with a separating-surface and traveling around such pulley during a portion of its course and at a tangent to a circle in another portion of its course, a material-supply pipe depositing material to be carried against the separating-surface of the belt at or near the point where it enters its circular course around the pulleys, and a water-pipe spraying water against the separating-surface of the belt while passing in its circular course, substantially as described.

4. In centrifugal ore-separators, the combination of rotatable pulleys, a belt provided with a separating-surface and traveling around

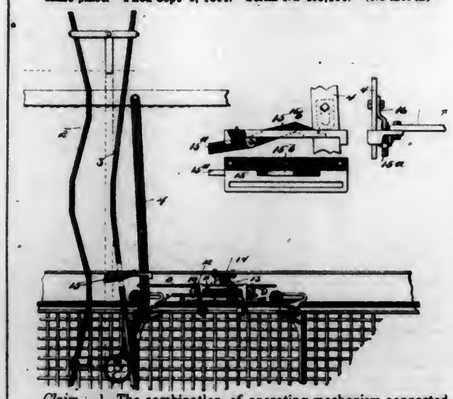


such pulleys during a portion of its course and at a tangent to a circle in another portion of its course, a material-supply pipe depositing the material to be carried against the separating-surface of the belt at or near the point where it enters its circular course around the pulleys, a water-pipe spraying water against the separating-surface of the belt while passing in its circular course, and means for detaching the particles adhering to the belt while passing through the tangential portion of its course, substantially as described.

5. In centrifugal ore-separators, the combination of rotatable pulleys, a belt provided with a separating-surface and traveling around such pulleys during a portion of its course and at a tangent to a circle in another portion of its course, and idlers abruptly changing the course of the belt from a tangential to a circular course to cause particles adhering to its separating-surface to be discharged, substantially as described.

6. In centrifugal ore-separators, a belt provided with a separating-surface, traveling a portion of its course in a circular direction, means for causing such travel of the belt, and means for supplying the separating-surface of the belt with the material to be separated, substantially as described.

479,955. CENTRIFUGAL ORE-SEPARATOR. ORRIN R. PECK, Chicago, Ill., assignor to Melinda Peck, same place. Filed Jan. 11, 1892. Serial No. 417,635. (No model.)



Claim.—1. In centrifugal ore-separators, the combination of rotatable pulleys and a belt engaging such pulleys at its upper and lower portions and provided with a separating-surface on its middle portion, substantially as described.

2. In centrifugal ore-separators, the combination of rotatable pulleys and a belt engaging said pulleys at its upper and lower portions and provided with a separating-surface on its middle portion and with one or more inwardly-projecting ribs or flanges, substantially as described.

3. In centrifugal ore-separators, the combination of rotatable pulleys and a belt engaging such pulleys at its upper and lower portions and provided with a separating-surface on its middle portion and holes or perforations along the edge of the separating-surface for the escape of the lighter particles of the material being treated, substantially as described.

479,956. DEVICE FOR OPERATING ELEVATOR-DOORS. HAROLD ROWETREE, Kansas City, Mo., assignor of one-half to J. B. Burdett, same place. Filed Sept. 9, 1891. Serial No. 405,180. (No model.)

Claim.—1. The combination of operating mechanism connected to the landing-doors of an elevator-well, control mechanism through which the stopping and starting of the car is effected, and a movable contact-piece upon the car, connected to said control mechanism and adapted to put said door-operating mechanism into action to open the door when the control mechanism is shifted to bring the car to rest opposite the landing, substantially as described.

2. The combination of mechanism attached to the landing-doors of an elevator-well, a movable contact-piece upon the car, adapted to put said door-operating mechanism into action, control mechanism capable of operation from the car to stop and start the said car, and connections between said movable contact-piece and said control mechanism, whereby said contact-piece is shifted to its operative position when the control mechanism is moved to bring the car to a state of rest, substantially as described.

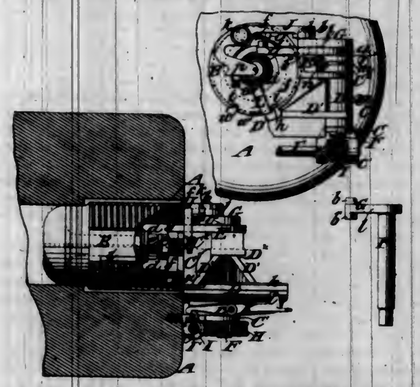
3. The combination of an elevator landing-door, slides carried by said door and provided with fingers, a spring connected to said door through said slides, to the fingers of which the opposite ends of said spring are attached, and catches by which the door is locked in its opened and closed position, all combined substantially as described, and devices adapted to put the said spring in tension in one direction when the door is opened and in the other direction when the door is closed, substantially as described.

4. The combination, with an elevator-door-operating mechanism, of a framework attached to the door, carrying two slides having projections at their opposite ends, fingers attached to said slides, a spring attached at its opposite ends to said fingers, a swinging lever engaging with the projections on said slides, and guides upon the car for operating said swinging levers, whereby the spring is put in tension for opening the door as the car approaches the landing and is put in tension for closing the door as the car recedes therefrom, substantially as described.

5. The combination, with the landing door of an elevator-well, of a door-closing device consisting of a spring connected to the door, a swinging lever connected to said spring and having a projection, guides upon the car by which said swinging lever is moved to put said spring in tension, and a latch by which said door is locked in its open position and having a curved face coacting with the projection on said swinging lever-arm by which said door is released, substantially as described.

6. An improved door-operating mechanism for elevators, comprising a pivoted catch mounted adjacent to the elevator-door, and having an upwardly-curved face and a swinging lever mounted adjacent to the door, a spring connecting said lever thereto, an adjustable projection on said lever for engaging the curved face of the said catch and moving said catch into position to disengage the door when the latter is to be closed, and devices adapted to move said lever, whereby the spring is put in tension and the catch released, substantially as set forth.

7. The combination, with the landing-door of an elevator-well, of a door-opening mechanism consisting of a spring connected to the door, a swinging lever having connections to said spring, guides upon the car by which said swinging lever is operated, a catch by which said door is locked in its closed position, a movable contact-piece carried by the car, and connections between said movable contact-piece and the elevator-control devices by which the contact-piece is moved in position to act upon said catch when the control devices are shifted to arrest the movement of the car, substantially as described.



8. The combination, with the movable contact-piece carried by the elevator-cage, of a cable running over sheaves at the top and bottom of the well, one of the sheaves being supported in movable bearings and said cable connected with a lever upon the cage, connections between said lever and said contact-piece, an operating-rope for stopping and starting the cage, and connections between the operating-rope and the movable sheave, substantially as set forth.

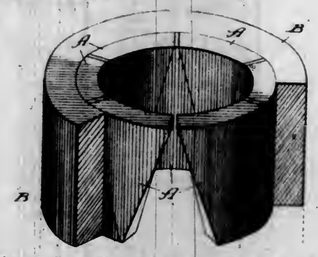
9. The combination, with the door of an elevator-well, a locking device for said door, and a spring connected to the latter, of means for automatically putting the spring under tension as the cage approaches each landing, a movable contact-piece carried by the cage, the operating-rope, and connections between the latter and said contact-piece whereby the contact-piece is protected or retracted upon stopping or starting the cage, substantially as set forth.

10. An improved door-operating mechanism for elevators, &c., comprising a movable catch-actuating contact-piece carried by the car-body and a sliding rod operatively connected to said contact-piece, a pull-rope operating the control-valve, and connections whereby said rod may be actuated by the pull-rope to move the contact-piece out of contact with the catch, substantially as set forth.

11. In a device for releasing the doors of elevator-wells, a slide mounted in bearings on the elevator-car, a contact-piece having a straight central portion secured to the forward end of the same, and means for operating said slide, connected to the control devices governing the movements of the car, substantially as described.

479,957. BREECH-LOADING CANNON. SAMUEL SEABURY, U. S. Navy. Filed Feb. 12, 1892. Serial No. 421,337. (No model.)

Claim.—1. The combination, with a breech-loading cannon and a breech-block for the same which has both a rotary and a backward-and-forward movement, a swinging carrier for said breech-block, and a hinge-pin attached to the breech and constituting a pivot upon which the said carrier swings, of a crank on said pin and a bar or rod pivoted to the breech-block and having a hook or slotted yoke engaging with a wrist of said crank, substantially as and for the purpose herein set forth.

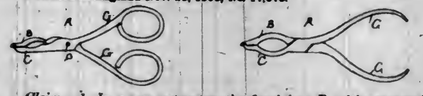


2. The combination, with a breech-loading cannon and a breech-block for the same which has both a rotary and a backward-and-forward movement, a swinging carrier for said breech-block, a swinging retractor for drawing the breech-block into the carrier and pushing it therefrom into the gun, and a hinge-pin attached to the breech and constituting a pivot on which said carrier and retractor swing independently of each other, of a bar or rod pivoted to the said breech-block and having a curved slotted yoke or hook and a crank on the hinge-pin having two wrists, one of which engages with the said slotted yoke or hook for turning the breech-block and the other engages with the retractor for withdrawing the breech-block from the gun, substantially as herein set forth.

3. The combination, with the breech-loading cannon and a breech-block which has both a rotary movement and a backward-and-forward movement in the breech thereof and in which there is a circumferential groove, of a breech-block retractor hinged to the breech and engaging in said groove in the breech-block, substantially as and for the purpose herein set forth.

4. The combination, with a breech-loading cannon and a breech-block having a turning movement therein, of a pin pivoted to the breech, a crank on said pin, and a bar or rod which is pivoted to the breech-block and connects the crank therewith and a portion of which covers and leaves uncovered the vent in the breech-block as the latter is turned in one direction or the other, substantially as herein set forth.

5. The combination, with the breech of a breech-loading cannon and a screw breech-block fitted to the same, of a locking-bolt fitted to slide in a substantially radial groove in the said block and engaging in a notch within the breech when the block is screwed up, substantially as herein specified.



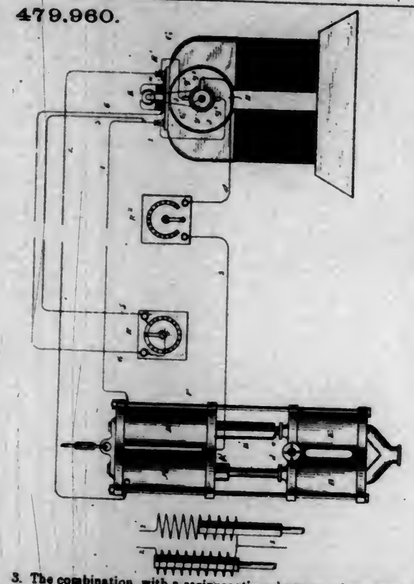
479,958. CHILL-RING. WILLIAM A. SPRING, Chicago, Ill., assignor to the Gates Iron Works, same place. Filed Nov. 20, 1891. Serial No. 412,506. (No model.)

Claim.—1. For chilling the interior of castings, a chilling-ring comprising a number of pointed sections with the point of one section at the butt of the adjacent section, substantially as described.

2. For chilling the interior of castings, a chilling-ring comprising a number of pointed sections having abutting edges radial to the axis of the ring arranged point to butt and movable endwise from each other under external pressure to diminish the diameter of the ring as the casting contracts on it, substantially as described.

479,959. PEN-EXTRACTOR. WILLIAM F. STANLEY, South Norwood, England. Filed Dec. 5, 1891. Serial No. 414,129. (No model.) Patented in England Nov. 23, 1888, No. 17,078.

Claim.—1. In a pen-extractor, the fixed jaw B, with concaved outer end, and the movable jaw C, with inverted-V-shaped end, both jaws pivoted together at D and forming the extended jaws beyond the said pivot-point D into scissor-handles, substantially as and for the purpose set forth.



2. In a scissor-shaped pen-extractor, the fixed jaw B, with concaved outer end, and movable jaw C, with inverted-V-shaped end, both jaws pivoted at D, substantially as and for the purpose set forth.

479,960. CONTROLLING MECHANISM FOR RECIPROCATING ELECTRIC ENGINES. CHARLES J. VAN DEPOELE, Lynn; C. A. Coffin and Albert Wahl, executors of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed Dec. 31, 1889. Serial No. 335,531. (No model.)

Claim.—1. The combination, with a reciprocating electric engine comprising a magnetic piston and motor-coils for imparting motion thereto, of a circuit supplying alternating currents to said coils and means located near the engine for regulating and controlling the current strength and also the rate of its alternations or phases in the motor-coils.

2. The combination, with a reciprocating electric engine comprising a magnetic piston and motor-coils, of a dynamo-electric machine and circuit extending therefrom for supplying currents to said coils in alternation and means for regulating and controlling the rate of such alternations irrespective of the rate of rotation of the armature of the dynamo-electric machine.

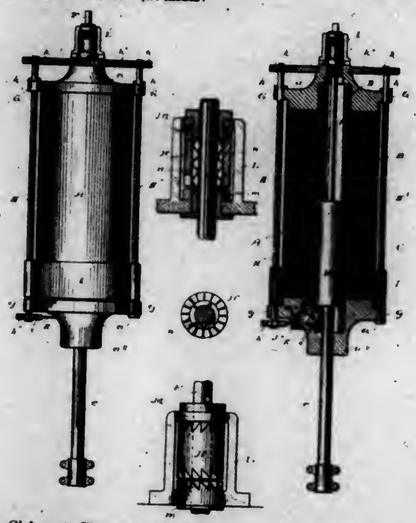
479,960.

3. The combination, with a reciprocating electric engine comprising a magnetic piston and motor-coils, of a generator and a circuit for supplying currents to said coils in alternation and means connected with the source of said supply-currents for raising and lowering the rate at which they are supplied to the motor-coils of the engine irrespective of the rate of rotation of the generator-armature.

4. The combination, with a reciprocating electric engine comprising a magnetic piston and motor-coils, of a source of current, conductors extending between said source and the motor-coils of the engine, means for directing the supply-currents to the circuits of the motor-coils in alternation, and means located near the engine for raising or lowering the rate at which the supply-currents rise and fall in the respective coils.

5. The combination, with a reciprocating electric engine comprising motor-coils and a magnetic piston, of a source of current therefor, conductors extending from said source to the engine, mechanism located near the engine and connected with the source of current for distributing said current alternately in the motor-circuits, and manually-actuated means, also near the engine, for controlling the speed of the current-distributing mechanism.

6. The combination, with a reciprocating pumping-engine, of a reciprocating electro-magnetic engine having its piston connected to the piston of the pump, circuits extending from a suitable source of current to and including the motor-coils, and means located near the engine for reducing the speed of the electric engine when starting the pump and for regulating the flow of current according to the work.



7. The combination, with a reciprocating pump, of a magnetic plunger connected to the piston thereof, a motor coil or coils for imparting reciprocating motion to the magnetic plunger and the pump-piston, a distant source of current and circuit connections extending therefrom to the motor coil or coils, and means adjacent to the pumping-engine for controlling the current-supply at the distant source.

8. The combination of a portable electrically-operated reciprocating pump, a distant source of current, electrical connections between the source and the motor-coils of the pumping-engine, and a portable current-controlling device adapted to be placed near the pumping-engine.

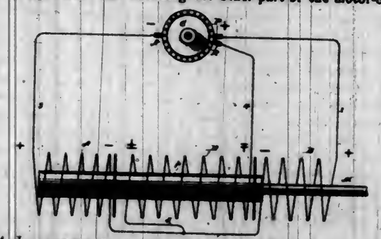
9. The combination of an electrically-operated reciprocating pump, a source of rising-and-falling currents connected by circuits to the motor-coils of the pump, and means for varying the rise and fall and the amount of current supplied to the motor-coils irrespective of the rate of rotation of the armature supplying the currents at the source.

10. The combination, with a reciprocating electric engine comprising a magnetic piston and motor-coils adapted to be energized in alternation, of a source of current remote therefrom, supply-conductors extending from the source to the motor-coils of the engine, means connected with the source of current for directing the same alternately to the respective motor-coils, and means adjacent to the engine for controlling the current-distributing mechanism at the distant source of supply current.

479,961. FEED MECHANISM FOR ELECTRIC RECIPROCATING ENGINES. CHARLES J. VAN DEPOELE, Lynn; C. A. Coffin and Albert Wahl, executors of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed May 22, 1890. Serial No. 352,718. (No model.)

Claim.—1. The combination, in a reciprocating engine, of a cylinder having heads and a reciprocating piston having a tool-holding extension at one end and grooved or splined extension at the other, a fixed support through which the cylinder is movable, two feed-screws on opposite sides of the engine, said screws being sustained in the fixed support and engaging screw-threaded extensions upon the cylinder, a gear-wheel at one end of each feed-screw and an idler in mesh with both, a ratchet at the other end of one of the feed-screws, a movable trigger in the path of the piston, and a connection between the trigger and the ratchet, whereby the feed mechanism is operated by the movement of the plunger, and a rotating mechanism engaging the splined extension and actuated by the reciprocations of the plunger to impart rotary movement thereto at each stroke.

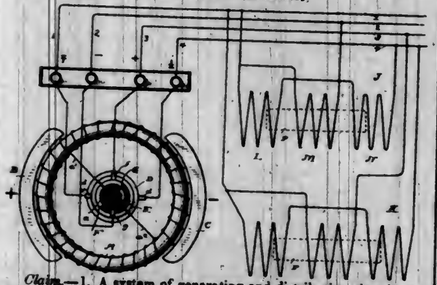
2. In a reciprocating engine, a tool-rotating mechanism comprising stationary face-ratchets, a reciprocating extension from the moving parts, and a double-ended ratchet in frictional engagement with the moving extension, but non-rotatable thereon, and arranged to be thereby moved into engagement with first one and then the other of the face-ratchets, one of said ratchets being displaced, whereby the return-stroke of the extension will move the double ratchet into engagement with the displaced face-ratchet and cause a partial rotation of the double ratchet and connected parts.



3. In a reciprocating engine, the combination, with an extension from the piston, of a pair of opposing face-ratchets, one of said ratchets being displaced and between which the said extension is reciprocated, a double-ended ratchet movable between the face-ratchets to engage first one and then the other, said double ratchet being non-rotatable upon the extension, and a frictional connection between the double ratchet and the said extension, whereby the double ratchet is moved into engagement with the face-ratchets alternately in accordance with the reciprocations of the extension.

479,962. RECIPROCATING ELECTRIC ENGINE. CHARLES J. VAN DEPOELE, Lynn; C. A. Coffin and Albert Wahl, executors of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed Sept. 19, 1890. Serial No. 365,546. (No model.)

Claim.—1. A reciprocating-electric-engine system comprising a plurality of motor-coils, a magnetic plunger adapted to be reciprocated therethrough, a generator having an armature of the continuous-current type and sectional commutator, means for dividing the current of the generator, two separate and independent circuits extending between the generator and engine and each including part of the coils of the engine, and means for directing the divided current into said circuits.

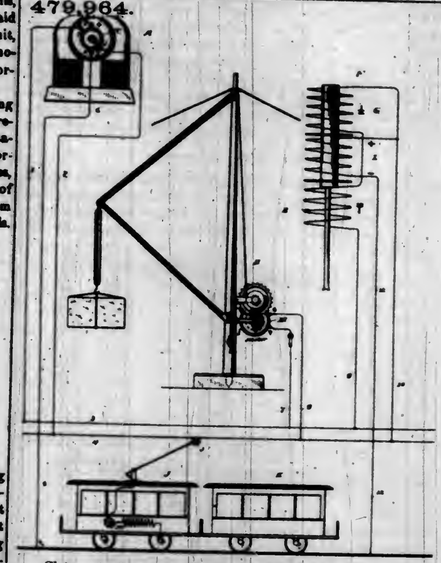


2. A reciprocating-electric-engine system comprising a plurality of motor-coils, and a magnetic plunger adapted to be reciprocated therethrough, a source of continuous current, means for dividing the said current into currents of continuous direction and of alternating polarity, separate circuits, each including parts of the motor-coils, and means for directing the current of one character to one of said circuits and the current of different character to the other circuit, whereby current of one character is supplied to one part of the motor-coils and current of the other character to the remaining motor-coils.

3. An electro-magnetic reciprocating-engine system comprising motor-coils, a magnetic plunger adapted to be reciprocated therethrough, a generator of the continuous-current type having main stationary commutator-brushes and a pair of auxiliary commutator-brushes movable toward and away from the main stationary brushes, a circuit extending from the stationary brushes and including part of the motor-coils, and a separate and independent circuit extending from the moving brushes and including the other part of the motor-coils.

4. In a system of reciprocating electric engines, an engine having coils operated by continuous currents and coils operated by alternating currents, an iron plunger magnetized by the alternating-current coil or coils and reciprocated by reaction upon the continuous-current coils, a generator arranged to give both continuous and alternating currents, and separate independent circuits between the continuous-current part of the generator and the continuous-current coils of the engine and between the alternating-current part of the generator and the alternating-current coils of the engine.

479,963. SYSTEM OF SUPPLYING CURRENTS TO RECIPROCATING ELECTRIC ENGINES. CHARLES J. VAN DEPOELE, Lynn; C. A. Coffin and Albert Wahl, executors of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed Apr. 11, 1891. Serial No. 388,565. (No model.)



Claim.—1. A system of generating and distributing electric currents, comprising an armature rotating within a field of force and having a suitable winding provided with terminals connected to two continuous rings and also to two discontinuous rings, a working circuit connected with and supplied by the continuous rings with current of alternating direction, and a separate circuit connected with and supplied by the discontinuous rings with current of continuous direction, and a motor coil or coils connected separately in each circuit and supplied thereby with currents of different character.

2. A system of generating and distributing electric currents, comprising an armature having a suitable winding terminating in two terminals, each of which is connected both to a continuous ring and to a ring forming part of a circle, a reciprocating electric engine having motor-coils energized by currents of different character, connections between the continuous ring and part of the motor-coils, and connections between the discontinuous ring or rings and the remainder of the motor-coils, whereby currents of different character are supplied to the separate sets of motor-coils.

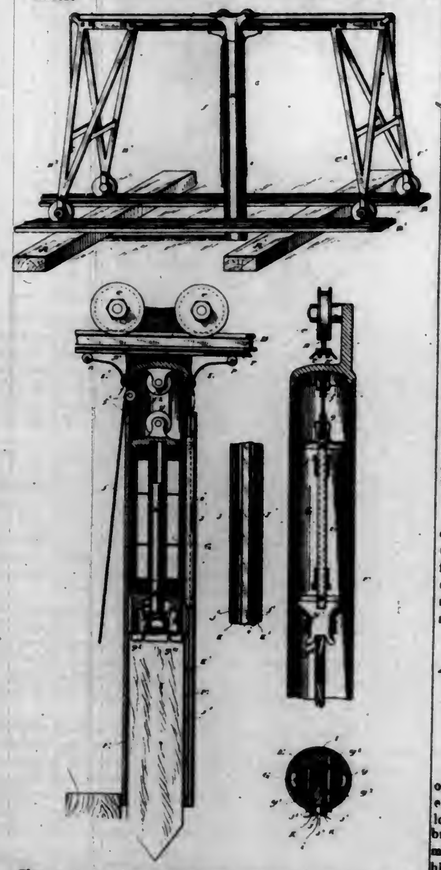
479,964. SYSTEM OF DISTRIBUTING ELECTRIC CURRENTS. CHARLES J. VAN DEPOELE, Lynn; C. A. Coffin and Albert Wahl, executors of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed May 20, 1891. Serial No. 393,474. (No model.)

479,964.

Claim.—1. A system of electrical distribution comprising a source of current of the continuous type, means located at the source for dividing the current into pulsating currents of continuous direction and pulsating currents of alternating direction, circuit-conductors extending from said source, and electric-motor translating devices adapted to be operated by currents of different character in circuit with and supplied with currents suitable to each directly from the source through part or all of the said conductors.

2. A system of electrical distribution comprising a source of current of the continuous type, means located at the source for dividing the current into pulsating currents of continuous direction and pulsating currents of alternating direction, comprising one stationary and two moving commutator-brushes upon the commutator thereof, circuit-conductors extending from said brushes, and electric-motor translating devices adapted to be operated by currents of different character in circuit with and supplied with currents suitable to each directly from the source through part or all of the said conductors.

3. A system of electrical distribution comprising a source of current of the continuous type, means for changing the continuous current into currents of different character, comprising stationary and moving commutator-brushes upon the commutator thereof, circuit-conductors extending from said brushes, and alternating-current, continuous-current, and combined-current translating devices in circuit with said conductors, substantially as described.



4. A system of distributing electrical currents, which comprises an electro-dynamic machine of the continuous-current type, stationary and moving brushes upon the commutator thereof, and working circuits extending from said brushes, and supplied, respectively, with pulsating currents of alternating and continuous direction, and translating devices of the continuous, alternating, and combined current types in circuit with and operated by the several conductors, substantially as described.

5. In a system of distributing electrical currents, which comprises a continuous-current electro-dynamic machine, stationary brushes upon the commutator thereof, an auxiliary set of commutator-brushes adapted to be moved upon said commutator toward and away from the stationary brushes, line conductors connected with and supplied by the moving brushes with alternating currents having a defined rise and fall, and a third conductor connected with one of the stationary brushes, alternating-current translating devices in circuit between the alternate-current conductors, continuous-current devices in circuit between the third conductor and one of the alternating conductors, and translating devices adapted to be energized by both alternating and direct currents placed in circuit with both sets of conductors, substantially as described.

6. A system of electrical distribution comprising a source of continuous current, stationary brushes upon the commutator thereof, moving brushes also upon said commutator, and a working circuit extending from said moving brushes and supplied thereby with alternating currents having a defined rise and fall, an electric-railway track connected to one of the stationary brushes and forming a third conductor.

a motor-car upon the track, provided with a continuous-current motor, traveling connections between one side of the alternating-current circuit and the track, whereby the car-motor is supplied with intermittent pulsating currents of continuous direction, stationary translating devices of the alternating-current type, and stationary translating devices of the alternate-current type in circuit with the alternate-current conductors, and a translating device or devices of the combined-current type in circuit with all of the conductors, substantially as described.

479,965. RECIPROCATING ELECTRIC PILE-DRIVER. CHARLES J. VAN DEPOELE, Lynn; C. A. Coffin and Albert Wahl, executors of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed May 23, 1891. Serial No. 393,848. (No model.)

Claim.—1. An electric pile-driver comprising a longitudinally-movable tubular casing, a reciprocating electric engine vertically movable within said casing, a frame supporting the casing in operative position, and electrical connections between the frame, the casing, and the reciprocating electric engine, substantially as described.

2. In an electric pile-driver, the combination of a movable track, a frame movable upon the track, a way upon the frame, a tubular casing suspended from the way, a reciprocating electric engine within the casing, insulated conductors carried by the way on the frame, traveling contacts between said conductors and insulated conductors carried by the casing, and traveling collector-brushes connected with the electric engine.

3. In an electric pile-driver, the combination, with a suitable frame including a horizontal way, of a tubular casing adapted to be moved longitudinally upon the way and formed with a vertical slit, said casing being adapted to receive and to guide the object to be driven, and a vertically-movable electric engine within the casing, substantially as described.

4. A reciprocating electric engine for pile-drivers, having an exterior casting provided with feet for resting upon the object to be driven, a loose drift also carried by the casting and having a foot-rest upon the object to be driven, and a reciprocating plunger within the casing arranged to strike the drift at each stroke, substantially as described.

5. A reciprocating electric engine for pile-drivers, having feet for resting upon the object to be driven, a loose drift also having a foot-rest upon the object to be driven, and a reciprocating plunger arranged to strike the drift at each stroke, a tubular metallic casing within which the engine and the object to be driven are sustained and guided, and means for raising the engine in the casing after the completion of each operation, substantially as described.

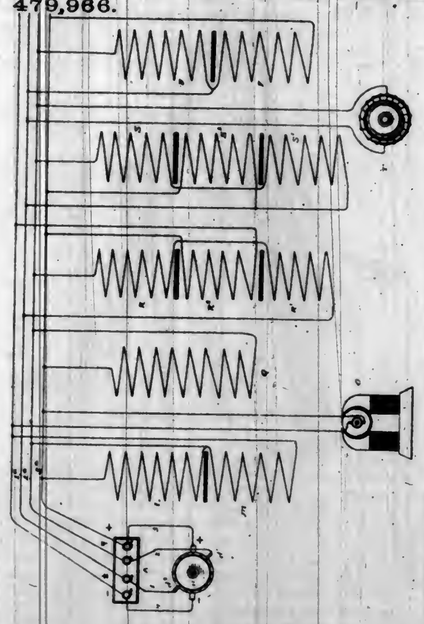
6. In an electric pile-driver, the combination, with a movable horizontal way, of a tubular casing or guide suspended from said way and formed with a vertical slit through which the object to be driven can be inserted, if desired, a reciprocating electric engine adapted to move vertically within the casing, bare conductors carried by the casing, traveling contacts carried by the engine engaging said conductors, and traveling connections between the casing and suitable conductors carried by the horizontal way substantially as described.

7. In an electric pile-driver, a vertical horizontally-movable tubular casing formed with a vertical slit, a suitable supporting-frame having a horizontal way, from which the casing is suspended, and a reciprocating electric engine arranged to move vertically within the casing and provided with a guide arranged to travel in the slit of the casing and provided with feet at its lower extremity adapted to rest upon and sustain the entire weight of the reciprocating engine upon the object to be driven.

8. The combination, with a suitable support, of a tubular casing having a vertical slit and adapted to contain and guide the object to be driven, a reciprocating electric engine adapted to move vertically within the casing and provided with feet for resting upon the object to be driven and having, also, a guide moving in the slit of the casing, and means whereby the engine may be raised and lowered within the casing.

9. In an electric pile-driver, the combination, with a vertical tubular casing adapted to receive and guide the object to be driven, of a reciprocating electric engine arranged within and adapted to move vertically within the casing, feet upon the engine resting and sustaining the weight thereof upon the object to be driven, and a vertically-movable part or drift resting upon the object to be driven and arranged in the path of the reciprocating plunger of the engine, whereby the recoil of the engine is rendered effective.

10. In an electric pile-driving machine, a reciprocating electric engine having a metallic exterior envelope, suspending devices at its upper end and feet at its lower end, a central aperture between the feet, a loose part or drift movable in the aperture and resting upon the object to be driven, a magnetic plunger for the engine, and a non-magnetic extension or hammer upon said plunger, said hammer adapted to strike the drift at each downward stroke.



479,966. ELECTRICAL TRANSMISSION OF POWER. CHARLES J. VAN DEPOELE, Lynn; C. A. Coffin and Albert Wahl, executors of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Original application filed May 6, 1891, Serial No. 391,799. Divided and this application filed Sept. 24, 1891. Serial No. 406,741. (No model.)

Claim.—1. A system of electrical distribution comprising a source of supply-current of relatively high potential, a motor-armature, a generator-armature wound to produce currents of the desired potential below that of the supply, a sectional commutator, main stationary brushes and auxiliary moving brushes, and connections between said main and auxiliary brushes, and suitable working circuits whereby the high-tension supply-current is converted into currents of lower potential, part having a defined rise and fall and part of constant potential.

2. A system of electrical distribution comprising a motor-armature, a generator-armature, both of the continuous-current type and each provided with a sectional commutator, a common field-magnet, a source of supply of relatively high potential connected with the motor-armature, stationary and moving brushes on the secondary commutator, and working circuits of different character connected, respectively, with the stationary and with the moving brushes and supplied with current of different character and of modified potential.

3. A system of electrical distribution comprising a motor-armature, a generator-armature, a common field-magnet, a source of supply-current of relatively high potential connected with the motor-armature, means connected with the generator-armature for imparting a pulsating or rising-and-falling character to part of the current produced thereby, consisting of auxiliary moving commutator-brushes, a working circuit or circuits connected with the said auxiliary moving brushes, and a circuit or circuits connected with the stationary brushes and supplied with continuous current, also of modified potential.

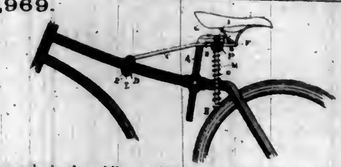
479,966.

479,967. PLASTIC COMPOSITION. RAPHAEL G. DE VAMOS, Paris, France, assignor to La Subérine, same place. Filed Dec. 22, 1891. Serial No. 415,838. (No specimens.) Patented in France Jan. 22, 1889, No. 195,535, and Feb. 25, 1889, Nos. 196,284 and 196,285; in England July 14, 1890, No. 10,982, and in Belgium Jan. 24, 1891, No. 93,532.

Claim.—1. A composition consisting of from one to two volumes of fragments or powder of cork and two to one volumes of an agglutinant composed of plaster-of-paris, dextrine, and sesquioxide of iron, substantially as herein set forth.

2. A composition consisting of one to two volumes of fragments of powder of cork and two to one volumes of an agglutinant composed of plaster-of-paris, dextrine, sesquioxide of iron, and an oxychloride, such as the oxychloride of zinc, substantially as herein described.

479,968. DUPLICATING APPARATUS. HENRY T. C. WEBB, Philadelphia, Pa. Filed Oct. 27, 1890. Serial No. 369,506. (No model.)



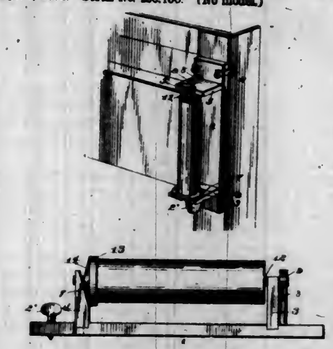
Claim.—In a duplicating apparatus, a bed, a two-part stencil-carrying frame having the pins *b*, and slotted standards having branch slots through which the pins pass to enable the frame to be removed and reversed, whereby impressions may be taken from either side of the stencil-sheet, substantially as herein described.

479,969. SADDLE FOR VELOCIPEDES. DAVID D. WRIGHT and WILLIAM R. BERRY, Peoria, Ill. Filed Feb. 11, 1892. Serial No. 421,105. (No model.)

Claim.—1. In a velocipede-saddle, the L-post A, secured in the frame of machine and having its upper horizontal portion split in halves and each having the semicircular indentations K made therein to form a circular bearing, said halves being designed to clamp together, for the purposes herein set forth and described.

2. In a velocipede-saddle, a rod C, having one end pivoted to the frame of machine and having a portion of its length flattened and having a slot cut in said flattened portion for the purposes described and carrying on its opposite free end the adjustable saddle B, substantially as herein set forth and described.

479,969.



3. In a velocipede-saddle, a rod I, clamped between the two halves of the L-post A in the manner set forth and described and provided near either end thereof with a vertical rod M, said rods being provided with spiral springs O O, supporting the bracket or support P, said springs bearing on the headed ends of the rods M M, for the purposes herein set forth and described.

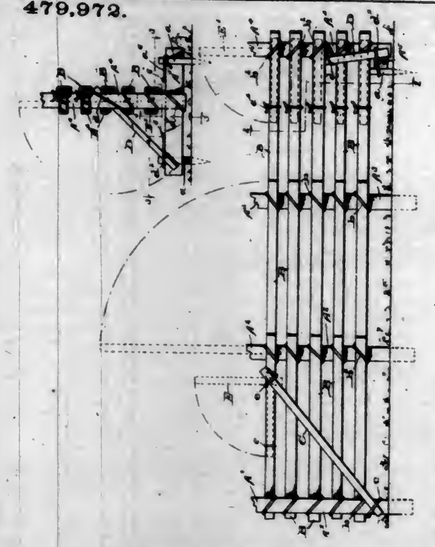
4. In a velocipede-saddle, the L-post A, secured in the frame of machine, with the upper horizontal portion split in halves and securing the rod I in the semicircular indentations K, the vertical rods secured in the ends of said rod I and passing through the bracket or support P, and the springs O, resting on the headed ends of said vertical rods M M and supporting the said bracket or support P, and the rod C, pivoted on the frame of machine, having a portion thereof flattened and provided with a slot for the purposes set forth, and said rod C resting in the supporter-bracket P and carrying on its free end the adjustable saddle B, substantially as herein set forth and described.

479,970. METHOD OF PRESERVING EGGS. EUGENE T. BURNETTE, Haywards, Cal. Filed June 9, 1892. Serial No. 436,147. (No specimens.)

Claim.—The method of preserving eggs, which consists in subjecting them to the action of the fumes or vapors arising from the combustion of a composition of matter consisting of chlorate of potash, sugar, and salicylic acid, substantially as herein described.

479,971. PAPER-HANGER. GEORGE CARR, Carrville, Iowa. Filed Apr. 7, 1892. Serial No. 428,150. (No model.)

Claim.—In a papering device of the character set forth, the combination of a frame or support having clamps at one end and a thumb-screw at the other, standards extending from said frame or support, one of which is provided with a slot and the other with an aperture, a roller removably engaging said standards, and a spring-catch extending outward adjacent to one of said standards and engaging one end of the roller, substantially as described.



479,972. FENCE. HERMAN CARTER, Lilly Chapel, Ohio, assignor to Cyrus Crabbs, Toronto, Canada. Filed Aug. 29, 1889. Serial No. 322,386. (No model.)

Claim.—1. The combination of the posts, rails, fastening-wires passed around the rails and the posts, and the horizontal brace-arms having one end engaged with the fastening-wire and the other secured to the rails, substantially as set forth.

2. The combination, with the ends of fence-rails where the fence terminates and the end post by which said rails are supported, of wires b^3 and locking-levers E' and fasteners for said locking-levers, whereby the end of the fence is finished and held in place.

3. The combination, in a fence, of the posts, the rails secured thereto by wires passing around them and the posts, braces C, extending longitudinally of said fence, lateral braces D, and locking-levers E and E', all substantially as shown and described.

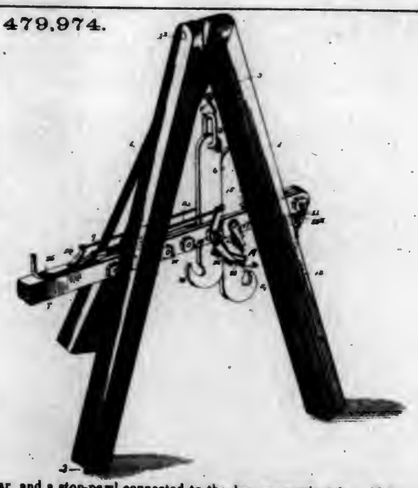
479,972.

479,973. DOOR FOR REFRIGERATORS. RODNEY G. CHASE, Elsdon, Ill. Filed Apr. 30, 1892. Serial No. 431,373. (No model.)

Claim.—1. The packing for a door, consisting of a rigid strip faced with a yielding material, springs at the back of said strip, said strip and springs being located in a recess at the meeting edges of the door or jamb, and a strip of canvas or like flexible material covering over said recess, substantially as described.

2. The packing for a door, consisting of a strip hinged at one edge and faced with a yielding material, springs at the back of said strip, said strip and springs being located in a recess at the meeting edges of the door or jamb, and a strip of canvas or like flexible material covering over said recess, substantially as described.

3. The packing for a door, consisting of a strip having a hinge consisting of a wire folded in to one edge and staples driven over said wire, said strip being faced with a yielding material, springs at the back of said strip, said strip and springs being located in a recess at the meeting edges of the door or jamb, and a strip of canvas or like flexible material covering over said recess, substantially as described.



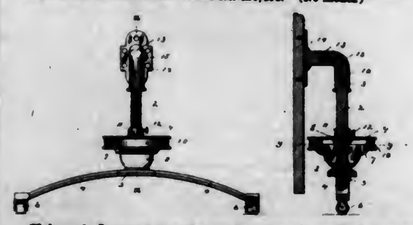
479,974. STUMP OR ROCK EXTRACTOR. OSCAR S. DISTRICK, Weatherly, Pa., assignor of one-half to Allen G Swartz, same place. Filed May 21, 1892. Serial No. 433,869. (No model.)

Claim.—1. In a stump or rock extractor, the combination of a support, a lever suspended from said support, a ratchet-bar freely movable through said lever, pull and stop pawls engaging the said ratchet-bar, arms controlling the engagement of said pawls with the said ratchet-bar, and a lever connected to said arms and adapted to be oscillated in a horizontal plane to alternately operate said arms, substantially as set forth.

2. In a stump or rock extractor, the combination of a suspended lever having a counterpoise weight secured thereto, a ratchet-bar freely movable through the said lever, pull and stop pawls engaging the said ratchet-bar, lifting-arms adapted to control the engagement of the said pawls, rods connected to said arms at their forward end, and a horizontally-disposed lever pivotally connected to the aforesaid lever and having the rear ends of said rods attached thereto, substantially as described.

3. In a stump or rock extractor, the combination of a lever freely suspended from a support and having a counterbalancing-weight attached thereto, a vertical bar to which said lever is pivotally connected and attached only at one point, a ratchet-bar freely movable through said lever, a pull-pawl connected to said lever and engaging said ratchet-bar, and a stop-pawl connected to the bar supporting the said lever, all arranged and operating substantially as described.

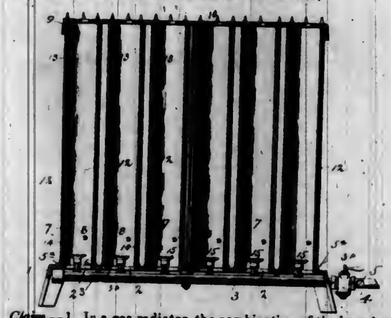
479,974.



4. In a stump or rock extractor, the combination of the supporting-legs, a bar suspended from said legs, a lever pivotally connected to said bar, a ratchet-bar freely movable through said lever, the said bar and ratchet-bar having lower hooked ends, a pull-pawl connected to said lever and engaging said ratchet-bar, a stop-pawl connected to said bar, and also engaging the ratchet-bar, lifting-arms secured to said lever and controlling the engagement of the pawls with the said ratchet-bar, rods connected to said lifting-arms, a horizontally-disposed lever pivotally connected to the aforesaid lever to which said rods are also attached, and a counterbalancing-weight attached to the front end of the said lever, substantially as described.

479,975. ENVELOPE-SEAL. HENRY DENIS, New Orleans, La. Filed June 10, 1891. Serial No. 396,518. (No model.)

Claim.—A permanent fastening for envelopes and wrappers, consisting of an outer member constructed of thin metal in the form of a single disk or plate having peripheral prongs or clips and a stud formed with a shank or stem and a head or knob of plano-convex shape, and the inner member constructed of thin metal in the form of a single disk or plate having peripheral prongs or clips, a hole or orifice registering with the stud, slots or slits, and inbent flexible lips by which the head or knob of the stud is guided into position and held permanently from withdrawal, substantially as described.



479,976. ANT OR INSECT GUARD. JONATHAN ELWOOD, Sanger, Cal. Filed Apr. 16, 1892. Serial No. 429,408. (No model.)

Claim.—1. In an ant-trap, the combination of a cup having a channel concentrically surrounding the upper edge thereof and a standard centrally arising from said cup and projecting above the same, a socket to engage the upper end of said standard, a flanged lid adjustably mounted on said standard, and arched arms secured to the bottom of said cup and having casters in the ends thereof, substantially as described.

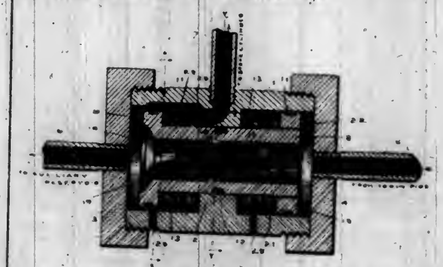
2. In an ant-trap, the combination of a cup having its channel concentrically surrounding the upper edge thereof and a standard centrally rising from said cup and projecting above the same, the upper end of said standard being tapered, a socket secured to the device to which the attachment is applied and having a conical opening to receive the tapered end of said standard, a flanged lid movably secured on said standard, and arched arms connected to the lower part of said cup and having casters in the ends thereof, substantially as described.

479,977. GAS-RADIATOR. WILLIAM J. FRAHER, New York, N. Y. Filed Feb. 23, 1892. Serial No. 422,493. (No model.)

Claim.—1. In a gas-radiator, the combination of the base having a series of apertures, the gas-pipe connected with said base and located below the apertures, the vertical tubes aligned with said apertures and their lower ends resting on said base, the casings surrounding said tubes or pipes, having apertures near their upper and lower ends, the cap-plate having a series of openings resting upon the upper ends of said tubes and casings and connected with the base, and the burners connected with the gas-pipe and projecting up through the apertures in the base, substantially as described.

2. In a gas-radiator, the combination of the base having a series of apertures, the gas-pipe located below said base, the open-ended vertical pipes resting on said base, having apertures near their lower ends, the casings surrounding said pipes resting upon said base and provided with apertures near their upper and lower ends, the cap-plate resting upon said pipes and casings, provided with a series of openings and connected with the base, and the burners connected with the gas-pipe and projecting up through the apertures in the base, substantially as described.

3. In a gas-radiator, the combination of the base having apertures therein, the open-ended vertical pipes resting on said base, the casings surrounding said pipes also resting on said base and provided with apertures near their upper and lower ends and inwardly-projecting integral tongues near their upper ends, the cap-plate resting on said pipes and casings, provided with a series of apertures and connected with the base, and the gas-pipe located below the base and provided with a series of burners projecting up through the apertures in the base, substantially as described.



4. In a gas-radiator, the combination, with the base having a series of apertures therein and surrounding annular grooves and bosses, of the open-ended vertical pipes having their lower ends resting in said grooves, the casings surrounding said pipes, with their lower ends resting upon said bosses, the cap-plate having openings resting upon said pipes and casings and connected with the base, the gas-pipe located below said base, and the burners connected with said pipe, projecting up through the apertures in the base, substantially as described.

5. In a gas-radiator, the combination, with the base having a series of openings or apertures therein, the vertical pipes and casings having apertures seated upon said base, and the cap-plate seated upon said pipes and casings and connected with the base, of the gas-pipe located underneath the base, provided with a stop-cock and having a series of burners projecting up through the base, the jet-pipe parallel with said gas-pipe, and the jet-burners connected with the jet-pipe, substantially as described.

6. In a gas-radiator, the combination, with a base having apertures therein, the connected cap-plate, and the open-ended vertical tubes interposed between the cap-plate and base, of the gas-burners located in the lower ends of said pipes and connected with a gas-supply pipe, said burners consisting of the disk, the rim provided with peripheral perforations, the flaring bottom, and the pipe connecting it with the gas-pipe, substantially as described.

479,978. VALVE FOR AIR-BRAKES. WILLIAM M. GILMORE, Boggstown, Ind. Filed Oct. 30, 1891. Serial No. 410,368. (No model.)

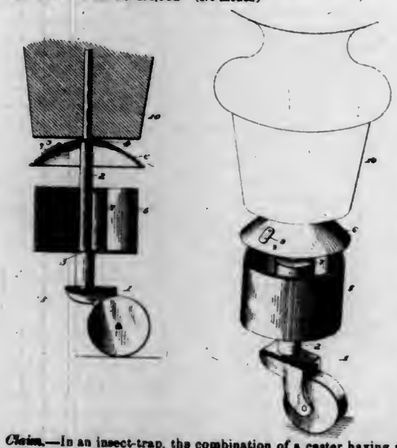
Claim.—1. A regulating-valve for air-brake mechanism, comprising a cylinder, an inlet from the train-pipe, connected at one end thereof, a similar pipe connected at the opposite end, leading to the auxiliary air reservoir, a pipe leading to the brake-cylinder, a central rib in such main cylinder, a piston-valve moving therein having springs between the end flanges of the valve and on each side of the rib for holding the valve normally in an operative position, such main valve provided with a central bore, an auxiliary valve working in such bore and having openings to admit the passage of air through to the auxiliary reservoir, such cylinder also provided with ports for permitting the passage of air to the brake-cylinder, exhaust-ports for permitting the escape of the compressed air from such cylinder on one side of the main valve, and an air-vent opening into the cylinder on the train-pipe side thereof, substantially as shown and described.

2. A regulating-valve for air-brake mechanism, comprising a cylinder, its ends closed by caps, an inlet from the train-pipe passing through one cap into the cylinder, a similar pipe from an auxiliary reservoir passing through the opposite cap and connecting with the air-space in the cylinder, such cylinder also provided with an outlet-pipe leading to the brake-cylinder, exhaust-ports connected with the air-chamber at one end of the cylinder, an air-vent connecting with the chamber at the opposite end so as to facilitate the movement of the valve, a piston-valve provided with the usual packing moving in such cylinder and having springs mounted upon its valve-stem bearing against the flanges of the valve on one side and against a rib centrally formed in such cylinder on the other, whereby the valve is normally held in such position that the ports leading to the brake-cylinder and to the exhaust are kept closed, an auxiliary valve working through the main valve having holes bored centrally through it to admit the passage of air, such valve located in line with the openings to the train-pipe and auxiliary reservoir and having its seat in the flange of the main valve adjacent to the opening to the auxiliary reservoir, and a spring mounted on the valve-stem of such auxiliary valve for normally holding it to its seat, such auxiliary valve adapted to be opened by a preponderance of pressure in the train-pipe over that of the auxiliary reservoir and automatically closed when there is no such preponderance, both valves being shorter than the cylinder, whereby the excess of pressure on either side the main valve is adapted to operate the same, opening and closing the ports leading to the brake-cylinder, all combined substantially as shown and described.

3. A regulating-valve for air-brake mechanism, comprising a cylinder, its ends closed by suitable caps, an inlet from the train-pipe connected through one cap to an outlet-pipe to an auxiliary reservoir connected through the other cap, a piston-valve working in such cylinder normally held in position by the pressure of springs coiled upon its stem so as to close the exhaust and inlet ports to the brake-cylinder, such valve centrally bored, a smaller valve working in such bore, having holes to admit the passage of air through it to the auxiliary reservoir and normally held closed by the pressure of a spring coiled upon its stem, exhaust-ports leading from the chamber at one end of such cylinder, and an air-vent leading from the chamber at the opposite end thereof, in combination with suitable main and auxiliary air-reservoirs and a brake-cylinder, substantially as shown and described.

479,979. SPRINKLING APPARATUS. GEORGE S. GLENN, Nashville, Tenn. Filed Jan. 5, 1891. Serial No. 376,696. (No model.)

Claim.—1. In a sprinkling apparatus, the combination of a pipe arranged along the surface to be sprinkled, connections between said pipe and a source of water-supply, and a plurality of convex-faced sprinklers in said pipe projecting above the surface to be sprinkled and provided with outwardly-tapering openings upon their lower portions to throw the water downwardly and unperforated upon their upper portions, the two portions of the sprinkler having a hinged connection to each other, substantially as described.

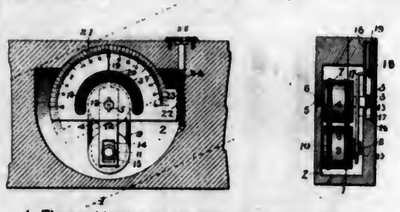


2. The combination, with pipe A, of the sprinkler F, connected to said pipe and inclined upwardly and toward the surface to be sprinkled, the lower portion of the face of said sprinkler being perforated and its upper portion unperforated, the two portions of the sprinkler having a hinged connection to each other, whereby access may be had to its interior, substantially as described.

479,979.

3. In a sprinkling apparatus, the combination of a sprinkler the face whereof is made in two parts having a hinged connection to each other, whereby the interior of the sprinkler may be exposed for cleaning, one of said parts being perforated and the other unperforated, substantially as described.

479,980. CASTER. WILLIAM GORDON, Stubbs, Tex. Filed Apr. 29, 1892. Serial No. 431,144. (No model.)



Claim.—In an insect-trap, the combination of a caster having an elongated stem provided with upper and lower annular supporting-shoulders, a poison-receptacle having a central opening in its bottom to receive the stem and provided with a central vertical tube having a top provided with an opening receiving the stem, said receptacle being supported by the lower shoulder, and a concavo-convex shield supported by the upper shoulder and arranged over the mouth of the receptacle and provided with a filling-orifice and having a pivoted cover to cover the same, substantially as described.

479,981. PLUMB-LEVEL. JAMES F. HALL, Kansas City, Mo., assignor of one-fourth to Thomas B. Buckner, same place. Filed Aug. 18, 1891. Serial No. 403,018. (No model.)

Claim.—1. The combination of the stock, the upper disk secured to the stock, the lower disk suspended from the upper disk, the dial-plate having a slot, and the link supported on the shaft, connected with the lower disk, and having an index-finger projecting through the slot, substantially as described.

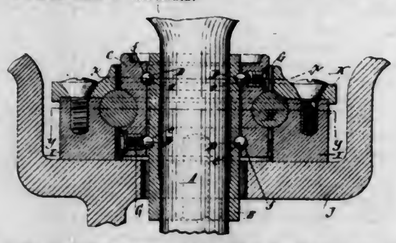
2. The combination of the stock, the upper grooved disk, the lower grooved disk having an extension, the cords by which the lower disk is suspended from the upper disk, the dial-plate having a slot, and the link supported on the shaft, having a slot by which it is connected to the extension of the lower disk, and provided with an index-finger projecting through the slot of the dial-plate, substantially as described.

3. The combination of the stock 1, disk 4, secured rigidly to said stock, a movable disk in connection with said stationary disk, a link connecting said disks, an index-finger secured to said link, and a suitable scale secured to said stock, substantially as described, and for the purpose set forth.

4. The combination of the stock 1, stationary disk 4, having its periphery grooved, a movable disk 9, having its periphery grooved, a flexible support resting in said grooves and supporting disk 9, a link connecting said disks, an index-finger on said link, and a scale secured to said stock, substantially as described, and for the purpose set forth.

5. The combination of the stock 1, pivoted link 12, having its lower end weighted, an index-finger 19 on the upper end of said link, a dial-face 16, having an opening 18, and a scale 21, said dial-face being provided with grooves 22, with which a screw 24 engages for adjusting the same, substantially as described, and for the purpose set forth.

479,982. DEVICE FOR MEASURING SHOT. JOHN M. HEATH, Talbotton, Ga. Filed Apr. 23, 1892. Serial No. 430,351. (No model.)



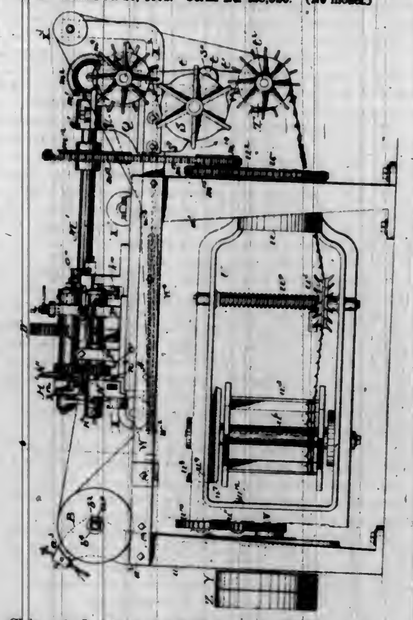
Claim.—1. A rotatable compartment-cylinder having radial projecting arms for rotating it, combined with a gravity locking device engaging any of said arms, and a top and bottom plate having openings, as set forth.

2. The combination, with the cylinder with its compartments, projections, and top and bottom plates with openings, of a bifurcated gravity locking device engaging any of said arms for said cylinder, as set forth.

3. The device described, consisting of the cylinder having compartments and radial projecting arms for revolving it and a top and bottom plate with openings arranged as described, and a pivoted weighted locking device having bifurated ends to receive any one of said projections, substantially as specified.

479,983. JOURNAL-BOX. JOHAN L. JÖNSSON, Stockholm, Sweden, assignor to the Aktiebolaget Separator, same place. Filed Nov. 23, 1891. Serial No. 412,767. (No model.)

Claim.—The combination, with the spindle, of a bushing surrounding the same, a sleeve surrounding the bushing, anti-friction balls interposed between the sleeve and the bushing, a fixed frame surrounding the sleeve, and an elastic support interposed between the sleeve and the frame, substantially as set forth.



479,984. BALE-TIE. RAMON KILNER, Newburg, N. Y. Filed Feb. 10, 1892. Serial No. 420,996. (No model.)

Claim.—1. A wire bale-tie having a hooked end for engaging the other end of the tie and provided at such hooked end with an auxiliary catch or lock which is securely held by such hooked end.

2. The bale-tie A, having the end *a*, formed with a hook a^1 and provided with the auxiliary catch or lock consisting of a ring B, securely held by such hook, as set forth.

479,985. BARB-WIRE MACHINE. IRVING A. KILNER, Newburg, N. Y. Filed Feb. 29, 1892. Serial No. 423,220. (No model.)

Claim.—1. In a barb-wire machine, the combination of a reel at one end of the traverse of the main wire, a guide-wheel at the other end of such traverse, devices for placing barbs upon the main wire, located between such reel and guide-wheel, and means, such as described, for binding the guide-wheel resiliently against the main wire, whereby such main wire is kept at uniform tension and with a steady feed, as set forth.

2. In a barb-wire machine, the combination of a coiling-head provided with a coiling-pin and a passage for the wire to be barbed, of a barbing mechanism and a barb-pusher whereby when the barb is formed it is pushed along the line-wire out of the way of the coiling-pin, as set forth.

3. The coiling-head provided with the coiling-pin and the tubular guide provided with the tubular nipple or barb-pusher e^3, which projects from the coiling-head, as set forth.

4. The tubular guide and its tubular nipple or barb-pusher e^3, in combination with the collar G, the yoke H, and means, substantially as set forth, for operating said yoke.

5. The combination of the tubular guide E and its nipple or barb-pusher e^3 with the collar G, the yoke H, the fork h^7 of which yoke clasps the collar G, the bevel-wheel h^9, held by the yoke H, and the cam-wheel H', as set forth.

6. The combination of the tubular guide E and its tubular nipple e^3 with the collar G, having the groove g', the pivoted yoke H, having the fork h^7, which clasps the collar G in the groove g', and the double arm h^4, the bevel-wheel h^9 in such double arm h^4, the cam-wheel H', and the spring h^{10}, as set forth.

7. In a barb-wire machine, the combination of the tubular wire-guide E, the collar G, surrounding such guide, the standard f, placed in front of such guide and collar, and the adjustable thimble F, secured in such standard in line with the guide E, such guide having its front end e^3 fitting loosely in such thimble, as set forth.

8. The combination of the box C and the wheel D therein and provided with the recess d^3 and face-plate d^5 with the block c^2 and the coiling-pin D^2, projecting from the said block through the face plate, the tubular guide E, and the nipple or barb-pusher e^3, which latter projects through the block c^2 and the face-plate d^5, as set forth.

9. The combination of the box C and the wheel D therein, provided with the face-plate d^5, with the tubular guide E, with the wheel D, and the nipple or barb-pusher e^3, projecting from said wheel, as set forth.

10. The combination of the block K, having the knife k^2, and the lever L, pivoted thereon, carrying the knife l^2 and having the forked end l^3, with the cam-wheel M and the shaft M', as set forth.

11. In a barb-wire machine, the main-wire take-up, which consists of a continuously-driven rotating shaft provided with a crank-pin provided with a loosely-turning wheel, on which the wire bears during the entire rotation of the shaft, as set forth.

12. In a barb-wire machine, the combination of the mechanism for placing the barb upon the main wire and the mechanism for drawing forward such line-wire after it is barbed with a main-wire take-up interposed between the same, which consists in a shaft provided with a crank-pin at one end, on which the pressure of the main wire is taken during the entire rotation of the shaft, as set forth.

13. The combination of the disk m^3, having the pin r', the wheel R, loose on said pin, the shaft m^2, carrying said disk, the shaft M', and intermediate gearing between the two shafts, as set forth.

14. In a barb-wire machine, the combination of the reel, its operative mechanism, and a brake therefor with a wheel over which the main wire passes to the reel and intermediate mechanism between such wheel and brake, whereby such brake is automatically affected by the traverse of the wire over the wheel, as set forth.

15. The combination of the reel w^2, the reel and twister-frame supporting the same, the wheel V upon the stud of said frame, the intermediate gearing between the reel and the wheel V, a brake for said wheel V, a wheel over which the main wire passes to the reel, and intermediate mechanism between such wheel and brake, whereby such brake is automatically affected by the traverse of the wire over the wheel, as set forth.

16. The combination of the reel w^2 and the train of mechanism for operating the same, one member of which is provided with a brake, with the loose wheel T and its supporting-arm t', the last connected with said brake, as set forth.

17. The combination of the reel w^2 and its operating mechanism, one member of which is provided with a brake having the lever v^{10}, with the wheel T, its supporting-arm t', the rod W, connecting the said arm with the said handle, the nut w^3 on the rod, the lug w^5 on the machine-frame, and the spring w^4 on the rod W and bearing between the lug-nut w^3 and the lug w^5, as set forth.

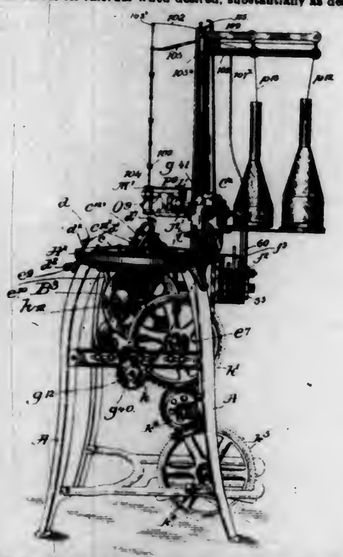
18. The combination of the reel w^2 and its operating mechanism, one member of which is provided with a brake, with the wheel T and its supporting-arm t', connected with such brake, the positively-driven wheel S, and the main-wire take-up R, as set forth.

479,986. KNITTING-MACHINE. ROBERT W. KING, Montreal, Canada. Filed Oct. 20, 1891. Serial No. 409,306. (No model.)

Claim.—1. In a knitting-machine, a conical needle-bed having an annular projection or rim extended around its surface near its smaller end to support a sinker-actuating ring, substantially as and for the purpose specified.

2. In a knitting-machine, a conical needle-bed having an annular projection or rim upon its surface to support a sinker-actuating ring and provided with an annular recess or groove above said rim and outside the bed to receive a wire, upon which the sinkers may be fulcrumed, substantially as and for the purpose specified.

3. In a knitting-machine, a conical needle-bed having an annular projection or rim and an annular recess or groove for the support of the sinker-fulcrum, and a sinker-fulcrum, combined with a series of sinkers and a sinker-actuating ring mounted on the said rim, to operate substantially as described.



4. In a knitting-machine, a conical needle-bed having a series of needle-grooves and a series of grooves between them to receive sinkers, combined with a fulcrum-wire supported by the said bed near its outer side and with a series of sinkers made as levers of the first order and mounted on the said fulcrum-wire, substantially as described.

5. In a knitting-machine, a conically-shaped needle-bed having a supporting-rim upon its upper side for the reception of a sinker-actuating cam and having at its inner side at a distance from its lower end a cylindrical neck, to operate substantially as described.

6. A conical needle-bed having a rim erected thereon between its ends and shaped to constitute a guide for a sinker-actuating cam-ring, said bed being grooved and slotted, as described, for the reception of needles and sinkers, a sinker-actuating cam-ring mounted and made movable and rotatable upon the said rim about said needle-bed, and a fulcrum-wire A^9, supported upon the outer side of the said bed in said

annular groove, combined with a series of sinkers having each a slot or projection at one edge between its ends to slip over or embrace the said fulcrum-wire and having at one end a hook or point and below it a breast and having its other end located at a point below said fulcrum-wire and shaped to be acted upon by said sinker-actuating cam-ring, to operate substantially as described.

7. A conical needle-bed having a rim erected thereon between its ends and grooved and slotted, as described, for the reception of needles and sinkers, a fulcrum-wire supported upon the outer side of the said bed near said rim, and a series of sinkers having a slot or projection at one edge between its ends to slip over or embrace the said fulcrum-wire and having hooks or points, combined with a sinker-actuating ring mounted and made movable upon the said rim and provided with a removable portion, whereby any sinker may be readily withdrawn from its fulcrum when desired, substantially as described.

8. A sinker having at one end a breast curved as described and a hook and at one edge between its ends an open slot to co-operate with a fulcrum and shaped at its other end to be engaged and vibrated about its fulcrum by a cam, substantially as described.

9. A stationary conical needle-bed having a cylindrical shank connected therewith between its upper and lower ends and projecting at some distance below the lower end of the bed, combined with a friction-ring surrounding the said shank to rotate thereon and a cam-ring attached to the periphery of the said friction-ring and gearing to engage and move the said cam-ring, substantially as described.

10. A conical needle-bed having a projecting rim slotted for the reception of the needles, the said bed being also slotted for the reception of a series of sinkers, combined with a fulcrum-wire and a series of sinkers having slots to embrace the said fulcrum-wire, and with a sinker-actuating ring to act upon the outer ends of the sinkers to vibrate them and at the same time keep the sinkers seated upon the fulcrum-wire, substantially as described.

11. In a knitting-machine, a needle-bed having projections to serve as a rim or support for a sinker-actuating cam, said needle-bed being grooved for the reception of a series of needles and slotted through at its upper end, as at A^4, between adjacent needle-grooves for the reception and guidance of a series of sinkers, substantially as described.

12. In a reversible knitting-machine, a cam-ring having knitting and non-knitting grooves and right and left hand guiding-gates located in proximity to the junction of the said grooves, combined with an oscillating directing-cam pivoted between the points of the said guiding-gates and devices to actuate said gates automatically, to operate substantially as described.

13. In a reversible knitting-machine, a cam-ring having knitting and non-knitting grooves and its guiding-gates, combined with an angular oscillating directing-cam movable with said ring and a friction device to steady the movement of the said directing-cam, substantially as described.

14. In a reversible knitting-machine, a cam-ring having knitting and non-knitting grooves and knoodle-guiding gates, combined with an oscillating directing cam fixed to a stem suitably journaled with relation to the cam-ring and provided with a stop by which the oscillating movement of the directing-cam is restricted, substantially as described.

15. In a knitting-machine, the combination, with a cam-ring and its main drawing-down cam, of a co-operating yielding false face located near the acting-edge of said cam, to operate substantially as described.

16. A knitting-machine containing the following instrumentalities, viz: a conical needle-bed, a conical cam-ring having knitting and non-knitting grooves and needle elevating and depressing cams suitable for roundabout or circular and reciprocating knitting, and a directing-cam and guiding-gates and actuating devices to automatically operate the said gates during reciprocating knitting for narrowing and widening, substantially as described.

17. The cam-ring having knitting and non-knitting grooves and its attached right and left hand guiding gates and lever for moving said gates, combined with a cam-controlled device to move said lever, substantially as described.

18. The cam-ring having knitting and non-knitting grooves and attached right and left hand guiding-gates, combined with a cam and means between it and the said gates to actuate the latter and means to automatically actuate said cam, substantially as described.

19. A knitting-machine containing the following instrumentalities, viz: a needle-bed to contain a series of needles, a cam-ring having knitting and non-knitting grooves and adapted to actuate the said needles, the said cam-ring carrying right and left hand guiding-gates and having a directing-cam pivoted between them, a gate-moving cam located outside the said bed, tripping-pins to actuate automatically the said cam, and means between the gate-moving cam and gate to actuate the latter, substantially as described.

20. In a reversible knitting-machine, a cam-ring having knitting and non-knitting cam-grooves, right and left hand guiding-gates located in proximity to the junction of the said grooves, a lever connected to the said gates, a cam-wheel having a locking-block and adapted to move the said gate, combined with a spring to act against the block and hold the cam in position, substantially as described.

21. In a knitting-machine, the combination, with a cam-ring having knitting and non-knitting grooves and right and left hand guiding-gates and a lever for moving the same, of a cam-wheel, substantially as described, having two radial grooves and cam projections for positively moving the said lever, substantially as described.

22. A knitting-machine containing the following instrumentalities, viz: a needle-bed containing a series of needles, a surrounding cam-ring having knitting and non-knitting grooves and guiding-gates at its inner side and drawing-down and elevating cams, a gate-controlling cam located outside the cam-ring, means to reciprocate the cam-ring, connections between the gate-controlling cam and gates, tripping-pins, stop rings or racks, and means to automatically move them to move the said tripping-pins and put them into proper positions to operate the gate-controlling cam at the proper time to actuate the gates, as and for purposes set forth, during reciprocating knitting.

23. A knitting-machine containing the following instrumentalities, viz: a conical needle-bed having a projecting rim, a series of needles, and a series of sinkers supported upon the outer side of the said conical bed, a sinker-actuating ring mounted upon the said rim and adapted to actuate the sinkers, a cam-ring having knitting and non-knitting grooves and right and left hand guiding-gates and a director and drawing-down and elevating cams, a gate-controlling cam located outside the cam-ring, means to operate the sinker-actuating ring from the cam-ring, as described, means to reciprocate the cam-ring, connections between the gate-controlling cam and gates, tripping-pins, stop rings or racks, and means to automatically move them to move the said tripping-pins and put them into proper positions to operate the gate-controlling cam at the proper time to actuate the gates, as and for the purposes set forth, during reciprocating knitting.

24. A knitting-machine containing the following instrumentalities viz: a stationary needle-bed to contain a series of needles, a rotating cam-ring having a removable drawing-down cam, an annular raceway presenting a level track and entirely surrounding the said cam-ring, means to move the raceway vertically, and connections between the said raceway and the said drawing down cam, whereby the change in vertical position of the raceway effects the shortening and lengthening of the stitches, substantially as described.

25. A knitting-machine containing the following instrumentalities, viz: a stationary conical needle-bed to receive a series of needles, a rotating cam-ring containing a movable drawing-down cam, an annular vertically-movable raceway entirely surrounding the said cam-ring and presenting a level surface to constitute a track, and a lever carried by the cam-ring and having one end connected with the drawing-down cam and its other end adapted to ride upon the said raceway, substantially as described.

26. A sinker made as a lever of the first order and having a hook with a curved breast below and slotted at its under side and having a curved rear end notched, as described.

27. A knitting-machine containing the following instrumentalities, viz: a stationary needle-bed adapted to receive a series of needles, a rotating cam-ring provided with a movable drawing-down cam, an annular raceway entirely surrounding said cam-ring and having a smooth level top, means between the said raceway and drawing-down cam to actuate the latter according to the changing positions of the raceway, a pattern-surface, and intermediate connections between it and the said raceway to automatically move the same and thereby effect the regulation of the length of the stitches, substantially as described.

28. In a knitting-machine, a raceway made as a smooth-topped ring having supports whereby the raceway may be moved vertically as it is partially rotated, as described, combined with a pattern-surface, a monitor-lever, and adjustable connections between it and the said raceway, to operate substantially as described.

29. A knitting-machine containing the following instrumentalities, viz: a needle-bed grooved for the reception of needles, a surrounding cam-ring having knitting and non-knitting grooves and right and left hand guiding-gates, a directing-cam located between said guiding-gates, a gate-controlling cam located outside the said cam-ring and made movable with it in its reciprocations and rotations, devices intermediate the said cam-ring and the said guiding-gates, a yoke connected with the hub of the said cam, a controller and two rings having each a tripping-pin, and means to automatically move it to put the said controller into position to enable the said cam to be put into operative position or to be put out of operative position with relation to the said tripping-pins, substantially as described.

30. In a knitting-machine, the combination, with a conically-shaped needle-bed having grooves for the reception of a series of needles, of a thread-support and latch-guard located above the smaller end of the said bed in proximity to the hooks of the needles, the said combined support and latch-guard receiving the thread upon its outer surface and delivering it to the needles, substantially as described.

31. In a knitting-machine, a conically-shaped needle-bed, in combination with a latch guard suspended over the needles and a thread-guide adapted to direct the thread onto the outside of the latch-guard, the latter having a suitable projection to prevent the thread slipping above it, substantially as described.

32. In a knitting-machine, a conical needle-bed and a latch-guard suspended above it to surround the upper ends of the needles, the said guard having a suitable support, combined with an independent thread-guide adjustably connected to the cam-ring, substantially as described.

33. The combination, in a knitting-machine, with a conical needle-bed, a cam-ring, and a series of needles projecting above the said needle-bed, of a thread-guide and means interposed between the said thread-guide and the said needles to prevent the contact of the thread between the knitting-point and the thread-guide with the needles when rotating the machine and the said needles are not knitting, substantially as described.

34. In a knitting-machine, a needle-bed having projections to serve as a rim or support for a sinker-actuating cam, said needle-bed being grooved for the reception of a series of needles and slotted through at its upper end, as at A^4, between adjacent needle-grooves for the reception and guidance of a series of sinkers, said needle-bed being also provided with an annular groove A^5, located between the said rim or support and the upper end of the said cylinder and intersecting the said sinker-slots, combined with a series of sinkers and a pivotal wire A^6, placed in said annular groove to constitute fulcra for the series of sinkers, substantially as described.

35. In a knitting-machine, a cam-cylinder, two freely-movable rings having tripping-pins supported by the said cylinder, and two stop rings or racks mounted on the bed-plate of the machine, each ring or rack having gear-teeth and being provided with adjustable stops, between which are received the said tripping-pins, combined with pinions to remove the said rings or racks, to operate substantially as described.

36. In a knitting-machine, a cam-cylinder, two freely-movable rings having tripping-pins supported by the said cylinder, and two stop rings or racks mounted on the bed-plate of the machine, each ring or rack having gear-teeth and being provided with adjustable stops, between which are received the said tripping-pins, combined with pinions to move the said rings or racks and with means, substantially as described, to intermittingly operate the said pinions, to operate substantially as described.

37. In a knitting-machine, a cam-cylinder, two freely-movable rings b b', having tripping-pins supported by the said cylinder, and two stop rings or racks mounted on the bed-plate of the machine outside the said rings b b', each ring or rack having gear-teeth and being provided with adjustable stops, between which are received the said tripping-pins, combined with pinions to move the said rings or rack, means, substantially as described, to intermittingly operate the said pinions, and locking devices for the said pinions, to operate substantially as described.

38. In a knitting-machine, a stop ring or rack having teeth, a movable ring, as b', having a tripping-pin b^4 and a pinion to actuate the same, and a change-wheel carried by the said pinion, combined with a reciprocating frame having two pawls and with means to reciprocate the said frame, to operate substantially as described.

39. In a knitting-machine, a stop ring or rack having teeth and a pinion to actuate the same, and a change-wheel carried by the said pinion, combined with a reciprocating frame having two pawls, means to reciprocate the said frame, and devices to control the position of the said frame to enable one or the other of its pawls to engage the change-wheel, to operate substantially as described.

40. In a knitting-machine, a stop ring or rack having teeth and a pinion to actuate the same, and a change-wheel carried by the said pinion, combined with a reciprocating frame having two pawls, means to reciprocate the said frame, and means to change the position of the said frame to enable one or the other of its pawls to actuate the change-wheel or keep both pawls from engagement with the change-wheel, substantially as described.

41. In a knitting-machine, a stop ring or rack having teeth, a pinion to actuate the same, a movable ring, as b', having a tripping-pin, as b^4, and a change-wheel carried by the said pinion, combined with a reciprocating frame having two pawls, means to reciprocate the said frame, and a locking rod or bar to engage and lock the change-wheel, substantially as described.

42. In a knitting-machine, the shaft A^{13}, having a pinion k^7, means to both reciprocate and rotate the said shaft, gears k^8 k^9 in engagement with the gear k^7, and cams k^{10} k^{11}, combined with pawl-carrying frames actuated by the said cams and pinions, stop rings or racks, and change-gears, to operate substantially as described.

43. In a knitting-machine, the combination, with a pair of reciprocating frames having pawls and slotted as described, of the eccentrics, their attached gears, a double quadrant, a pattern-surface, and intermediate connections whereby the said quadrant may be moved to rotate the said gears and eccentrics and move the pawl-carrying frames, so that one or the other of their pawls may be in operative position, substantially as described.

44. In a knitting-machine, the reciprocating pawl-frame, its actuating-cam, and the leg depending from the pawl-frame and provided with a projection, combined with a stilt to keep the pawl-frame elevated at desired times, substantially as described.

45. The shaft A^{13}, its gear B^2 and pinion A^{10}, and gear-wheel A^3, provided with a reciprocating plate having a locking-stud, combined with shaft c^7, its attached notched disk, means to rotate the shaft, a vibrator mounted loosely on the said shaft and having a notch, means to actuate the said vibrator, and means to move the said plate and compel the coupling-pin to rest in the notch of the disk in order that the said disk may assume control of and rotate the said gear and shaft A^{13}, substantially as described.

46. The shaft A^{13}, its gear B^2 and pinion A^{10}, and gear-wheel A^3, provided with a reciprocating plate having a locking-stud, combined with shaft c^7, its attached notched disk, means to rotate the shaft, a vibrator mounted loosely on the said shaft and having a notch, means to actuate the said vibrator, and means to move the said plate in a direction to cause the coupling-pin to engage the notch in the said vibrator in order that it may assume control of the said gear-wheel and effect the oscillations of the said shaft A^{13}, substantially as described.

47. In a knitting-machine, the main rotating shaft c^7, a notched disk fixed thereto, a vibrator provided with a notch and mounted loosely with relation to the said shaft, means to actuate the vibrator, a gear-wheel mounted loosely on the said shaft, a second shaft having a pinion in mesh with the said gear-wheel, a guide-plate mounted in the said gear-wheel and made movable diametrically in connection therewith, a coupling-pin carried by the said guide-plate, the latter having at one end a projection extended outside the said gear-wheel, and a spring connected with the said guide-plate, combined with a movable brake and means to actuate it to control the engagement of the said coupling-pin with either the notch in the said disk or in the said vibrator, substantially as described.

48. The shaft c^7, provided with a notched disk, a gear-wheel loosely mounted on the said shaft and provided with a diametrically-sliding guide-plate having a coupling-pin and a roller or projection at or near its end opposite the coupling-pin, a shaft or pinion thereon with which the said gear-wheel is in engagement, and a vibrator having a notch and provided with a spring-held locking-dog, combined with a shoe and with means to move the vibrator and to rotate the shaft having the notched disk, the shoe acting through the guide-plate to retain the coupling-pin in the notch of the vibrator, substantially as described.

49. In a knitting-machine, a power-shaft having a tight and two loose pulleys, and a belt-shifter adapted to control two belts, combined with a pattern or monitor chain, a monitor-lever, and connections intermediate the monitor-lever and the belt-shifter to automatically determine which of the two belts shall be put upon the tight pulley, according to whether the cam-ring is to be rotated or reciprocated, substantially as described.

50. In a knitting-machine, the shaft e^3 and shoe controlled thereby to effect the change from rotating or circular knitting to reciprocating knitting, the belt-shipper controlling the driving-belts, a monitor-lever f^3, connections between it and the belt-shipper, a toe 13 on the said monitor-lever, and a monitor-lever f, having a toe, combined with a monitor-chain whereby the belt-shipper is actuated at a slight period of time in advance of the rocking of the shaft e^3, as and for the purposes set forth.

51. In a knitting-machine, the following instrumentalities, viz: a stationary needle-bed, a series of needles therein, a rotating cam-ring having a movable drawing-down cam, a surrounding annular raceway having a smooth top or upper surface all around said ring, actuating devices between the said raceway and the said drawing-down cam, inclined supports for the said raceway, and a pattern-surface, combined with intermediate devices, substantially as described, and actuating means therefor, whereby the said raceway may be moved for the production of a slack course at times determined upon by the pattern-surface, substantially as described.

52. In a knitting-machine, the following instrumentalities, viz: a needle-bed containing a series of needles, a cam-ring having cams to reciprocate the same, a yarn-guide, and rolls between which the yarn being knitted is passed, the said yarn serving to rotate the said rolls to thereby feed a supplemental thread, substantially as described.

53. In a knitting-machine, a thread-feeding attachment containing a pair of rolls, two yarn-arms located above said rolls, and means to change their relative positions to put the yarn carried by either of said yarn-arms between the said rolls to be held thereby, substantially as described.

54. In a knitting-machine, a thread-feeding attachment containing a pair of rolls, two yarn-arms located above said rolls, and means to change the relative positions of said yarn-arms to place that one of the said yarns going to the needles out of contact with the said rolls and leave the end of the yarn not then used in knitting between and held by the said rolls, substantially as described.

55. In a knitting-machine, a shaft having yarn-passages and two yarn-arms, each having a yarn-passage for a distinct and separate yarn, combined with means to rotate the said shaft and yarn-arms, substantially as described.

56. In a knitting-machine, a shaft having yarn-passages and two yarn-arms, each having a yarn-passage for a distinct and separate yarn, combined with holding-rolls, means to rotate the said shaft and yarn arms, and means to move one of the said yarn-arms to take its yarn away from the rolls referred to, the other yarn-arm being positively brought into position to have its thread held by the said rolls, substantially as described.

57. In a knitting-machine, the combination, with rolls between which the thread is passed on its way to the yarn-guide, of cutting mechanism located between the said rolls and the usual yarn-guide to sever the thread below the rolls, substantially as described.

58. A needle-bed, a cam-ring, a yarn-guide mounted on the cam-ring, a pair of rolls located above the said yarn-guide, two yarn-arms located above the said rolls, a support for the yarn-arms, means to actuate the said yarn-arms to place one of the yarns outside of and the other between the bight of the said rolls, and a thread-cutter, to operate substantially as described.

59. In a knitting-machine, a thread-feeding device and a pair of rolls between which the yarn is held, combined with a pair of shears and with an arrow-pointed cam p^2 to close said shears, substantially as described.

60. In a knitting-machine, a thread-feeding device and a pair of rolls between which the yarn is held, combined with a pair of shears and with a suitable cam p^2 to co operate with the said shears, substantially as described.

61. In a knitting-machine, a thread-feeding device and a pair of rolls between which the yarn is held, combined with a pair of shears and with two arrow-pointed cams to co-operate with the said shears, substantially as described.

62. In a knitting machine, the following instrumentalities, viz: a needle-bed, a series of needles therein, a cam-ring to reciprocate the said needles, a yarn-guide, two vibratable yarn-arms, each provided with a yarn, a pair of rolls to engage and hold both the said yarns between the yarn-guide and yarn-arms, and means to effect the twisting of the said yarns between the said rolls and yarn-arms, substantially as described.

63. In a knitting-machine, the following instrumentalities, viz: a rotating shaft, as e^7, provided with a notched disk fixed thereto, a gear-wheel, as A^2, loose on the said shaft, a guide-plate carried by said gear-wheel and provided with a coupling-pin, a shaft A^{12}, having a pinion engaged constantly by the said gear-wheel, said shaft being provided with a bevel-gear, a needle-bed, a cam-ring having teeth in engagement with the teeth of the said bevel-gear, a vibrator loose on said shaft e^7 and having a notch, gearing and connections between said shaft e^7 and the said vibrator to reciprocate the same as the shaft is rotated, and a device to slide the said plate in the said gear-wheel to cause the said coupling-pin to engage either the notch in the said disk or the notch in the said vibrator to thereby enable the said disk or the said vibrator to assume control of and move the said gear-wheel, according as it is desired to rotate or reciprocate the said cam-ring, substantially as described.

64. A knitting-machine containing the following instrumentalities, viz: a needle-bed, a series of needles therein, a cam-ring having cams to actuate the said needles, a yarn-guide to present yarn to the needles, two guide-arms, each provided with a yarn, and a pair of rolls located between said guide arms and the yarn-guide, the said rolls receiving at times both yarns between their bight and aiding one yarn to carry the other with it toward the needles and at other times to hold the end of but one of the said yarns—viz., the one not engaged in the fabric at the needles, substantially as described.

65. A knitting-machine containing the following instrumentalities, viz: a needle-bed, a series of needles therein, a cam-ring having cams to actuate the said needles, a yarn-guide to present yarn to the needles, two guide-arms, each provided with a yarn, and a pair of rolls located between said guide-arms and the yarn-guide, the said rolls receiving at times both yarns between their bight and aiding one yarn to carry the other with it toward the needles and at other times to hold the end of but one of the said yarns—viz., the one not engaged in the fabric at the needles—means to twist together the said yarns between the said yarn-arms and rolls, and thread-cutting mechanism located and made operative below said rolls and between them and the yarn-guide to sever one or the other of the said yarns, according to which one is not then to be engaged by the needles, substantially as described.

66. The hollow shaft N', the thread-arms O^3 P^3, pivoted thereon, and the gear M', combined with means to rotate the said shaft in one and then in an opposite direction and to vibrate the said thread-arms substantially as described.

67. The rolls B^x and the hollow yarn-guiding shaft N', adapted to guide and keep separated two yarns, the center of rotation of said shaft being substantially in line with the bight of said rolls, combined with two thread-arms and with means to impart rotary reciprocatory movement to said shaft and to vibrate the said thread-arms, substantially as described.

68. The shaft K', its attached pinion, the rack and means to reciprocate it, and the segment-arm L', combined with the gear M', the connected hollow yarn-guiding shaft, its pivoted arms, and the rolls, to operate substantially as described

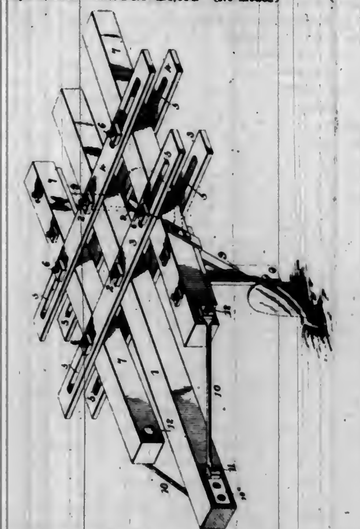
69. The take-up and a rotating shaft having passages for the yarns, combined with a series of jointed guides interposed between them, substantially as described.

70. The take-up lever provided with a quadrant at its rear end, combined with a spring adapted to be adjustably secured at different points of the quadrant, to operate substantially as described.

71. In a knitting-machine, needle-bed having a series of stationary seats, combined with a series of sinkers having their bearings when the stitch is being drawn on the said seats and means to actuate the said sinkers, substantially as described.

72. In a knitting-machine, the combination, with rolls between which the thread is passed on its way to the yarn-guide, of yarn-arms and means to move them and hold their yarns out of contact with the said rolls, as when both the yarns are to be fed to the needles, one yarn reinforcing the other, substantially as described.

73. In a reversible knitting-machine, a needle-bed adapted to receive and guide a series of needles and a needle-actuating cam ring or plate having a knitting-groove and a non-knitting groove on a level extended all around the upper edge of the said ring and adapted to receive the butts of the said needles and maintain them in correct position not only for all-around or circular work, as well as when narrowing and widening, as described, but also for topping, combined with mechanism to depress from the said level into the knitting-groove and elevate from said knitting-groove back into the said level all the said needles in succession for all-around work or any number of said needles less than the whole number, as may be required for heel and toe knitting, substantially as described.

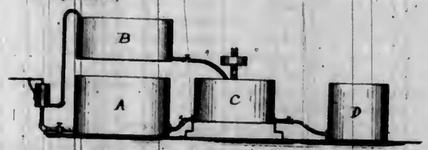


74. In a knitting-machine, a bed for the needles, a series of needles therein, a cam-ring to actuate the needles, a series of seats stationary with relation to the cam-ring, and a sinker-actuating cam, combined with a series of sinkers the breasts of which are drawn in a curve struck from the point of contact of the end of the sinker with the said seats at the time that the needles are drawing their loops about the breasts of the sinkers below their hooks, substantially as described.

75. A knitting machine containing the following instrumentalities, viz: a bed-plate having an opening, a conical needle-bed having a shank to fit said opening, a narrow cone-shaped cam-ring having a series of cams, substantially as described, a yarn-guide, and a yarn-rest interposed between said yarn-guide and needles to receive the yarn and prevent it from sliding on the needles not being reciprocated to form loops, whereby conical beds of various lengths may be used in connection with the same cam-ring, according to the diameter of the tube to be knitted, substantially as described.

76. In a knitting-machine, the combination, with a needle-bed for roundabout or circular knitting, said needle-bed being grooved for the reception of a series of needles, the upper end of the bed being provided with a series of slots in line with the dividing-walls of the needle-grooves and adapted to receive and guide a series of sinkers, of a series of sinkers having their fulcra between the upper and lower ends of the said sinker-grooves, a series of needles, a cam-ring to actuate the said sinkers, and a ring having cams to reciprocate the said needles, for the purposes set forth.

479,987. LISTING-PLOW.

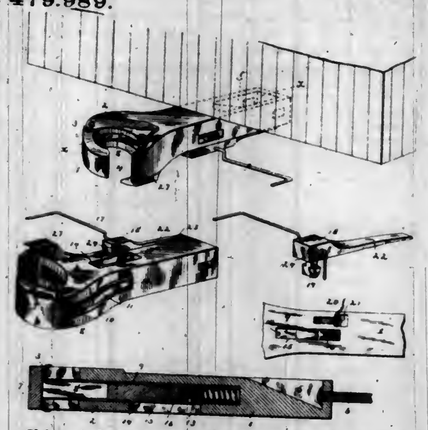


CALVIN N. LEATHERWOOD, Hutto, Tex. Filed Apr. 7, 1892. Serial No. 428,184. (No model.)

Claim.—In a listing-plow, the combination, with the main beam 1, the upper and lower front and rear cross-bars 3 and 4, embracing the upper and lower sides thereof, the bolts 2, passed through the cross-bars and beam 1, securing the beams and bars rigidly together, the longitudinal slots formed in the cross-bars and at opposite sides of the beam 1, and the bolts adjustably mounted in the slots, of the opposite beams 7, provided at diagonally-opposite ends with depending plow-carrying standards and having perforations through which the bolts 6 pass, whereby the bars and beams 7 are adjustably connected, the loose connecting-rods between the front ends of the beams 7 and 1, the opposite inclined bounds 10, bolted at their rear ends to the front ends of the beams 7 and provided at their front ends with securing-plates having a series of holes, and bolts passed through the same into the beam 1, substantially as specified.

479,988. METHOD OF RESTORING NITRATING ACIDS.

HUDSON MAXIM, New York, N. Y., assignor to The Columbia Powder Manufacturing Company, same place. Filed May 16, 1891. Serial No. 392,958. (No specimens.)

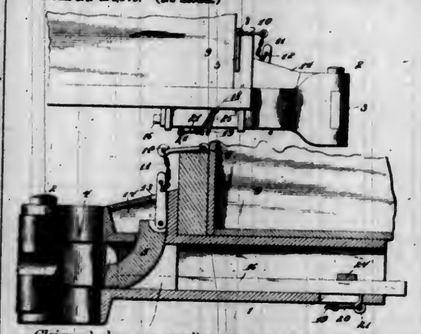


Claim.—The method of restoring mixed nitric and sulphuric acids which have become weakened in the production of nitro compounds, which consists in adding a quantity of dry nitrate to the weakened mixture, allowing the acid sulphate produced by this addition to crystallize, removing the liquid from the crystals by a centrifugal machine, and further washing the crystals by a portion of the weakened mixture, substantially as described.

479,989. CAR-COUPLING.

RICHARD J. REYNOLDS, Springville, Ala., assignor of one-half to George M. Jones, same place. Filed Mar. 30, 1892. Serial No. 427,042. (No model.)

479,989.



Claim.—1. In a car-coupling, the combination of a draw-head having a draw-bar extending rearward therefrom provided with a recess in the upper face thereof near one end having an inclined bottom surface, and a tail-pin fitted in said recess, substantially as described.

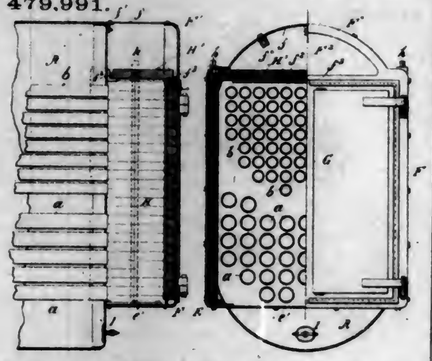
2. In a car-coupling, the combination of a draw-head having a jaw pivotally mounted therein provided with a shank, a spring seated in the side of said draw-head and engaging said shank of the jaw, a dog movably mounted within the draw-bar and adapted to engage the shank of the jaw, an operating-lever to engage said dog, and a support removably connected to the draw-bar, in which said operating-lever is pivotally mounted, substantially as described.

479,990. CAR-COUPLING.

JOHN P. ROLLINS, Cedar Rapids, Iowa, assignor of one-half to George O. Rollins, same place. Filed Mar. 11, 1892. Serial No. 424,573. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head having a longitudinal opening and provided with slightly-curved inclined ways, a knuckle hinged to the draw-head, a curved latch-block arranged on the ways and adapted to engage the knuckle, a bar pivotally secured to the latch-block, and a rock-shaft connected with the bar, substantially as described.

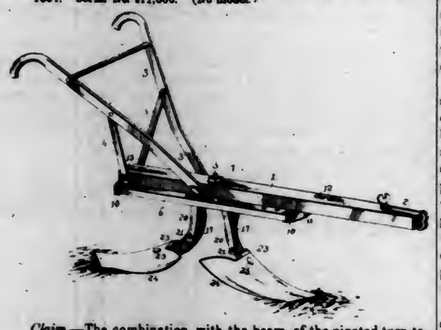
2. In a car-coupling, the combination of a draw-head having a longitudinal opening and provided with a slot, a knuckle hinged to the draw-head, a sliding bar arranged to engage the knuckle and having a stem projecting through the slot, and a rock-shaft connected with the stem, substantially as described.



479,991. PORTABLE TUBULAR BOILER.

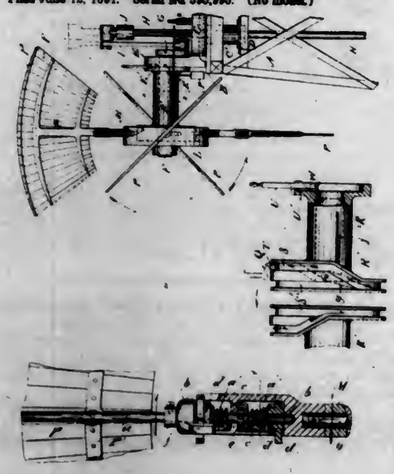
GEORGE SELDEN, Erie, Pa. Filed Jan. 7, 1892. Serial No. 417,302. (No model.)

Claim.—1. The combustion-chamber for connecting the direct and return tubes of the tubular boiler, made removable and composed of cast side and rear connecting-frames and doors paneled and bricked, substantially as described.



2. The combination, with a portable tubular boiler made cylindrical in form over the fire-pot and elliptical in form in rear thereof and provided in said rear elliptical portion with direct flues and over

479,991.



the latter with return-tubes and with a hand-hole for giving access to said flues, of a removable brick-lined combustion-chamber located above said hand-hole and connecting the direct and return tubes, substantially as described.

479,992. PLOW. KELLY N. SHARP, Mozelle, Ga. Filed Nov. 14, 1891. Serial No. 411,886. (No model.)

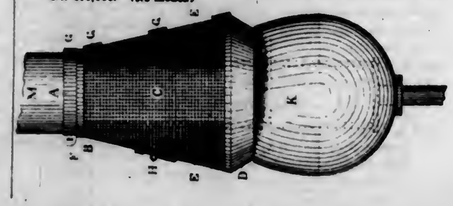
Claim.—The combination, with the beam, of the pivoted turn-table secured thereto and provided with central and diagonally-opposite series of openings, and a pair of plow-standards provided with plows and terminating at their upper ends in securing-plates, and bolts for securing said standards removably to the central or diagonally-opposite series of openings, substantially as specified.

479,993. WIND-MACHINE. JAMES T. SHOUP, Jr., Springfield, Ohio. Filed June 12, 1891. Serial No. 395,993. (No model.)

Claim.—1. In a wind-machine, the combination, with a turn-table head and a wind-wheel shaft carried by said head, of wind-wheels having rotatable blades, shafts connected to said blades, crank-pieces on said shafts, rollers on the inner ends of said cranks and fitting in a groove in said cam, whereby the blades are rotated according to the direction of said groove, and a lever pivoted to said cam and adjustable in notches in said head, whereby the cam may be rotated to adjust the grooves to different positions and change the points at which said rotatable blades are operated.

2. In a wind-machine, the combination, with a head and an adjustable cam mounted thereon having guiding-grooves, of a wind-wheel mounted on said shaft, rotatable blades forming the wings of said wind-wheel and provided with axial spokes, blade-shafts, crank-pieces connecting said shafts with said cam-grooves, and a yielding driving mechanism between each blade and its respective blade-shaft, the same consisting of a driving-cage mounted on the blade-shaft and having bearings for the said spoke and provided with a plurality of bars connecting said bearings, stop-pieces having wings adapted to engage with said bars and fixed to said spoke, and a pair of coil-springs, each engaged at one end with its respective stop-piece and at the other end with said cage.

3. In a wind-machine, the combination, with a wheel-rim, rotatable blades therefor having axial spokes on which they rotate, blade-shafts rotatably mounted in said rim, and means to rotate them, of a driving extension or cage from each blade shaft, having bearings for its respective blade-spoke, and a spring connection between each spoke and said driving extension or cage, consisting of a pair of springs mounted on said blade-spoke and acting reversely thereon, one end of each spring being connected with the driving extension or cage and the other end of each spring with the blade-spoke, whereby the rotative influence of the blade-shaft will be exerted on the respective spoke through one spring and the reaction of the blade in stopping will be exerted through the other spring.

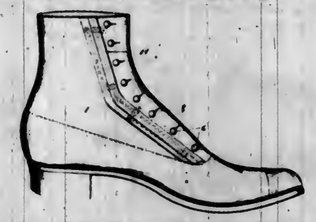


4. In a wind-machine, the combination, with a wind-wheel, its shaft, rotatable blades for said wheel, blade-shafts mounted in the rim of said wind-wheel, and a yielding connection between each blade and blade-shaft, respectively, of a cam having grooves and adjustably mounted adjacent to said wind-wheel, crank-pieces forming the operative connection between each blade-shaft and said cam, each crank-piece having a gear-segment, a segment on each blade-shaft meshing with said crank-piece, whereby the cam-groove will rotate the crank-pieces and the respective blades, and a cam-switch consisting of a deflecting pivoted piece mounted on said cam and adapted to guide the crank-pieces from one groove to another, according to its adjusted position as a switch, and means to operate said cam-switch to vary the influence of the cam on said blades.

5. In a wind-machine, a wind-wheel having rotatable blades, shafts, and cranks for said blades, a cam having grooves on its periphery, substantially as described, rollers mounted on said cranks and adapted to travel in said grooves, a switch to open one or another portion of said cam-grooves, and means to operate said switch.

6. In a wind-machine, the combination, with a wheel-rim, rotatable blades therefor having axial spokes, blade-shafts rotatably mounted in said rim, and means to rotate said shafts, of a yielding mechanism between each spoke and shaft, consisting of spoke-bearings connected by a plurality of bars forming a cage and mounted on said shaft to rotate therewith, stop-pieces fixed to said spoke and having wings extending out between said bars, and springs connected at one end to their respective stop-piece and at the other end to said driving-cage, whereby the rotative impulse is mainly transmitted to said blades before the said stop-wings are in contact with said bars.

7. The herein-described yielding driving mechanism between two rotatable shafts, the same consisting of a driving-cage mounted on the driving-shaft and having bearings for the driven shaft and provided with a plurality of bars connecting said bearings, stop-pieces having wings adapted to engage with said bars and fixed to said driven shaft, and a pair of coil-springs, each engaged at one end with its respective stop-piece and at the other end with said cage, substantially as shown and described.



479,994. SPARK-ARRESTER FOR ELECTRIC-ARC LAMPS. CHARLES SHALLWOOD, Birmingham, Ala. Filed Dec. 26, 1891. Serial No. 416,108. (No model.)

Claim.—1. In a spark-arrester for electric lamps, the combination of the metallic frame with inwardly-projecting taper bottom having gauze or wire-netting on the inside, said frame secured to one-half of the band A and having at its bottom the braces I I, with thumb-screws J J, substantially as described.

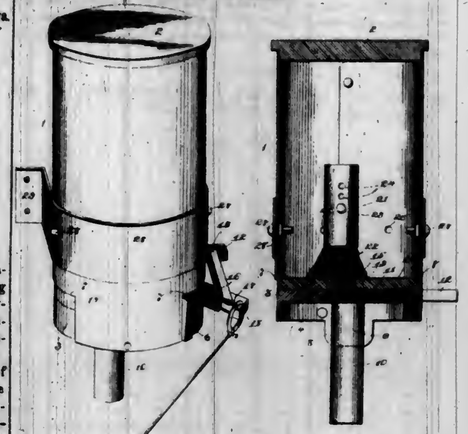
2. In a spark-arrester for electric lamps, the combination of a metallic frame with inwardly-projecting taper bottom and gauze or wire-netting, said frame secured to a metallic band and having a door made with metallic frame and inwardly-projecting taper bottom and gauze or wire-netting, said door having hinges on one side and a bolt on the opposite side, substantially as described.

479,995. SHOE-FASTENING. EDWARD E. STACY, Whiting, Iowa. Filed Apr. 15, 1892. Serial No. 429,354. (No model.)

Claim.—1. In a self-buttoner for shoes and the like, the combination of two plates pivotally connected to each other and extending lengthwise of the upper and carrying buttons or heads, and levers pivotally connected to a portion of said plates for operating the button-flap to draw the same over onto the said buttons or heads, substantially as described.

2. In a self-buttoner for shoes and the like, the combination of two plates, pivotally connected and carrying buttons or heads, the same being secured to the upper, pivoted levers connected to the button-flap, operating-levers connected to said pivoted levers, and clasps connected to said button-flap to be engaged by said operating-levers, substantially as described.

479,996. STRAWBERRY-VINE CUTTER. WILLIAM H. STARKS, Bellevue, Wash. Filed Mar. 22, 1892. Serial No. 426,917. (No model.)



Claim.—In a cutting implement, the combination with the handle, of a stationary shear-blade secured to one end of said handle and curved up and away from the lower end thereof, a stub-shaft projecting from said handle near its lower end, a rolling gage-wheel mounted on said shaft, and a traveling cutting-disk secured to the inner face of said wheel and provided with a peripheral series of sharpened cutting-teeth extending beyond the periphery of said wheel and working against said stationary shear-blade, substantially as set forth.

479,997. BREAD-PAN, &c. ANDREW H. STEVENS, Farmington, Wis. Filed June 8, 1891. Serial No. 395,602. (No model.)

Claim.—The herein described bake-pan, comprising a lower and and an upper inverted section, the two being provided at their meeting edges with horizontal annular flanges, and the lower section provided at the inner edge of its horizontal flange with an internal inclined flange fitting within the lower edge of the upper section, the rigid loosely-interlocked and removably-connected bails 7 and 8, secured, respectively, to the sections 4 and 1, and the horizontally-disposed U-shaped locking-bail 9, located diametrically opposite the rigid bails and having its upper terminal or branch pivotally connected to the upper pan-section above its horizontal flange and its lower branch or terminal adapted to be removably sprung under and engaged with the horizontal flange of the lower pan-section, substantially as described.

479,998. REPLANTING ATTACHMENT FOR CULTIVATORS. ROBERT C. SUMNERS and WILLIAM BOLINGER, Eureka, Kans. Filed Sept. 26, 1891. Serial No. 406,838. (No model.)

Claim.—1. The combination, with the standards of a cultivator, of the transverse connecting-bar having the opposite slotted ends, the J-shaped bolts mounted in the slots and embracing the cultivator-standards, the hopper-cylinder, means for operating the feed-disk, and the U-shaped metal strap embracing the hopper-cylinder and having its ends laterally bent to form perforated ears and bolted to the center of the bar, substantially as specified.

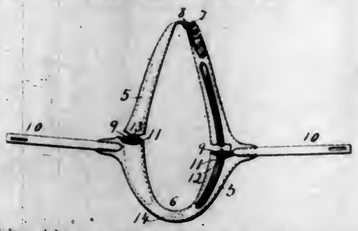
2. The herein-described corn-planting cultivator attachment, comprising a cylindrical hopper and feed-disk-operating means, said hopper having a series of annular perforations, and a metal strap, of U shape, embracing the cylinder, bolts passing through the strap and any pair of the perforations of the cylinder, whereby the strap is adjustable upon the same, said strap being adapted at its ends for connection with the cultivator, substantially as specified.

3. In an attachment of the class described, the combination, with the sheet-metal cylinder and the cast-metal circular bottom having a surrounding depending flange riveted to the cylinder and provided with a tangentially-disposed arm, of a circular feed-disk mounted for oscillations in the cylinder and provided with a central opening, mounted for rotation upon a stud concentrically located upon the upper side of the bottom plate, and provided with a laterally-disposed arm extending through the wall of the cylinder, a spring connection engaging the arm and that of the bottom plate, and a cord leading from the arm of the feed-disk and adapted when drawn to throw the seed-opening of the feed-disk into register with the discharge-opening in the bottom, substantially as specified.

4. In an attachment of the class described, the combination, with the cylindrical hopper formed of sheet metal and provided near its bottom edge with slots, of the cast metal bottom inserted in the hopper and having lugs extending up in front of the slots thereof, the oscillating feed-disk mounted upon the bottom and provided with a seed-opening adapted to be thrown in register with the discharge-opening of the bottom, and means for oscillating the feed-disk, substantially as specified.

5. In an attachment of the class described, the combination, with the sheet-metal cylindrical hopper and the cast-metal cylindrical bottom provided with a depending perforated lug and a discharge-opening adjacent thereto, of a seed-tube, a bolt passing through the perforated lug and tube, an oscillating feed-disk having a seed-opening, and means for oscillating said feed-disk, substantially as specified.

479,999. CORRUGATED PACKING. ROBERT H. THOMPSON, New York, assignor to the Thompson & Norris Company, Brooklyn, N. Y. Filed May 9, 1891. Serial No. 392,162. (No model.)



479,999.

Claim.—1. A packing material comprising two strips or pieces of corrugated paper or like substance united, with their corrugations extending at an angle to each other, the corrugations being indented at the points of contact, substantially as specified.

2. A packing material comprising two strips or pieces of corrugated paper or like substance united, with their corrugations extending at an angle to each other and having broadened contact-points, and also comprising strips or pieces of plain paper or like substance secured to the outer sides of the corrugated strips or pieces, substantially as specified.

480,000. HORSE-COLLAR. ALLEN D. ULRICH, Kokomo, Ind. Filed Aug. 24, 1891. Serial No. 403,589. (No model.)

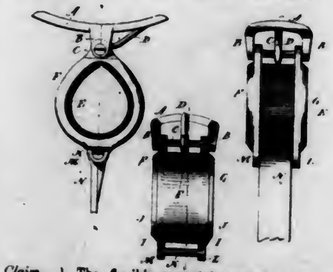
Claim.—A horse-collar having cushioned or padded side portions, a flexible unpadded portion joining the side portions in front, a flexible portion to join the pads at the top, stiffeners permanently secured up and down the shoulders upon the pads, and means for attaching traces to the pad portions at a distance from the stiffeners, substantially as described, whereby the collar is adapted to bend freely at the front and top to permit the pads to rest steadily on the horse's shoulders while each shoulder advances and recedes to avoid chafing.

480,001. ALARM-BELL FOR DOORS. JOEL H. WELLER, Boyertown, Pa. Filed Mar. 2, 1892. Serial No. 423,467. (No model.)

Claim.—1. The combination, with a door, drawer, or other movable part, of a bell having a pivotal spring actuated hammer provided at one end with a projecting loop, and a stationary arm carrying a trip pivotally connected with it and constituting a catch at one end for engaging said projecting loop of the bell hammer and at the opposite end weighted and arranged to stop against the arm, one of said parts—the bell or arm—carried by the door, drawer, or other movable part and the other stationarily located with respect to the said movable parts.

2. The combination, with a door, drawer, or similar movable part, of a bell having a pivoted hammer, and an arm carrying a pivoted and overbalanced trip stopping against said arm and arranged to engage the bell-hammer, said arm swiveled to move laterally and take the trip out of operative relation with the said hammer and spring-actuated to an upright position, one of said parts—viz., the bell or arm—fastened to the door and the other stationarily located.

3. The combination, with a door, drawer, or similar movable part, of a bell having a post with a pin extending transversely therethrough, and a hammer in one piece comprising an arm pivoted on said pin and having a clapper at one end and a loop at the opposite end, and a spring coiled on a pin and its end fastened in the post, and a trip for engaging said loop, substantially in the manner and for the purpose described.



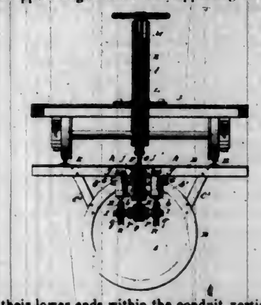
480,002. MEAT-CUTTER. OLIVER D. WOODRUFF, Southington, Conn. Filed Nov. 16, 1891. Serial No. 411,995. (No model.)

Claim.—1. In a machine for cutting meat and similar purposes, the combination of a case provided with a hopper near one end, through which meat may be supplied to the case, the interior of the case constructed with a series of spiral ribs running from the hopper end toward the opposite or delivery end, but terminating near the said delivery end and so as to leave a plain annular surface within the case at the delivery end, combined with a revolving forcer constructed with a spiral rib by which the meat may be forced toward the delivery end, the body of the forcer from the hopper toward the delivery end constructed with a surface substantially parallel with the corresponding surface of the case and with a series of spiral ribs upon its surface from the hopper toward the delivery end inclined in the same direction as the ribs in the case, but the said spiral ribs on the body of the forcer terminating at a distance from the outer or delivery end of the forcer, the said outer or delivery end filling the said annular plain surface at the delivery end of the case, but extending inward therefrom, and corresponding in diameter to the internal diameter of the ribs in that part of the case and constructed with one or more openings upon the said plain surface leading outward through the end of the forcer, the said openings in said plain surface of the forcer being adapted to pass over the ribs in that part of the case, substantially as described.

2. In a machine for cutting meat and similar purposes, the combination of a case adapted to receive the material to be cut, the case constructed upon its inside with spiral ribs inclined toward the delivery end of the case, combined with a revolving forcer within the case adapted to force the meat supplied to the case toward the delivery end of the case, the delivery end of the forcer constructed with its surface plain and corresponding in diameter to the internal diameter of the corresponding portion of the ribs in the face, the said plain surface of the forcer constructed with openings into the interior of the case and so that said openings may work across the ribs in the case as the forcer is revolved, the said openings each turned outward toward and through the delivery end of the forcer, so as to form separate and independent outlets from each of said openings, substantially as described.

480,008. TUG-LOOP. HERMANN ARMBRUSTER, New Haven, Conn. Filed May 2, 1892. Serial No. 431,540. (No model.)

Claim.—1. The flexible material loop E, constructed with a groove around its two edges, forming ribs I I and flaps J J, combined with metal reinforces F G, grooved upon their insides, corresponding to the ribs I I of the loop and adapted to receive the same, while the flaps J will overlap the metal of the reinforces upon their inner surface, and the two reinforces secured together, substantially as described.



2. A flexible metal loop E, combined with the metal reinforces F G, constructed to inclose the edges of the said loop, and the reinforces constructed with a projection from their lower side, with a bolt K through the said projections, and a buckle-frame constructed with outwardly-projecting ears B, the reinforces constructed with corresponding ears and a transverse bar C through said ears and through corresponding projections on the reinforce, whereby the loop is hinged to the buckle-frame with the tongue B hung upon the said bar C, substantially as described.

480,004. ELECTRIC RAILWAY. CHARLES H. BAKER, Lake Geneva, Wis. Filed Sept. 1, 1891. Serial No. 404,423. (No model.)

Claim.—1. In an electric railway, the combination, with the car and motor, of the conduit-rings having spaced ends extending downwardly and forming supplemental arches on opposite sides of said

space at the top of the conduit, side plates secured to opposite sides of said ends and forming a longitudinal way or slot, vertically-adjustable hangers suspended within said supplemental arches, conducting-wires supported by said hangers, and means for removably engaging said wires and connecting the same with the electric motor, substantially as set forth.

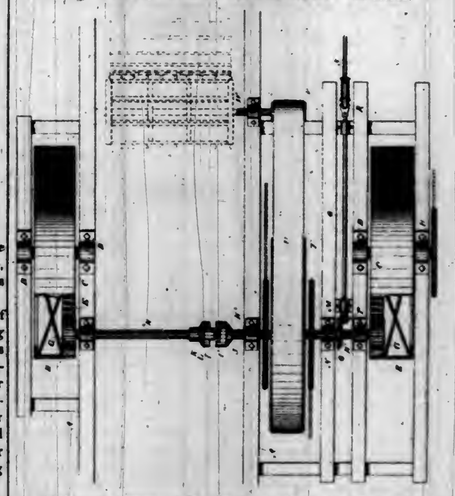
2. In an electric railway, the combination, with the motor-car, of the conduit-rings provided with supplemental arches located on opposite sides of the slot, perforated cylindrical brackets secured over said arches, vertically-sliding hangers supported within said brackets and provided with upper flanged heads and supporting the main conduct-

ing-wires at their lower ends within the conduit, vertically-adjustable contact-rollers supported within the conduit from the car-frame, means for adjusting said rollers, and wires passing from said rollers to the motor, substantially as set forth.

3. In an electric railway, the combination, with the motor-car, of the conduit having the longitudinal slot and the ring arches having the supplemental arches located on opposite sides of said slot, hangers adjustably suspended within said supplemental arches, conducting-wires supported by said hangers, the grooved or perforated hanger and conductor suspended from the motor-car through the slot, a right-angularly-disposed hollow shaft secured to the lower end of said hanger within the conduit, revolving contact-wheels mounted upon each end of said shaft and adapted to engage said conducting-wires, means for vertically adjusting said shaft and contact-wheels, and wires passing from said wheels to the motor, substantially as set forth.

4. In an electric railway, the combination of the conduit having a longitudinal slot and supplemental arches located on opposite sides of said slot, hangers adjustably suspended within said supplemental arches, conducting-wires supported by said hangers, the car-frame provided with a tubular upright, a sliding shaft located within said upright and vertically adjustable therein, the longitudinally perforated or grooved hanger and conductor-bar secured to the lower end of said shaft and projecting within said slot, a right-angularly-disposed hollow shaft suspended from the lower end of said hanger within the conduit and provided with hollow spindle ends in communication with the interior bore of said hanger, and revolving contact-wheels mounted upon said hollow spindle, substantially as set forth.

480,005. GATE-LATCH. BENJAMIN BENNETT, Scranton, Pa. Filed Dec. 9, 1891. Serial No. 414,510. (No model.)



Claim.—1. In a fastener for gates, the combination, with the spring-catch and co-operating locking projection, of the rock-shaft pivoted in bearings on the gate to turn on its longitudinal center and having the cranked end co-operating with the catch to release the same, substantially as described.

2. In a fastener for gates, the combination, with the spring-catch and the co-operating locking projection, of the rock-shaft pivotally mounted on the gate and the upwardly-extending crank-handle at one end and the downwardly-extending crank at the opposite end of the rock-shaft, co-operating with the catch for disengaging the same, substantially as described.

3. The combination, with a gate hinged to open in one direction, of a spring-catch, a co-operating locking projection with which the catch engages to lock the gate when closed, the rock-shaft journaled on the gate, having the crank co-operating with the catch, and the handle moving in the direction of the movement of the gate in opening to turn the rock-shaft and release the catch, whereby by one continuous movement the catch is released and the gate opened, substantially as described.

480,006. TRAVELING HARVESTER. DANIEL BEST, San Leandro, Cal. Filed Sept. 14, 1891. Serial No. 405,696. (No model.)

Claim.—An improved traveling harvester, consisting of the main frame, the bearing-shafts journaled independently upon opposite sides of the frame and carrying the bearing-wheels, counter-shaft sections from which the header and thrasher are driven independently, journaled across the frame in a line above and behind the line of the bearing-wheel shafts and carrying spur-pinions upon their outer ends, internally-toothed gears fixed to the bearing-wheels and engaging said pinions, a thrashing-cylinder having a belt-pulley on the end of its shaft upon the side opposite from the bearing-wheel which drives the cylinder, a pulley on the same side of one of the counter-shaft sections, a belt running from the counter-shaft pulley to the pulley on the thrashing-cylinder and driving the cylinder from the side remote from the main driving-wheel, and a clutch mechanism interposed in the length of the counter-shaft and serving as a bearing for the outer part of said shaft, all combined, constructed, and arranged to operate as herein described.

480,007. MACHINE FOR WEAVING COILED-WIRE FABRIC. ORLANDO P. BRIGGS and FRED L. BRYANT, Chicago, Ill. Filed Aug. 29, 1891. Serial No. 404,084. (No model.)

Claim.—1. In a machine for weaving coiled wire fabric for bed-bottoms, the combination, with a stationary coiler, a longitudinally-movable carriage in line with said coiler, fabric engaging and releasing mechanism supported by said carriage, and trimming mechanism supported upon the ends of said carriage and suitably connected with the driving mechanism of the machine, substantially as shown and described.

2. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a stationary coiler, of a longitudinally-movable carriage in line with said coiler, fabric engaging and releasing mechanism supported by said carriage, and trimming mechanism supported by said carriage at the ends and at the middle thereof and suitably connected with the driving mechanism of the machine, substantially as shown and described.

3. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a coiler, of a carriage arranged in line with said coiler and automatically reciprocating devices supported by said carriage for engaging and releasing the marginal coil of the fabric, the reciprocation of said devices being toward and from said marginal coil, substantially as shown and described.

480,007.

4. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a coiler, of a carriage arranged in line with said coiler, reciprocating mechanism supported by said carriage for engaging and releasing the marginal coil of the fabric, and mechanism also supported by said carriage for drawing the fabric from said reciprocating, engaging, and releasing mechanism, the reciprocation of said mechanism being toward and from said marginal coil, substantially as shown and described.

5. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a coiler, of a series of pins for engaging the marginal coil of the fabric at the side of the wire of said coil toward said fabric, said pins being suitably connected to a part of the machine periodically reciprocating in a direction parallel to the coiling-axis, whereby the sides of said pins and said coil are reciprocated in a direction parallel to the coiling-axis, substantially as shown and described.

6. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a coiler, of a series of pins arranged to engage the marginal coil of the fabric at the side of the wire of said coil toward said fabric, and a support for said pins, and mechanism for periodically reciprocating said support in a direction parallel to the coiling-axis and subsequently in a direction at right angles to the coiling-axis, substantially as shown and described.

7. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a coiler, of a series of pins for engaging the marginal coil of the fabric at the side of the wire of said coil toward said fabric, said pins being suitably connected to a part of the machine periodically reciprocating in a direction parallel to the coiling-axis, whereby the sides of said pins and said coil are reciprocated in a direction parallel to the coiling-axis, and a reciprocating knife-edge for engaging the marginal coil, and automatic mechanism for actuating said knife-edge, substantially as shown and described.

8. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a coiler, of a series of pins arranged to engage the marginal coil of the fabric at the side of the wire of said coil toward said fabric and a support for said pins, and mechanism for periodically reciprocating said support in a direction parallel to the coiling-axis and subsequently in a direction at right angles to the coiling-axis, and a reciprocating knife-edge for engaging the marginal coil, and automatic mechanism for actuating said knife-edge, substantially as shown and described.

9. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism, of automatically-reciprocating devices for engaging the marginal coil of the fabric at the side of the wire of said coil toward the fabric and holding the same in fixed relation to the coiling-axis while a new coil is being projected, the reciprocation of said devices being toward and from said marginal coil, substantially as shown and described.

10. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism, of a support for the coil being projected from the coiling mechanism and reciprocating mechanism for engaging the marginal coil of the fabric at the side of the wire of said coil toward said fabric and holding the same in a fixed position adjacent to the support for the new coil, the reciprocation of said mechanism being toward and from said marginal coil, substantially as shown and described.

11. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism, of a channel for the coil being projected from the coiling mechanism and reciprocating mechanism for engaging the marginal coil of the fabric at the side of the wire of said coil toward the fabric and holding the same in a fixed position adjacent to the channel for the new coil, the reciprocation of said mechanism being toward and from said marginal coil, substantially as shown and described.

12. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism, of a channel for the coil being projected from the coiling mechanism and reciprocating mechanism located at a higher level than said channel for engaging the marginal coil of the fabric at the side of the wire of said coil toward the fabric and holding the same in a fixed position adjacent to the channel for the new coil, the reciprocation of said mechanism being toward and from said marginal coil, substantially as shown and described.

13. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a channel for receiving the new coil and reciprocating mechanism for engaging the marginal coil of the fabric at the side of the wire of said coil toward the fabric and holding the same in a fixed position adjacent to said channel, the reciprocation of said mechanism being toward and from said marginal coil, substantially as shown and described.

14. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism and means for drawing the fabric away from the coiling-axis, of reciprocating mechanism for engaging the marginal coil of the fabric and holding the same in a fixed position while a new coil is being projected from the coil-forming mechanism, the reciprocation of said mechanism being toward and from said marginal coil, substantially as shown and described.

15. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with mechanism for forming the coils, of means for drawing the fabric away from the coiling-axis and a series of movable pins adapted to engage the marginal coil of the fabric while a new coil is being formed and release the same and engage the new marginal coil of the fabric prior to the forming of a second new coil, substantially as shown and described.

16. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two series of movable pins adapted to alternately engage the marginal coil of the fabric while a new coil is being formed, substantially as shown and described.

17. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism, of a reciprocating pin-bar and a series of pins located upon said pin-bar and adapted to engage the marginal coil of the fabric at the side of the wire of said coil toward the fabric, substantially as shown and described.

18. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with mechanism for forming the coils, of a reciprocating pin-bar and a series of pins supported by said pin-bar and adapted to engage the marginal coil of the fabric at the side of the wire of said coil toward the fabric, and a coil-receiving channel adjacent to said pins, substantially as shown and described.

19. In a machine for weaving coiled wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two reciprocating pin-bars, each bearing a series of pins adapted to alternately engage the marginal coil of the fabric, substantially as shown and described.

20. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two reciprocating pin-bars, each bearing a series of pins adapted to alternately engage the marginal coil of the fabric, and a coil receiving channel located adjacent to said pins, substantially as shown and described.

21. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of an automatically-reciprocating knife-bar adapted to engage the marginal coil of the fabric at the side of said coil toward the fabric, substantially as shown and described.

22. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a knife-bar for engaging the marginal coil of the fabric at the side of said coil toward the fabric, and a coil-receiving channel located adjacent and parallel to said knife-bar, substantially as shown and described.

23. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two automatically-reciprocating knife-bars adapted to alternately engage the marginal coil of the fabric at the side of said coil toward the fabric, substantially as shown and described.

24. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two automatically-reciprocating knife-bars adapted to alternately engage the marginal coil of the fabric at the side of said coil toward the fabric, and a coil-receiving channel located adjacent and parallel to said knife-bars, substantially as shown and described.

25. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of an automatically-reciprocating knife-bar adapted to engage the marginal coil of the fabric at the side of said coil toward the fabric, and automatic mechanism for drawing the fabric from the coiling-axis, substantially as shown and described.

26. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a knife-bar for engaging the coil of the fabric at the side of said coil toward the fabric, and a coil-receiving channel located adjacent and parallel to said knife-bar, and automatic mechanism for drawing the fabric from the coiling-axis, substantially as shown and described.

27. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two automatically-reciprocating knife-bars adapted to alternately engage the marginal coils of the fabric at the sides of said coils toward the fabric, and automatic mechanism for drawing the fabric from the coiling-axis, substantially as shown and described.

28. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two automatically-reciprocating knife-bars adapted to alternately engage the marginal coil of the fabric at the side of said coil toward the fabric, and a coil-receiving channel located adjacent and parallel to said knife-bars, and automatic mechanism for drawing the fabric from the coiling-axis, substantially as shown and described.

29. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a series of movable pins adapted to engage the marginal coil of the fabric, automatic mechanism for moving said pins and an automatically-reciprocating knife-bar adapted to co-operate with said series of pins in engaging and retaining the marginal coil in a fixed position, substantially as shown and described.

30. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a reciprocating pin-bar and a series of pins supported by said pin-bar and adapted to engage the marginal coil of the fabric, an automatically-reciprocating knife-bar adapted to co-operate with said pins in engaging the marginal coil of the fabric, and a coil-receiving channel adjacent and parallel to said pins and said knife-bar, substantially as shown and described.

31. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two reciprocating pin-bars, two series of pins, one supported by one of said pin-bars and the other by the other of said pin-bars and adapted to alternately engage the marginal coil of the fabric, and an automatically-reciprocating knife-bar adapted to co-operate with said pins in engaging the marginal coil of the fabric, substantially as shown and described.

32. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two reciprocating pin-bars, two series of pins, one supported by one of said pin-bars and the other by the other of said pin-bars and adapted to alternately engage the marginal coil of the fabric, and an automatically-reciprocating knife-bar adapted to co operate with said pins in engaging the marginal coil of the fabric, and a coil-receiving channel located adjacent and parallel to said pins and knife-bar, substantially as shown and described.

33. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two reciprocating pin-bars and two series of pins, one being supported by one of said pin-bars and the other by the other of said pin bars and adapted to alternately engage the marginal coil of the fabric, and two automatically-reciprocating knife-bars adapted to alternately co-operate with one of said series of pins in engaging the marginal coil of the fabric and retaining the same in a fixed position, substantially as shown and described.

34. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two reciprocating pin-bars and two series of pins, one being supported by one of said pin-bars and the other by the other of said pin-bars and adapted to alternately engage the marginal coil of the fabric, and two automatically-reciprocating knife-bars adapted to alternately co-operate with one of said series of pins in engaging the marginal coil of the fabric and retaining the same in a fixed position, and a coil-receiving channel located parallel and adjacent to said pins and knife-bars, substantially as shown and described.

35. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a series of pins for engaging the marginal coil of the fabric, and means for shifting said series of pins in a direction parallel to said marginal coil, and an automatically-reciprocating knife-bar adapted to engage the marginal coil of the fabric, substantially as shown and described.

36. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a series of pins for engaging the marginal coil of the fabric, and means for shifting said series of pins in a direction parallel to said marginal coil, and an automatically-reciprocating knife-bar adapted to engage the marginal coil of the fabric, and a coil-receiving channel located adjacent and parallel to said pins and knife-bar, substantially as shown and described.

37. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of fabric supporting and shifting mechanism, automatic mechanism for operating said fabric supporting and shifting mechanism, and automatic mechanism for at intervals disengaging said mechanism for operating said fabric supporting and shifting mechanism, substantially as shown and described.

38. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with a coil-forming mechanism, of reciprocating pins for holding the marginal coil while the new coil is being formed and intertwined therewith and then releasing said marginal coil, automatic mechanism for shifting said pins, and automatic mechanism for periodically arresting the action of the mechanism for shifting said pins, whereby said pins are left in engagement with the marginal coil while an increased number of new coils are projected into the same coil-space and made to intertwine with the marginal coil, substantially as shown and described.

39. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of pins and a knife-bar for engaging the marginal coil and retaining the same in a fixed position while a new coil is being formed and made to intertwine with said marginal coil, automatic mechanism for moving said pins and knife-bar out of engagement with said marginal coil and into engagement with the new marginal coil, and automatic mechanism for preventing said first-mentioned mechanism for causing said pins and knife-bar to disengage said marginal coil until an increased number of new coils have been projected into the same coil-space and made to intertwine with said marginal coil, substantially as shown and described.

40. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a series of pins for engaging the marginal coil of the fabric, a pin-bar supporting said pins, and a shaft extending parallel with said pin-bar and having cams for reciprocating said pin-bar, substantially as shown and described.

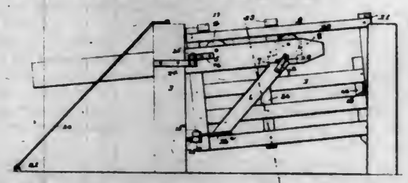
41. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of two pin-bars, each bearing a series of pins adapted to alternately engage the marginal coil of the fabric, and cams for engaging said pin-bars and alternately moving said series of pins into engagement with the final coil of the fabric, substantially as shown and described.

42. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism, of a suitable support for the fabric and a knife-bar for engaging the final coil of the fabric and holding the same in a fixed position, said knife-bar being secured to a relatively fixed support, so as to move by gravity in one direction with reference to the marginal coil of the fabric, and a cam for periodically forcing said knife-bar in the opposite direction with reference to said marginal coil, substantially as shown and described.

43. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with the coil-forming mechanism and a suitable support for the fabric, of two knife-bars arranged to alternately move by gravity in one direction with reference to the marginal coil of the fabric, and a cam for alternately moving said knife-bars in the opposite direction with reference to the marginal coil of the fabric, substantially as shown and described.

44. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism and mechanism for carrying the fabric transversely, of automatic cutting mechanism located between the ends of the space to be occupied by the fabric, substantially as shown and described.

45. In a machine for weaving coiled-wire fabric for bed-bottoms,



the combination, with automatic mechanism for engaging the marginal coil of the fabric and a relatively fixed wall located at one side of the path of the fabric, of a yielding presser-bar O, located at the side of the fabric opposite said relatively stationary wall and having a flat face to press upon said fabric to keep the latter in the same plane, substantially as shown and described.

46. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a longitudinally-shiftable carriage for receiving the fabric, said carriage having two faces to which the line of movement is substantially perpendicular, two cam-faces, and a suitable support and suitable driving mechanism therefor, one pair of said faces extending between and being adapted to be engaged by the other of said pairs of faces, and said faces being adjustable with reference to each other, substantially as shown and described.

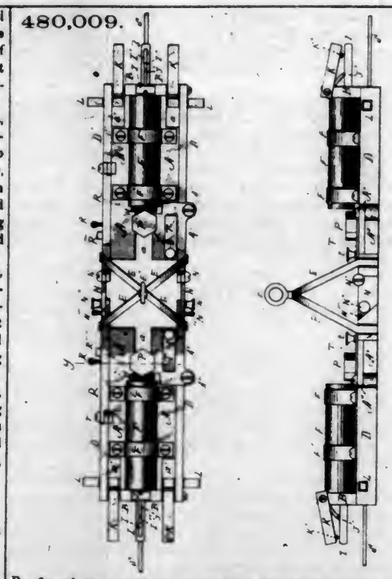
47. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination, with coil-forming mechanism, of a shiftable fabric-support adapted to be shifted toward and from the coil-forming mechanism and having faces to which the line of movement of said support is substantially perpendicular, and a duplex adjustable cam J, arranged to make engagement with said faces, and automatic means for rotating said cam, substantially as shown and described.

48. In a machine for weaving coiled-wire fabric for bed-bottoms, the combination of automatic means for coiling the wire and passing the running wire through the final coil of the fabric, automatic means for feeding the fabric, and automatic means for intermitting this feed whenever extra wires are to be inserted into any part of the fabric, substantially as shown and described.

480,008. GATE. JOSEPH F. DOUGHERTY, Hale, Mo. Filed Nov. 30, 1891. Serial No. 413,532. (No model.)

Claim.—1. The combination, with a post, of a hanger hinged to the post and composed of a horizontal arm provided at its outer end with an elongated mortise and with recesses at the inner end of the mortise, and an inclined brace provided at its upper end with a tenon arranged in the mortise, said brace being adapted to engage the recesses, and a gate suspended from the hanger, substantially as described.

2. The combination, with a post, of a hanger composed of a horizontal arm provided at its outer end with an elongated mortise and having recesses at the inner end of the mortise, an inclined brace provided at its upper end with a tenon and arranged to engage the recesses, link-plates arranged on opposite sides of the arm and the brace and connecting the two parts, and a gate suspended from the hanger, substantially as described.

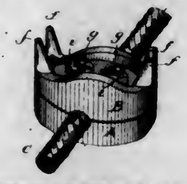


480,009. SAFETY CUT-OUT. RUDOLPH FURGANG, Boston, Mass., assignor of one-half to Isaac Kaffenburgh, same place. Filed Oct. 14, 1891. Serial No. 408,707. (No model.)

Claim.—1. In a safety attachment for electrical wires, the plate A, of conductive material and provided with the spaces or openings *a'*, end pieces B, and swinging weights K, held normally up, as described, the ground connections L, the bolt H and spring *d* within the cylinder F, and the block P, to which the end of the wire is secured, combined and arranged substantially as set forth.

2. In a safety attachment for electrical wires, the plate A, of conductive material, cylinder F, spring *d*, end piece B, rod I, provided with the perforation I', shaft J, sustained by the said end piece, and catch-pin J', whereby when the spring is released the bolt is checked in its outward movement, substantially as described.

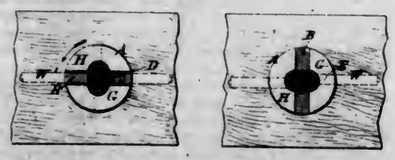
3. In a safety attachment for electrical wires, the pair of plates A A, of conductive material, a supporting insulated frame, as E, conductive gates, as N, capable of being opened to destroy the connection, bolts and springs sustained by said plates, and blocks, as P, to which the ends of the electric wire are secured, said blocks being held against the bolts by the tension of the wire, whereby the breaking or cutting of a wire releases the spring on that side, thus causing the bolt to throw out the block to which the broken or cut wire is secured and drop it through the central space between the two plates, substantially as set forth.



4. In an apparatus of the character described, the combination of the plates A, of conductive material, ground connections L, and latches

R, of conductive material, arranged, as described, to swing back into contact with the said ground connections, substantially as set forth.

5. In an apparatus of the character described, the combination of the plates A, of conductive material, bolt H, and spring *d*, block P, to which the end of the wire is secured, and outwardly-swinging gate A', whereby access may be had to the said block, substantially as described.

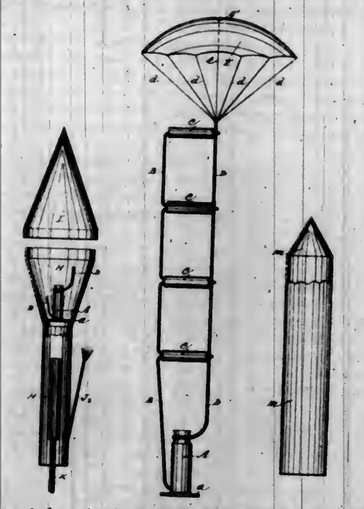


480,010. SPROCKET DEVICE FOR CONVEYERS. MICHAEL GARLAND, Bay City, Mich. Filed Apr. 25, 1892. Serial No. 430,486. (No model.)

Claim.—1. In that type or species of log-haul-up machines or conveyers in which a rope or cable is employed, the combination, with the traveling rope or cable, of an attachment device comprising two metallic castings, each grooved to constitute a half-housing for the rope or cable, one of said castings being formed or provided with sets of upwardly-projecting log-engaging teeth and the two parts being securely clamped together and onto the cable, all in substantially the manner and for the purposes hereinbefore set forth.

2. A rope or cable carrier attachment device composed of two parts A and B, adapted to be clamped onto the rope, as specified, the upper part B having the teeth *f* and the combined parts being shaped to coact or properly engage with the teeth of a sprocket-wheel, all as and for the purposes set forth.

480,011. INSULATOR. JOHN J. GREEN, Boonton, N. J., assignor to the Security Insulator Company, of New Jersey. Filed Mar. 24, 1892. Serial No. 426,220. (No model.)



Claim.—1. An insulator having a transverse diametrical groove formed in its upper portion for the introduction of the wire, a chan-

nel at right angles to said groove for permanently retaining said wire, and an axial perforation extending from the intersection of said groove and channel to the bottom of the insulator, through which a screw or pin is made to pass for securing the insulator to its support, at the same time permitting it to be rotated for the purpose of securing the wire, as set forth.

2. An insulator frictionally movable upon a central axis, having a transverse diametrical groove formed in its upper portion for the introduction of the wire, and a channel at right angles to said groove for permanently retaining said wire, which channel is provided with three or more bearing points or surfaces so disposed with reference to each other as to produce a bend in the wire when the insulator has been rotated into position, as set forth.

480,012. SIGNAL-ROCKET FOR VESSELS. THOMAS W. HAND and WALTER TEALE, Hamilton, Canada. Filed Jan. 9, 1892. Serial No. 417,459. (No model.)

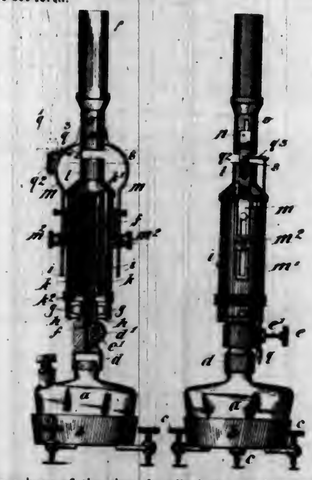
Claim.—1. In a signal-rocket, the combination of an igniting-light A with its wad *a* and its attached fuse B, which is also attached to a series of colored lights C, substantially as described.

2. In a signal-rocket, an igniting-light A and its attached fuse B, with the colored lights C, in combination with the non-ignitible connecting-line D, substantially as described.

3. In a signal-rocket, the combination of the igniting-light A, colored lights C, fuse B, connecting-line D, and a parachute E, with its strands *d*, its center elastic strand *e*, and its center *d'*, substantially as described and set forth.

4. The rocket H, having widened top with its close-fitting conical cover I, forming a chamber containing and inclosing the igniting-light and wad, the flexible fuse, the colored lights, the flexible and non-ignitible connecting-line, and fabrical parachute, with fuse J, attached to lower part of said rocket H, giving power to the whole, substantially as described and set forth

---

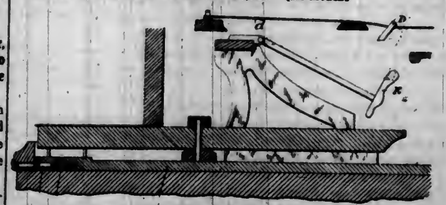


480,013. STANDARD OIL-LAMP. AUGUSTUS G. V. HARCOURT, Cowley Grange, England. Filed Dec. 4, 1888. Serial No. 292,663. (No model.) Patented in England Sept. 3, 1887, No. 11,995, and in France June 20, 1888, No. 191,339.

Claim.—1. In a lamp of the class described, the combination, with the burner, of a non-transparent chimney composed of two superposed sections adjustable relatively to each other, so as to form a space between them, the proximate ends of said sections lying above the burner in the vertical plane of the same, for the purpose set forth.

2. In a lamp of the class described, the combination, with a jacketed burner, of a non-transparent chimney composed of two superposed sections adjustable relatively to each other, so as to form a space between them, the proximate ends of said sections lying above the burner in the vertical plane of the same, for the purpose set forth.

3. In a lamp of the class described, the combination, with the burner, of a non-transparent chimney composed of a lower stationary section encompassing the burner and having a contracted portion extending beyond said burner, so as to inclose the lower portion of the flame, and an upper section, the lower portion of which is likewise contracted and adapted to inclose the upper portion of the flame, said upper section having curved arms *m*, and means for adjusting the said arms on the stationary section of said chimney, for the purpose set forth.



4. In a lamp of the class described, the combination, with the burner, of a non-transparent chimney composed of a lower stationary section encompassing the burner and having a contracted portion extending beyond said burner, so as to inclose the lower portion of the flame, and an upper section, the lower portion of which is likewise contracted and provided with two vertical slots o diametrically opposite each other, said contracted and slotted portion being adapted to inclose the upper portion of the flame, said upper section having curved arms *m*, one of which is provided with a bearing q^3, and means for adjusting the said arms on the stationary section of said chimney, for the purpose set forth.

5. In a lamp of the class described, the combination, with the burner, of a non-transparent chimney composed of a lower stationary section encompassing the burner and having a contracted portion extending beyond said burner, so as to inclose the lower portion of the flame, and an upper section, the lower portion of which is likewise contracted and adapted to inclose the upper portion of the flame, said upper section having curved and recessed arms *m*, said recesses being formed in the edges of the arms diametrically opposite each other, and means for adjusting the said arms on the stationary section of said chimney, for the purpose set forth.

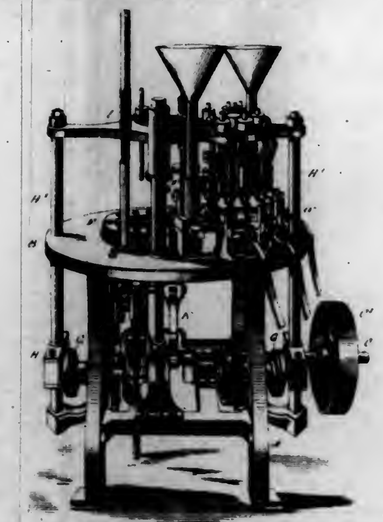
6. In a lamp of the class described, the combination, with the burner and a chimney composed of two sections adjustable vertically relatively to each other, the proximate ends of said sections lying above the burner in the vertical plane thereof, of means, such as a gage-disk *v*, for determining the hiatus between the two chimney-sections, substantially as and for the purpose set forth.

480,014. PIANO-ACTION. WILLARD L. HAWES, Wakefield, Mass. Filed Apr. 18, 1892. Serial No. 429,548. (No model.)

Claim.—1. A piano-action mounted upon a frame adjustable inward and outward in relation to the bed or key-frame bottom and the key-blocks, whereby the position of the hammers in relation to the agraffe is varied at will, as and for the purposes described.

2. In an action for grand and similar pianos, the longitudinally-movable key-frame carrying the action and hammers, and means for adjusting said frame or one end of it inward or outward in relation to the piano-front and upon the bed, as and for the purposes described.

3. In a grand piano, the combination of the longitudinally and transversely movable key-frame, the hammers and hammer-actions supported thereby, and the agraffe, as and for the purposes described.



4. The combination, in a piano, of a key-frame, the hammers and hammer-actions supported thereby, the agraffe, the key-blocks, and guiding connection between one or both ends of the key-frame and key-block, and means for moving the key-frame and bolt or guide transversely in relation to each other, as and for the purposes described.

5. The combination of the key-frame, the hammers and hammer-actions mounted thereon, the agraffe, the key block or blocks, the bolt or key-frame guide connecting the key-frame at each end with the blocks arranged at one end at least to be adjustable transversely to the frame, with an adjusting-screw carried by said frame and engaging said bolt, as and for the purposes described.

6. The combination of the key-frame, the key-block, the bolt at one end entering a slideway in said block and adjustably connected with the key-frame, and means for adjusting said frame on said bolt carried by said frame, as and for the purposes described.

7. The combination of the key-frame, the key-block, the adjustable connecting-bolt, and the key-slip having a hole by which access to the adjusting-screw is had, as and for the purposes described.

480,015. CARTRIDGE-LOADING MACHINE. CHARLES S. HENRY, Aurora, Ind., assignor to the Standard Cartridge Company, of New Jersey. Filed Apr. 11, 1892. Serial No. 428,669. (No model.)

Claim.—1. In a machine for loading cartridges, the combination, with the primary actuating mechanism and tool-carrier, of two reciprocating shafts for moving the tool-carrier, provided with box-yokes at their lower ends, substantially as described.

2. In a machine for loading cartridges, the combination, with the primary actuating mechanism, of a reciprocating shaft carrying independently-pivoted levers for giving the crimpers vertical movement and for inserting shells into the shell-carrier through intermediate mechanism, substantially as described.

3. In a machine for loading cartridges, and in combination with the actuating mechanism thereof, a rotating shell-placer operated thereby, whereby the cartridge-shells are successively transferred from said placer to the shell-carrier, substantially as described.

4. In a machine for loading cartridges, the combination, with a shell-carrier, of a rotating shell-placer provided with cells for the ingress and egress of shells therefrom, substantially as described.

5. In a machine for loading cartridges, the combination, with the shell-carrier, shell-feeding tube, and a vertically-reciprocated rod, of a rotating shell-placer provided with cells or holes for the ingress and egress of shells therefrom, substantially as described.

6. In a machine for loading cartridges, the combination, with the shell-carrier, shell-feeding tube, and a vertically-reciprocated rod, of a horizontally-rotating shell-placer provided with cells and means for revolving the same, substantially as described.

7. In a machine for loading cartridges, the combination, with the actuating mechanism, of a shell-carrier in the form of a ring provided with cells and having notches in the inner rim and gear-teeth on the periphery of its lower part and mechanism for rotating the same, substantially as described.

8. In a machine for loading cartridges, the combination, with a shell-carrier, substantially as described, of a vertical shaft provided with a cap having a pin near its periphery carrying a block which slides in a box formed in an oscillating lever, an oscillating lever, a cam on the driving-shaft, a rod having a crank on its lower end provided with a pin or roll riding in the groove of the cam and on its upper end a short arm or lever, and a spring-pressed lever whereby the shell-carrier is given an intermittent movement, substantially as described.

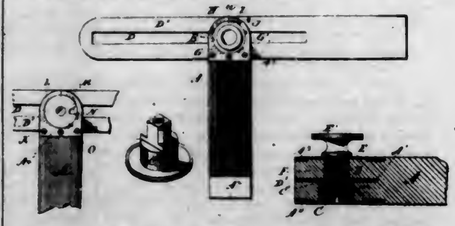
9. In a machine for loading cartridges, the combination, with the driving-shaft having crank-wheels at each end provided with crank-pins, of two reciprocating shafts having box-yokes at their lower ends in which said crank-pins slide in blocks and carrying at their upper ends a tool-carrier provided with loading-tools, substantially as described.

10. In a machine for loading cartridges, the combination, with the powder and shot magazines, of a charge-slide or bar provided with an aperture having a cup or ring to regulate the charge of powder or shot, substantially as described.

11. In a machine for loading cartridges, the combination, with the powder and shot magazines, of a charge-slide provided with an apertore and having gear-teeth at one end, a segment-gear and rack-bar fixed to a guide-rod secured to the tool-carrier, whereby with the upward and downward movement of the tool-carrier the charge-slide is given a forward and backward movement, as and for the purpose described.

12. In a machine for loading cartridges, the combination, with the shell-carrier, the wad-feeding, wad-cutting, and wad-placing devices, and the powder and shot magazines, of two crimpers successively operating by suitable means and mechanism upon the cartridge-shell, substantially as described.

13. In a machine for loading cartridges, the combination, with the rotating shell-placer, shell-carrier, and tool-carrier, of shell-feeding and shell-delivery tubes and an ejector, substantially as described.

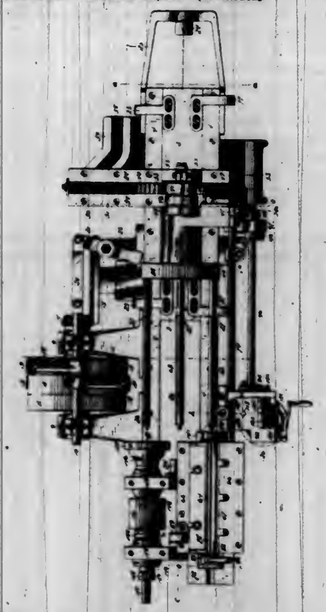


14. In a machine for loading cartridges, the combination, with the driving-shaft, of cam D, having opposed faces, rod K, having an arm at its lower end provided with a pin or roll working in and operated by said cam and at its upper end a short arm or lever K^2, whereby the locking-lever K^2 is released from engagement with the shell-carrier, substantially as described.

15. In a machine for loading cartridges, the combination, with the shell-carrier in the form of a ring, a tool-holder, and loading devices, of wad-feeding rolls, wad-cutting and wad-placing devices arranged on a circular line, and ratchet-and-pawl mechanism W' for operating the wad-feeding rolls, substantially as described.

16. In a machine for loading cartridges, the combination, with the primary actuating mechanism, shafts H' H', tool-holder I, slotted lever W^2, and pawl and ratchet W', of the wad-feeding rolls W, arranged in a circular line on the table B and geared together by the bevel-gears w, whereby said rolls are given simultaneous movement, substantially as described.

17. In a machine for loading cartridges, the combination, with the ring-shaped shell-carrier F, provided with cells f' for receiving and holding the shells while being charged, and the tool-carrier I, of the powder and shot magazines having actuated charge-slides provided with charge-regulating rings, and the wad-cutting and wad-placing devices arranged above and in circular line with said shell-carrier, whereby predetermined charges of powder and shot are delivered into the shells in said carrier and wads are cut and rammed or placed on said charges successively, as set forth and described.



480,016. BEVEL. DAVID HOADLEY, Naugatuck, Conn. Filed Feb. 23, 1892. Serial No. 422,409. (No model.)

Claim.—1. In a bevel-square, the combination, with a longitudinally-cleft stock having the opposite faces of its inner end provided with circularly-arranged graduations, of a slotted blade inserted into the cleft of the stock, a rotatable coupling-head having one end provided with an index-disk and constructed with a centrally-threaded bore and with a rib to fit into the slot of the blade, a disk for attachment to the said head at the opposite end thereof from the disk before mentioned, and a clamping-screw entering the said head and bearing upon the outer face of the removable disk, substantially as described.

2. In a bevel-square, the combination, with a longitudinally-cleft stock, of plates applied to the upper and lower faces of the inner end of the same, having circular openings and circularly-arranged groups of graduations adjoining such openings, a slotted blade located in the cleft of the stock, a rotatable coupling-head having one end provided with an index-disk and constructed with a centrally-threaded bore and with a rib to fit into the slot of the blade, a disk for attachment to the said head at the opposite end thereof from the disk before mentioned, and a clamping-screw entering the said head and bearing upon the outer face of the removable disk, substantially as described.

480,017. MACHINE FOR SIZING AND POLISHING PAPER TUBES. ALFRED C. HOBBS and CHARLES B. RICHARDS, Bridgeport, Conn., assignors to the Union Metallic Cartridge Company, same place. Filed June 23, 1886. Serial No. 205,959. (No model.)

Claim.—1. A rotating disk having arbors which take up the tubes, in combination with sizing-jaws which rotate about the tubes while on the arbors and stripping-jaws whereby the tubes are removed therefrom.

2. The reciprocating carriage and the disk having arbors to take up the tubes, said disk being adapted to make a quarter-revolution at each forward movement of the carriage, in combination with a lubricator 59 for the arbors, jaws 67, which hold the tubes singly while they are taken up by the arbors, and sizing-jaws through which the tubes pass singly, as and for the purpose set forth.

3. The reciprocating carriage and the intermittently-rotating arbor-disk, in combination with lubricator 59, jaws 67, the sizing-jaws, and a set of spring stripping-jaws, operating substantially as described.

4. The reciprocating carriage and intermittently-rotating arbor-disk, in combination with jaws 67, from which the tubes are taken singly by the arbors, roller 88, which lubricates the tubes while on the arbors, and sizing-jaws 153.

5. The arbors having shoulders 27, in combination with jaws 67, from which the tubes are taken singly, rotating sizing-jaws 153, through which the tubes pass while on the arbors, and stripping-jaws 161, having shoulders which spring over the ends of the tubes and rest upon the shoulders 27, whereby the sized tubes are removed from the arbors.

6. The combination, with the carriage-disk 28, carrying the arbors, jaws 67, and the sizing-jaws 153, of mechanism, substantially as described and shown, for imparting reciprocatory motion to the carriage and intermittent rotary motion to the disk.

7. The carriage having brackets 30 and lateral extension 31, in combination with disk 28, shaft 29, having ratchet 46, cross-slide 33, engaging cam-slot 38 and segment-gear 41, and a pawl pivoted to said segment, whereby said cross slide is caused to actuate shaft 29 and the disk.

8. The reciprocating carriage provided with a reciprocating cross-slide and shaft 29 upon said carriage, in combination with ratchets 46 and 48, keyed to said shaft, segment-gear 41, free to turn thereon, pawl 43, pivoted to the segment and engaging ratchet 46, and sliding pawl 47, engaging ratchet 48, whereby, after each forward movement of the shaft it is held against backward movement.

9. In a machine of the class described, shaft 29, having ratchet 46, a loose segment 41, pawl 43, pivoted to said segment and engaging the ratchet, and a friction-disk 54, in combination with cross-slide 33, engaging said segment, and clamping-arms 55, engaging said disk.

10. Shaft 29, carrying ratchets 46 and 48, and a loose segment 41, having a pawl engaging ratchet 46, in combination with cross-slide 33, engaging the segment, pawl 47, engaging ratchet 48, and pivoted lever 50, one end of which is pivoted to pawl 47 and the other provided with a roller to engage a cam, whereby pawl 47 is caused to release the ratchet when the forward movement takes place.

11. The combination, with the reciprocating carriage and intermittently-rotating arbor-disk, of lubricator 59 for lubricating the arbors singly.

12. The reciprocating carriage and the intermittently-rotating arbor-disk, in combination with lubricating-washers 60, a spring-band encircling them, and bracket 65, upon which they are supported.

13. The combination, with the arbors and operating mechanism, substantially as described and shown, of the hopper-jaws 67 and means, substantially as shown and described, for opening and closing the jaws.

14. Jaws 67 and plates 68, to which they are secured and which are provided with screw-pins carrying rollers, in combination with a slide having angular slots engaged by said rollers, whereby the jaws are opened and closed.

15. Slide 72, having slots 71, and plates 68, carrying rollers engaging said slots, in combination with jaws 67, adjustably secured to said plates.

16. The slide having slots 71 and the jaws having rollers which engage said slots, in combination with an adjustable bed 78.

17. The bed having a V-shaped notch 80 and screws 79, whereby it is adjusted up or down, in combination with jaws having angular faces corresponding with said notch, rollers 70, and a slide engaged by said rollers, whereby the jaws are opened and closed.

18. The combination, with the slide, of the bed having semi-cylindrical pieces 81 and the jaws having quadrant-shaped pieces 82, whereby the ends of the tubes are firmly grasped, so that they cannot be crushed when the arbors are forced in.

19. The slide and jaws 67, having angular faces and carrying quadrant-shaped pieces 82, in combination with an adjustable bed having a V-shaped groove corresponding with the faces of the jaws and a semi-cylindrical piece 81, which forms with pieces 82 a perfect circle when the jaws are closed, as and for the purpose set forth.

20. The combination, with the arbors and the jaws, of spring-actuated slides 84, having curved recesses at their inner ends which permit the points of the arbors to pass but hold back the tubes and then permit the arbors to pass forward with the tubes as the jaws open.

21. The arbors, the bed, the jaws, and slide 72, in combination with slides 84, having recesses 87, and springs 85, whereby they are pressed together.

22. The bed, jaws 67, slide 72, and the reciprocating carriage having dogs 77, in combination with rod 74, having an arm adapted to engage said dogs, and pivoted lever 73, one end of which is pivoted to the slide and the other to rod 74.

23. The arbors, slide 72, and jaws 67, in combination with block 83, having an opening 86, slides 84, carried by said block, and springs 85, whereby they are held in position.

24. The combination, with the reciprocating carriage, the arbors, and an intermittently-rotating disk by which they are carried, of lubricator 59, whereby the arbors are lubricated, spring actuated slides 84, and jaws 67.

25. The reciprocating carriage and arbors 26 upon an intermittently-rotating disk carried thereby, in combination with lubricator 59, bed 78, having semi-cylindrical pieces 81, and jaws 67, having quadrant-shaped pieces 82, whereby the ends of the tubes are clamped to prevent crushing when the arbors are forced in.

26. The reciprocating carriage and arbors 26 upon an intermittently-rotating disk carried thereby, in combination with lubricator 59, jaws 67, and bed 78, having pieces 81 and 82, and spring-actuated slides 84, as described, and for the purpose set forth.

27. The arbors and lubricator 59, in combination with guide 141 and jaws 67.

28. The combination, with the arbors and jaws 67, which hold the tubes singly as the jaws are pressed in, of lubricating-roller 88, whereby the exterior of the tube is lubricated.

29. The combination, with the arbors, lubricator 59, and jaws 67,

which hold the tubes as the arbors are pressed in, of roller 88, whereby the tubes are lubricated as they are drawn out from the jaws.

30. Slide 90, carrying roller 88 and having an adjustable block 94, in combination with rock-shaft 96 and lever 95, carried by said shaft and pivoted to block 94.

31. The rock-shaft, slide 90, lever 95, and roller 88, in combination with cam 106, slide 102, having pivoted arm 103, and crank 99, secured to the rock-shaft and pivoted to slide 102.

32. The rock-shaft, lever 95, the crank, slide 102, having a pivoted arm, and face-cam 106, against which said arm bears, in combination with air-cylinder 138, having a petcock, and piston 140, pivoted to lever 95 and adapted to slide in said cylinder, as and for the purpose set forth.

33. Slide 96, carrying roller 88, slotted to receive an adjustable block 94, the rock-shaft, and lever 95, in combination with stop 135, spring 137, and the piston and air-cylinder.

34. Roller 88, the slide, and the rock-shaft, in combination with lever 95 and the piston and air-cylinder.

35. In a machine of the class described, cam 106 and the rock-shaft having lever 95 and crank 99, in combination with slide 102, to which said crank is pivoted and which is provided with a roller engaging said cam, whereby the shaft is actuated, and stop 135, whereby the oscillation of said shaft is limited.

36. The rock-shaft having crank 99 and oscillating face-cam 106, in combination with slide 102, to which said crank is pivoted, a stud 105 on said slide, and arm 103, pivoted to said slide and engaging said cam and provided with a curved slot through which the stud passes, whereby when the cam is oscillated in one direction the arm is held down and the slide reciprocated and when oscillated in the other direction the arm is raised and the slide remains stationary.

37. The combination, with the arbors, rollers 88 and 112, and casting 92, having a recess for lubricating material in which roller 112 rotates, of a slide 90, by which roller 88 is carried, and mechanism, as a rock-shaft and connections, by which said slide is reciprocated.

38. The reciprocating carriage and the tube-carrying arbors carried by an intermittently-rotating disk on said carriage, in combination with lubricating-roller 88, carried by a reciprocating slide, and a roller 112, rotating in a recess containing lubricating material, whereby during the forward movement of the carriage roller 88 receives lubricating material and during the backward movement of the carriage it lubricates tubes upon the arbors.

39. The tube-carrying arbors, roller 88, and roller 112 upon shaft 113, in combination with a reservoir, a casting having a recess 123 for lubricating material, and intermediate connections with shaft 107, whereby rocking motion is imparted to roller 112.

40. The combination, with the tube-carrying arbors and lubricating-roller 88, of a reservoir 120, having a passage leading to recess 123, a piston 124 for forcing the lubricating material into said recess, and a roller 112 in said recess, whereby the lubricating material is transferred to roller 88.

41. Arbors 26, rollers 88 and 112, and lubricator-reservoir 120, in combination with piston 124, rack 125, and a pinion and pawl whereby the piston may be lifted out of the reservoir to permit filling.

42. Rollers 88 and 112 and reservoir 120, having a passage leading to recess 123, in combination with rack 125, a piston pivoted to said rack, a weight for forcing down the lubricating material, and a pinion engaging said rack, whereby the piston may be raised out of the reservoir.

43. Reservoir 120, having a recess 123, communicating therewith, and roller 112, journaled in said recess, in combination with rack 125, a piston pivoted thereto, a pinion for raising said rack, a pawl for holding said rack in its raised position, and a spring-rack 134 for holding the pawl in disengaged position when the piston is in operative position.

44. The reciprocating carriage, the arbors, an intermittently-rotating disk upon said carriage by which the arbors are carried, and arbor-lubricator 59, in combination with jaws 67, from which the arbors take the tubes, and lubricating-roller 88, by which the tubes are lubricated on the arbors.

45. The reciprocating carriage, the arbors carried by an intermittently-rotating disk upon said carriage, and arbor-lubricator 59, in combination with jaws from which the tubes are taken by the arbors, a roller upon a reciprocating slide by which the tubes are lubricated during the backward movement of the carriage, and a roller 112, by which roller 88 is lubricated.

46. The reciprocating carriage and the arbors carried by an intermittently-rotating disk on said carriage, in combination with jaws 67, from which the paper tubes are taken by the arbors, and a chuck 146, having jaws 153, whereby the tubes are sized while on the arbors.

47. The arbors, the outer shell, and the chuck secured thereto, in combination with jaws 153, ring 154, secured to the chuck, whereby the jaws are held in place, and set-screws 156, whereby the jaws may be adjusted.

48. The tube-carrying arbors and the rotating outer shell carrying sizing-jaws 153, in combination with a non-rotating inner shell carrying stripping-jaws 161.

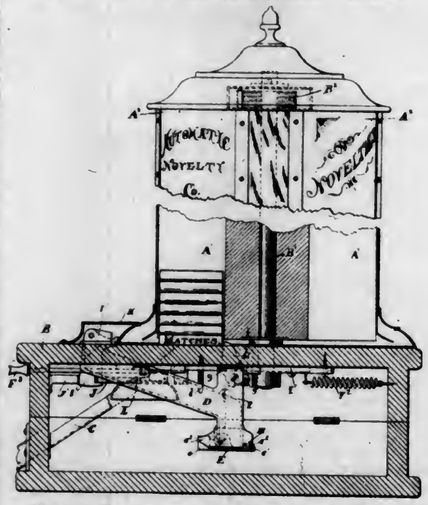
49. The outer shell carrying jaws 153 and provided with a belt-pulley whereby rotation is imparted, in combination with the inner shell having spring stripping-jaws secured thereto and clamp 158, whereby the inner shell is held in position.

50. The inner shell having shoulders 160 and the stripping-jaws having shanks 162, secured to the shell, as shown, in combination with clamp 158, the rotating outer shell, and the sizing-jaws carried thereby.

51. The inner shell carrying spring stripping-jaws and held by clamp 158, in combination with a rotating outer shell carrying chuck 146, provided with undercut ways 152 to receive the sizing-jaws, and ring 154, whereby said jaws are held in place.

52. The combination, with the tube-carrying arbors having shoulders 27, of the rotating outer shell carrying sizing-jaws through which the tubes pass while on the arbors and a non-rotating inner shell carrying stripping-jaws provided with shoulders 163.

53. The tube-carrying arbors and lubricating-roller 88, in combination with the chuck carrying sizing-jaws 153.



54. The arbors, lubricating-roller 88, and a rotating outer shell carrying a chuck with sizing-jaws, in combination with a non-rotating inner shell carrying spring stripping-jaws.

55. Lubricator 59 and the tube-carrying arbors, in combination with lubricating-roller 88 and the sizing-jaws.

56. Lubricator 59 and the tube carrying arbors, in combination with lubricating-roller 88, the sizing-jaws, and spring stripping-jaws.

57. The reciprocating carriage and the arbors carried by an intermittently-rotating disk, in combination with bracket 65, carrying lubricator 59 and the feeding mechanism, bracket 93, carrying lubricating-rollers 88 and 112, and bracket 143, having an opening 142, carrying the sizing and stripping jaws.

480,018. COIN-ACTUATED MACHINE. JAMES M. HUNTER, Chicago, Ill. Filed May 19, 1892. Serial No. 433,539. (No model.)

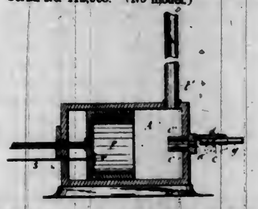
Claim.—1. In coin-actuated machines, the combination of a rotatable turret provided with storage-compartments, a spring for rotating the turret for bringing the storage-compartments successively into relation to a point of discharge, coin-actuated mechanism for releasing the discharging mechanism, and discharging mechanism for forcing out the desired article, substantially as described.

2. In coin-actuated machines, the combination of a rotatable turret provided with storage-compartments, a spring for rotating the turret for bringing the storage-compartments successively into relation to a point of discharge, means for holding the turret from rotating until after the discharge of an article, coin-actuated mechanism for releasing the discharging mechanism, and discharging mechanism for forcing out the desired article, substantially as described.

3. In coin-actuated machines, the combination of an article-storage compartment, coin-actuated mechanism for releasing the discharge mechanism, discharge mechanism comprising a longitudinally-movable bar, a pivoted discharge-finger advancing with said bar in an erect position, and means for tripping said finger at the limit of its advanced movement, substantially as described.

4. In coin-actuated machines, the combination of an article-storage compartment, coin-actuated mechanism for releasing the discharge mechanism, discharge mechanism comprising a longitudinally-movable bar, a pivoted discharge-finger, means for tripping it into its two positions, and a balanced latch closing the end of the coin-chute, the coin-chute provided with a hook, notch, and beveled corners, substantially as described.

5. In coin-actuated machines, the combination of a coin-chute, a latch closing the discharge end of the chute and locked to prevent it from being moved away from the end of the chute until unlocked by a coin, means for moving the latch away from the end of the chute when unlocked and at the same time advancing the discharge mechanism of the machine, and means for locking the latch and discharge mechanism against a second advance until they have been returned to their initial position, substantially as described.



6. In coin-actuated machines, the combination of the draw-bar F', the flexible spring-bar J, with its latch *j* attached to and moving longitudinally with the draw-bar, the inclined guide J', arranged to throw the spring-bar into position for operating the turret-pawl, the pawl I' and lugs I for holding the turret in such position that its storage-compartments are in line with the discharge-opening, and the shield K for covering and limiting the motions of the pawl I, substantially as described.

7. In coin actuated machines, the combination of the draw-bar F', the discharge-finger G, attached thereto, and its lug g^3, moving with the draw-bar, and the stops g^5 g^4, arranged to trip the discharge-finger into two positions, substantially as described.

8. In coin-actuated machines, the combination of the draw-bar, the discharge-finger G and its lug g^3, attached thereto and moving with said bar, the stops g^5 g^4 for tripping the discharge-finger into its two positions, the vertical post F, attached to the draw-bar and carrying the balanced latch E at its lower end, the coin-chute D, with the hook e^3 at its lower end for locking the discharge mechanism in its initial position, the safety-notch H, located in the lower end to prevent the discharge mechanism from being moved forward until it has been returned to its initial position, and the beveled lower end e^2 for guiding the balanced latch, substantially as described.

9. In coin-actuated machines, the combination of the draw-bar F' and the discharging mechanism attached thereto, the vertical post F, attached to and moving with said bar, the flexible spring-bar L^3, with its weighted end L' attached to the post F, the post *l* for tripping the spring-bar L^3, and the bell L, substantially as described.

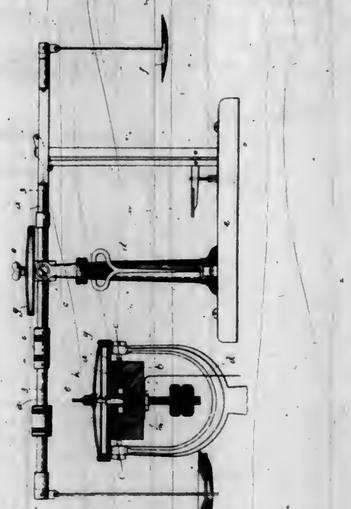
480,019. EXPLOSIVE ENGINE. JOHN JOYCE, Oswego, N. Y. Filed Nov. 21, 1891. Serial No. 412,605. (No model.)

Claim.—1. An explosive engine comprising a chamber, a piston in said chamber, a cartridge-holder in the end wall of said chamber, a cartridge-ejector movably connected to the cartridge-holder, a cartridge-carrier movable toward and from said holder, and a plunger in said carrier, as set forth.

2. In an explosive engine, the combination of a chamber, a piston in said chamber, a cartridge-holder in the end wall of the chamber, a cartridge-carrier movable toward and from the holder, a plunger in said carrier, a lever connected to said plunger, a hammer back of the plunger, a spring drawing the hammer to the plunger, an arm adapted to hold the hammer remote from the plunger, a cam on the aforesaid lever adapted to throw the arm out of engagement with the hammer, and connections between said levers and main shaft of the engine to operate said levers, as set forth.

3. An explosive engine comprising a chamber, a piston in said chamber, a cartridge-holder in the end wall of the chamber, a cartridge-ejector movably connected to the cartridge-holder, and a lever connected to said ejector and actuated by the main shaft of the engine, as set forth.

4. The combination, with the chamber A and piston P, of the block C, seated stationary in the rear wall of said chamber, the block C', seated movable longitudinally on the block C, and the port *a* in the adjacent sides of said blocks, the loops *d d*, extending rearward from the movable block C', and the rock-arm D, consisting of two rods united at the ends and spread apart at the center and passing through the aforesaid loops, as and for the purpose set forth.



5. In combination with the chamber A and piston P, the cartridge-holder C C', pivoted post *f*, cartridge-carriers *c c'*, pivotally connected at the front end to said post, the lever A, and the plunger *g*, connected to said lever and supporting the rear end of the plunger, substantially as described and shown.

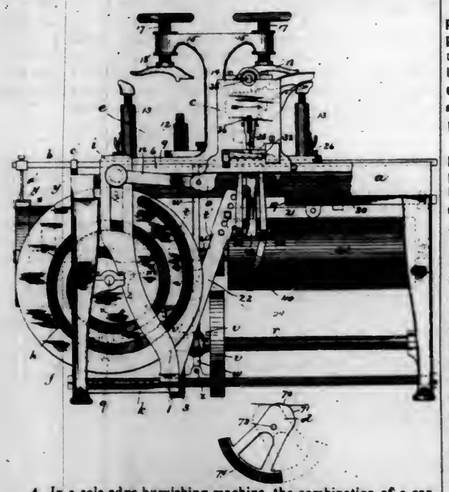
6. In combination with the chamber A, provided with the cartridge-holder in its end wall, the cup-shaped piston P, disposed with its mouth toward the cartridge-holder, and the valve *v*, connected to the solid end of the cup and arranged to open inward, substantially as and for the purpose set forth.

7. In combination with the case A and cross-head T, the piston P, formed cup-shaped and having its closed end toward the front and provided with the valve *v*, and the stem *s*, adjustably connected to the cross-head and having its inner end in line with said valve, as and for the purpose set forth.

8. In combination with the case A and piston P, the cartridge-holder C C', cartridge-carrier *c c'*, plunger *g*, lever A, connected to said plunger and actuated by the main shaft of the engine, the cam *i*, attached to said lever, the hammer H, provided with the shoulder *l*, the arm *l'*, adapted to engage said shoulder, and the spring S, drawing the hammer toward the plunger, substantially as set forth.

480,020. WEIGHING-SCALES. EDWARD C. JUDD, Boston, Mass., assignor to the American Scale Manufacturing Company, same place. Filed Mar. 30, 1891. Renewed July 5, 1892. Serial No. 438,936. (No model.)

Claim.—The combination of the block *b*, pivoted to a supporting-standard, the beam passing through and affixed to said block and provided with a longitudinal slot or guide, a rack-bar adapted to slide in said slot or guide, a weight engaged with one end of said bar, and a hand or pointer carrying shaft journaled in said block and provided with a pinion meshing with said bar and at its upper end with a handle or thumb-piece, whereby the shaft may be rotated to move the weight through the rack-bar, said shaft passing through a dial affixed to the block, as set forth.



480,021. SOLE-EDGE-BURNISHING MACHINE. GEORGE A. KNOX, Lynn, Mass. Filed Sept. 3, 1889. Renewed Dec. 30, 1891. Serial No. 416,565. (No model.)

Claim.—1. In a sole-edge-burnishing machine, the combination of a carriage having a burnishing-tool, means for impelling said tool upon the carriage, fixed guides on which said carriage is movable in a rectilinear direction, automatic means, substantially as described, whereby said carriage is given a progressive movement on said guides, then held at rest, and then given a second progressive movement, a jack adapted to be partially rotated, and means, substantially as described, for giving said jack a half-rotation while the carriage is held at rest between its first and second progressive movements, as set forth.

2. In a sole-edge-burnishing machine, the combination of a carriage, fixed guides on which said carriage is movable in a rectilinear direction, a burnishing-tool mounted on the carriage, independent

means for reciprocating said tool, automatic means, substantially as described, for giving said carriage a first and a second progressive movement in one direction, and means, substantially as described, for stopping the operation of the machine at the end of the second progressive movement, as set forth.

3. In a sole-edge-burnishing machine, the combination of a carriage, fixed guides on which said carriage is movable in a rectilinear direction, a burnishing-tool mounted on said carriage, a motor having the cam-grooved disk *f*, and connections between the same and the carriage for giving said carriage a first and a second progressive movement in one direction, and automatic means, substantially as described, for reversing the said motor and thereby giving the carriage a first and a second progressive movement in the opposite direction, as set forth.

4. In a sole-edge-burnishing machine, the combination of a carriage, a burnishing-tool thereon, a power-rotated disk *f*, having two cam-grooves *h h'*, connections, substantially as described, between the cam-groove *h* and the carriage, whereby the latter is given a first and a second progressive movement in one direction and an intermediate period of rest, a jack pivotally connected to a fixed support and provided with a pinion concentric with its pivot, a movable rack engaged with said pinion, and connections, substantially as described, between said rack and the cam-groove *h'*, whereby the rack is held at rest during the progressive movements of the carriage and moved to partly rotate the pinion and jack while the carriage is at rest between said movements, as set forth.

5. In a sole-edge-burnishing machine, the combination of a carriage, a burnishing-tool thereon, a shaft, as 38, journaled in bearings on said carriage and adapted to reciprocate the burnishing-tool, means for giving the carriage a first and a second progressive movement in one direction, an elongated pulley impelled by the power that gives the carriage its progressive movements, and a belt which communicates motion from said pulley to the tool-reciprocating shaft on the carriage, said belt being adapted to move along the elongated pulley with the carriage, as set forth.

6. In a sole-edge-burnishing machine, the combination of a carriage, a burnishing-tool thereon, a shaft journaled in bearings on said carriage and adapted to reciprocate the burnishing-tool, means for moving the carriage progressively, an elongated power-driven pulley, a belt running from said pulley to the tool-reciprocating shaft on the carriage, and a bracket affixed to the carriage and provided with flanged idle-pulleys, whereby the belt is moved with the carriage along the elongated pulley, as set forth.

7. In a sole-edge-burnishing machine, the combination of a carriage, a burnishing-tool thereon, a driving shaft *u*, having fast pulleys *y y'* and a loose pulley *z*, intermediate means operated by said shaft, whereby the carriage is moved progressively, a belt-shipper engaged with a driving-belt on said pulleys and having adjustable collars *d' d*, and a projection *f'* on the carriage arranged to strike said collars and move the shipper to stop the machine at the end of the progressive movement of the carriage in each direction, as set forth.

8. In a sole-edge-burnishing machine, the combination of the shaft *u*, having the fast pulleys *y y'* and loose pulley *z*, the shaft *u*, the loose pulleys *e d'* on said shaft connected by belts 80 81 with fast pulley *ff* on the shaft *u*, one of said belts being crossed and the other open, a clutch *v* on the shaft *r*, adapted to engage either the pulley *z* or the pulley *d'* with said shaft, a carriage *c*, having a burnishing-tool, the cam-grooved disk impelled by a connection with the shaft *r*, connections between said disk and the carriage whereby the latter is moved progressively by the rotation of said disk, a shipper *a'*, engaged with the belt that imparts motion to the shaft *u*, a bar *b'*, carrying said shipper and provided with collars *d' d*, a lug *f'* on the carriage *c*, arranged between said collars and adapted to move the bar and shipper to stop the operation of the machine at the ends of the progressive movement of the carriage, and a connection, as the lever *w*, between the shipper-bar and the clutch *v*, whereby a movement of the shipper-bar by the operator to start the machine after each stoppage thereof also reverses the rotation of the disk *f* and changes the direction of the progressive movement of the carriage, as set forth.

9. In a sole-edge-burnishing machine, a jack composed of a base-plate connected at one end by a pivot 7 to a fixed support, an upper plate connected centrally to said base-plate by a pivot 10 at one side of the pivot 7, and duplicate boot or shoe holding devices supported by said upper plate at opposite sides of the pivot that connects the latter with the base-plate, combined with a burnishing-tool, and means, substantially as described, for presenting said tool to a sole-edge supported by said jack, as set forth.

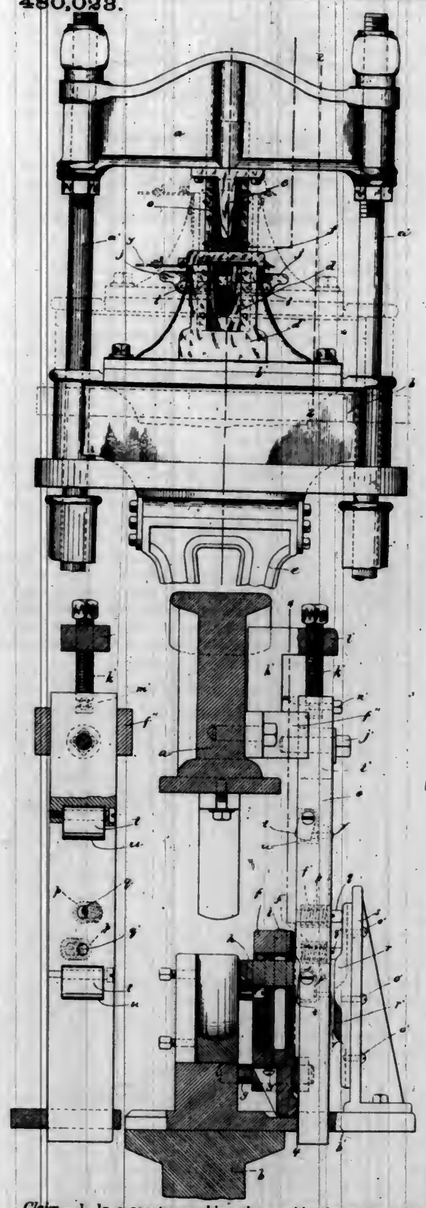
10. In a sole-edge-burnishing machine, a jack composed of a base-plate connected at one end by a pivot 7 with a fixed support, an upper plate 9, connected centrally by a pivot 10 with said base-plate and having a central post 14, arms 15 on said post, screws 17, working in sockets in two pairs of standards 12 13 on the upper plate 9, said arms and clamps on said screws formed to bear simultaneously on the heels and soles of boots or shoes supported by said standards, combined with a burnishing-tool, and means, substantially as described, for presenting said tool to a sole-edge supported by said jack, as set forth.

11. In a sole-edge-burnishing machine, the combination of a carriage, fixed guides on which said carriage is movable in a rectilinear direction, means for moving the carriage progressively, a holder, as 53, mounted on the carriage and provided with parallel guides and with locking devices, whereby it may be secured to the carriage with said guides in either a horizontal or an inclined position, and a reciprocating cross-head fitted to move on the guides supported by the cross-head, as set forth.

12. In a sole-edge-burnishing machine, the combination of a carriage, fixed guides on which said carriage is movable in a rectilinear direction, means for moving the same progressively, a reciprocating cross-head movable on guides on the carriage, vertical guides on said cross-head, a slide movable vertically on said guides, and a burnishing-tool carried by said slide and adapted thereby to rise and fall while in operation, as set forth.

13. In a sole-edge-burnishing machine, the combination of a carriage, fixed guides on which said carriage is movable in a rectilinear direction, means for moving the carriage progressively, a reciprocating cross-head movable on guides on said carriage, a vertically-movable slide on said cross-head, a burnishing-tool carried by said slide, and an arm or presser-foot attached to said slide and adapted to bear on the tread-surface of the sole of a boot or shoe held in a fixed position whereby said slide and tool are caused to rise and fall by the curvature of said tread-surface, as set forth.

480,022. WHEEL. AXEL LEVEDAHL, Aurora, Ill., assignor to the Gardner Sewing Machine Company, same place. Filed Apr. 21, 1892. Serial No. 430,107. (No model.)



Claim.—1. The wheel, substantially as described, consisting of a rim, a flat sheet-metal plate secured to the rim at or near its outer margin, a hub secured to the said metal plate, and braces connecting the body of the wheel with the hub externally to the plate.

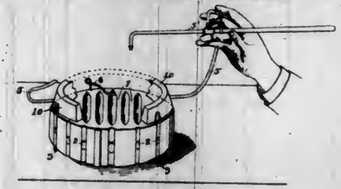
2. In combination with a wheel-rim, a flat sheet-metal plate secured to the rim at or near its outer edge, a hub secured to the plate and projecting externally thereto, and inclined braces connecting the outer end of the hub with the wheel at or near its margin.

3. In combination with a wheel-rim, a flat sheet-metal plate secured to the rim at or near its outer edge, a hub secured to the plate and projecting externally thereto, and braces connected with the outer end of the hub and passing through the plate into connection with the rim.

480,023. HEEL-STIFFENER MACHINE. LEMUEL W. LITCH, Swampscott, Mass. Filed Feb. 21, 1891. Renewed June 20, 1892. Serial No. 437,346. (No model.)

480,023.

Claim.—1. In a counter-machine, the combination of the fixed male former, the female former mounted on a reciprocating cross-head, the yoke affixed to said cross-head, the block *h*, adapted to move with said yoke and also independently thereof on vertical guides in the yoke, the side wipers *j j*, pivoted to said block, studs affixed to the yoke and projecting into slots in said pivoted wipers, and means for arresting said block at a given point in the movement of the female mold, thereby causing the wipers to swing crosswise of the path in which the female former moves, as set forth.



2. In a counter-machine, the combination of the fixed male former, the female former mounted on a reciprocating cross-head, the yoke affixed to the cross-head and provided with vertical guides, the block *h*, movable on said guides and having the flange-wiper *g'*, the side wipers pivoted to said block at opposite ends of the wiper *g'*, and means, substantially as described, for swinging said side wipers to form the side portions of a counter-flange, the wiper *g'* forming the intermediate portion of said flange, as set forth.

3. In a counter-machine, the combination of the fixed male former, the female former mounted on a reciprocating cross-head, the yoke affixed to the cross-head and provided with vertical guides, the block *h*, movable on the said guides and having the flange-wiper *g'*, the side wipers pivoted to said block at opposite ends of the wiper *g'*, the binding-bar *o*, secured to a fixed support and provided with the spring-retracted pins or bolts *q q'*, adapted to engage the block *h*, and the standards *s*, affixed to the reciprocating cross-head and provided with cams or projections *r r'*, adapted to project said pins, as set forth.

4. In a counter-machine, the combination of the fixed male former, the female former mounted on a reciprocating cross-head, the yoke affixed to the cross-head and provided with vertical guides, the block *h*, movable on said guides and having the flange-wiper *g'*, the side wipers pivoted to said block at opposite ends of the wiper *g'*, the binding-bar *o*, secured to a fixed support and provided with the spring-retracted pins or bolts *q q'*, adapted to engage the block *h*, the standards *s*, affixed to the reciprocating cross-head and provided with cams or projections *r r'*, adapted to project said pins, and means for vertically adjusting said binding-bar, as set forth.

5. In a counter-machine, the combination of the fixed male former, the female former mounted on a reciprocating cross-head, the yoke affixed to the cross-head and provided with vertical guides, the block *h*, movable on said guides and having the flange-wiper *g'*, the side wipers pivoted to said block at opposite ends of the wiper *g'*, the binding-bar *o*, secured to a fixed support and provided with the spring-retracted pins or bolts *q q'*, adapted to engage the block *h*, the standards *s*, affixed to the reciprocating cross-head and provided with cams or projections *r r'*, adapted to project said pins, and the take-up pieces *t t*, mounted on said binding-bar and arranged to rigidly support the yoke and flange-wipers during the flange-forming operation, as set forth.

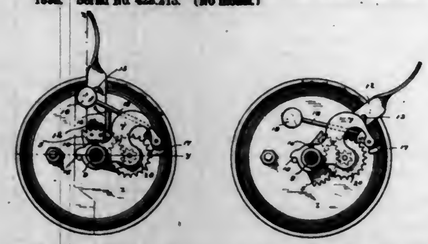
480,024. BLOWPIPE-PAD. GEORGE W. MELOTTE, Ithaca, N. Y. Filed Mar. 2, 1892. Serial No. 423,469. (No model.)

Claim.—A bed or pad for soldering jewelry and the like, provided with ridges formed on the face of the bed integral therewith and adapted to support the articles to be soldered and permit access of flame and heat to their under sides, said pad being open directly over the ridges to allow free use of a blowpipe, substantially as set forth.

480,025. JOURNAL-BEARING. JOHN R. MONTAGUE and JOHN A. PROSS, Syracuse, N. Y. Filed Nov. 2, 1891. Serial No. 410,642. (No model.)

Claim.—1. A journal-bearing consisting of the combination, substantially as hereinbefore set forth, of a series of rollers of uniform diameter from end to end, a series of sets of balls arranged between the rollers, and means for holding the rollers and the balls in position.

2. A journal-bearing consisting of the combination, substantially as hereinbefore set forth, with a housing, of a series of rollers and a series of sets of balls arranged between the rollers, each roller being a little greater in diameter than that of each ball and about equal in length to each set of balls.

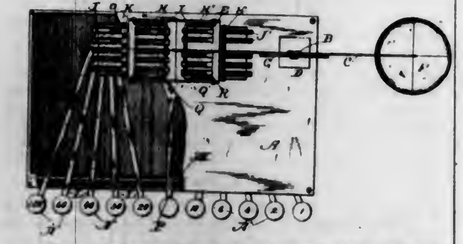


3. The combination, substantially as hereinbefore set forth, of a shaft, a flanged sleeve secured thereto, a bearing-block formed with a recessed opening, within which the sleeve is arranged, a series of rollers arranged between the flanges, and a series of sets of balls also arranged between the flanges and between the rollers.

4. The combination, substantially as hereinbefore set forth, of a shaft, a flanged sleeve secured thereto, a bearing-block formed with a recessed opening, within which the sleeve is arranged, a bushing seated in the opening and interposed between the sleeve and the block,

a series of rollers arranged between the flanges, and a series of sets of balls arranged between the flanges and between the rollers.

5. The combination, substantially as hereinbefore set forth, of a shaft, a flanged sleeve secured thereto, a bearing-block formed with a recessed opening, within which the sleeve is arranged, a series of rollers, a series of sets of balls arranged between the flanges, and the securing-ring which closes the opening at one side of the bearing-block and serves to hold the parts in position.

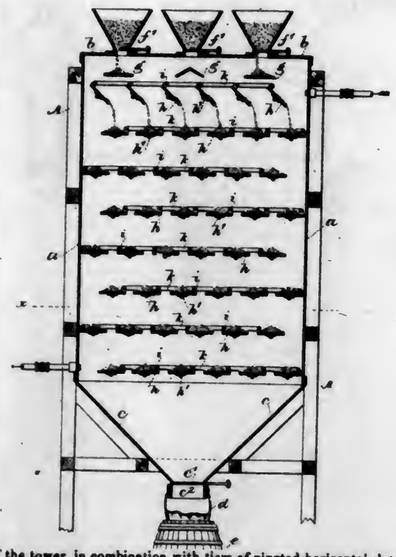


480,026. BICYCLE-BELL. AUGUSTUS MORTON, Bridgeport, Conn., assignor to The Bridgeport Brass Company, same place. Filed Feb. 29, 1892. Serial No. 422,913. (No model.)

Claim.—1. The combination, with the standard, bell, and hammer, of the operating-lever having a stop 13, against which the hammer normally rests, the segment-gear, a verge to which the hammer is attached, a pinion engaging the segment-gear, and an escape-wheel connected to the pinion and engaging the verge, so that movement of the lever in either direction will cause the hammer to strike the bell, the stop acting to hold the hammer out of contact with the bell until the lever is moved.

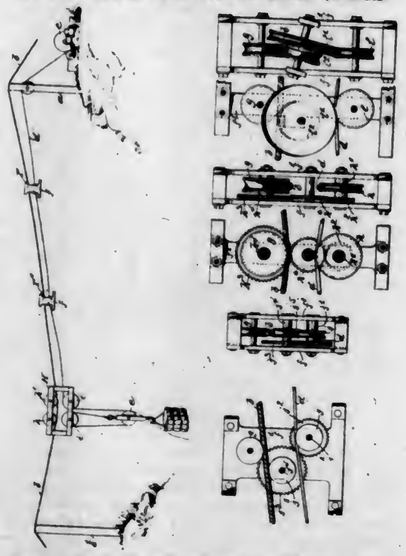
2. The combination, with the bell and hammer, of the operating-lever, connections intermediate the operating-lever and the hammer which vibrate the latter when the lever is moved, a spring acting to return the lever to position, and a stop upon the lever, which is normally engaged by the hammer to prevent the latter from striking the bell.

480,027. WEIGHT-PAN FOR BALANCES. ROBERT H. MCCLELLAND, Williamsville, Ill. Filed Jan. 26, 1892. Serial No. 419,346. (No model.)



Claim.—An improved device for weighing, consisting of a scale-pan provided with two or more tilting cups or receptacles arranged in series, a suitable finger-lever for tilting all of the receptacles within a series, two or more tilting weight-holding cups or receptacles, and an independent finger-lever for tilting each of said cups or receptacles, in combination with two or more disk-shaped weights, all combined substantially as described.

480,028. APPARATUS FOR MAKING BLEACHING-POWDER. EDMUND C. NATION, Peekskill, assignor to himself, and Eugene Waugh, Brooklyn, N. Y. Filed Jan. 11, 1892. Serial No. 417,621. (No model.)



Claim.—1. A closed tower for the manufacture of bleaching-powder, having feed-hoppers and slides at the upper end and a hopper at the lower end and a pipe for supplying the gas at the upper part of the tower, in combination with tiers of pivoted horizontal slats at suitable distances and with the slats in one tier above the spaces between the slats in the next tier, the slats in each tier being connected at one end, and means for tilting the slats from outside the tower, substantially as specified.

2. A closed tower for the manufacture of bleaching-powder, having hoppers and slides at the upper end for supplying the hydrated lime into such tower and a hopper at the lower end for receiving the bleaching-powder and a pipe for supplying the gas at the upper part

of the tower, in combination with tiers of pivoted horizontal slats set at suitable distances one above the other, the slats of one tier being intermediate to those of each other tier, bosses upon the corners of the slats, rods pivoted to said bosses for connecting the slats of the respective tiers, the shaft of one slat in each tier passing outside the tower, and a crank-arm or equivalent device connected therewith for tilting the slats of the tiers, substantially as specified.

480,029. CONVEYING APPARATUS. CHARLES M. NORTH, Montclair, N. J., assignor to the Lidgerwood Manufacturing Company, New York, N. Y. Filed Mar. 8, 1892. Serial No. 424,135. (No model.)

Claim.—1. In a conveying apparatus, in combination, a cable or track-way, a load-carriage, a rope traveling therewith, and a rope-carrier containing a wheel adapted to be turned by said traveling rope, a wheel adapted to bear against the cable or track-way, and connections between said two wheels, whereby the rotation of the first is communicated to the second, substantially as described.

2. In a conveying apparatus, in combination, a cable or track-way, a load-carriage, a rope traveling therewith, and a series of rope-carriers, each containing a wheel adapted to be turned by said traveling rope, a wheel adapted to bear against said cable or track-way, and connections between said two wheels, whereby the rotation of the first is communicated to the second, the said connections being constructed to produce various speeds as between different members of the series, substantially as described.

3. In a conveying apparatus, in combination, a cable or track-way, a load-carriage, a rope traveling therewith, and a rope-carrier containing a wheel adapted to be turned by said traveling rope, a wheel adapted to bear against said cable or track-way, and connections between said two wheels, whereby the rotation of the first is communicated to the second at a reduced speed, substantially as described.

4. In a conveying apparatus, in combination, a cable or track-way, a load-carriage, a rope traveling therewith, and a rope-carrier mounting the following parts, viz: two wheels between which the cable or track-way is clamped, a third wheel adapted to support said traveling rope, and connections whereby the rotation of said third wheel is communicated to one of the two wheels first mentioned, substantially as described.

5. In a conveying apparatus, in combination, a cable or track-way, a load-carriage, a rope traveling therewith, the supports by which said cable or track-way is stretched on an incline, and a rope-carrier mounting the following parts, viz: a wheel adapted to run on top of the cable or track-way, two wheels arranged below on opposite sides of a vertical line dropped from the center of the first wheel, and connections between said lower two wheels, one of said lower two wheels being adapted to support said traveling rope and the other being adapted to bear against the under side of the cable or track-way, substantially as described.

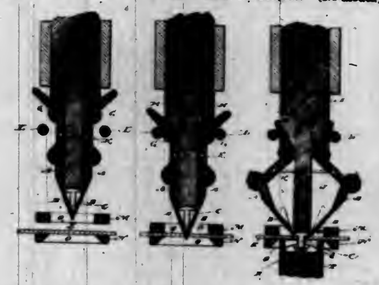
6. In a conveying apparatus, in combination, a cable or track-way, a load-carriage, a rope extending to said load-carriage and running approximately parallel with the cable or track-way, and a rope-carrier mounting the following parts, viz: a traction device adapted to travel on the cable or track-way and mechanism actuated by said rope, whereby the movement of said traction device, and thereby that of the carrier, is controlled, substantially as described.

7. In a conveying apparatus, in combination, a cable or track-way, a load-carriage, a rope extending to said carriage and running approximately parallel with the cable or track-way, and a series of rope-carriers, each of which mounts the following parts, viz: a traction device adapted to travel on the cable or track-way and mechanism actuated by said traveling rope, whereby the movement of said traction device, and thereby that of the carrier, is controlled, substantially as described.

8. In a conveying apparatus containing a cable or track-way, a carriage, a rope extending to said carriage and running approximately parallel with the cable or track-way, a rope-carrier, a device mounted on said carrier, adapted to travel on the cable or track-way, and a device mounted on said carrier, adapted to engage with said rope, the combination, with said devices, of connections whereby the motions of one of said devices are communicated to the other, substantially as described.

9. In a conveying apparatus containing a cable or track-way, a carriage, a rope extending to said carriage and running approximately parallel with the cable or track-way, a series of rope-carriers, a device mounted on each of said carriers, adapted to travel on the cable or track-way, and a device mounted on each of said carriers, adapted to engage with said rope, the combination, with said devices on each carrier, of connections whereby the motions of one are transmitted to the other, the speed of said transmission being in decreasing series from the carriage toward the end of the cable or track-way, substantially as described.

10. In a conveying apparatus, in combination, a load-carriage, a cable or track-way, a member connected with the carriage and extending along the cable or track-way, a rope-carrier, mechanism mounted thereon engaging with and driven by said member, propelling mechanism, also mounted upon said carrier, and means whereby the movement of the mechanism driven by said member is communicated at a reduced speed to said propelling mechanism, substantially as described.



11. In combination, a cable or track-way, a load-carriage, a fall-rope extending to said load-carriage, and a fall-rope carrier mounting the following parts, viz: a propelling device engaging with said cable or track-way and mechanism engaging with said fall-rope, whereby the motions of said fall-rope are communicated to said propelling device, substantially as described.

480,080. SPRING-RIM FOR VELOCIPEDE-WHEELS. WILLIAM J. PERRY, Bristol, England. Filed Mar. 17, 1892. Serial No. 425,298. (No model.) Patented in England May 14, 1891, No. 8,349.

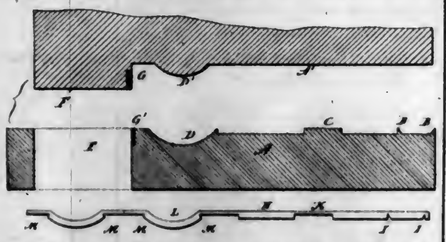
Claim.—In a spring-rim, the combination, with the rim B, of the series of springs A, curved or otherwise shaped so as to partly overlap each other, the holes *d*, by means of which the springs are fastened to the rim B, the resilient substance C, mounted upon the material D, the substance C being graduated in thickness from the center to the edges, causing the center or exposed part *d* to be the thickest, the holes *e* in part D, and means engaging therewith for holding the substance C in position, substantially as set forth.

480,081. BUTTON-SETTING MACHINE. IRVING G. PLATT, Waterbury, Conn. Filed Mar. 1, 1889. Serial No. 301,639. (No model.)

Claim.—1. In a machine for attaching hollow-shanked buttons to cloth, the combination, with a reciprocal shank-carrier pointed at its lower end to puncture the cloth, constructed to contain a button-shank, and comprising one or more movable members, of a plunger arranged to move in line with the said shank-carrier when the same is in its normal position to push the contained button-shank out of it, a button-head carrier, means for actuating the same, and a cloth-holder located between the said shank-carrier and plunger and the said button-head carrier, substantially as set forth.

2. In a machine for attaching hollow shanked buttons to cloth, the combination, with a reciprocal shank-carrier having its lower end pointed to puncture the cloth, constructed to receive a button-shank, and comprising one or more pivotal arms, of a plunger arranged to move in line with the said shank-carrier when the same is in its normal position to push the contained button-shank out of it, a button-head carrier, means for actuating the same, and a cloth-holder located between the shank-carrier and plunger and the button-head carrier, substantially as set forth.

3. In a machine for attaching hollow-shanked buttons to cloth, the combination, with a reciprocal shank-carrier pointed at its lower end to puncture the cloth, constructed to contain a button-shank and with a lateral opening to admit the same, and comprising one or more pivotal arms, of a plunger arranged to move in line with the said shank-carrier when the same is in its normal position to push the contained button-shank out of it, a button-head carrier, means for actuating the same, and a cloth-holder located between the shank-carrier and the plunger and the button-head carrier, substantially as set forth.



4. In a machine for attaching hollow-shanked buttons to cloth, the combination, with a reciprocal shank-carrier pointed at its lower end to puncture the cloth, constructed to contain a button-shank, and comprising one or more pivotal arms, of a reciprocal head constructed at its lower end with a plunger and having the said arm or arms pivoted to it, stationary means independent of the head for co-operating with the shank-carrier to withdraw the pointed end thereof from the cloth, a button-head carrier, means for actuating the same, and a cloth-holder located between the said button-head carrier and the said reciprocating head, substantially as set forth.

5. In a machine for attaching hollow-shanked buttons to cloth, a reciprocating head carrying a plunger, two bell-crank levers pivoted to such head on opposite sides of the said plunger, two shank-carrying arms having their lower ends pointed and pivoted to the lower ends of the said levers, and means for rocking the levers to separate the shank-carrying arms and so withdraw them from the cloth, substantially as set forth.

6. In a machine for attaching hollow-shanked buttons to cloth, the combination, with a reciprocal head constructed at its lower end with a plunger, of two bell-crank levers pivoted to the said head on opposite sides of the said plunger, two shank carrying arms pivoted

to the lower ends of the said levers and having their lower ends pointed and constructed to contain a button-shank which they normally support below the lower end of the said plunger, stationary pins for engagement by the upper ends of the bell-crank levers as the said head descends, a spring for holding the levers and arms in their normally-closed positions, a button-head carrier, means for actuating the same, and a cloth-holder located between the lower ends of the said arms and the button-head carrier, substantially as set forth.

480,032. METHOD OF FORMING BUTTON-BARS. IRVING G. PLATT, Waterbury, Conn. Filed Dec. 21, 1891. Serial No. 415,775. (No specimens.)

Claim.—1. A method of forming button-bars, consisting in flattening the stock-strip to form walls standing approximately at a right angle to the face thereof and bending the unflattened strip between two of such walls, whereby they are set to form, virtually, undercut shoulders, substantially as described.

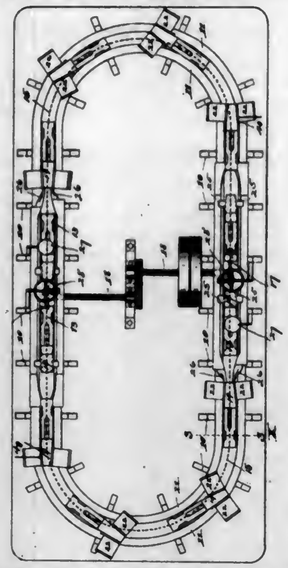
2. A method of forming button-bars, consisting in first forming two notches near together in the same face of the stock-strip, the outer walls of the notches standing approximately at a right angle to the faces of the said strip, then flattening the strip between the notches, then bowing the unflattened strip between two places so notched and flattened, and then cutting up the strip midway of the length of the flattened places, substantially as described, and whereby by notching and bending the strip as described virtually undercut shoulders are formed in the bar between its ends and bowed central portion.

480,033. METHOD OF PREPARING BATTERY SOLUTIONS. EDWARD POPPOWITSCH, Brooklyn, N. Y. Filed Feb. 6, 1892. Serial No. 420,577. (No specimens.)

Claim.—1. The described method of preparing a saturated solution for a battery fluid, consisting in suspending a mass of soluble crystals at a point near the bottom of the solvent or liquid and allowing the bottom portion of the liquid to absorb the dissolved crystals, and then raising the mass to a higher point for a time, and continuing the steps in succession until the liquid has become fully saturated.

2. The described method of preparing a saturated solution of bichromate of potash or analogous depolarizing-salt for use in a voltaic battery, consisting in suspending a mass of bichromate crystals in a volume of water at a point near the bottom of the containing-vessel until the lower portion of the volume is completely saturated, then raising the mass a short distance until an additional portion of the volume is completely saturated, and continuing the successive steps until the entire or complete saturation is effected.

480,034. APPARATUS FOR FORMING AND SOLDERING SHEET-METAL CANS. WILLIAM P. QUENTELL, Kansas City, Mo. Filed Oct. 31, 1891. Serial No. 410,531. (No model.)



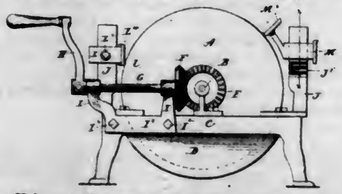
Claim.—1. In an apparatus for forming sheet-metal cans and soldering the side seams thereof, the combination, with a track, of a carriage movable upon said track, a form mounted on said carriage, folders mounted upon the carriage, adapted to engage the blank, and stationary cams adapted to move the folders, and means for soldering the seam, substantially as described.

2. In an apparatus for forming sheet-metal cans and soldering the side seams thereof, the combination, with a track, of a carriage movable upon said track, a form mounted on said carriage, folders mounted upon the carriage, adapted to engage the stock and fold it upon the form, and means for applying the solder to the seam, and an ejector adapted to strip the finished can from the form, substantially as described.

3. In an apparatus for forming sheet-metal cans and soldering the side seams thereof, the combination, with a track, of a carriage movable upon said track, a form mounted on said carriage, a bed-plate to support the blank, folders mounted upon the carriage, adapted to engage the stock and fold it upon the form, and means for applying the solder to the seam, substantially as described.

4. In an apparatus for forming sheet-metal cans and soldering the side seams thereof, the combination, with a track, of a carriage movable upon said track, a form mounted on said carriage, a bed-plate located beneath the form to support the blank, vertically-movable folders hinged to the bed-plate, said folders adapted to engage the stock and fold it upon the form, and means for applying the solder to the seam, substantially as described.

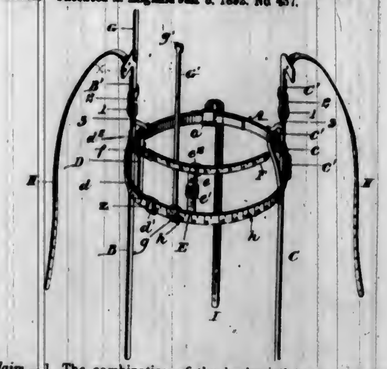
5. In an apparatus for forming sheet-metal cans and soldering the side seams thereof, the combination, with a track, of a carriage movable upon said track, a form mounted on said carriage, folders mounted upon the carriage, adapted to engage the stock and fold it upon the form, and a solder-receptacle having a valve therein whereby to apply the solder to the seam, substantially as described.



6. In an apparatus for forming sheet metal cans and soldering the side seams thereof, the combination, with a track, of a carriage movable upon said track, a form mounted on said carriage, folders mounted upon the carriage, adapted to engage the stock and fold it upon the form, a solder-receptacle provided with a valve, and means to operate said valve whereby to apply solder to the seam, substantially as described.

7. In an apparatus for forming sheet-metal cans and soldering the side seams thereof, the combination, with a track, of a carriage movable upon said track, a form mounted on said carriage in fixed relation thereto, a bed-plate pivotally mounted on the carriage and adapted to support a blank, folders mounted upon the carriage and adapted to engage the stock and fold it upon the form, and means for applying the solder to the seams, substantially as described.

8. In an apparatus for forming sheet-metal cans and soldering the side seams thereof, the combination, with a horizontal track, of a carriage movable upon said track, a form mounted on said carriage in fixed relation thereto, a pivoted bed-plate to support the blank, pivoted folders mounted upon the carriage and adapted to engage the blank, and suitable means for soldering the seams, substantially as described.



480,035. CUTLERY-GRINDER. DANIEL REED, Ansonia, Conn. Filed Jan. 4, 1892. Serial No. 416,974. (No model.)

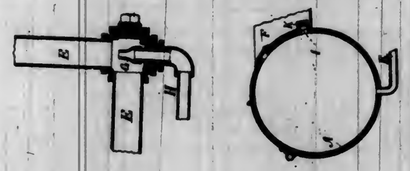
Claim.—1. In a machine for grinding cutlery, the combination, with the standard thereof, of a grindstone journaled thereupon, means for rotating the said stone, a laterally-adjustable rest-carrier having two corresponding horizontal slotted feet adapted in their spread to rest upon the opposite sides of the said standard at one end thereof, and an upright riding centrally between the said feet, and a rest having an opening to adapt it to fit over the said upright to which it is adjustably secured.

2. In a machine for grinding cutlery, a rest having a square face constructed at its lower edge with an inwardly-projecting curved lip, substantially as described.

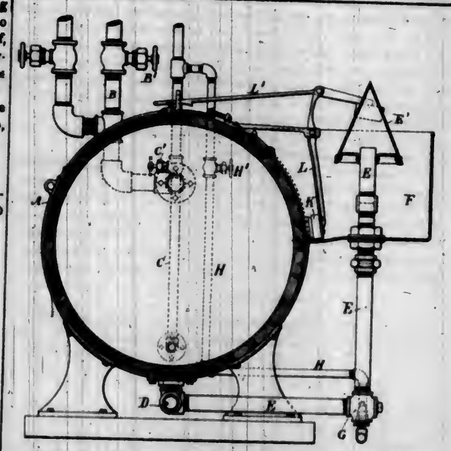
480,036. TAILOR'S MEASURING APPARATUS. JOHN H. REESE, Philadelphia, Pa. Filed Dec. 16, 1891. Serial No. 415,236. (No model.) Patented in England Jan. 8, 1892. No. 437.

Claim.—1. The combination of the horizontal body-encircling band, a main vertical arm rigidly affixed thereto so as to cross the same, a similar arm adjustably connected with said band, and a short vertical arm adjustably mounted upon the band in rear of one of said main vertical arms, the said main vertical arms being adapted to bear forwardly against the arms of the person to whose body the band is applied and the said short vertical arm being adapted to be adjusted rearwardly toward one arm of the person, substantially as described.

2. The combination of the main horizontal body-encircling band, a main vertical arm affixed thereto so as to cross the same and adapted to bear forwardly against the arm of the person to whose body the band is applied, an angular section extensible on the upper portion of said main vertical arm, and a short vertical arm adjustably mounted in rear of the said main vertical arm and adapted to be adjusted rearwardly toward the arm of the person, substantially as described.



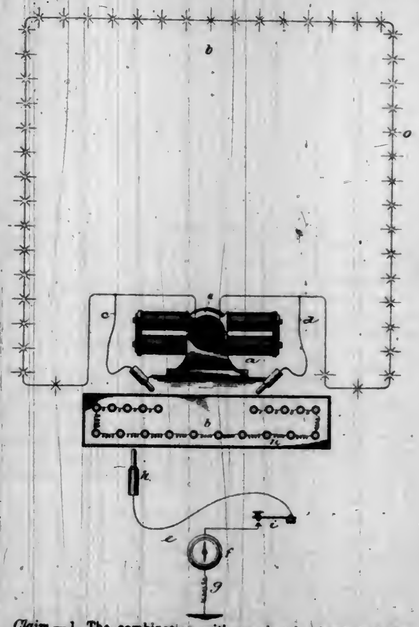
3. The combination of the main horizontal band, a main vertical arm thereon, a horizontally-adjustable arm in the rear of said vertical arm, and a vertically-movable horizontal band having a sliding connection with said adjustable arm, substantially as described.



4. The combination of the main horizontal band, the vertical arm, its extensible angular section, the flexible member G, the horizontally-adjustable arm D, the vertically-adjustable band F, and the sliding member G', substantially as described.

5. The combination of the main horizontal band provided with means whereby its ends may be connected, the two main vertical arms, the shoulder-straps connected therewith, and the fastening devices on the horizontal band, with which said straps may be engaged, substantially as described.

480,037. WASHING-MACHINE ATTACHMENT. HENRY L. ROWE, New York, N. Y., and GEORGE W. MCDONALD, Franklin, N. J. Filed Feb. 27, 1892. Serial No. 422,974. (No model.)

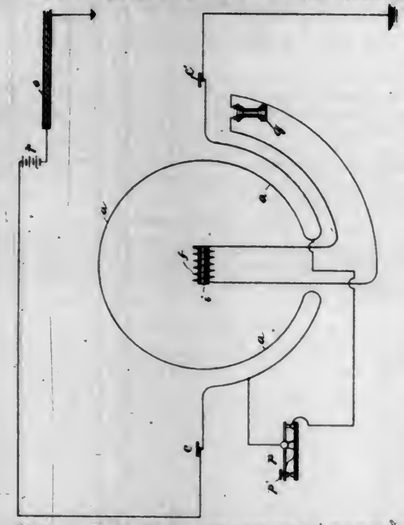


Claim.—1. The combination, with a washing-machine and the discharge water-pipe therefrom, of an elevated reservoir, a pipe leading to the same, and a steam-injector in such pipe for discharging the water from the washing-machine into the reservoir, and a branch or connection between the reservoir and the washing-machine and a valve and cock in the same, substantially as and for the purposes set forth.

2. The combination, with the washing-machine and the discharge water-pipe therefrom, of an elevated reservoir, a pipe leading from the bottom of the washing-machine to the reservoir and a deflector thereon, a steam-pipe and cock for supplying steam to the washing-machine, an ejector-nozzle, and a pipe and cock therewith connected for supplying steam to eject the water from the washing-machine into the reservoir, substantially as set forth.

480,038. TESTING APPARATUS FOR ELECTRIC-LIGHTING CIRCUITS. CHARLES H. RUDD, Evanston, assignor to the Western Electric Company, Chicago, Ill. Filed Dec. 10, 1888. Serial No. 293,124. (No model.)

Claim.—1. The combination, with an electric circuit including translating devices and a dynamo-machine for supplying said circuit, of branch circuits *c d* from opposite sides of said dynamo-machine, provided each with a movable connecting device, a rheostat with which said connecting device may be connected at will to include the rheostat between the terminals of the dynamo-machine, and a ground branch including a galvanometer and provided with a movable switching device or plug for connecting said branch with different portions of said



rheostat, whereby the neutral point of the rheostat with respect to a leak on the circuit may be determined, substantially as specified.

2. The combination, with an electric circuit containing translating devices and an electric generator, of a rheostat adapted to be connected with different sides of said generator and a ground branch including a condenser, a galvanometer, and a discharging device, said ground branch being adapted to be connected between different coils of the rheostat, whereby the location of any accidental leak on the lamp-circuit may be approximately located.

3. The combination, with an arc-light circuit including a dynamo, of connecting devices on different sides of said dynamo, a condenser, with the opposite ends of which said connecting devices are adapted to be connected, respectively, and an indicating device adapted to be connected to different portions of said rheostat to determine the neutral point thereof with respect to any leak that may exist at any point of the lamp-circuit, substantially as and for the purpose specified.

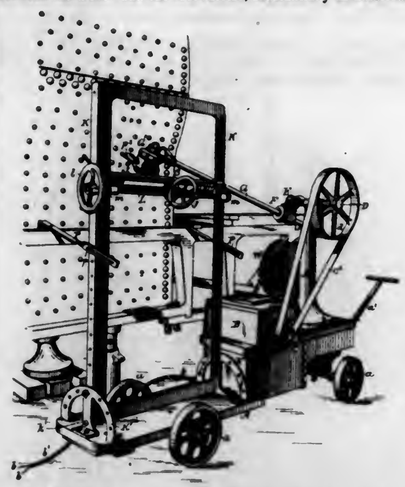
480,039. DEVICE FOR MEASURING ELECTRICAL CURRENTS.

CHARLES H. RUDD, Evanston, assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 6, 1891. Serial No. 411,090. (No model.)

Claim.—1. The combination, with a field-coil, of a measuring-coil concentric with and in the field thereof and movable with respect thereto and a telephone in the circuit of the measuring-coil, substantially as described.

2. The combination, with a field-coil in circuit of the current to be measured, of a measuring-coil concentric with and in the field of said field-coil and movable with respect thereto, and means for interrupting the current through the field-coil, and a telephone included in the circuit, substantially as described.

3. The combination, with a field-coil in circuit of the current to be measured, of a measuring-coil rotatable about one of its diameters, said diameter being coincident with a diameter of the field-coil, placed concentric with said field-coil, and suitable means for interrupting the current through said field-coil, an index in connection with said measuring-coil, and a scale adapted to indicate the angle between the axes of the two coils, and a telephone included in the circuit, substantially as described.



4. The combination, with a field-coil in circuit of the current to be measured, of a measuring-coil rotatable about a diameter, said diameter being coincident with a diameter of the field-coil placed concentric with said field-coil, suitable means for interrupting the circuit through said field-coil, a suitable scale attached to said field-coil, and a suitable index attached to said measuring-coil, adapted to indicate on the scale the angle between the planes of the two coils, and a telephone included in the circuit, substantially as described.

480,040. PORTABLE MACHINE FOR DRILLING.

JOHN R. SAYLOR, Philadelphia, Pa. Filed Jan. 7, 1892. Serial No. 417,966. (No model.)

Claim.—1. The combination, in a portable drilling-machine, of the carriage, a motor carried thereby, a supporting-frame also mounted upon the carriage, the tool-carrier mounted upon the supporting-frame, and the tool, with adjustable gearing between the motor and the tool, whereby the tool can be adjusted upon the frame without disengaging the gearing, substantially as described.

2. The combination, in a portable drilling-machine, of the carriage, a vertical frame pivoted to said carriage, a motor, a tool-carrier, and a cross-frame on which the tool-carrier is mounted, said cross-frame being pivoted to the vertical frame, with intervening gearing between the motor and the tool-carrier, substantially as described.

3. The combination of the carriage, motor thereon, a frame, vertically-adjustable slide mounted on said frame, a tool-spindle, feed-screw attached to the spindle and to the slide, a head carrying said tool-spindle, a shaft G, gearing with the said tool-spindle, and a head E, carrying a sleeve to which the shaft is adapted, said head carrying gear-wheels driven by the motor, substantially as specified.

4. The combination of the pivoted frame, racks thereon, a slide, pinions on said slide, a tool-carrier mounted on said slide and adjustably geared to a motor, means for locking the tool-carrier to the slide, and means for locking the slide to the frame, substantially as specified.

5. The combination of the carriage, motor thereon, gearing, a tool-carrier adjustably connected to said gearing, a slide to which the tool-carrier is attached, a vertical frame on which the slide is mounted, said frame being pivoted to the carriage, and cleats for securing the frame to the article to be drilled, substantially as described.

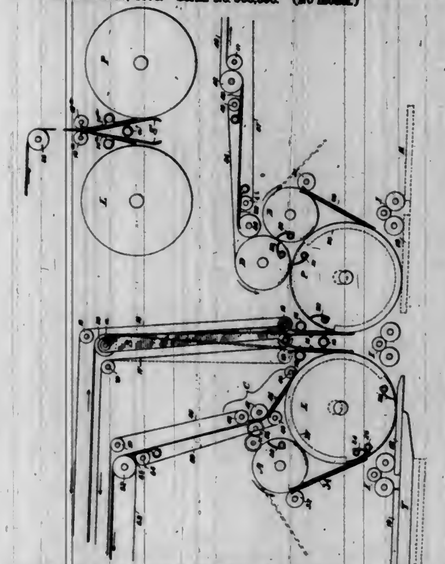
6. The combination of the tool-carrier, a sleeve thereon, right and left gear-wheels having clutch-faces adapted to engage with the clutch-faces on the drill-spindle, and a head carrying gearing which meshes with the gear-wheel and which is adjustably connected to the driving mechanism, substantially as described.

7. The combination, in mechanism for drilling, &c., of the shaft D, mechanism for driving said shaft, a sleeve hung to said shaft, gear-wheel on the sleeve, and a gear-wheel on the shaft, and intervening gearing, and a shaft G, adapted to slide in but turn with the sleeve, with drilling mechanism at the end of said shaft G, substantially as described.

8. The combination of the shaft D, the shaft G, geared thereto, and drilling mechanism geared to said shaft G, a supporting cross-frame J, blocks in which said frame is pivoted, a supporting-frame K for the said blocks, and means for locking the blocks to the supporting-frame, substantially as described.

9. The combination of the shaft D, the drilling mechanism geared to said shaft, a carrying-frame for the said drilling mechanism, a shaft, pinions on said shaft, a supporting-frame on which the carrying-frame slides, and racks on the said supporting-frame with which the gear-wheels mesh, substantially as described.

480,041. HAT.



DAVID SCHLESINGER, New York, N. Y. Filed Jan. 11, 1892. Serial No. 417,808. (No model.)

Claim.—In a folding hat, the combination, with a crown composed of a series of tapering pieces of fabric sewed to each other, of a band connecting the lower ends of said pieces, eyelets in said band, a brim formed of sector-shaped pieces sewed to each other, a steel band in the outer edge of said brim, and an elastic band in the inner edge of said brim, the crown being connected with the brim at a short distance outward from said elastic band, substantially as set forth.

480,042. PRINTING-MACHINE.

WALTER SCOTT, Plainfield, N. J. Filed Feb. 10, 1891. Serial No. 380,980. (No model.)

Claim.—1. In a printing-machine, the combination of a reciprocating type-bed carrying the forms, two oscillating impression-cylinders, a sheet-feeding apparatus common to the two cylinders, the cylinders alternating in receiving the leading sheet therefrom, and delivery means for each cylinder, substantially as described.

2. In a printing machine, the combination of a reciprocating type-bed carrying an inner and an outer form, two oscillating impression-cylinders arranged to print in both directions of their movement, a sheet-feeding apparatus common to both cylinders, the cylinders alternating in receiving the leading sheet from the feeding apparatus, sheet-reversing appliances, and delivery means, substantially as described.

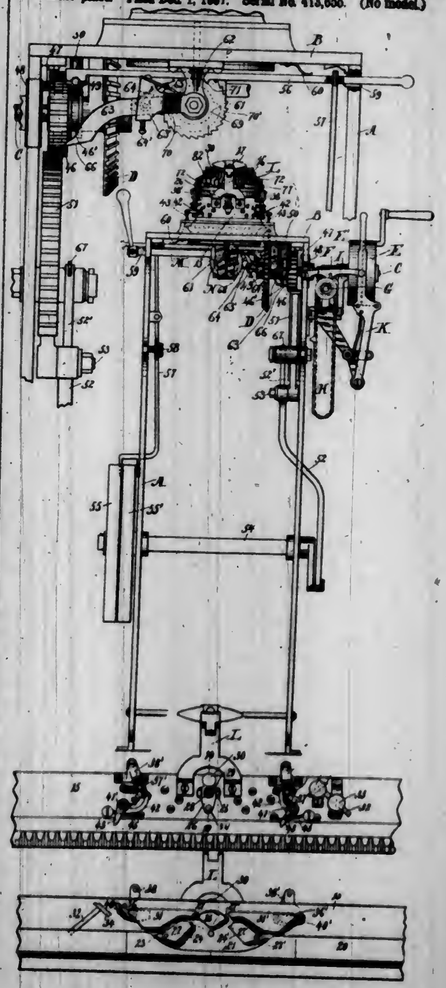
3. In a printing-machine, the combination of a reciprocating type-bed carrying an inner and an outer form, two oscillating impression-cylinders which take impressions in both directions of their movement, an apparatus feeding the sheets to the cylinders at adjacent points thereof, the cylinders alternating in taking the leading sheet, reversing appliances for each cylinder, and delivery means for each cylinder, substantially as described.

4. In a printing-machine, the combination of a reciprocating type-bed, two oscillating impression-cylinders, an apparatus for feeding the sheets down between the cylinders, the cylinders alternating in receiving the leading sheet from the feeding apparatus, and reversing appliances and delivery means for each cylinder, substantially as described.

5. In a printing-machine, the combination of a reciprocating type-bed, two oscillating impression-cylinders, an apparatus for feeding the sheets down between the cylinders, the cylinders alternating in receiving the leading sheet from the apparatus, reversing appliances at the outer side of each cylinder, and delivery means above each cylinder, substantially as described.

6. In a printing-machine, the combination of a reciprocating type-bed, two oscillating impression-cylinders, an apparatus for feeding the sheets down between the cylinders, guides and switching devices directing one sheet to one cylinder and the next sheet to the other cylinder, and reversing appliances and delivery means for each cylinder, substantially as described.

7. In a printing-machine, the combination of a reciprocating type-bed, two oscillating impression-cylinders, an apparatus for feeding the sheets down between the cylinders, guides and switching devices directing one sheet to one cylinder and the next sheet to the other cylinder, reversing appliances at the outer side of each cylinder, and delivery means above each cylinder, substantially as and for the purposes described.



8. In a printing machine, the combination of a reciprocating type-bed, two oscillating impression-cylinders, a set of feeding-tapes, guides and swinging arms directing one sheet to one cylinder and the next sheet to the other cylinder, reversing appliances at the outer side of each cylinder, and delivery means above each cylinder, substantially as and for the purposes described.

9. In a printing-machine, the combination of a reciprocating type-bed, two oscillating impression-cylinders, a set of feeding-tapes, swinging arms carrying a pair of the rollers for said tapes, guides for each cylinder, reversing appliances at the outer side of each cylinder, and delivery means above each cylinder, substantially as and for the purposes described.

10. In a printing-machine, the combination of a reciprocating type-bed, two oscillating impression-cylinders, a set of feeding-tapes, rollers for said tapes, swinging arms carrying a pair of said rollers and having its axis of motion coincident with the axis of another of said rollers, guides for each cylinder, reversing appliances at the outer side of each cylinder, and delivery means above each cylinder, substantially as and for the purposes described.

480,043. CIRCULAR-KNITTING MACHINE.

ADOLPH SEDNIKARDEKY, Milwaukee, Wis., assignor to the Kalamazoo Knitting Company, same place. Filed Dec. 1, 1891. Serial No. 413,655. (No model.)

Claim.—1. In a circular-knitting machine, the combination of the following devices: a revolvable cam-cylinder, two block-cams fixed on the cam-cylinder at a little distance apart, a single tilting cam mounted on a swinging arm pivoted directly on the cylinder between the block-cams, the tilting cam having no vertical movement in relation to the cam-cylinder, except such as it has by the swinging of the arm on which it is mounted, and being so arranged as to be locked in position medially between and out of contact with the block-cams, but when released to tilt from one cam to the other, and means for locking the cam releasably in the medial position, the tilting cam being arranged when held in medial position between the block-cams to receive against its under edges from both directions the thrust of the studs on the needles and carry them downwardly into position to engage the fixed cams and when released and tilted to one or the other of the fixed cams to receive the needles and successively to carry them in opposite directions alternately out of action, substantially as described.

2. In a circular-knitting machine, the combination, with a revolvable cam-cylinder and block-cams fixed on the cylinder, of a lifting-cam, a swinging arm pivoted on the cylinder, a stud rigid on the cam and movable endwise through the swinging arm and faced therein to prevent pivotal movement of the cam on the arm, a pin securing the stud in the arm, a spring holding the stud and cam yieldingly to the arm, and means for locking the arm in position midway between cams fixed on the cylinder, substantially as described.

3. In a circular-knitting machine, the combination, with a revolvable cam cylinder and upper cam-blocks rigid on the cam-cylinder, the outer ends of which blocks are inclined inwardly downward, of a movable needle-catcher on the inner surface of the cam-cylinder, having a body part arranged to swing under the rigid cam-block and a terminal inwardly-projecting flange inclined on its outer face inwardly downward, a swinging arm pivoted on the outer surface of the cam-cylinder, a pin fixed in the needle-catcher and pivoted in the swinging arm, and a spring adapted to hold the needle-catcher yieldingly upward on the arm, substantially as described.

4. In a circular-knitting machine, the combination, with a revolvable cam-cylinder, of a needle-catcher mounted on a swinging arm pivoted on the cam-cylinder and a tripping device pivoted on the cylinder, arranged to be tripped by the movement of the cam-cylinder when passing a relatively fixed pin, and thereby to tilt the needle-catcher and said pin to actuate the tripping device, substantially as described.

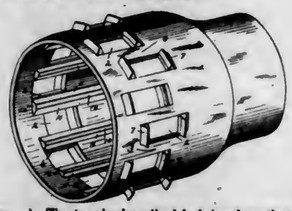
5. In a circular-knitting machine, the combination, with a revolvable cam-cylinder, of a needle-catcher mounted on a swinging arm pivoted on the cam-cylinder, a tripping device pivoted on the cam-cylinder, comprising an arm adapted to engage the swinging arm on which the needle catcher is mounted and a tripping-arm adapted to engage a relatively fixed pin when the cam-cylinder is reciprocated, and said tripping-pin, substantially as described.

6. In a knitting-machine of the class described, the combination, with a ratchet-wheel, a disk rigid thereto, having a part of greater radial extent and a part of less radial extent, and the tripping-pin resting on and actuated by the disk, of an actuating-lever pivoted alongside the ratchet-wheel and having a pawl adapted to engage the ratchet-wheel in one direction, and reciprocating mechanism arranged to actuate the lever, substantially as described.

7. In a circular-knitting machine, the combination, with a tripping-pin, a pin-actuating wheel having parts of greater and less radial extent, a ratchet-wheel rigid thereto, and a swinging pawl-provided arm for actuating it, of a reciprocating rod or pitman wristed on a shaft and having a part arranged to strike against the arm and swing it, substantially as described.

8. In a circular-knitting machine, mechanism comprising a ratchet-wheel 61, a swinging arm 63, a spring-actuated pawl pivoted on the arm and arranged to engage the ratchet-wheel, a bracket 63′, an adjusting-screw 64′, and a lever-actuating rod 52, wristed at one extremity on the crank of a shaft and near its other extremity wristed on an oscillating arm, which rod is provided with a projecting part arranged to strike against and actuate the ratchet-arm 63, substantially as described.

9. In a knitting-machine of the class described, the combination, with the main driving-shaft and an independent or auxiliary driving-shaft having a fast and a loose pulley, and means for connecting the auxiliary shaft mechanically to the driving-shaft to operate it reciprocally, including a gear loose on the main shaft and a disk fast thereon, of a spring-actuated belt-shifting lever arranged normally to guide the belt to the loose pulley, a sliding catch-provided locking and shifting bar connected movably to the belt-shifting lever, and a gear-shifting lever connected to the sliding bar, whereby by the releasing of the sliding bar the spring-actuated belt-shifting lever shifts the belt from the fast to the loose pulley on the auxiliary shaft and the gear on the main driving-shaft is put out of engagement with said disk, substantially as described.



10. In a knitting-machine of the class described, the combination, with the frame, a locking and sliding bar provided with a catch adapted to engage the frame, a spring-actuated lever connected to the bar, a gear on the main shaft, and a lever connected to the bar and adapted to shift the gear on the main shaft, of a tooth-provided wheel adapted at a prescribed point in its revolution to engage and lift and thereby release the sliding bar, substantially as described.

11. In a circular-knitting machine, a sinker constructed of sheet metal, comprising a head or bearing part 73, nearly circular, a hooked guard 74, extending outwardly from its outer edge, adapted to pass over and engage a supporting and guiding flange, a tongue 75, projecting from its inner edge, a catcher 76 on its inner edge above the tongue, adapted to take onto the thread or yarn detachably, and a needle-cylinder 16, having a radial slot to receive the tongue 75 and maintain the sinker movably in an upright position, substantially as described.

12. In a circular-knitting machine, the combination, with a needle-cylinder, of a sinker-ring on the outside of the needle-cylinder, provided with an annular partially-round channel, and sinkers having nearly circular lower extremities adapted to rest in recesses therefor in the outer surface of the needle-cylinder in the partitions between the needle-grooves therein and be held movably thereto by the sinker-ring, into which a portion of the lower circular part of the sinkers is received, substantially as described.

13. In a circular-knitting machine, the combination, with a needle-cylinder and a cam-cylinder revolubly thereabout, of a series of sinkers pivoted to the needle-cylinder on the outside and tiltable slots therefor in the needle-cylinder, the sinkers being provided with guards adapted to ride on and be controlled by a cam-ring, and the cam-ring having a radially eccentric or cam part on which the sinkers ride and by which they are tilted, which ring is supported revolubly on the needle-cylinder and is carried around by the revolving cam-cylinder, substantially as described.

480,044. WHEEL-HUB CASTING. MELVIN L. SMITH, Muncie, Ind., assignor of one-half to Sarah B. Smith, same place. Filed Apr. 11, 1892. Serial No. 428,693. (No model.)

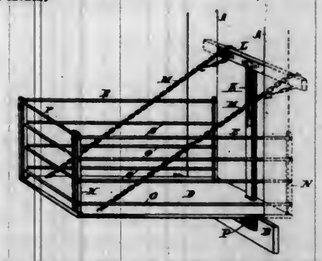
Claim.—1. The herein-described hub-band casting, the same being provided with mortise openings, having upon its outer side and at the front and rear ends of the openings diverging lugs, and the bars between the openings having their outer edges flared and their inner edges converged, substantially as specified.

2. The herein-described hub-band casting, the same having the series of mortises or openings and intermediate bars, which have their opposite outer edges flared and their inner edges converged or inwardly flared, substantially as specified.

3. The herein-described hub-band, the same having the series of mortises, the intermediate bars of which have their outer edges flared outwardly and their inner edges flared inwardly, and the intermediate superficial internal ribs located upon the under side of each bar and having their opposite faces inwardly converged and forming a continuation of the inner face of the bars, substantially as specified.

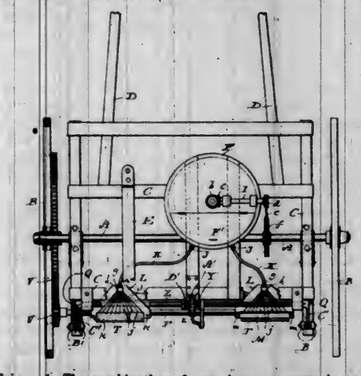
4. The herein-described cast-metal hub-band, having series of mortises, the intermediate bars of which have their outer corners or edges flared outwardly and their inner corners or edges flared inwardly, the internal annular shoulder formed in rear of the mortise, and the series of ribs extending from the shoulder forwardly upon the under side of the bars, said ribs having their front ends beveled and their opposite faces converged toward their inner edges and forming continuations of the faces of the bars, substantially as specified.

480,045. TRAY FOR JEWELERS. HENRY B. SOMMER, Philadelphia, Pa. Filed Mar. 24, 1892. Serial No. 426,232. (No model.)



Claim.—1. A tray having supporting-pieces with journals on the lower parts of the ends, with bearings in the sides of the tray, and side bars supported on journals connected with the upper part of the ends of the supporting-pieces, said parts being combined substantially as described.

2. A tray having parallel supporting-pieces journaled in the sides thereof and with grooves in their upper edges, substantially as described.



3. A tray provided with supporting-pieces, each of which is provided with journals mounted on the sides of the tray, and an additional journal mounted on a rising and falling bar, the latter being formed with recesses in its under side, so as to pass over the journals proper of the supporting-piece, substantially as described.

480,046. PORTABLE WINDOW-SCAFFOLD. ADOLPH STAUBER and CARL STAUBER, Clinton, Iowa. Filed Mar. 1, 1892. Serial No. 423,418. (No model.)

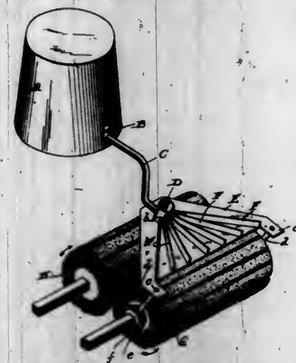
Claim.—The combination of the platform D, provided with exterior marginal guards, the vertical post K, hinged at its base at the center of the inner end of the said platform, the transverse bar L, adapted to extend in each direction beyond the jambs of the window and supported from the inner end of said platform by the post K, the chains M, adjustably attached at their upper ends to the bar L and extended diagonally outwardly and downwardly therefrom and attached at their outer ends to the outer portion of the platform D, and the legs G, pivoted, respectively, at their upper ends to the inner end of the platform D near the corners of the latter and crossed midway of their length and adapted to rest at their lower ends on the floor of the building and further provided centrally with the longitudinal slots H, and the adjusting-bolt J through said slots, substantially as set forth.

480,047. SPRINKLER. JACOB R. STEITZ, St. Francis, Wis. Filed Aug. 21, 1891. Serial No. 403,339. (No model.)

Claim.—1. The combination of a carriage, a receptacle mounted thereon, a rotary brush, a stationary brush in opposition to the rotary one, a distributing-shield extended beyond the stationary brush and having its discharge end over the rotary brush, and tubes connecting the receptacle and the shield, substantially as set forth.

2. The combination of a carriage, a receptacle mounted thereon, a laterally-adjustable rotary brush, a stationary brush in opposition to the rotary one and laterally adjustable therewith, and suitable means for conveying the contents of the receptacle to said brushes, substantially as set forth.

3. The combination of a carriage, a receptacle mounted thereon, a vertically-adjustable rotary brush, a stationary brush in opposition to the rotary one and vertically adjustable therewith, and suitable means for conveying the contents of the receptacle to said brushes, substantially as set forth.



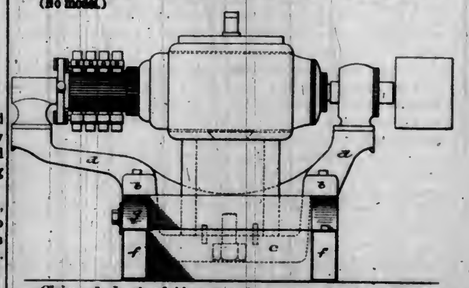
4. The combination of a carriage, a receptacle mounted thereon, a vertically and laterally adjustable rotary brush, a stationary brush always in opposition to the rotary one, and suitable means for conveying the contents of the receptacle to the brushes, substantially as set forth.

5. The combination of a carriage, a receptacle mounted thereon, a rotary brush, a stationary brush in opposition to the rotary one, a radially-channeled shield having its discharge end over the rotary brush, and tubes leading from the receptacle to the shield, substantially as set forth.

6. The combination of a suitable receptacle, a pair of spraying-brushes in frictional contact, a shield positioned to have its rear end over one of the brushes, a series of radiating plates set on edge upon the shield, and a tubular connection between said shield and receptacle, substantially as set forth.

7. The combination of a suitable receptacle, a pair of spraying-brushes in frictional contact, a shield positioned to have its rear end over one of the brushes, a slotted cup on the shield, having a tubular connection with the receptacle, and a series of plates set on edge upon the shield to radiate from the cup, substantially as set forth.

480,048. SPRINKLER. JACOB R. STEITZ, St. Francis, Wis. Filed Mar. 14, 1892. Serial No. 424,803. (No model.)



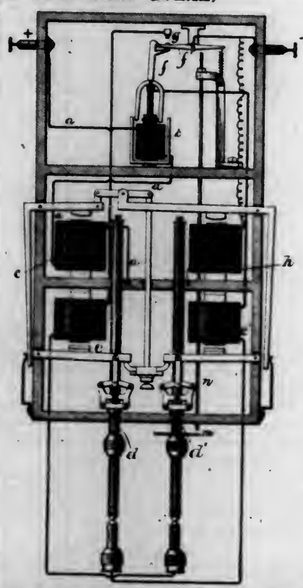
Claim.—1. The combination of a suitable receptacle, a pair of rotary brushes in frictional contact, and a distributing-shield having a tubular connection with the receptacle and positioned to discharge onto one of the brushes, substantially as set forth.

2. The combination of a suitable receptacle, a pair of rotary brushes in frictional contact, and a radially-channeled shield having a tubular connection with the receptacle and positioned to discharge onto one of the brushes, substantially as set forth.

3. The combination of a suitable receptacle, a pair of rotary brushes in frictional contact, and a distributer having a tubular connection with the receptacle and positioned to discharge onto at least one of the brushes, substantially as set forth.

480,049. FIELD-MAGNET FRAME FOR DYNAMO-ELECTRIC MACHINES. ERNST P. WARNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 10, 1890. Serial No. 339,916. (No model.)

Claim.—1. In the field-magnet frame or casting for a dynamo-electric machine, the combination, with the feet or supports and the heel-bar, said supports being raised above the heel-bar, of the arms extending outwardly from said supports, and a strut between said feet or supports, substantially as and for the purpose specified.



2. The combination, in the field-magnet frame or casting for a dynamo-electric machine, of the feet raised above the heel-bar thereof, said heel-bar, the movable frame of the carriage upon which said feet are placed, and arms curved outwardly and extending above said feet, and the bearings of the armature supported upon said arms, substantially as and for the purpose specified.

3. The combination, in the field-magnet frame of a dynamo-electric machine, of the feet or supports thereof raised above the heel-bar, the sliding frame supporting the said feet, and the heel-bar extending downwardly, and the stationary and movable parts of the carriage inclosing said heel-bar, substantially as specified.

4. In the field-magnet frame for a dynamo-electric machine, the combination, with the feet or supports thereof, of the heel-bar, said feet or supports being raised above the heel-bar, the arms extending above said feet or supports, and the journal-bearings of the armature resting thereon, substantially as and for the purpose specified.

5. The field-magnet frame for a dynamo-electric machine, consisting in the combination, with the pole-pieces and the cores, of the heel-bar *c*, extending downwardly below the supporting-feet *b*, said supporting-feet *b*, the arms *d*, and the strut *e* for bracing the feet, said strut being placed between the cores, substantially as and for the purpose specified.

480,050. DUPLEX ARC LAMP. ERNEST P. WARNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 24, 1891. Serial No. 382,362. (No model.)

Claim.—1. The combination, with two pairs of carbons placed in derived circuit, of a unitary electro-magnetic device for controlling the same and a polarized electro-magnetic switching device or commutator adapted upon the reversal of the current to transfer the arc from one pair of carbons to the other.

2. The combination, with two independently-adjustable carbon-rods and unitary means for automatically controlling the same, of a polarized electro-magnetic switching device for shifting the arc from the carbons of one rod to the other on the reversal of the current, substantially as and for the purpose specified.

3. The combination, with one of two independently-adjustable carbon-rods, of a disk *m*, secured thereto, and a rod *n*, against which the disk is brought to force the said rod *n* against the pivoted lever *f* of the polarized switching device, substantially as and for the purpose specified.

480,051. SKATE. JAMES WARNER, East Somerville, Mass. Filed Mar. 14, 1892. Serial No. 424,793. (No model.)

Claim.—1. The combination, with the transversely-apertured runner, of the foot and heel plates having depending slotted arms or brackets and a pivoted locking-hook mounted on one arm or bracket of each plate and engaging the apertures in the runner, substantially as set forth.

2. The combination, with the runner and its adjustable foot-plate adjustable toward and from the heel-plate, of the longitudinal bar extending from heel to foot plate and carrying the sole-clamps, a lever pivoted to said plate and operating the clamps, and a pivoted wedge on the heel-plate and locking the longitudinal bar thereto, substantially as set forth.

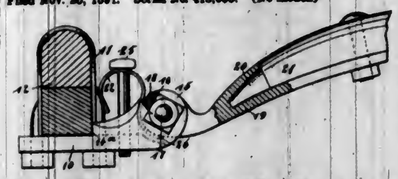
3. The combination, with a runner having front and rear series of parallel inclined slots, of the foot and heel plates having depending slotted arms or brackets and pivoted depending locking-hooks passing through the slots and forcing the upper edge of the runner firmly against the upper walls of the slots in the arms or brackets, substantially as set forth.

4. In a skate, a bracket for the toe-plate, comprising two divergent limbs curved above to lie in the same plane and adapted for attachment upon the lower side of the toe-plate, said limbs being integrally connected below by a hook portion that is cross-grooved to fit upon a runner, the limbs being transversely slotted to receive two clamping-arms, substantially as described.

5. In a skate, a toe-plate having a bracket provided with two divergent limbs having transverse clamp-receiving slots and a depending hook portion cross-grooved to fit a runner and provided with a locking-hook crossing said slot, substantially as set forth.

6. In a skate, the combination, with a runner in which spaced holes are formed in series near its top edge, of a toe-plate provided with front and rear limbs grooved to fit upon the top of the runner near the front, a bracket the limbs of which are affixed upon the lower side of the toe-plate and diverged from an integral hook portion below that is grooved to seat it upon a runner near its toe, and a locking-dog pivoted on said hook portion and having a cam-hook adapted to interlock with either of the holes in the runner, substantially as described.

7. In a skate, the combination, with a runner having spaced perforations near the top edge, of a toe-plate having two depending limbs notched to straddle the runner and a cam-hook locking-dog pivoted to a depending piece on the toe-plate and adapted to interlock with either of the perforations, substantially as described.

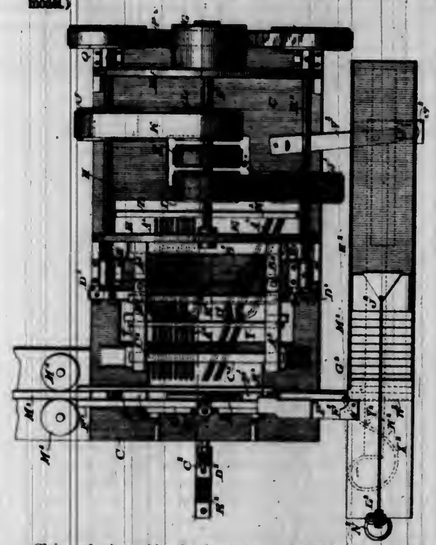


8. In a skate, the combination, with a runner perforated in series near the heel, of a heel-plate whose depending notched limbs are adapted to seat upon the top edge of the runner and provided with two spaced upwardly-projected toes at the rear edge, a cap-plate below the heel-plate, having a locking-toe projected through a longitudinal slot in the heel-plate and bearing a sharp lip turned rearward at the free top end, a tongue or rivet fixed to the heel-plate and loosely secured in a longitudinal slot in the cap-plate, a U-shaped brace fast on the cap-plate and grooved where bent below to embrace the top edge of the runner, and a lever-dog having a cam-hook and pivoted on one limb of the brace, which is adapted when upwardly vibrated to interlock with either of the perforations in the runner, substantially as described.

9. In a skate, the combination, with a runner perforated in series near the toe and heel, a toe-plate whereon are two depending limbs front and rear that are grooved to embrace the top edge of a runner, a bracket thereon between said limbs, and a cam-hook locking-dog on the bracket, which will engage either of the perforations in the runner at the front, of a heel-plate on which two upwardly-projected toes are formed at the rear edge, two depending limbs on the heel-plate front and rear, grooved in alignment to embrace the runner above, a cap-plate below the heel-plate, a toe thereon projected through a longitudinal slot in the heel-plate and provided with a sharp lip above, and a locking-dog that has a cam-hook, which will interlock with either of the perforations at the rear end of the runner, substantially as described.

10. In a skate, the combination, with a runner and a bracket at its rear provided with a locking-dog that engages either of a series of transverse holes in said runner, of a heel-plate having two toes at the rear and two depending limbs that are notched below and embrace the runner above, said heel-plate being slotted longitudinally to allow a toe on the cap-plate of the bracket to project through it, and a device to lock the heel-plate in connection with a toe-plate of the skate, substantially as described.

11. In a skate, the combination, with a runner, a toe-plate, and a heel-plate independently and adjustably attachable upon the runner, of a connecting-bar, two curved clamping-arms adapted to slide below on the toe-plate and pivoted to a cam-lever and on the connecting-bar, a stud on the bar engaging with a cam-slot on the lever, and a vibratable wedge-lever pivoted on the heel-plate and adapted to lock said plate to the connecting-bar, substantially as described.



480,052. THILL-COUPLING. SAMUEL A. WHITFIELD, Chicago, Ill. Filed Nov. 26, 1891. Serial No. 413,095. (No model.)

Claim.—1. The combination, with the thill-coupling, of a spring 22, curved to rest on the rear end of the thill-iron, thence curved or bowed upward, rearward, and downward into contact with the thill-clip, and a bolt extending down through the upward bow into the thill-clip, substantially as shown and described.

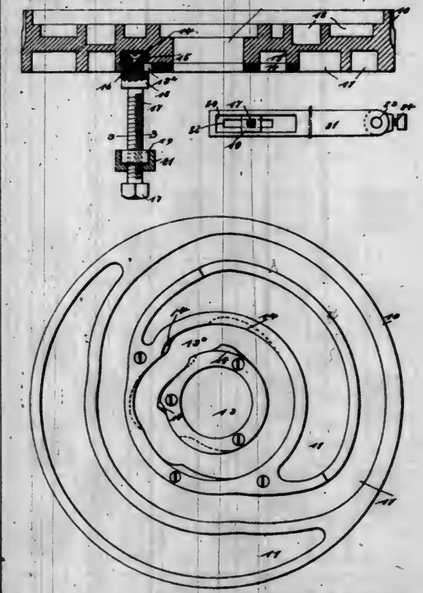
2. A thill-coupling comprising a clip-bar adapted to be secured to an axle, said clip-bar having side flanges with slots therein to receive the axial bolt of the thill-iron knuckle, an S-shaped spring held between the flanges, one end of the spring pressing against the under side of the knuckle and the opposite end pressing against the axle-clip, and a tension-bolt extending downward through the spring and into a threaded hole in the clip-bar, substantially as described.

480,053. BRUSH-BLOCK-BORING MACHINE. VESTUS P. WILLCOX, Trenton, N. J. Filed Apr. 22, 1891. Serial No. 389,923. (No model.)

Claim.—1. A machine for the purpose set forth having a stationary frame, a reciprocating frame movable on said stationary frame, plates secured to the stationary frame for supporting and also preventing the endwise movement of the boring-tools, mechanism, substantially as described, for rotating said boring-tools, a brush-block holder on said reciprocating frame, and an automatic feeding device operated by the movement of the reciprocating frame for conveying the brush-blocks to the said holder, said parts being combined substantially as described.

2. A stationary frame, a reciprocating frame having a holder thereon, a sliding bar with a pivoted clamping-arm, a lever pivoted to the reciprocating frame and connected with said sliding bar, and means, substantially as described, for moving said lever, so as to operate said sliding bar, said parts being combined substantially as described.

3. A reciprocating frame with a holder thereon, a sliding bar having a pivoted arm adapted to clamp a block in said holder, a lever pivoted to said reciprocating frame and adapted to operate said sliding bar, and means, substantially as described, for raising and lowering said lever, said parts being combined substantially as described.



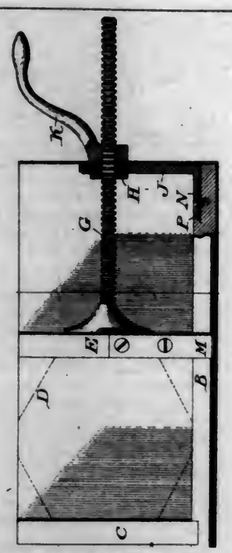
4. A reciprocating frame with a holder thereon, a sliding bar having a pivoted arm adapted to clamp a block in said holder, a lever pivoted to said reciprocating frame and connected with said sliding bar, so as to be adapted to operate the same in opposite directions, a frame with inclined top, a roller connected with the outer end of the lever and riding on said inclined top, and springs bearing against said lever, said parts being combined substantially as described.

5. A reciprocating frame with a brush-block holder thereon, a supply-trough with a discharge-opening in its side at one end thereof, a lever engaged and oscillated by an arm attached to the reciprocating frame, a spring-finger attached to said lever and adapted to engage the end block in said trough, and means, substantially as described, for keeping the blocks which are in the trough at the discharge end thereof, said parts being combined substantially as described.

6. A reciprocating frame with a brush-block holder thereon, a supply-trough for said brush-blocks having a discharge-opening at one side, a lever having an angular limb engaged by an arm attached to the reciprocating frame, a finger connected with the said lever and adapted to move across the front end of the supply-trough, and a guide located between said trough and holder, said parts being combined substantially as described.

7. A machine for the purpose named having a stationary frame with side bars, a movable plate having bosses mounted on said bars, a driving-shaft mounted on said movable frame and connected with said driving-shaft by intermediate mechanism carried by said movable frame, a counter-shaft having a worm wheel thereon and journaled in lugs on the under side of the movable frame, wheels on said rotary shaft, and pitmen connected with said wheels and pivoted to bosses on said side bars, said parts being combined substantially as described.

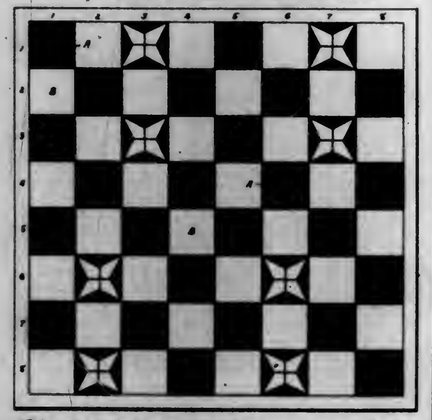
480,054. CAM FOR BUTTONHOLE-MACHINES. JOSEPH F. WINCHESTER, Brooklyn, N. Y. Filed Apr. 19, 1892. Serial No. 429,513. (No model.)



Claim.—1. A buttonhole cam-wheel having the usual grooves 11 12 in its opposite faces and the auxiliary guiding cam-grooves 13 and 14, produced on one side thereof and opposite each other and between the axis of the wheel and its grooves 11, substantially as shown and described.

2. The combination, with the cam-wheel having the double cam-groove therein and the grooved arm adapted to connect with the guide-plate of the machine, of a nut held in the groove of the arm, a bolt secured in the nut, and a roller journaled on one end of the bolt, so as to enter the cam-grooves, substantially as shown and described.

480,055. CIGAR-PRESS. ELVIN T. ZELLERS, Philadelphia, Pa. Filed Apr. 11, 1892. Serial No. 428,626. (No model.)

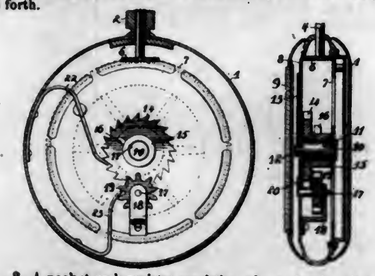


480,055.

Claim.—1. A cigar-press consisting of a base, end, and back pieces, a follower having lips guiding it on the base and back pieces, a standard secured to the base, a screw secured to the follower and passing through the standard, and a nut swiveled to the standard and mounted on the screw, said parts being combined substantially as described.

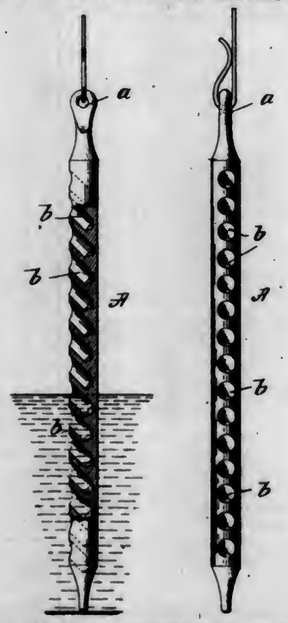
2. In a cigar-press, a follower connected with the back and base of the frame by means of angular lips, one limb of each of which enters a groove in the respective part, a portion of the base being recessed to raise the adjacent lip so as to clear the table, substantially as described.

480,056. GAME APPARATUS. FRANK H. ADAMS, Rutherford, N. J. Filed Aug. 22, 1891. Serial No. 403,380. (No model.)



Claim.—1. A checker-board in which some, but not all, of the initial-playing squares are differentiated from the others by suitable marks, symbols, or colors.

2. A checker-board in which the initial-playing squares on the third and seventh rows from the left on the opposite sides of the board are differentiated from the others by suitable marks, symbols, or colors.

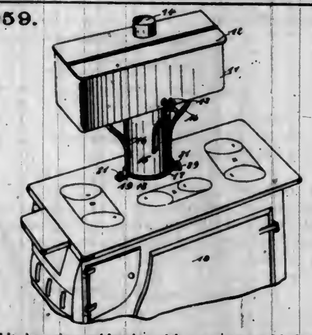


480,057. POCKET CASH-REGISTER. WILLIAM ARBENTER, St. Louis, Mo. Filed Mar. 25, 1892. Serial No. 426,358. (No model.)

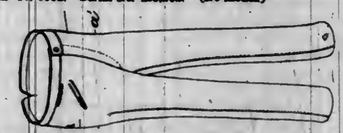
Claim.—1. In a pocket cash-register, the combination, with a casing provided with a main and an auxiliary dial and at its periphery with a tubular post 2, of a main shaft journaled in said casing and carrying a hand traveling over the main dial, a gear-wheel 7, fixed to said shaft, a shaft 4, disposed in the post 2 and carrying a knob 5 at its outer end and a pinion 6 at its inner end meshing with the gear 7, a second shaft journaled at one side the main shaft and carrying a hand traveling over the auxiliary dial, a pinion 19, fixed to said auxiliary shaft, and a pin or stud 16, projecting from the main shaft and adapted to engage the pinion 19, substantially as and for the purpose set forth.

2. A pocket cash-register consisting of a casing 1, a dial 8, fixed therein, a smaller dial 21, printed on said first-named dial, a shaft 10, fastened to the center of said dial 8, a hand 13, carried by said shaft, a gear-wheel 7, fixed to the opposite end of said shaft, a shaft 4, provided with a gear-wheel 6, the teeth of which are adapted to mesh with the teeth of the gear-wheel 7, a ratchet-wheel 14, also fixed to said shaft, a spring 22 in contact with the said ratchet-wheel, a shaft 17, also passing through the said dial and carrying a suitable hand, a gear-wheel 19, fixed to said shaft 17, a pin 16, secured to the extension 15 of said ratchet-wheel and adapted to come in contact with the teeth of said gear-wheel, a bracket 18 for supporting the said shaft 17, and a spring 23, the free end of which is in contact with the said gear-wheel 19 for holding the same against movement independent of the operating mechanism, substantially as described.

480,058. WAINAGE-ROD. JOHN F. BARKER, Springfield, Mass. Filed May 26, 1892. Serial No. 434,446. (No model.)



Claim.—A liquid-depth gage consisting of a bar provided at intervals along its length with a series of outwardly-opening pockets having their axes oblique to the length of the bar, substantially as and for the purpose set forth.



480,059. HOT-WATER BOILER. CONRAD BOHER, Hopewell, N. J. Filed Feb 8, 1892. Serial No. 420,857. (No model.)

Claim.—A stove-boiler having a vertical flue through it and a flange around its base, in combination with a separate and independent ring 18 upon its lower end and lugs 19, sliding on said ring and provided with bolt-openings, substantially as set forth.

480,059.

480,060. TROUSERS. JOSEPH BERNSTEIN, Philadelphia, Pa. Filed Mar. 17, 1892. Serial No. 425,282. (No model.)

Claim.—The herein-described trousers, the front and back portions of each leg of which are composed of a single piece of fabric, said portions being undivided or seamless at the outer side of the upper or body part thereof and being sewed along their contiguous lower or cut edges on the outer and inner sides of the leg of the garment, substantially as shown and specified.

480,061. BICYCLE-SUPPORT. FRANCIS H. BURCHARD, Milwaukee, Wis. Filed Oct. 9, 1891. Serial No. 408,270. (No model.)

Claim.—1. In a support for bicycles, the combination of the bicycle-frame, a non-rotatable shaft secured to and projecting out laterally from opposite sides of the frame, said shaft having its opposite ends provided with cammed or beveled surfaces, disks rotatably mounted upon said shaft, supporting-standards rotatable with the disks, said standards turning against the cammed surfaces, and means for holding the disks in adjusted position, substantially as set forth.

2. In a support for bicycles, the combination of the frame thereof, a segmental rack secured thereto, a non-rotatable shaft passing through said segment, supporting-standards movable upon said shaft, and a spring-actuated pawl for controlling the supporting-standards in their adjusted positions, substantially as set forth.

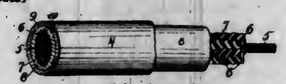
3. In a support for bicycles, the combination of the frame thereof, a segmental rack secured thereto, a non-rotatable shaft passing through said segment and having upon its opposite ends bevel or cam surfaces, supporting-standards having their inner ends bearing against the beveled ends of the non-rotatable shaft and rotatable upon screws or trunnions extending therefrom, and a spring-actuated pawl for controlling the supporting-standards, substantially as set forth.

4. In a support for bicycles, the combination of the frame thereof, an arm connected thereto, said arm formed or provided upon its outer end with a segmental rack, disks upon opposite sides of the segment, a non-rotatable shaft passing through registering apertures in said segment and disks, said shaft provided upon its opposite ends with beveled or cammed surfaces, supporting-standards secured upon screws or trunnions extending from the beveled or cammed ends and rotatable with the disks, and a spring-actuated pawl engaging the ratchet-teeth of the segment, substantially as set forth.

5. In a support for bicycles, the combination of the frame thereof, an arm connected thereto, said arm formed or provided upon its outer end with a segmental rack, disks upon opposite sides of the segment, said disks provided with laterally-tubular extensions, a non-rotatable shaft passing through registering apertures in the segment and disks, said shaft provided upon the opposite ends with beveled or cammed surfaces, supporting-standards passing through slots or recesses in the tubular extensions and turning with the disks upon screws or trunnions extending from the non-rotatable shaft, and means for holding the disks and supporting-standards in their adjusted position, substantially as set forth.

6. In a support for bicycles, the combination of the frame thereof, an arm connected thereto, said arm formed or provided upon its outer end with a segmental rack, disks upon opposite sides of the segment, a non-rotatable shaft passing through registering apertures in the segment and disks, said shaft provided upon opposite ends with beveled or cammed surfaces, supporting-standards secured upon screws or trunnions extending from the beveled or cammed ends and rotatable with the disks, and a spring-actuated angular pawl for engaging the teeth of the segment provided at its outer end with a finger-piece at right angles thereto, substantially as set forth.

7. The combination, with the frame of a bicycle, of rods pivoted to a non-movable portion thereof, said rods being non-movable laterally and adapted to swing in an arc of a circle upon their pivot so as to embrace the wheel of the machine and prevent the same from turning laterally upon its pivot, substantially as set forth.



8. In a support for bicycles, the combination of supporting-standards pivoted to a non-movable portion of said frame constructed to be swung down to engage the ground, and rods working upon the same pivot, non-movable laterally and constructed to move in an arc of a circle simultaneously with the supporting-standards so as to embrace the wheel of the machine and prevent the same from turning laterally upon its pivot, substantially as set forth.

480,062. WAIST. ADOLPHE BOUCHARD, St. Elmo, Ala. Filed Mar. 12, 1892. Serial No. 424,726. (No model.)

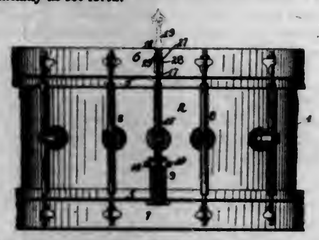
Claim.—A jacket or waist formed with a vertically-arranged sheath on its inside under the button-line of its meeting edges, a spring arranged in the sheath, and hooks on the spring arranged and adapted to engage an undergarment and hold the spring and jacket close thereto, substantially as specified.

480,063. WATERPROOF WOVEN SNARE-STRING FOR DRUMS. EMIL BOULANGER, St. Louis, Mo. Filed May 10, 1892. Serial No. 432,492. (No model.)

Claim.—1. As a new article of manufacture, a snare string comprising a number of strands of fibrous material and a weatherproof compound applied thereto and all compressed, substantially as set forth.

2. As a new article of manufacture, a snare-string comprising a number of strings of fibrous material weatherproof, compressed, and having applied to its smooth outer surface a weatherproof covering, substantially as set forth.

3. As a new article of manufacture, a snare-string comprising a number of strings of fibrous material weatherproofed, compressed, and having applied to its smooth outer surface a coating of shellac or other resinous material, substantially as set forth.



480,064. DEVICE FOR ADJUSTING DRUM-SNARES. EMIL BOULANGER, St. Louis, Mo. Filed May 10, 1892. Serial No. 432,493. (No model.)

Claim.—1. A device for securing and adjusting drum-snare strings, consisting of an interiorly-screw-threaded tubular rod carrying a clamp at one end, a guide-bracket encircling said rod and carrying a projection engaging said slot, and an adjusting-screw working in the tubular rod, substantially as and for the purpose set forth.

2. A device for securing and adjusting drum-snare strings, having a bracket 21, secured to the shell 2 by screw-headed bolt 23, said bolt

having its end fitted to engage in the elongated slot in the hollow tube 15, substantially as set forth.

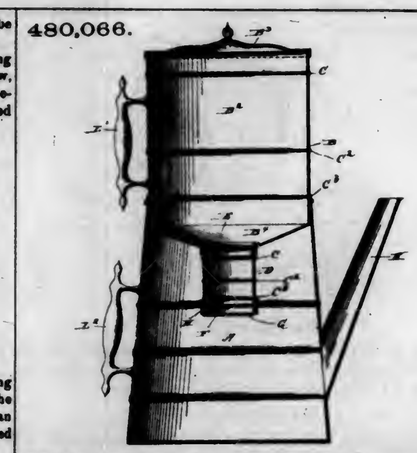
3. A device for securing and adjusting drum-snare strings, having a hollow tube, one end of which is secured in a fixed clamping-jaw, the opposite end interiorly screw-threaded and having in its outer periphery an elongated slot adapted to engage the end of a screw-headed bolt, substantially as set forth.

4. A device for securing and adjusting drum-snare strings, having a hollow tube secured to a fixed clamping-jaw, the opposite end of the tube interiorly screw-threaded and said tube constructed with an elongated slot fitted to engage and travel on the end of a screw-headed bolt, substantially as set forth.

480,065. TOY. SAMUEL M. BOYD, Middletown, N. Y. Filed Aug. 31, 1891. Serial No. 403,296. (No model.)

Claim.—1. In a toy, the combination, with a suitable base, of a spring thereon, a plate carried by said spring and provided with an audible signal, a spring-acted catch on said plate, adapted to sound said signal, and a pneumatic device automatically controlling the release of said catch, substantially as described.

2. In a toy, the combination, with a suitable base, of a spring thereon, a standard supported from said spring, a slide on said standard, a hollow rubber ball collapsible by the relative movements of said slide and standard, a catch also supported from said spring and adapted to hold the latter under tension, and connections between the slide and catch for releasing the latter by the movement of the slide in response to the reaction of the ball, substantially as described.



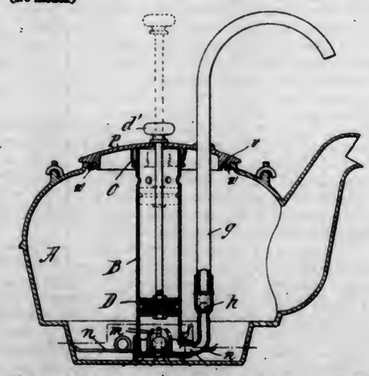
3. In a toy, the combination of a base having a bar thereon, a spring on said base, catch devices supported from said spring, adapted to engage said bar, a rubber ball also having support from said spring, and connections between the ball and catch, substantially as described.

4. In a toy, the combination of a suitable base having a bar thereon, a spring on the base, a plate supported on the spring and formed with a rectangular recess at its lower edge, a spring-acted catch pivoted on said plate and formed with an inclined edge at the bottom and with a shoulder at the upper extremity of said incline, the shoulder normally lying adjacent to the recess of the plate, said catch being adapted to engage the bar secured to the base, a standard also supported from the plate, a slide on said standard, a rubber ball adapted to be collapsed by the movement of the slide relatively to the standard, and a flexible connection between the slide and catch, substantially as described.

5. In a toy, the combination, with a base and a spring thereon, of a spring-acted catch adapted to maintain the spring under tension, a pneumatic device automatically controlling the release of the catch, and an audible signal adapted to be sounded by the catch, substantially as described.

480,066. COFFEE-POT. ROBERT G. BROWN, Kansas City, Kans. Filed Mar. 17, 1892. Serial No. 425,354. (No model.)

Claim.—The combination, with an apparatus comprising a lower or receiving vessel having a spout and handle, of a superimposed vessel removably secured thereon and consisting of two chambers for the reception of tea or coffee and water, the upper or water chamber having a cover adapted to be used in connection with the lower or receiving chamber, and an approximately conical bottom tapering to the diameter of the intermediate or coffee chamber, the latter being provided with a removably-secured reticulated disk or strainer at or near its upper end, a second strainer at or near the lower end on which the

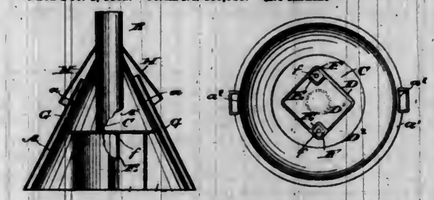


substance contained therein is supported, a third strainer arranged over the mouth of said chamber and held in position by a friction-ring, and the beads C, C^2, and C^3, formed on the upper or water chamber and the intermediate or coffee chamber to facilitate a proper proportioning of the ingredients, substantially as described, and for the purpose set forth.

480,067. CARRIAGE-CURTAIN FASTENER. ALPHA BOKER, Hueneme, Cal. Filed Mar. 29, 1892. Serial No. 426,980. (No model.)

Claim.—The herein-described improved carriage-curtain fastener, consisting of the stationary plate having a hole or opening and a slot and parallel guideways, the movable member having flanged ends fitting in said guideways and having a longitudinal cylindrical chamber fitting said slot, the bridge near the inner end of said cylindrical chamber, the lug or stop secured to said stationary plate and projecting into said cylindrical chamber, and the coil-spring bearing at its inner end against the inner end of said cylindrical chamber and at its outer end against said lug or stop, substantially as set forth.

480,068. COMBINED LIQUID RECEPTACLE AND PUMP. JAMES H. BULLARD, Springfield, Mass. Filed Jan. 18, 1892. Serial No. 418,370. (No model.)



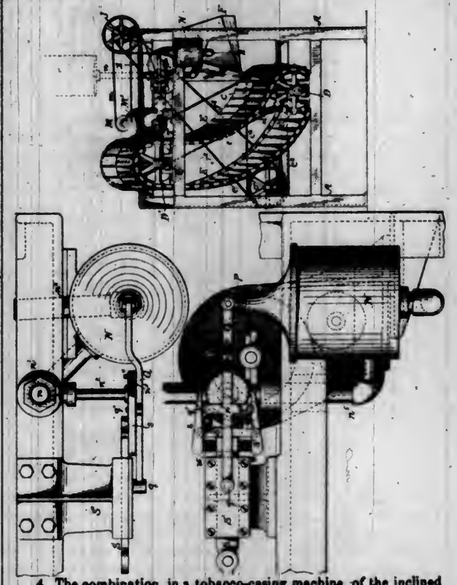
Claim.—1. In a receptacle and pump of the character described, the combination, with the receptacle, of the contained chamber-casing comprising the casting *x*, of cup form, having the opening *a* in its bottom, the downwardly-extending supporting-feet, the lateral hubbed opening, the upper internal rabbet or socket, and the upwardly-extended lugs *m m*, the ends of which are adapted to be inwardly turned, all integrally formed, and the cylindrical shell B fitted in said socket, the piston and its operating-rod, the ball-valve *b* for closing said opening *a* and restrained against displacement by said lugs *m*, and an outlet-pipe connected to the said lateral opening and extended to the exterior of the receptacle and provided with a check-valve, all substantially as described and shown.

2. In a receptacle and pump of the character described, in combination, a receptacle having an entrance-opening and a closing lid with an aperture therein, a pump-casing contained in the receptacle, having at its lower portion a valved opening leading thereto from the receptacle-chamber and having its upper extremity extended to terminate just below the lid within said aperture and having thereat an inverted-cup-formed cap, which is centrally apertured and having an outwardly-extended flange which lies under the inner edge portion which surrounds the aperture in said lid, the pump-piston with its rod extended through the aperture in said cap above the top of the lid and provided with a handle-knob, and the valved outlet-conduit leading from the pump-chamber below the piston to the exterior of the main receptacle, substantially as described.

3. In a liquid receptacle and pump of the character described, the combination, with the receptacle having an opening within and through its top and a removable centrally-apertured lid for said opening, of the pump casing centrally set in the receptacle, with the upwardly and outwardly extended spring-arms *q q*, which are adapted to lie under the edge portion of the receptacle-top which surrounds the opening, a valved opening in the bottom of the pump-casing, and the valved outlet-opening and conduit leading from near the bottom of the pump-casing to the exterior of the receptacle, and the piston and rod extended through and above the lid, substantially as and for the purpose set forth.

480,069. CLOTHES-POUNDER. DAVID D. CADY, Munson, Ill. Filed Feb. 1, 1892. Serial No. 419,995. (No model.)

Claim.—1. A clothes-pounder having a horizontal partition forming an upper closed chamber, communicating by apertures in its side walls with the exterior of the pounder, a depending partition in the lower chamber, concentric with the outer shell of the pounder, or approximately so, and vertical tubes formed within the depending partition and braced by the latter, said tubes communicating with the upper closed chamber of the pounder, substantially as described, the horizontal partition being imperforate, except the apertures registering with the vertical tubes, substantially as described.



2. A clothes-pounder consisting of a conical shell flanged at the bottom and having a horizontal partition forming an upper closed chamber which is in communication with the exterior of the shell by reason of apertures in the latter, said shell being imperforate below the horizontal partition, a handle-socket secured to the horizontal partition and projecting through the upper end of the shell, an imperforate vertical partition depending from the horizontal one, vertical tubes formed partly by said depending partition and communicating by apertures with the upper closed chamber, open-ended air-conductors on the exterior of the shell, said conductors extending at their upper ends over the apertures leading to the upper closed chamber and communicating with said chamber by such apertures, the lower ends of the tubes extending to the extreme bottom of the shell, the flange of which is removed at such conductors, and guard-hoods secured to the handle-socket and overhanging the upper ends of the conductors, substantially as described.

480,070. TOBACCO-CASING MACHINE. JOHN T. CARTER, Danville, Va., assignor to the Carter Machine Company, same place. Filed June 6, 1891. Serial No. 395,377. (No model.)

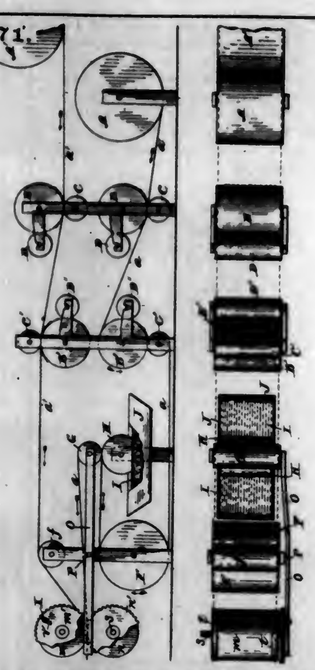
Claim.—1. A carrying-belt for tobacco-spraying machines, having one part covered with canvas and the other part surfaced with metallic slats overlapping each other, substantially as described.

2. The combination, in a machine for casing tobacco, of the two inclined shafts, a slack carrying-belt for the tobacco, adapted to the shafts, said carrying-belt having part of its surface composed of metallic slats overlapping each other, with a spraying device opposite said metallic slats, substantially as described.

3. The combination, in a tobacco-spraying machine, of the two shafts, a carrying-belt adapted thereto, wheels on said shafts, the wheel on one shaft being adjustable thereon, and means for locking the wheel to its shaft, with a chain belt passing over the wheels on the shafts so that one shaft is driven from the other, the whole so arranged that the trough of the belt can be regulated, substantially as and for the purpose described.

4. The combination, in a tobacco-casing machine, of the inclined shafts, carrying-belt thereon, mechanism for driving said shafts, a feed-chute, and a partition or fence, with a spraying device for spraying the tobacco as it passes along the belt, the whole arranged substantially as described.

5. The combination, in a tobacco-spraying machine, of the feeding devices for the tobacco, a spraying device having a tank for the liquor, a float box or cylinder connected to the tank, a float in said box, and a valve controlled by said float, whereby the supply of liquor to the float-box is regulated, substantially as described.



6. The combination of a spraying device, the tobacco-agitating belt, a tank, a float-box connected to said tank, a float in said box, a lever connected to said float, a reciprocated slide, pawls carried thereby, ratchet-wheels with which said pawls are adapted to engage, a feed-pipe for said float-box, a valve therein controlled by said ratchet-wheels, and projections on said float-lever acting to throw one or other of the pawls into or out of gear with its ratchet-wheel, whereby the valve in the feed-pipe is operated and the supply of fluid is regulated, substantially as specified.

7. The combination of the float-box, a float therein, a lever connected to said float, projections on said lever, a reciprocating slide, pawls on said slide, situated in the path of the projections on the lever, an inlet-pipe for the float-box, a valve in said pipe, a ratchet-wheel controlling the operation of said valve, and the pawls being arranged to operate the valve through the medium of the ratchet-wheels, substantially as described.

8. The combination, in a tobacco-spraying machine, of the inclined shafts, tobacco-carrying belts thereon, tobacco-spraying device, a float-box, a float therein, a float-lever, a reciprocating slide, a connecting-rod connected to a crank-pin on one of said inclined shafts and to the slide, whereby a reciprocating motion is imparted to said slide, pawls carried by said slide, a supply-pipe for the liquor, a valve therein, ratchet-wheels on the spindle of the valve, and pawls adapted to engage with said ratchet-wheels, with projections on the lever connected to the float for throwing one or the other of the pawls out of engagement with its ratchet-wheel, substantially as and for the purpose set forth.

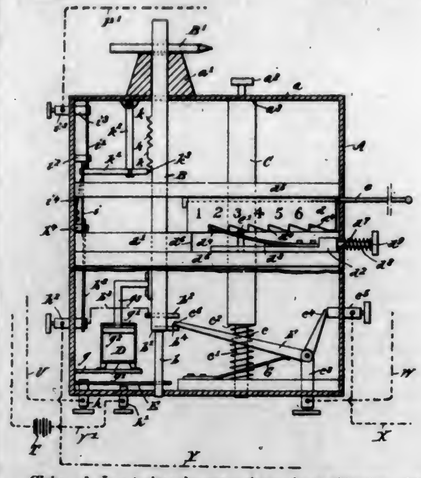
480,071. MACHINE FOR MAKING STICKY FLY-PAPER. FRANK B. CLAGGETT, Oshkosh, Wis. Filed May 2, 1892. Serial No. 431,513. (No model.)

480,071.

Claim.—1. In a machine for making sticky fly-paper, the combination of a pan for holding a fly-catching substance, a coating-roller working in said pan, a guiding-roller for bringing the paper in contact with the coating-roller, and a pivoted lever or its equivalent for raising said guiding-roller and the paper carried thereby out of contact with the coating-roller, and means for operating the lever, whereby spaces at regular intervals are formed on said paper, substantially as and for the purpose described.

2. In a machine for making sticky fly-paper, the combination of a supply-pan for holding a fly-catching substance, a coating-roller working in said pan, a guiding-roller G above said coating-roller for bringing the paper to be coated in contact with the coating-roller, and a pivoted lever connected by one end to the said guiding-roller G and its other end working in conjunction with a pin on a feed-roller, whereby the guiding-roller G is automatically and periodically raised, thereby raising the paper at regular intervals from off the coating-roller to form uncoated spaces, substantially as and for the purpose described.

480,072. CLOTHES-PIN. JOHN W. COOK, Harrisburg, Oreg., assignor of one-half to John R. Medley, same place. Filed Jan. 22, 1892. Serial No. 418,966. (No model.)



Claim.—1. A clothes-pin provided with a bearing to run upon the supporting-line, a guide-opening for the pulling-cord, and a plurality of clasps for holding the clothing, whereby the article of clothing being dried may be utilized to connect the adjacent pins, substantially as set forth.

2. A clothes-pin having at its upper end a bearing to run upon the supporting-line and provided below such bearing with a guide-opening for the pulling-cord and below such opening with the clasps, substantially as shown and described.

3. The improved clothes-pin formed of wire bent and twisted to form the clasps A and the guide-opening C and provided with a bearing to run upon the supporting-wire, substantially as set forth.

4. The combination of the supporting-line and its supports, the guide-pulleys 1 and 2, the clothes-pins having bearings arranged to run on the supporting-line, and also having guide-openings for the pulling-cord and provided below each opening with a plurality of clasps, whereby the clothes being dried may be utilized to connect the adjacent pins, and the pulling-cord passed over pulley 1, thence through the guide-openings of the pins around the pulley 2, and then back and secured to the foremost pin, all substantially as and for the purposes set forth.

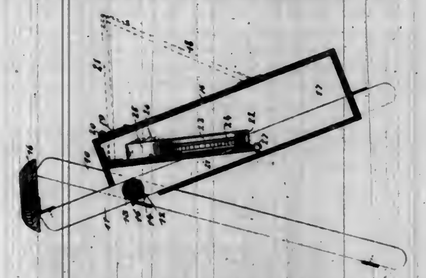
480,073. TRAIN-ORDER ANNUNCIATOR. LEONARD T. CRABTREE, Embarrass, Wis. Filed Oct. 15, 1891. Serial No. 408,743. (No model.)

Claim.—1. In a train-order annunciator, the combination, with a battery and a telegraph receiving-instrument, of a train-order recording and indicating device, a current-changer that will hold a visual signal exposed, a signal-bell, electric connections between the battery telegraph-instrument, recording device bell, and current-changer, and a normally-open circuit-closer electrically connected to the bell, battery, and order-recorder, that will be mechanically closed by impact of a car-wheel, substantially as described.

2. In a train-order annunciator, the combination, with a battery, a switchboard, main-line wires, a receiving-instrument, a train-order recorder and indicator, and wires connecting these devices electrically, of an electrically-connected signal-bell, a normally-open circuit-closer, and a mechanical device connecting the circuit-closer with a rock-shaft and treadle-arm thereon, that will be depressed by impinge of wheels on a locomotive or car, close the circuit, and ring the bell, substantially as described.

3. In a train-order annunciator, the combination, with a battery, a switchboard, main-line wires, a receiving-instrument, a train-order recorder and indicator, a current-changer, and wires connecting all these devices electrically, of a cord or other operating device for a visual signal, which may be connected to the lever of the current-changer and hold it rocked, a normally-open circuit-closer, a signal-bell, wires to connect the bell with the circuit-closer, battery, and order-recorder, and a mechanical device which will close the circuit and cause the bell to ring when engaged by the wheel of a locomotive or car, substantially as described.

4. In a train-order-annunciator apparatus, a current-changer comprising a rocking lever on a base-block, a rock-shaft supporting the lever, a crank-arm thereon, two separated spring contact-plates supported on binding-posts, a shifting contact-plate which is secured on a rotatable binding-post and that may engage either spring-plate, an arm on said post, and a link-bar loosely connecting this arm with the crank-arm of the rock-shaft, substantially as described.



5. In a train-order-annunciator apparatus, a recording and exhibiting device comprising a case, movable indicator-slides therein having numerals that may be exposed before sight-holes in the front of the case, a vertically-adjustable gravity-bar, means to move the indicator slide-plates longitudinally, a rocking bell-crank lever supported on a binding-post that will engage its short arm with another post when the gravity-bar is elevated, a contact-bar on the gravity-bar that will engage the long arm of the bell-crank when the gravity-bar is depressed, a binding-post bearing a spring contact-plate that will be depressed when the gravity-bar falls, and another binding-post that will be engaged by the spring contact-plate when the gravity-bar falls, substantially as described.

6. The combination, with a case, a gravity-bar adapted to slide vertically in the case, a removable style that supports the bar elevated, a series of separated projections formed on one side of the gravity-bar, and a dash-pot device connected with the bar, of a finger-bar supported to swing and loosely engage the projections on the gravity-bar with one end, and a contact-plate that is actuated to make and break a closed electric circuit by the other end of the finger-bar when the gravity-bar falls, substantially as described.

7. In a train-order annunciator, the combination, with a case having an apertured front wall, indicator slide-plates numbered in series which when slid will expose a number before an aperture, a pusher-bar for each slide-plate, and a spring on each pusher-bar that engages its free end with teeth on the edge of a slide-plate, of a vertical slide-bar, pins on said bar that will compress the springs on the pusher-bars when the slide-bar is depressed, and a spiral spring below on the slide-bar that holds it normally elevated, substantially as described.

8. In a train-order-annunciator apparatus, the combination, with a signal-bell, a battery, an annunciator-case, a gravity-bar vertically movable in the case, a binding-post on the case supporting a contact spring-plate that is loosely engaged by the lower end of the gravity-bar, another adjacent binding-post whereon the contact-plate will be imposed when the gravity-bar falls, a circuit-closer comprising a box, two binding-posts thereon, to one of which a circuit-closing bar is hinged by one end and adapted to bear on the other post when swung upwardly, and connecting-wires between the bell binding-posts, battery, and posts on the annunciator-case, of a rod depending from the circuit-closing bar, a spiral spring on said rod which holds it and the circuit-closing bar normally depressed, a rock-shaft below having a crank on one end connected with the depending rod, and an arm on the other end of the rock-shaft near a track-rail, which will be depressed and close the circuit when impinged upon by a car-wheel, substantially as described.

480,074. FOLDING BLACKING-STAND. JOHN A. CRAMPTON, Newport, Del. Filed Aug. 19, 1891. Serial No. 403,063. (No model.)

Claim.—1. A folding blacking-stand comprising folding cross-legs having a hinged foot-rest at the top and a box carried by the stand and provided with a swinging lid and an outwardly-swinging shelf, substantially as described.

2. A folding blacking-stand comprising folding cross-legs, a hinged foot-rest, and a box having a hinged lid, substantially as described.

3. In a blacking-stand, the combination, with a frame, of a box secured to the frame and having an outwardly-swinging lid and a shelf hinged in the box and adapted to be swung upwardly out of the box and supported by the lid thereof, substantially as described.

4. In a blacking-stand, the combination, with a box having an outwardly-swinging lid provided with a hook for engaging an eye on the box to lock the lid closed, of a shelf hinged in the box and provided with an eye, said box being adapted to be swung upwardly out of the box and its eye engaged by the hook of the lid of the box, substantially as and for the purpose specified.

5. In a blacking-stand, the combination, with pivoted cross-frames, one of which is provided with a cross-bar and the other with a hook for engaging said bar, of a foot-rest pivoted to one frame and adapted to rest on the other, a box secured to one frame and having a hinged lid, and a hinged shelf in the said box, substantially as herein shown and described.

6. A blacking-box stand comprising a folding frame, a hinged foot-rest carried by the frame, a box secured to the frame and having a hinged lid, and a shelf hinged in the box and adapted to be supported by the lid of the box when swung out of the same, said shelf carrying a blacking-box holder and a sponge-holder, substantially as herein shown and described.

480,075. LATCH. GEORGE H. DUNCAN, Greenwich, Mass. Filed Dec. 28, 1891. Serial No. 416,297. (No model.)

Claim.—1. In a door-latch, the hollow cylindrical barrel b B', made in two parts, one of said parts being integral with the latch-plate and the other being adapted to fit edgewise upon the first, in combination with the latch-bolt reciprocating within said barrel in the direction of its length, the knob-spindle reciprocating through the same at right angles thereto, and with the connecting-tongue J and anti-friction rollers L, for the purpose set forth.

2. In a door-latch, the knob spindle adapted to move longitudinally in actuating the latch-bolt and provided with the corner-notches h, in combination with escutcheon-plates having square sockets to fit said spindle and annular sleeves surrounding the same, and with a lock-plate N n, having a similar socket through which the spindle passes, said plate being inserted transversely through said sleeve and adapted by a partial rotation to engage with the notches n, for the purpose set forth.

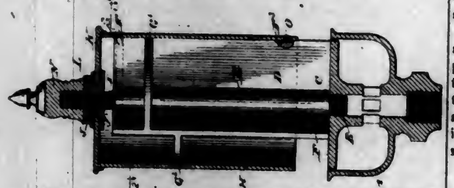
480,076. BROILER ATTACHMENT FOR STOVES. THOMAS P. DUNNE, New York, N. Y. Filed Nov. 19, 1891. Serial No. 412,371. (No model.)

Claim.—1. A broiler attachment for stoves, composed of two telescoping sections, each having a triangular end piece, and an inclined top plate connected at one end with the oblique top edge of the end piece, substantially as set forth.

2. A broiler attachment composed of two triangular end pieces and inclined top plates provided at each lower end with a flange, and pins projecting downwardly from said flange, substantially as set forth.

3. A broiler attachment composed of two triangular end plates, a curved top plate provided at its lower end with a flange, pins projecting downward from said flange, and a curved hood formed along the upper edges of the inclined plate, substantially as set forth.

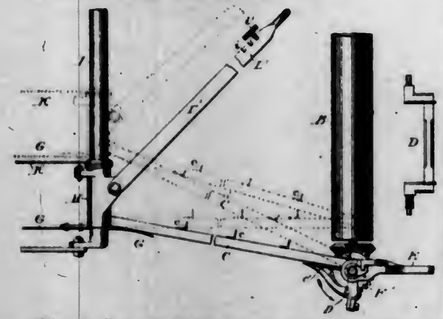
4. A broiler attachment composed of two end plates and inclined top, and a curved hood formed along the upper edge of the inclined top, substantially as set forth.



480,077. FOOT-LATCH FOR REVERSIBLE PLOWS. OSCAR H. EDDY, Greenwich, N. Y., assignor to W. Eddy & Sons, same place. Filed Mar. 5, 1892. Serial No. 423,812. (No model.)

Claim.—In a foot-latch for reversible plows, the combination, with a bell crank lever having end hooks and means for securing the lever pivotally upon a plow, of a spring-supporting rod having one end pivoted to the bell-crank lever and provided with a spring-supporting

flange and the other end movable in a fixed support, and a coil-spring inclosing the rod with one end of the spring bearing upon the flange on the rod and the other end upon the fixed support, substantially as described.



480,078. STEAM-WHISTLE. JOHN EISIG, Jacksonville, Fla. Filed Mar. 15, 1892. Serial No. 424,985. (No model.)

Claim.—1. A steam-whistle comprising a fixed web and a bell held longitudinally adjustable on the said web and forming with the latter longitudinal chambers of different lengths, substantially as shown and described.

2. A steam-whistle comprising a nozzle, a web secured on the said nozzle and provided with longitudinal and transverse partitions, and a bell fitted over the said web and held longitudinally adjustable thereon, substantially as shown and described.

480,079. GRAIN-BINDER. GEORGE ESTERLY, Whitewater, Wis., assignor to the Esterly Harvesting Machine Company. Filed Dec. 5, 1891. Serial No. 414,147. (No model.)

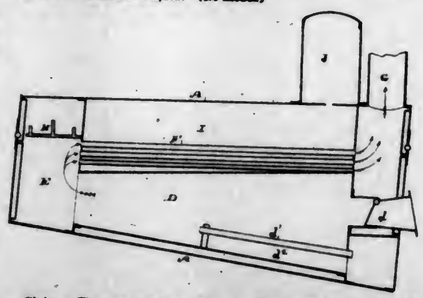
Claim.—1. In a grain-binding machine, the combination of a laterally and longitudinally moving butt-board and a supporting-plate overlapping the same and extending beyond its lower end to support the butt-ends of the adjusted grain and prevent the same from shifting forward.

2. In a grain-binding machine, and in combination with the binding-table whereon the loose grain is delivered, the butt-board, the driving-crank at its upper end, the plate G, against which it slides at the lower end, the plate-supporting sleeve, the sleeve-supporting guide extending in a fore-and-aft direction, and means under the control of the driver for shifting the sleeve in a fore-and-aft direction and fixing it in position.

3. In a grain-binding machine, and in combination with the binding-table whereon the loose grain is delivered, the butt-board, means for moving the same laterally and longitudinally at its upper end, the stationary butt-supporting plate overlapping and extending beyond its lower end, and a spring-finger forward of said plate to act upon and retain the butts of the grain.

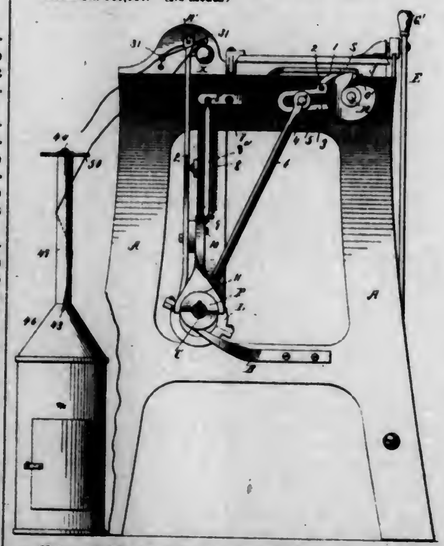
4. In a grain-binding machine, and in combination with the binding-table whereon the loose grain is delivered, the butt-board, the actuating-crank at its upper end, the plate G, extending beyond its lower end, the support for said plate, adjustable in a fore-and-aft direction, and the spring-finger attached to said support.

480,080. INTERCHANGEABLE-INITIAL FINGER-RING. JOSEPH H. FINK, New York, N. Y. Filed Apr. 14, 1891. Serial No. 388,873. (No model.)



Claim.—1. In an interchangeable-initial finger-ring, the combination, with the box of the ring and a perforated setting, of an initial letter or like character having arrow-headed locking-bars, which pass through perforations of the setting, enter the box below, and engage removably with a laterally-elastic securing device that is firmly attached to the bezel of the box or ledges thereon, substantially as described.

480,080.



2. In an interchangeable-initial finger-ring, the combination, with a ring having a box attached to its hoop portion, a setting which is perforated, and seats in the box, and an initial letter for the ring, of two parallel keeper-rods that are elastic and are affixed by their ends to ledges in the box and one or more locking-bars which have one end affixed to the initial letter, pass through the perforated setting, and interlock arrow-heads on their free ends between the keeper-rods, substantially as described.

480,081. BOILER. FRANK X. FISCHER, Oakland, Cal. Filed Mar. 6, 1889. Serial No. 302,152. (No model.)

Claim.—The combination, with a boiler having one end smaller than the other, of a wheeled frame having a rear axle provided with a curved seat at its middle portion, adapted to receive the larger end of the boiler, and a front axle supporting the smaller front end of said boiler and pivotally secured thereto, so that it may turn about its pivot without impediment, substantially as herein described.

480,082. MACHINE FOR SEWING STRAW COVERS FOR BOTTLES. VALENTIN FLECKENSTEIN, Oshkosh, Wis. Filed Oct. 31, 1890. Serial No. 369,917. (No model.)

Claim.—1. The combination of a forming-cylinder, a guiding-scroll, a stationary straw-supporting table, an endless-chain straw-carrier extended far enough to carry the sewed cover around the cylinder between the same and the scroll, mechanism for automatically stopping the stitch-forming mechanism and the endless straw-carrier mechanism for varying the length of the stitch, and a hand mechanism for restarting the machine when a new cover is to be made, substantially as described.

2. The combination of stitch forming mechanism, the forming-cylinder, the guiding-scroll, a straw-carrier, a binder H, pivoted at A to the frame and swinging over upon the top of the feed-table for holding the straw down, the horizontal sliding platform G, and a lever G', connected thereto and to the frame, the said platform being on a plane above the binder and serving for doubling the straw and holding it upon the binder, substantially as described.

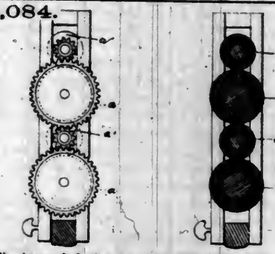
3. The combination of stitch-forming mechanism, a forming-cylinder, a guiding-scroll, a straw-carrier, a ratchet-wheel and pawl, a notched wheel and pawl, a slotted arm, an adjustable connecting-rod 6, and mechanism for operating the stitch-forming devices, and the endless-chain straw-carrier whereby the length of the stitches can be varied and the machine automatically stopped when the cover is finished and the cutting of the threads is to be performed, substantially as described.

4. The combination of stitch-forming mechanism, a forming-cylinder having a removable cover, a guiding-scroll provided with an opening intermediate of its length for admitting access to the straw-cover, the straw-feeding mechanism, and mechanism for operating the stitch-forming and straw-feeding devices, substantially as described.

5. The combination of stitch-forming mechanism comprising a reciprocating hooked needle, arm 19, carried by wheel 17 and carrying the thread, toothed bar 16, toothed wheel 17, and means for operating said bar 16, the forming-cylinder, a guiding-scroll, a straw-carrier, and mechanism for operating said carrier and the other parts of the stitch-forming mechanism, substantially as described.

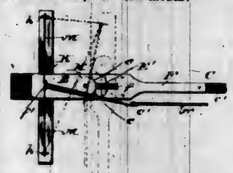
6. The combination of the stitch-forming mechanism comprising the hooked needle, rocking thread-carrier 19, thread-gripper 28, lever x for operating the same, slotted plate 26, through which the thread and needle pass, and knife 42, applied to the gripper and operated by the lever which operates the gripper, a forming-cylinder, a guiding-scroll, a straw-carrier, mechanism for operating said carrier, and mechanism for operating the stitch-forming mechanism, substantially as described.

7. The combination of stitch-forming mechanism, feeding mechanism, plate 26, provided with a slot 27, gripper 28, knife 42, mounted on the same pivot as the gripper, but set at a different angle so as to engage the wall of the slot later, and lever x, as and for the purpose described.



480,083. WASHING-MACHINE. JOHN FLYNN, Vail, Iowa. Filed Oct. 26, 1891. Serial No. 410,061. (No model.)

Claim.—In a washing-machine, the combination of the suds box, the pounder having the openings and formed of the perforated pieces and provided with the rigid upwardly-extending arm, and the operating means for the pounder, and the holding-rack to secure the articles to be washed to the under side of the pounder, and the cords for detachably holding the said rack in position.

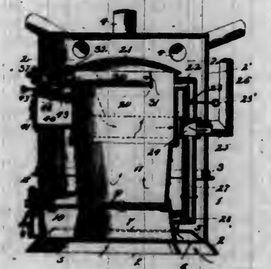


480,084. MACHINE FOR DECORTICATING RAMIE, &c. WALTER T. FORBES, Atlanta, Ga. Filed Dec. 29, 1891. Serial No. 416,451. (No model.)

Claim.—The improved machine for decorticating ramie and similar growths, consisting of the frame and the two pairs of yielding surfaced rolls journaled therein, the said rolls being arranged in a common plane and the rollers of each pair being relatively one large and the other small, the rollers of each pair being in contact and the small roll of one pair being in contact with the large roll of the other pair, and the drive mechanism arranged to turn the small rolls faster than the large ones, substantially as set forth.

480,084.

480,085. GATE. GEORGE FORD, New Harmony, Ind. Filed Nov. 19, 1891. Serial No. 412,390. (No model.)



Claim.—1. In a gate, the combination, with the hinge-post, of the block connected therewith and having a concaved rear face, the hinge-pin secured therein, the gate, the longitudinal bar or beam rigidly attached to the gate and having a longitudinal slot, the friction-roller upon the under side of the bar or beam, the lower hinge, and the cords and levers connected with the bar or beam, substantially as shown and described.

2. In a gate, the combination, with the hinge-post, of the block having a concaved rear face and convex forward face, the vertical hinge-pin inserted in said block, the gate having a rigid rearwardly-projecting bar slotted longitudinally and carrying a roller rear of said slot and upon the under side of said bar, and the cords connected with the bar rear of the roller, substantially as shown and described.

3. In a gate, the combination, with a hinge-post, of a gate hinged thereto, the rigid rearwardly-projecting bar or beam slotted, as described, the vertical hinge-pin, the cross-beam connected with the hinge-post and arranged adjacent the rear end of the bar or beam, guides carried at the ends of the cross-beam, the cords passed through said guides and connected with the bars or beams, and the lower hinge, substantially as shown and described.

4. The combination, with the hinge and supplemental posts, of the beam connecting the same, the block having the concave rear face and convex forward face, the vertical hinge-pin, the gate, the slotted bar or beam rigid with the gate, the friction-roller attached to the under side of the bar or beam, the lower hinge, the cross-beam, guides, ropes, and levers, all arranged substantially as shown and described.

480,086. FURNACE. THOMAS E. FREEMAN, Sioux Falls, S. D., assignor of one-half to William D. Roberts, same place. Filed Apr. 21, 1892. Serial No. 430,123. (No model.)

Claim.—1. In a furnace, the combination, with the casing, the hot-air pipes leading therefrom, the furnace-body, a box in rear thereof, and the smoke-flue leading from said box to the chimney, of a shield within the furnace-body, its rear edge standing near the top and rear of said body and its front opening through said body, a front radiator between the casing and body, curving through about one-third of a circle and communicating at its center with said opening from the shield, a rear radiator similarly located and occupying the remaining two-thirds of a circle, its center communicating with said box, and depending oblique pipes connecting the ends of the front and rear radiators, as and for the purpose set forth.

2. In a furnace, the combination, with the casing, the hot-air pipes leading therefrom, the furnace-body, a box in rear thereof, an exit-pipe connecting the body with said box, a damper in said pipe, and the smoke-flue leading from the box to the chimney, of an opening at the front of said body near its top, a front radiator between the casing and body, curving throughout part of a circle and communicating at its center with said opening, a rear radiator similarly located, occupying the remaining part of the circle and communicating at its center with said box, and depending oblique pipes connecting the ends of the radiators, as and for the purpose set forth.

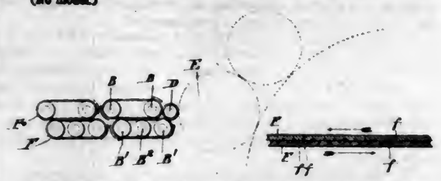
3. In a furnace, the combination, with the casing, the hot-air pipes leading therefrom, the furnace-body, a box in rear thereof, a dust-exit flue connecting said box with the ash-pit of the body, a damper in said flue, and the smoke-flue connecting the box with the chimney, of an opening in the front of the furnace-body near its top, a front radiator between the casing and body, curving throughout part of a circle and connecting at its center with said opening, a rear radiator similarly located, occupying the remaining part of the circle and communicating at its center with said box, and depending pipes connecting the ends of said radiators, as and for the purpose set forth.

4. In a furnace, the combination, with the casing, the hot-air pipes leading therefrom, the furnace-body, a box in rear thereof, an exit-pipe connecting the body with said box, a damper in said pipe, a dust-exit flue connecting the box with the ash-pit, a damper in said flue, and the smoke-flue connecting the box with the chimney, of a front radiator between the body and casing, curving throughout part of a circle and communicating at its center with the front of the body, and a rear radiator similarly located, occupying the remaining part of the circle, communicating at its center with said box, and connected at its ends with the ends of the front radiator, as and for the purpose set forth.

5. In a furnace, the combination, with the casing, the hot-air pipes leading therefrom, the furnace-body having a convex top, the coal-chute opening into the front of said body and having a door, and the smoke-flue leading to the chimney, of a front radiator curving around the body within the casing and near the top of said body, with which it communicates at its center, a rear radiator also curving around the body, connected with the front radiator, and communicating with the smoke-flues, a pipe connecting the front radiator with said chute, and a damper in this pipe, all as and for the purpose hereinbefore set forth.

480,087. PORTFOLIO OR POCKET-CASE. CHARLES GALLE, St. Louis, Mo. Filed Dec. 11, 1891. Serial No. 414,692. (No model.)

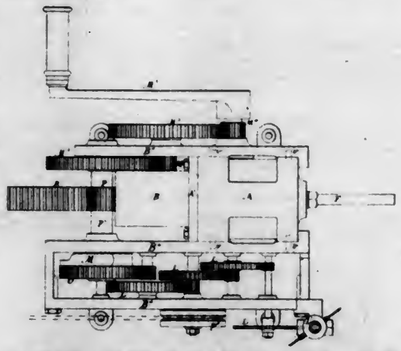
Claim.—1. As a new article of manufacture, a portfolio comprising an inner layer forming the body, a cover of pyroxyline material suitably secured thereto, and the flexible connections joining the side edges of the portfolio, substantially as described.



2. As a new article of manufacture, a portfolio comprising a single foundation layer doubled or folded upon itself to form two sides and an end, and a cover of pyroxyline material secured to said body, the edges of the sides formed by the layer and cover being joined together, substantially as described, for the purpose specified.

3. A portfolio comprising the inner layer, the transparent cover secured to the layer, and flexible connections which join the side edges of the layer and cover, substantially as described.

4. A portfolio comprising the inner layer, the pyroxyline cover, said layer and cover being folded to form the sides or faces of the portfolio, and the lacing connecting the edges of said sides or faces, substantially as described.



5. As a new article of manufacture, a portfolio comprising an inner layer forming the body thereof, and a pyroxyline cover secured to said body and having an ineffaceable inscription on the inner face of said cover, the sides of the portfolio being flexibly connected together, substantially as described.

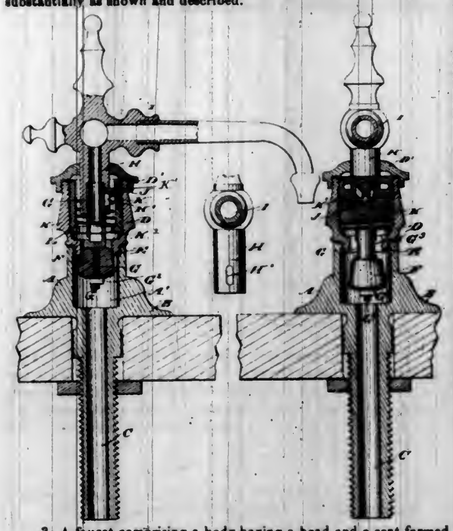
480,088. RUBBING-APRON FOR CONDENSING CARDING-ENGINES. SAMUEL H. GIDLEY, Philadelphia, Pa., assignor to John Dobson and James Dobson, same place. Filed June 25, 1891. Serial No. 397,405. (No model.)

Claim.—In rub-roll mechanism for condensing carding-engines, the combination, with two pairs of rub-roll shafts mounted relatively to each other, as described, of short endless aprons or belts mounted thereon laterally between said shafts and provided on their rubbing-surfaces with a series of shallow longitudinal channels or grooves, substantially as described.

480,089. COMPRESSED-AIR MOTOR. PAUL GIFFARD, Paris, France. Filed Aug. 25, 1888. Serial No. 283,761. (No model.) Patented in France Mar. 5, 1888, No. 189,141, and in England July 23, 1888, No. 10,645.

Claim.—1. A compressed-air motor consisting of a compressed-air cylinder having one end open, a hollow plunger also having one end open and entering the open end of the cylinder, and multiplying gear driven by the plunger for transmitting power to the apparatus to be driven, substantially as described.

2. A compressed-air motor consisting of a compressed-air cylinder having one end open, a hollow plunger also having one end open and entering the open end of the cylinder, an air-pump connected with the cylinder for storing air therein, and gear driven by the plunger for transmitting power to the apparatus to be driven, substantially as described.



3. For a compressed-air motor, an expansible-air reservoir consisting of the combination of a compressed-air cylinder having one end open and an air-pump communicating with the other end, with a hollow plunger, also having one end open, entering the open end of the cylinder, and a rack-bar extending from the closed end of the piston for communicating motion to the driving-gear of the motor, substantially as described.

4. A compressed-air motor consisting of a compressed-air cylinder having one end open, a hollow plunger also having one end open and entering the open end of the cylinder, an air-pump connected with the cylinder for storing air therein, multiplying gear driven by the plunger, and other gear connected to the said plunger for returning it to its original position against the action of the compressed air, substantially as described.

480,090. FAUCET. JAMES M. GILMOUR, East Orange, N. J. Filed Jan. 7, 1892. Serial No. 417,942. (No model.)

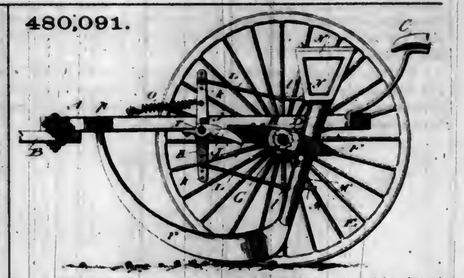
Claim.—1. A faucet comprising a body provided with a valve-seat, a valve adapted to be seated on the said valve-seat and arranged to close in line with the pressure of the water service, a discharge-spout loosely engaging the stem of the said valve and formed with a slot, the said spout being mounted to turn in the said valve-body, and a pin projecting from the valve-stem and passing through the slot in the spout to engage a groove on the said body, so that on turning the spout the pin moves in the groove to actuate the valve and at the same time the pin slides in the slot of the spout, substantially as shown and described.

2. A faucet comprising a body having a head and a seat formed thereon, a valve adapted to be seated on the said seat and arranged to close with the pressure of the water service, a valve-stem carrying the said valve and connected with the discharge-spout, and a pin held on the said stem and engaging a V-shaped groove on the said head, substantially as shown and described.

3. A faucet comprising a body having a head and a seat formed thereon, a valve adapted to be seated on the said seat and arranged to close with the pressure of the water service, a valve-stem carrying the said valve and connected with the discharge-spout, a pin held on the said stem and engaging a V-shaped groove on the said head, and a spring pressing on the said pin for automatically closing the valve, substantially as shown and described.

4. A faucet comprising a body, a head held thereon and formed with a valve-seat, a sleeve held on the said head and formed with a V-shaped groove, a valve adapted to be seated on the said valve-seat, a valve-stem carrying the said valve, a discharge-spout formed with a stem engaging the said valve-stem, and a pin projecting from the said valve-stem and passing through a vertical slot in the said spout to engage with its outer end the said V-shaped groove, substantially as shown and described.

5. A faucet comprising a body, a head held thereon and formed with a valve-seat, a sleeve held on the said head and formed with a V-shaped groove, a valve adapted to be seated on the said valve-seat, a valve-stem carrying the said valve, a discharge-spout formed with a stem engaging the said valve-stem, a pin projecting from the said valve-stem and passing through a vertical slot in the said spout to engage with its outer end the said V-shaped groove, and a spring held in the said sleeve and pressing against the said pin, substantially as shown and described.

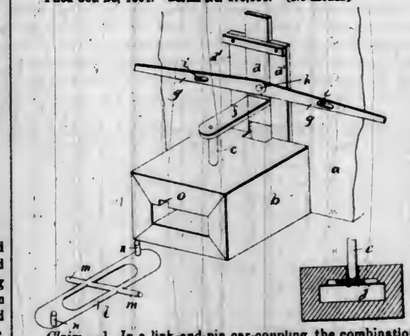


480,091. SEED-PLANTER. JACOB C. HAAS, Bremen, Ind., assignor of one-half to George F. Wahl and I. L. D. Seiler, same place. Filed Feb. 10, 1892. Serial No. 420,992. (No model.)

Claim.—1. The combination, with the frame, wheels, and axle, of a ratchet-lug on the axle and the dropping mechanism actuated by said lug, as set forth.

2. The combination, with the frame, wheels, and axle, of the lug on the axle, the shaft forward of the axle, the cam on said shaft in the path of said lug, the vertical arms on the ends of said shaft, the pivotal adjustable arms carrying pivotal slides, and the spring acting on the vertical arm, substantially as described.

3. The combination, with the axle and the lug loosely seated thereon, of the ratchet fast on the axle and operative connections between said lug and ratchet, as set forth.



480,091.

4. The combination, with the axle, of the chambered lug loosely sleeved thereon, the ratchet fast on said axle and arranged in the chamber of the lug, and the flat spring on said lug engaging said ratchet, substantially as and for the purpose specified.

5. The combination, with the frame, axle, and wheels, of the chambered lug loose on the axle, the ratchet fast on the axle in the chamber of the lug, the springs on the lug engaging the ratchet, the rock-shaft forward of the axle, the adjustable cam thereon, the vertical arms carried by said shaft, the springs acting thereon, and the pivotal adjustable rods connected with said arm and having the slides pivotally connected therewith, substantially as described.

480,092. CAR-COUPLING. WILLIAM HERRICK, Russell, Minn. Filed Oct. 28, 1891. Serial No. 410,098. (No model.)

Claim.—1. In a link-and-pin car-coupling, the combination, with the coupling head, of a horizontally-swinging pin-holding cam pivoted to the upper face of the head-opening, so as to swing from and beneath the pin-opening, said cam being so shaped as to be swung in opposite directions by a lug or portion of the link, substantially as described.

2. The link-and-pin coupling-head, in combination with the horizontal cam pivoted between its ends in the top of the interior of the head and arranged and constructed substantially as described, and a link having a projection arranged so that when the link enters the head it will engage the cam and swing it from beneath the link-hole and when the link moves out of the head it will engage said cam and swing it beneath said hole, substantially as set forth.

3. In a car-coupler, the combination of the coupling-head, the coupling-pin, and the swinging cam within the head, arranged to hold and automatically drop said pin, and the coupling-link having the central lateral stops and the projections at its ends, said cam being so constructed as to be operated by the in-and-out movement of the said projection and the coupling-link, as set forth.

4. The coupling-head having the cam provided with curved edges and pivoted between its ends to the top of the interior of the head, so as to rest above the link, and a link having a portion adapted to engage said cam when it leaves and enters the head, and thereby swing the link in opposite directions, as described.

480,093. BAND-SHELL FOR WHEEL-HUBS. HENRY HIGGIN, Newport, Ky. Filed Apr. 18, 1892. Serial No. 429,581. (No model.)

Claim.—1. As an article of manufacture, a shell for hub-bands, having an inturned flange adapted to take over the point of the hub-band and provided with an annular depression, substantially as and for the purpose specified.

2. As an article of manufacture, a shell for hub-bands, adapted to engage with the point of the hub-band provided with an annular

depression and having a corrugated or knurled portion between its outer end and the annular depression, substantially as and for the purpose specified.

3. The combination, with a hub-band having an annular groove, of a shell adapted to engage with the point of the band and provided with an annular depression adapted to take into the groove on the band, substantially as and for the purpose specified.

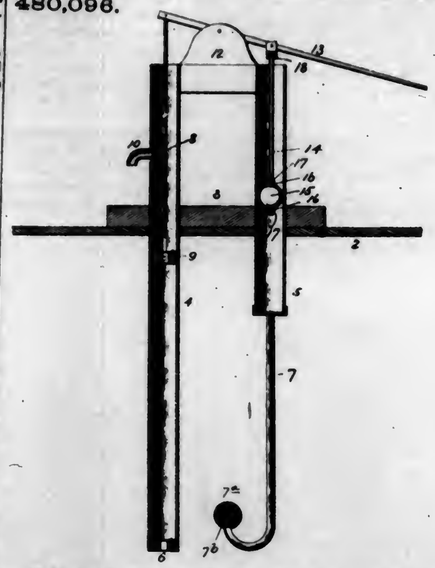
4. The combination, with the hub-band B, having groove *b'* and bead-ring *b²*, of the shell-band C, having flange *c* and depression *c'*, and adapted to abut against the bead-ring of the band, substantially as and for the purpose specified.

480,094. COMPOSITION FOR AND METHOD OF MAKING HEADS AND LIMBS OF DOLLS. SOLOMON D. HOFFMANN, Moscow, Russia. Filed Apr. 23, 1892. Serial No. 430,360. (No specimens.)

Claim.—1. The herein-described composition of matter, consisting of glue, glycerine, zinc oxide, and Japanese wax, in substantially the proportions set forth.

2. The herein-described method of producing the heads and the limbs of dolls, which consists in reducing glue, glycerine, zinc oxide, and Japanese wax to a liquid state, pouring the liquid into molds, smoothing the molded mask, dipping the mask in a bath of glue, glycerine, white zinc oxide, Japanese wax, and coloring-matter reduced to a thin liquid, and finally decorating the molded article and immersing it in its decorated state in a bath of collodion, as herein set forth.

480,095. DEMIJOHN-HOLDER. ERIC W. H. HOLME, Toronto, Canada. Filed Jan. 14, 1892. Serial No. 418,064. (No model.)



Claim.—1. A frame for the purpose described, comprising the side bars A, straight feet B, extending substantially at right angles from the bottom of said bars A completely under and forming a support for the demijohn, rockers D, and cross-bars E and F, substantially as described.

2. A frame for holding demijohns, comprising the side bars A, arch-shaped at top to fit over the top of the demijohn, straight feet B, extending at right angles from the bottom of said side bars completely under and supporting said demijohn, rockers D, and cross-bars E and F, all substantially as shown and described.

480,096. PURIFYING-PUMP. GEORGE W. HORN and JOHAN L. HORN, Farmington, assignors, by direct and mesne assignments, to William W. Norman, Delta, Mo. Filed Jan. 13, 1892. Serial No. 417,994. (No model.)

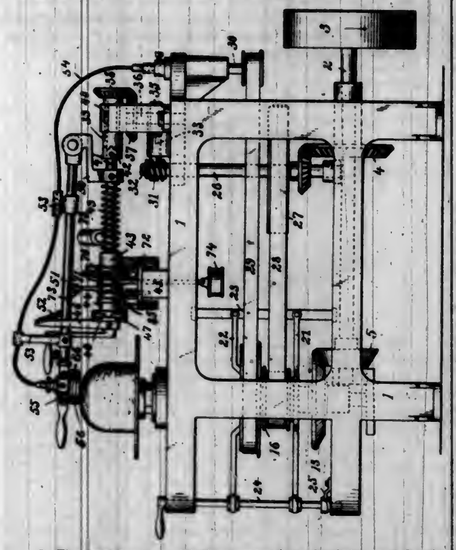
Claim.—1. In a pump of the character described, the combination, with the air-cylinder having a downwardly-extending pipe provided with a wire nozzle and a gravity-valve, of the plunger located in said cylinder provided with an aperture, the vertically-movable tube passing through said aperture, and having a nut or collar at its upper end, the cage connected with the pump-handle, provided with an aperture through which said rod loosely passes, the cross-piece, and valve, substantially as specified.

480,096.

2. In an air-cylinder, the combination, with the operating-handle and the cage connected therewith, having an aperture in its lower side, and a cross-piece and valve, of the vertically-movable tube passing loosely through said aperture and provided with a nut or collar, and the plunger having an aperture through which the lower end of said tube passes, substantially as described.

480,097. RUBBER SHOE. BERNHARD HOROVITZ, Stillwater, Minn. Filed Mar. 28, 1892. Serial No. 426,685. (No model.)

Claim.—The combination, with a low-cut rubber or overshoe having a bellows-like vamp or tongue-flap connecting the quarters of the shoe, of a snow-excluder consisting of a hem-like strip of flexible material secured water-tight at the mouth of the shoe with its edge projecting forward and provided with draw strings or cords passing outward and forward through eyes in the quarters of the shoe, whereby when the shoe is in position and the strings are drawn tight and tied the edge of said hem-like strip will be embedded in the socks of the wearer and the quarters will be secured over the bellows-like flap, making a water-tight and snow-tight joint, substantially as and for the purpose set forth.



480,098. MACHINE FOR POUNCING HATS. JOHN R. HOWE, Danbury, Conn. Filed May 7, 1891. Serial No. 391,892. (No model.)

Claim.—1. In a hat-pouncing machine, the combination, with the rotative hat-support, of the pouncer-lever, the pouncer connected therewith, a weight and connections interposed between it and the pouncer-lever, whereby the pouncer is forced against the hat, the notched disk and the hook engaging therewith, the gears 79 and 70, and means, as described, for disengaging the hook from the disk, the whole arranged and adapted to operate substantially as set forth.

2. The combination, with the pouncer-lever and the shaft whereby it is carried, of a clutch interposed between said shaft and a constantly-moving part of the machine, a spring for normally holding the shaft in engagement, and a pair of cams whereby the disengagement of the clutch is effected and the shaft stopped, substantially as and for the purpose set forth.

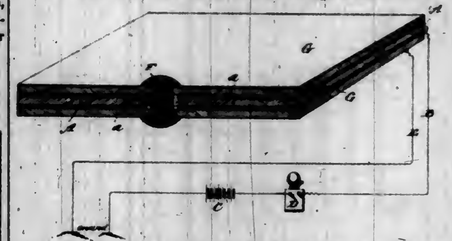
3. The combination, with the pouncer-lever having accommodation for a pouncer-head, of the feeding-shaft 41, a clutch for connecting said shaft to a constantly-moving portion of the machine, cams, as described, for disengaging said clutch, and a slotted crank embracing the pouncer-lever, whereby said lever will be moved over the surface of the hat, but may be thrown outward in the slot for purposes of disengagement.

4. The combination, with the pouncer-lever, of the feeding-shaft 41, the clutch whereby said shaft is connected with its motor part, the spring for engaging the clutch, the means for disengaging the clutch, the slotted crank carried by said shaft, the strap and weight mechanism for drawing the pouncer-head against the hat, and the spring for disengaging it therefrom, substantially as described.

5. The combination, with the pouncer-lever having a seat for the pouncer-head, of the bracket to which said lever is fulcrumed, the shaft to which the bracket is attached, means for starting and stopping the shaft, a slotted crank whereby the lever is carried with the shaft, a weight and strap for insuring the engagement of the pouncer, and a spring for effecting the disengagement of the pouncer, substantially as described.

6. The combination, with the pouncer-lever and the pouncer-head seated and adapted to revolve in said lever, of the feeding-shaft whereby said pouncer-lever is carried over the surface of the hat, the flexible shaft connected to and adapted to drive the pouncer-head, and driving means, as described, for the rotation of the flexible shaft, substantially as set forth.

7. The combination, with the pouncer-lever, its pouncer, and the feeding-shaft 41, of the double strap-wheel having the connected gear journaled on the feed-shaft, the straps and weights connected to the pouncer-lever, the rock-shaft 75, a disk 80, secured thereto, and a pin 81, secured to a gear connecting with the gear of the feed-shaft, and a weight borne by the shaft 75 and adapted to rotate the same, substantially as set forth.



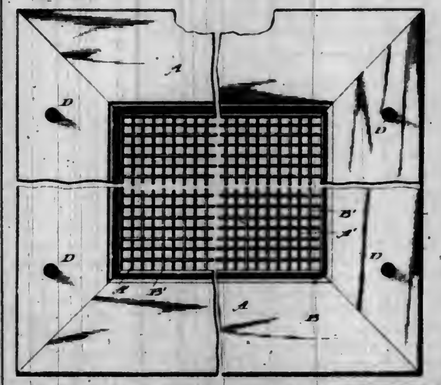
8. The combination, with the feeding-shaft, the strap-wheels and gear journaled thereon, and the straps and weight, of the rock-shaft journaled behind the feed-shaft and bearing the weight, the gear on said rock-shaft and engaging the gear on the feed-shaft, and the notched disk and the hooked lever engaging the latter, whereby the weight is held in its lifted position, and means for disengaging the rear shaft to permit the weight to act, substantially as specified.

9. The combination, with the hat-support, of the pouncer-head, the pouncer-lever, a handle connected to the end of the latter, said handle having a cut-out portion 67 to receive a swinging ring 68 and having a bearing for the pouncer-head, and a binding-screw 69 to clamp said ring in its desired position, substantially as described.

10. The combination, with the lathe-shaft, of the friction-disk and its hub splined to the lathe-shaft and provided with a clutch, the pulley 16, having two clutch-faces and journaled upon the lathe-shaft, a pulley 20, journaled above the pulley 16 and provided with a clutch-face, and levers connected to the disk-hub and the pulley 20, whereby engagement and disengagement of the several clutch-faces are effected, substantially in the manner hereinbefore specified.

11. The disk 13 upon the hub 12, splined to the lathe-shaft, and the pulley 20, adapted to drive the pouncer, in combination with levers whereby said parts 12 and 20 may be raised relative to the lathe-shaft, and an intermediate pulley journaled about the lathe-shaft and adapted for engagement either with the pulley 20 or the hub 12, substantially as set forth.

480,099. ELECTRIC JAIL-PLATE. WILLIAM S. HULL, Sheffield, Ala. Filed Dec. 8, 1891. Serial No. 414,405. (No model.)



Claim.—1. A compound plate for the purpose described, comprising two outer plates, an intermediate insulated plate, and a bolt or rivet electrically disconnected from the intermediate plate and binding said plates together, and electrical connections extending from one of the outer plates and from the intermediate plate to a battery and to an alarm, substantially as specified.

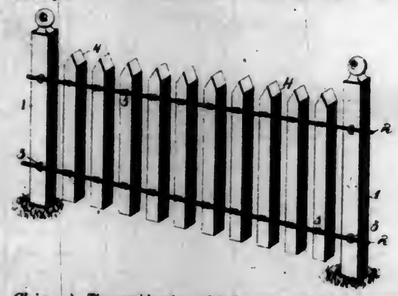
2. An electrical plate for the walls of jails, safes, vaults, &c., consisting of two outer plates, an intermediate insulated plate, and bolts or rivets binding the plates together, the holes in the intermediate plate being larger than those of the outer plates, substantially as specified.

3. A safe, jail, or vault wall comprising outer plates, an intermediate plate, an interposed mass of insulating material upon both sides of the intermediate plate, and means for binding the plates together, said means being electrically disconnected from one of said plates, as set forth.

4. A jail, safe, or vault wall consisting of a plurality of plies of metal plates, all intermediate plies being insulated from the adjacent plies throughout their entire surfaces, plate-binding devices mechanically separated from one intermediate ply, and electrical connections between intermediate plies, a battery, an alarm, the ground, and an outer ply, substantially as shown and described.

480,100. ELECTRIC SCREEN FOR DOORS OR WINDOWS. WILLIAM S. HULL, Sheffield, Ala. Filed Feb. 3, 1892. Serial No. 420,190. (No model.)

Claim.—1. A guard or screen consisting of two normally-separated screens supported to slide bodily toward and from each other, and a sounding device electrically connected with said screen, as set forth.

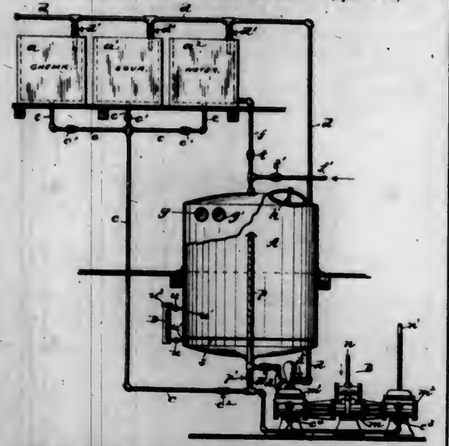


2. A guard or screen composed of two sections arranged face to face and normally separated and slidingly supported with interposed springs, and a sounding device and battery electrically connected with said section, as set forth.

3. A guard or screen composed of two sections arranged with the screenings face to face, normally separated and slidingly supported with interposed springs, combined with a sounding device and battery connected with the screening of said section, as set forth.

4. A screen or guard composed of two frames provided with screenings upon their adjacent faces, said screenings being alternately arranged as to their wires, the two frames being normally separated,

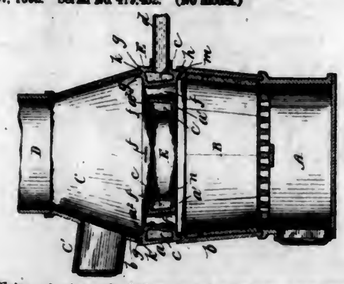
spring-held, and slidingly supported, combined with a sounding device and battery connected with the said screenings, substantially as described.



480,101. WIRE-AND-PICKET FENCE. BENJAMIN F. INGRAM, Bowling Green, Mo. Filed Mar. 15, 1892. Serial No. 425,041. (No model.)

Claim.—1. The combination, with the posts and the wires secured thereto, of the pickets and spring clamping devices rigidly secured to the pickets and adapted to be clamped upon said wire, said devices consisting of outwardly-convergent jaws having their free ends bent from each other, substantially as and for the purpose set forth.

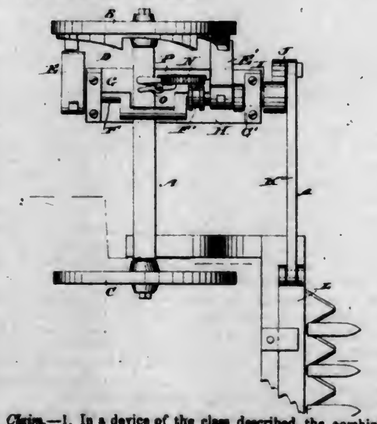
2. A fence consisting of posts 1, wires 2, secured to the same, pickets 4, adapted to be removably attached to the said wires at predetermined distances apart, clasps 5, secured to the said pickets and having jaws 6, the terminal ends of which project in an opposite direction, and a suitable device for securing the said clasps to the pickets, whereby any of the said pickets may be removed at any time and a new one fixed without in any way affecting or changing the said wires, substantially as described.



480,102. PROCESS OF BLEACHING. SAMUEL D. KEENE, Providence, R. I., assignor, by direct and mesne assignments, of three-fourths to Herbert H. Fenner, same place, Edward G. Blodgett, Edmund W. Orswell, Pawtucket, R. I., and the Holyoke Machine Company, Holyoke, Mass. Filed Aug. 23, 1889. Serial No. 321,778. (Specimens.)

Claim.—1. The process of bleaching or dyeing fibrous or porous materials or substances herein described, the same consisting in, first, placing the material or substance, in a dry condition, in a suitable keir; second, creating a vacuum within said keir; third, admitting the liquid bleaching or dyeing agent to the keir at atmospheric pressure, with the outlets to the keir closed; fourth, creating an artificial pressure much greater than that of the atmosphere upon the stationary body of liquid within the keir; fifth, removing said liquid agent from the keir, and, finally, repeating said second, third, fourth, and fifth steps in connection with the liquid agents to which the material or substance is subsequently subjected in the ordinary bleaching or dyeing process.

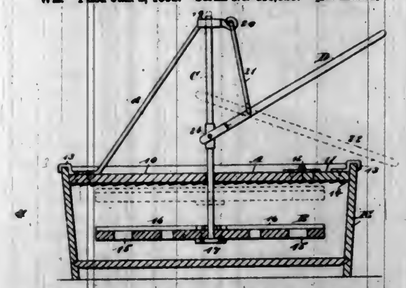
2. The process of bleaching fibrous or porous materials or substances herein described, the same consisting in, first, placing the material or substance, in a dry condition, within a keir; second, exhausting the air from the keir to form a vacuum; third, admitting the bleaching chemic to the keir at atmospheric pressure; fourth, creating a considerably-increased artificial pressure upon the stationary body of chemic within the keir; fifth, removing the chemic from the keir; sixth, repeating the second, third, fourth, and fifth steps in connection with the sour; seventh, repeating said second, third, fourth, and fifth steps in connection with the washing liquid, and, finally, removing the material or substance from the keir and drying the same.



480,103. COMBINED RADIATING AND HOT WATER OR AIR HEATING FURNACE. JOHN H. KEYSER, New York, N. Y. Filed Jan. 27, 1892. Serial No. 419,452. (No model.)

Claim.—1. An updraft furnace or heating-stove constructed with a flame or hot-gas expansion feed-door section C C', an updraft-section D, a lower fire-chamber section B, an ash-pit section A, and an intermediate hollow ring-section E, having tubular flame-flues through it in communication with the chambers C and D, said section serving for heating and distributing water or air, and the same being constructed with a water or air heating chamber and a central circular passage and arranged to overhang a fire-bed below it, so that the flame passes in contact with it and through its flues and central circular passage and therefrom into the chamber C and out at a draft-passage above, said hollow rim-section being applied between the feed-door section and the fire-chamber-section, and thus leaving the lower and upper portions of the furnace free to radiate heat, substantially as and for the purpose described.

2. The combination of the hollow intermediate water or air heating and distributing ring-section, the fire-bed and fire-chamber of greater diameter than the central circular passage of the ring-section, and the feed-door section having a base of greater diameter than the said circular passage of the hollow ring-section, whereby a furnace having an upper and lower radiating-surface and an intermediate water-heating portion is produced and the heat from the grate effectively brought in contact with said water-heating portion, substantially as described.



480,104. SICKLE-BAR MOVEMENT FOR MOWERS AND REAPERS. ALVIN W. LANPHERE, Indian Lake, N. Y. Filed Mar. 21, 1892. Serial No. 425,794. (No model.)

Claim.—1. In a device of the class described, the combination, with a toothed wheel, of a rock-shaft arranged parallel to the said toothed wheel, arms secured to the said rock-shaft and extending onto the teeth of the said wheel at opposite sides, the said arms being arranged at angles to each other, so as to be alternately engaged by the teeth of the said wheel, a sleeve fitted on the said shaft and arranged to turn with the latter and to permit a sliding motion of the shaft, and a crank-arm secured on the said sleeve and adapted to be connected with the sickle-bar, substantially as shown and described.

2. In a device of the class described, the combination, with a toothed wheel, of a rock-shaft arranged parallel to the said toothed wheel, arms secured to the said rock-shaft and extending onto the teeth of the said wheel at opposite sides, the said arms being arranged at angles to each other, so as to be alternately engaged by the teeth of the said wheel, a sleeve fitted on the said shaft and arranged to turn with the latter and to permit a sliding motion of the shaft, a crank-arm secured on the said sleeve and adapted to be connected with the sickle-bar, and means, substantially as described, for imparting a longitudinal sliding motion to the said shaft to throw the said arms into and out of mesh with the said toothed wheel, substantially as shown and described.

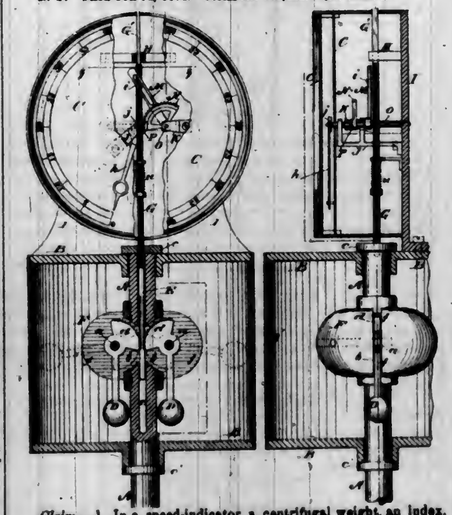
480,105. WASHING-MACHINE. FRANK A. LAPHAM, Waterford, Wis. Filed Jan. 2, 1892. Serial No. 416,825. (No model.)

Claim.—1. As an improved article of manufacture, a washing-machine adapted for attachment to a tub or like receptacle, the said machine consisting of a cover provided upon its under face with a ribbed or rubbing surface, a rubber located below the rubbing-surface of the cover, a shaft connected with the rubber and extending through the cover, a bearing for said shaft, and a lever whereby the shaft may be raised or lowered and revolved, substantially as and for the purpose specified.

2. In a washing-machine, the combination, with an upper plate or cover provided upon its inner face with a ribbed or rubbing surface, and arms projected upward from the plate or cover and connected at their upper ends, of a rubber located beneath the rubbing-surface of the plate or cover, a shaft attached to the rubber and journaled in the upper connecting medium of the arms, a lever connected with the shaft, and a link connection between the lever and the connecting medium of the arms, whereby the shaft may be raised or lowered, and consequently the rubber, or whereby the shaft may be rocked or rotated, substantially as and for the purpose set forth.

3. The combination, with a receptacle, of a cover adapted to close the upper portion thereof and constructed in hinged sections, brackets supporting the cover in position, the said cover being provided upon its upper face with a ribbed or rubbing surface, and arms projected upward from the cover attached thereto and connected at their upper ends by a plate or block, of a rubber, of substantially disk shape, located beneath the rubbing-surface of the cover, the said rubber being provided with apertures extending through from top to bottom and ribs upon its upper face, a shaft connected with the rubber, passing loosely through the cover and journaled in the connecting medium of the cover-arms, a lever having a pivotal connection with the shaft, and a link connecting the lever with the connecting medium of the cover-arms, substantially as shown and described, whereby the rubber may be raised or lowered and rocked within the receptacle in engagement with the rubbing-surface of the cover or below said surface, as and for the purpose specified.

480,106. SIGN-LETTER. LOUIS LEVETT, New York, N. Y. Filed Nov. 20, 1891. Serial No. 412,522. (No model.)



Claim.—1. A window-sign letter comprising separable parts, some of which are provided with suitable fastenings for attachment to glass plates or other objects, which parts are adapted to receive and hold the remaining parts of the letter, the several parts when joined and combined together forming a complete letter, as set forth.

2. In a device of the class described, the combination, with a glass plate or equivalent object, of a window-sign letter adapted to be carried by the said glass plate and composed of separable parts, some of which are provided with suitable fastenings for attachment to the said plate, which parts are adapted to receive and hold the remaining part or parts of the letter, the several parts when joined and combined together forming the complete letter, as set forth.

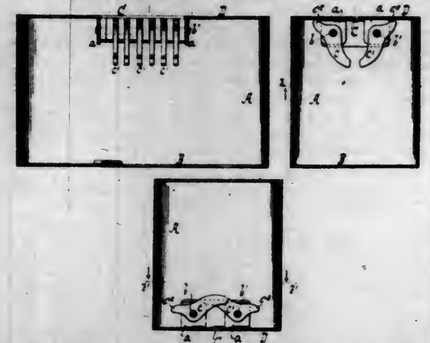
3. As a new article of manufacture, a sign-letter comprising a body portion and a support for holding and securing a letter to an object and forming a part of the letter, as specified.

480,107. SPEED-INDICATOR. ISAAC H. LEWIS, Fort Schuyler, N. Y. Filed Oct. 31, 1891. Serial No. 410,422. (No model.)

Claim.—1. In a speed-indicator, a centrifugal weight, an index, and means for imparting uniform motion to the index from the variable motion of the weight, consisting in a pivoted arm through which motion is transmitted at a radius which varies with the speed.

2. In a centrifugal speed-indicator, the combination of a rotary shaft, centrifugally-actuated weighted arms thereon, a linearly-operated indicator-spindle controlled by the said arms, a dial index-hand, and an index-arm for operating the same, fulcrumed aside from the line of movement of said indicator-spindle, having connection therewith at radial distances from its said fulcrum, which vary with the speed; substantially as and for the purposes described.

3. The combination, in a centrifugal speed-indicator, of a revolving shaft, centrifugal weights pivoted thereon bearing toothed segments, a toothed rack tangentially engaging with said segments, a non-rotary indicator-spindle supported on the said rack, a speed-indicating dial, and an index thereon operated by the said spindle.



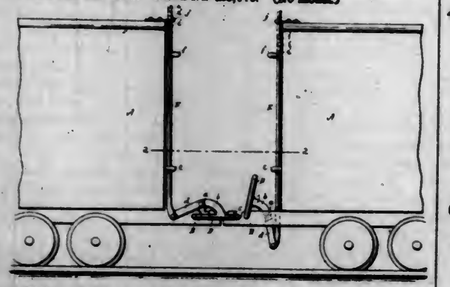
4. The combination, in a centrifugal speed-indicator, of a rotary shaft, centrifugal weights pivotally suspended thereon, toothed segments attached to the weights, a rack in the axis of the shaft engaging tangentially with said segments, and an index operated by the rack.

5. In a centrifugal speed-indicator, the combination, with a rotary shaft, centrifugally-actuated weighted arms suspended thereon, a toothed index-operating rack, and toothed segments, engaging tangentially therewith, fixed to the said weighted arms, of an index-arm pivoted aside from the line of movement of the said rack or an extension thereof, such as the spindle G, and a projecting pin upon the said rack or its extension engaging with said arm at variable distances from its pivot, substantially as and for the purposes described.

6. The combination, in a centrifugal speed-indicator, of a rotary shaft or equivalent, weights pivoted thereon having centrifugally-in-

parted angular motion, an indicator-spindle operated longitudinally by said angular motion, a dial having approximately equal subdivisions representing rates of speed, a slotted index-arm pivoted aside from the spindle, a pin in the latter engaging with the slotted arm at variable distances from its pivot, a toothed segment on the axis of the arm, and an index-hand for the dial and pinion thereon engaged with by the said toothed segment.

480,108. SLOT-PROTECTOR FOR MONEY-SAFES. JOSEPH LOCH, Brooklyn, N. Y. Filed Apr. 7, 1892. Serial No. 428,172. (No model.)

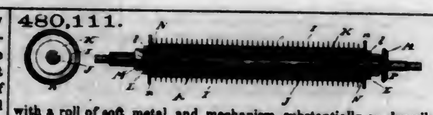


Claim.—The combination, with a toy money-box having its top wall provided with a coin-slot and having on its inside a series of pendent lugs *a*, of the pins *b b'*, carried by the lugs, and the sets of fingers *c c'*, mounted intermediate their extremities on the pins and formed at their outer ends with the toe-pieces c^2 c^2, which bear against the inside of the top wall when the latter is uppermost, substantially as and for the purposes described.

480,109. PROCESS OF RECOVERING SULPHUR, CARBONATE OF SODA, AND IRON OXIDE. GEORGE LUNGE, Zurich, Switzerland, and JAMES DEWAR, Cambridge, England. Filed Dec. 19, 1891. Serial No. 415,660. (No specimens.) Patented in England May 9, 1891, No. 8,018; in France Dec. 5, 1891, No. 217,871, and in Belgium Dec. 8, 1891, No. 97,497.

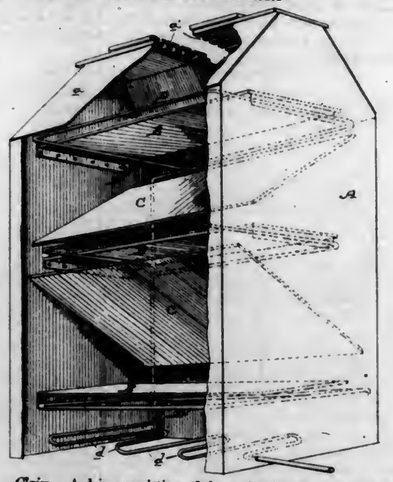
Claim.—The herein-described process of recovering sulphur, carbonate of soda, and iron oxide from the residue obtained by decomposing sodium sulphide with a ferrite, which consists in acting on the said residue in a moist condition with a suitable mixture of carbonic acid and oxygen.

480,110. CAR-COUPLING. JOHN B. MAINES, Providence, R. I. Filed Mar. 16, 1892. Serial No. 425,170. (No model.)



Claim.—In a car-coupling, the combination, with the hook-bar B, of the coupling-link D, provided with the arm *b*, the connecting-link *d*, the operating-rod E, provided with the pins *i i* and the handle *g*, the elongated guide-eye *f*, and the hook-rest *j*, adapted to engage with the pins *i i*, substantially as described.

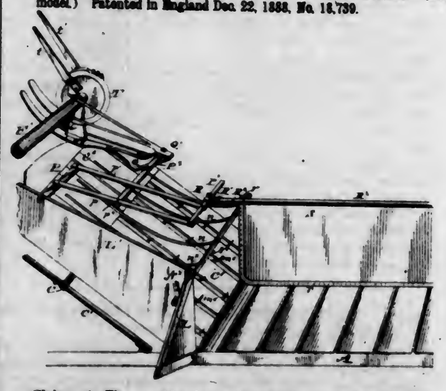
480,111. MACHINE FOR CUTTING AND TRIMMING PAPER. JOHN J. MANNING, New York, N. Y. Filed July 22, 1891. Serial No. 400,366. (No model.)



Claim.—1. The combination of the pair of supporting-cylinders, the winding spool-shaft for the roll of paper to be wound upon, the movable segment overlapping one of the supporting-cylinders and provided with a roll of soft metal, and mechanism, substantially as described, for moving the segment and roll back and forth.

2. The combination, with the revolving cutter-shaft, of the circular cutters, the washers or fillings between the same, the end collars, clamping-nuts, and flanged guide wheels or idlers running loosely on the end collars, substantially as described.

480,111.



480,112. DRIER. STEPHEN A. MERRIMAN, Santa Clara, Cal. Filed Oct. 2, 1891. Serial No. 407,562. (No model.)

Claim.—A drier consisting of the casing having an air-regulator at its top, the horizontal separated trays supported at different heights within said casing, a deflector-plate located between adjacent trays, adjacent plates being oppositely inclined and having their edges extending beyond vertical planes of the edges of the trays and terminating short of the walls of the casing, the steam-pipe entering the upper portion of the casing under the uppermost tray and extending around under each tray, and a coil formed in said pipe in the bottom of the casing, substantially as herein described.

480,118. GRAIN-BINDING HARVESTER. LEWIS MILLER, Akron, Ohio. Original application filed Apr. 30, 1886, Serial No. 200,754. Divided and this application filed Apr. 2, 1889. Serial No. 305,753. (No model.) Patented in England Dec. 22, 1888, No. 18,739.

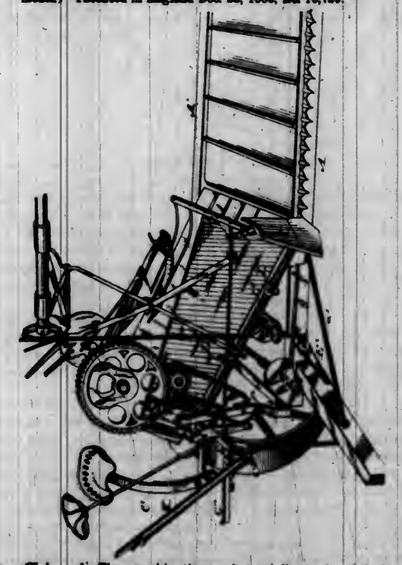
Claim.—1. The combination, substantially as hereinbefore set forth, of a fender or guide-board, a bar secured thereto, parallel links pivoted thereon and extending toward the grain-platform, a cross-bar pivoted on the opposite ends of these links, a wind-board supported on this bar, an adjustable breast-plate, binder-head, or knotter-shield, and an intermediate bar supported on the binder-head and pivoted to one of the links, whereby the adjustment of the binder-head imparts a greater range of adjustment to the wind-board.

2. The combination, substantially as hereinbefore set forth, of a platform-carrier, an inclined slotted elevating binder-table, pickers or gatherers working therethrough, a breast-plate, a wind-board, and flexible supporting connections interposed between the breast-plate and wind-board and overhanging the pickers and elevator.

3. The combination, substantially as hereinbefore set forth, of the fender or guide-board, the rearwardly-projecting rock-shaft mounted therein, and the elastic floating fingers carried thereby, under which the grain passes on its way to the binder.

4. The combination, substantially as hereinbefore set forth, of an intermediately horizontally divided sectional elevating binder-table, a rock-shaft overhanging the fixed section, and elastic floating fingers carried thereby, overlying both sections of the table.

5. The combination, substantially as hereinbefore set forth, of the fender, the rock-shaft of the float, turning in bearings therein, the crank-arm actuating the binder-shaft, and the connecting-rod uniting them.



6. The combination, substantially as hereinbefore set forth, of the binder-arm crank, the rock-shaft of the float, the divided connecting-rod uniting them, the intermediate crank-arm therein, and the rock-shaft carrying the cut-off fingers actuated by said crank-arm.

7. The combination, substantially as hereinbefore set forth, of the binder-frame, the slotted lower fixed portion or section of the horizontally intermediately divided binder-table, its upper movable portion, the rock-shaft journaled therein, and the cut-off fingers carried by said shaft, over which fingers the grain passes.

8. The combination, substantially as hereinbefore set forth, of a binder-frame, a binder-gear standard adjustable therein, a slotted horizontally-divided sectional binder-table, the upper portion of which is adjustable with the binder-gear standard, a rock-shaft journaled in said upper portion, cut-off fingers on said shaft, a vibrating binder arm or needle, and a link directly connecting the binder-arm and cut-off to vibrate them in unison.

9. The combination, substantially as hereinbefore set forth, of a carrier-platform, a slotted divided binder-table, pickers gathering and elevating the grain, elastic floating fingers pressing upon the grain in its upward passage, cut off fingers temporarily arresting the flow of the grain, packers consolidating the grain while thus arrested, and a binder-arm encircling the bundle with band material at the proper moment.

480,114. GRAIN-BINDING HARVESTER. LEWIS MILLER, Akron, Ohio. Original application filed Apr. 30, 1886, Serial No. 200,754. Divided and this application filed Apr. 2, 1889. Serial No. 305,754. (No model.) Patented in England Dec. 22, 1888, No. 18,739.

Claim.—1. The combination, substantially as hereinbefore set forth, of the transverse sills, the longitudinal frame-bars, the connecting corner-pieces, the standards mounted, respectively, on the inner, front, and rear corner-pieces, the longitudinal supporting-bar or upper binder-frame tube of the binder-gear frame mounted thereon, and the inclined transverse bracing binder-frame tubes respectively connecting the front and rear sills directly with the longitudinal supporting-bar.

2. The combination, substantially as hereinbefore set forth, of the transverse sills, the longitudinal frame-bars, the connecting corner-pieces, the diagonal braces connecting the sills and rear corner-pieces, the box-bracket on the front sill at the point of intersection of the braces, the standards on the inner corner-pieces, the longitudinal supporting-bar or upper frame-tube supported by said standards, and the inclined transverse bracing-frame bar or bars respectively connecting the front and rear sills with the longitudinal supporting-bar.

3. The combination, substantially as hereinbefore set forth, of the transverse sills, the longitudinal frame-bars, the connecting corner-pieces, the standards thereon, the longitudinal supporting-bar or upper frame-tube mounted thereon and extending beyond its forward supporting-standard, the forward inclined transverse frame-bar connecting the front sill and longitudinal supporting-bars and extending beyond the forward supporting-standard, the inclined brace C', connecting the forward end of the upper longitudinal frame-tube and the outer end of the forward inclined transverse frame-bar, and the driver's-seat-supporting standard carried by said brace.

4. The combination, substantially as hereinbefore set forth, of the transverse sills, the inner longitudinal frame-bar, the connecting corner-pieces, the standards mounted on the inner corner-pieces, the forwardly-extended longitudinal supporting frame-tube mounted on said standards, the forward inclined bracing binder-frame bar extending outward beyond the intersecting longitudinal frame-tube, the inclined brace connecting the projecting ends of these tubes, and the driver's-seat-supporting standard and the driver's foot-board both mounted on the brace so as to bring them above, in front, and outside of the longitudinal plane of the driving-wheel.

5. The combination, substantially as hereinbefore set forth, of the transverse sills, the longitudinal frame-bars, the corner-pieces, the standards, the upper longitudinal frame-tube, the inclined transverse forward binder-frame tube, the inclined brace connecting the projecting ends of these tubes, the rack thereon, the adjusting-lever, and the link connecting the lever and tongue.

6. The combination, substantially as hereinbefore set forth, of the transverse sills, the longitudinal frame-bars, the connecting corner-pieces, the standards, the longitudinal frame-tube, the forward transverse inclined intersecting bracing binder-frame tube, the brace connecting the projecting ends of these tubes, the rack and adjusting-lever thereon, the tongue pivoted on the frame, the box-bracket on the front sill, the pivoted draft-rod connecting the box-bracket and tongue, and the link connecting the tongue and adjusting-lever.

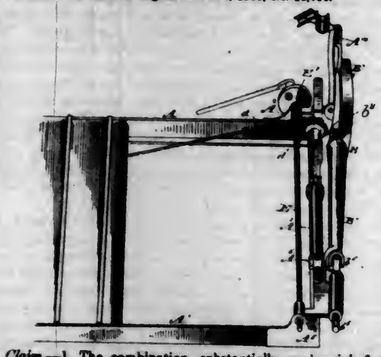
7. The combination, substantially as hereinbefore set forth, of the front sill, the box-bracket thereon, the forward inclined transverse bracing binder-frame tube, the longitudinal supporting-frame tube intersecting it, the deflector, and the fender or guide-board secured to the box-bracket, and inclined transverse binder-frame tube.

8. An angular box-bracket constructed substantially as hereinbefore set forth, secured to the front transverse frame-bar or sill near the heel end of the cutting apparatus and constituting a guard and guide for the heel end of the knife and the pitman, a support for the inner shoe and grain guard or deflector, a point of attachment for the draft-rod connected with the tongue, and a support for the front bar of the binder-frame.

9. A corner-piece constructed substantially as hereinbefore set forth, secured to the inner front corner of the frame and constituting a support for the inner longitudinal and front transverse frame-bars, the binder-frame, the axle support, binder-gear standard, gearing, adjusting devices, shafts, and tongue-plate.

10. The inner rear corner-piece constructed substantially as hereinbefore set forth, constituting a support for the inner longitudinal and rear transverse frame-bars, binder-frame, axle-support, shafts, and gearing.

11. The combination, substantially as hereinbefore set forth, of the transverse sills, the inner longitudinal frame bar or tube, the interposed socketed angular corner-pieces, the crank-shaft journaled therein, and standards mounted thereon supporting the longitudinal binder-frame support on which the binder-gear standard is adjustable.



12. The combination, substantially as hereinbefore set forth, of the combined main and binder frame, the inclined brace-bar C', and the driver's seat and the tilting lever mounted thereon.

13. The combination, substantially as hereinbefore set forth, of the platform-frame, the binder-frame, a binder-gear standard adjustable therein, the inclined transverse brace-bar C' and a lever mounted on said bar, a tongue hinged to the platform-frame, and a link connecting the tongue and lever to tilt or rock the machine on its supporting-wheels.

14. The combination, substantially as hereinbefore set forth, of the front sill, a shoe thereon which supports the inside deflector or

nose-piece and the butt guide-board, and a transverse inclined bracing frame-tube, the lower end of which is attached to the shoe, while the upper end is connected with the upright standard which supports the upper longitudinal binder-frame tube near its point of intersection with said transverse inclined bracing frame-tube.

480,115. GRAIN-BINDING HARVESTER. LEWIS MILLER, Akron, Ohio. Original application filed Apr. 30, 1886, Serial No. 200,754. Divided and this application filed Apr. 3, 1889. Serial No. 305,756. (No model.) Patented in England Dec. 22, 1888, No. 18,739.

Claim.—1. The combination, substantially as hereinbefore set forth, of the platform-frame, its inner rear corner-bracket, the sleeve-bearing thereon, the driving-wheel, its tubular arm or support interposed between the wheel and frame, the joint connecting said arm and sleeve-bearing, the two-part counter-shaft, its universal joint, the bevel-pinion B^3 on the counter shaft, and the bevel-wheel B^4 on the driving-wheel, and the adjustable connection between the frame and the free end of the supporting-arm.

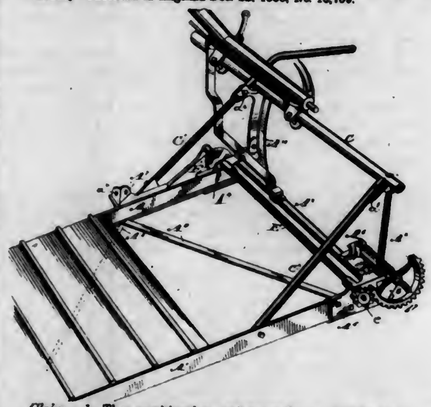
2. The combination, substantially as hereinbefore set forth, of the platform-frame, its inner corner-bracket, the sleeve-bearing thereon, the driving-wheel, the tubular arm or support on which it is mounted, interposed between the driving-wheel and the platform-frame, the joint connecting said arm and frame, the vertically-expanded plate or extension of the supporting-arm, the driving-wheel axle secured thereto, the adjustable connection between the frame and the free end of this plate, the jointed counter-shaft inclosed by the axle-support, and its driving-gears.

3. The combination, substantially as hereinbefore set forth, of the platform-frame, the fixed bearing-sleeve on the inner rear corner thereof, the axle-supporting arm jointed thereto, its vertically-expanded plate, the axle and gear-shield connected therewith, the driving-wheel or bevel-gear-wheel carried thereby, and the bevel-pinion on the jointed counter-shaft, the secondary shaft driven by said bevel-wheel, and the adjustable connection uniting the free end of the axle-support with the frame.

4. The combination, substantially as hereinbefore set forth, of the platform-frame, the fixed bearing on the inner rear corner thereof, the axle-supporting arm pivoted thereto, the expanded plate forming a guide-flange as well as a support for the driving-wheel axle, a standard on the inner front corner of the platform-frame in which said guide-flange traverses, and adjusting-gear on the guide-flange, actuating corresponding mechanism on the axle-support to vary its relation to the main frame.

5. The combination, substantially as hereinbefore set forth, of the platform-frame, the fixed bearing on the inner rear corner thereof, the axle-supporting arm pivoted thereto, the driving-wheel outside both of said arm and frame, the jointed secondary or counter shaft, the movable portion of which has bearings in the axle-supporting arm, and the gear on the driving-wheel, meshing with a pinion on said shaft.

6. The combination, substantially as hereinbefore set forth, of the platform-frame, the jointed tumbling shaft mounted on the inner rear corner thereof, the driving-wheel, its axle-supporting arm inclosing said shaft and pivoted to the frame at a point where the sections of the jointed tumbling shaft are connected, and the adjustable connection of its free end with the frame in advance of the driving-wheel.



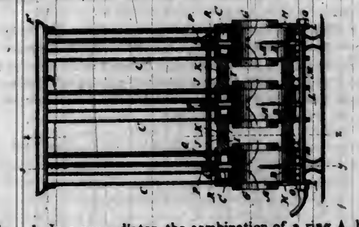
7. The combination, substantially as hereinbefore set forth, of the transverse sills, the inner longitudinal frame bar or tube, the interposed front and rear inner or stubble side corner-pieces, the fixed bearing-sleeve for the pinion-shaft or counter-shaft, mounted on the inner rear corner-piece, the tubular arm or axle-support, the joint connecting the fixed bearing-sleeve and tubular arm, the vertically-expanded or plate-shaped extension of the jointed arm, the driving wheel axle projecting outwardly therefrom, the standard on the inner front corner-piece, its guide-flange, the front edge of the axle-support working in the guide-flange, its rack, and the worm-gear mounted on the corner-piece and actuating the rack to adjust the axle relatively to the frame.

8. The combination, substantially as hereinbefore set forth, of the transverse sills, the inner longitudinal frame-bar, the connecting corner-pieces, the driving-wheel-axle support pivoted on the inner rear corner-piece, the guide-flange in which its free end traverses, the adjusting-gearing mounted on the inner front corner-piece, the pulley on the longitudinal frame-bar, and the lifting cord or chain passing from the axle-support over this pulley to the grain-wheel arm to adjust both ends of the frame simultaneously.

9. The combination, substantially as hereinbefore set forth, of the transverse sills, the longitudinal frame-bars, the connecting corner-pieces, the grain-wheel-supporting arm pivoted to a standard on the outer divider, a rear depending bracket on the frame, the pulley thereon, a loose pulley on the inner or stubble side supporting-bar, the driving-wheel, its axle-support hinged to a sleeve-bearing on the rear inner corner piece or bracket, the adjusting mechanism of the axle-support, and a chain or cord passing from the grain-wheel-supporting arm under its pulley, across the frame, and over the stubble-side pulley to the axle-support, so that both ends of the machine may be adjusted simultaneously.

10. The combination, substantially as hereinbefore set forth, of the platform-frame, the grain-guard board secured thereon, the grain-wheel-supporting arm pivoted to the front sill or finger beam, its expanded rear end, the sector rack thereon, the bracket on the grain-guard, the worm carried thereby meshing with the sector-rack, and the jointed handle which actuates and locks the worm in position to adjust and hold the grain-wheel in proper relation to the frame.

480,116. GRAIN-BINDING HARVESTER. LEWIS MILLER, Akron, Ohio. Original application filed Apr. 30, 1886, Serial No. 200,754. Divided and this application filed Apr. 3, 1889. Serial No. 305,756. (No model.) Patented in England Dec. 22, 1888, No. 18,739.



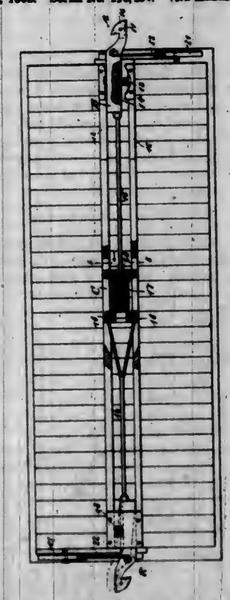
Claim.—1. The combination, substantially as hereinbefore set forth, of the front and rear transverse angle-iron frame bars or sills, the longitudinal frame-tubes, the interposed socketed angular braces or corner-pieces connecting these longitudinal tubes and transverse frame-bars, a brace extending diagonally backward from the front transverse frame bar or sill to the rear inner drive-wheel or stubble-side corner-piece, and a second diagonal brace extending diagonally backward from the front sill to the rear divider or grain-side corner-piece to give additional stiffness to the frame.

2. The combination, substantially as hereinbefore set forth, of the front transverse frame bar or sill, the inner longitudinal frame-tube, their connecting corner-piece, the tongue hinged directly thereto, the angular box-bracket on the front sill, and the draft-rod connecting the box-bracket and tongue.

3. The combination, substantially as hereinbefore set forth, of the transverse sills, the diagonal braces converging from the ends of the rear sills and intersecting at the front sill, the tongue, and the draft-rod connecting the front sill and tongue at the intersection of the braces.

4. The combination, substantially as hereinbefore set forth, of the front and rear sills, the longitudinal frame-bars, the shoe, a tongue-brace attached to or near said shoe, diagonal braces extending, respectively, from the front sill near the shoe to the outer and inner ends of the rear sill, and an inclined transverse bracing frame-bar forming one bar of the support for the binder-gear standard, both the diagonal braces and transverse frame-bar rigidly bracing the machine at the point of its heaviest strain from the draft.

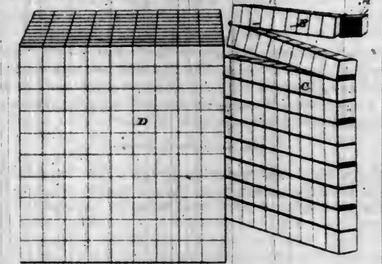
480,117. GAS-RADIATOR. WILLIAM J. MULLEN, New York, N. Y. Filed Feb. 4, 1892. Serial No. 420,334. (No model.)



Claim.—1. In a gas-radiator, the combination of a ring A, having opposite side openings G communicating with the external atmosphere, the flues C, rising from the uppermost side of the ring, a gas-burner B, located in the ring, and a gas-supply pipe M, connected with the gas-burner, substantially as described.

2. In a gas-radiator, the combination of a series of rings A, each having opposite side openings G, which are in communication with the external atmosphere, devices for detachably connecting the rings, a pair of flues C, rising from the uppermost side of each ring, a gas-burner projecting into each ring, and a gas-supply pipe M, connected with the gas-burners, substantially as described.

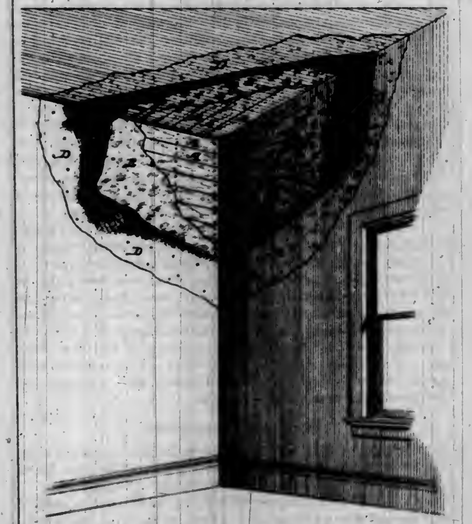
3. In a gas-radiator, the combination of a series of rings A, each formed with a grooved boss I and having opposite side openings G, communicating with the external atmosphere, the keys K, engaging the grooved bosses, a pair of flues C, rising from the uppermost side of each ring, a perforated diaphragm extending over the upper open ends of all the flues, a perforated cap surmounting the tubes and diaphragm, devices for detachably connecting the rings, a gas-burner projecting into each ring, and a gas-supply pipe connected with the gas-burners, substantially as described.



480,118. CAR-COUPLING. ROBERT L. MURDOCH, Silver City, N. Mex. Filed Jan. 18, 1892. Serial No. 418,457. (No model.)

Claim.—1. In a car-coupler, the combination, with parallel slotted guides and the cylinder 17 therebetween, provided with lugs 18 18 at opposite sides of its ends, sliding in said slots, and the spiral spring within the cylinder, of the sliding draw-heads, a rod extending from one draw-head through the closed end of the cylinder and through the spring and there provided with a head or cross-piece, and a rod connecting the other draw-head with the opposite end of the cylinder, substantially as set forth.

2. In a car-coupler, the combination, with the longitudinal parallel beams 12 12, slotted midway of their ends, a cylinder 17, having lugs 18 sliding in said slots, and a spiral spring within the cylinder, of the draw-heads mounted to slide longitudinally and laterally between the outer ends of the beams, a spring between each draw-head and one beam to hold said draw-head against the opposite beam, a rod 15, extending from one draw-head through the closed end of the cylinder, through the spring therein and provided with a head bearing on the spring, and a rod 16, connecting the other draw-head with the opposite end of the cylinder, substantially as set forth.



480,119. METRIC MODEL. JAMES MCCOURT, Salem, Oreg. Filed May 4, 1891. Serial No. 391,563. (No model.)

Claim.—1. A metric model composed of a cube of suitable material having a separable one-tenth part on one side, said part being divided into tenths and one of said tenths having a separable cube forming a one-tenth part of it, substantially as herein described.

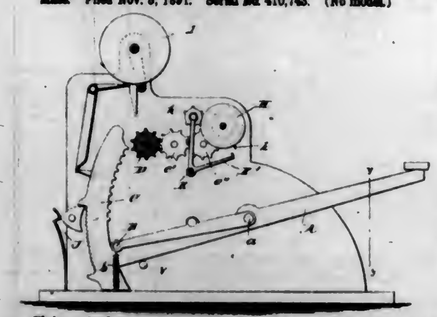
2. A metric model composed of a cube of suitable material having a separable one-tenth part on one side thereof, said part being divided into ten equal strips hinged together and one of said strips having divided from and hinged to its end a cube forming a one-tenth part of said strip, substantially as herein described.

480,120. WALL OR CEILING COVERING. JOHN P. MCMURRAY, San Francisco, Cal. Filed Oct. 9, 1891. Serial No. 408,262. (No model.)

Claim.—The improved wall or ceiling covering consisting of a continuous surface of boards, a thin adhesive plaster coat spread upon the board surface, a continuous coating of burlaps pressed and rubbed into the adhesive first coat, and one or more overlying subsequent coats of adhesive plaster applied thereto, substantially as herein described.

480,121. DENTAL DISK-CARRIER. MATHEW S. NICHOLS, Central Village, Conn. Filed June 26, 1891. Serial No. 397,484. (No model.)

Claim.—1. In a dental disk-carrier, the combination, with a shank or body of the carrier, of a head hinged to the outer end thereof, a clamp movable upon said shank or body at the rear of the head, and



means for operating the clamp, essentially as and for the purpose specified.

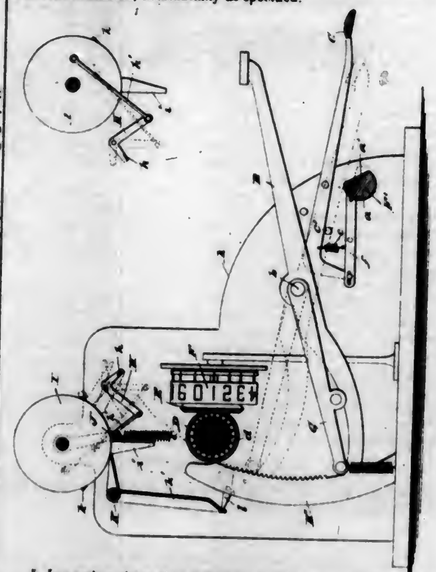
2. The combination, with the shank or body of the carrier having a flattened outer end portion, of a head hinged to said outer end portion capable of being turned parallel with or at a right angle to said shank, a slotted sliding clamping sleeve receiving said flattened shank portion within or through it, and means for locking or holding the sleeve when adjusted outward, essentially as specified.

3. An implement of the character described, consisting in the shank A, having a threaded portion *f* and a flat outer end *b*, the head B, pivoted at its under side to the outer extremity of the end *b*, as shown at *c*, a slotted sleeve C, sliding on the end *b*, and a nut *e*, working on the threaded part *f*, substantially as set forth.

480,122. CASH REGISTER AND INDICATOR. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 3, 1891. Serial No. 410,745. (No model.)

Claim.—1. In a cash-register and accounting-machine, the combination, with the key-levers and their arc racks having, respectively, teeth corresponding in number to the required action of the key and the fluted shaft or roller operated upon by said teeth and having thereon a loose toothed wheel connected thereto by a pawl and ratchet so arranged that said wheel is carried with the shaft during the forward movement of the latter, but is held stationary during its backward movement of the series of adding-wheels arranged upon a shaft parallel with said fluted roll and alongside thereof, the pinion thereon, the carrying devices, and the idler-wheels for transmitting the movement of said shaft to the adding-wheel shaft, substantially as specified.

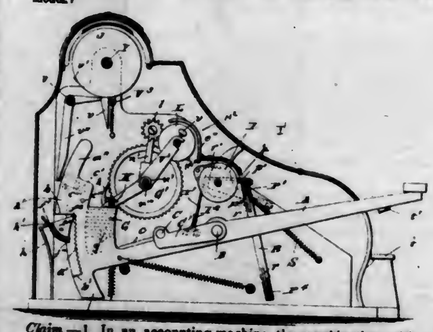
2. In a cash-register and accounting-machine having a fluted shaft or roll acted upon by an arc rack on the key-levers and carrying a pinion loosely thereon and connected thereto by a pawl-and-ratchet device so arranged that said wheel is revolved with the shaft during its forward movement, but permits the shaft to turn loosely thereon during its backward movement, the combination therewith of the adding-wheels arranged side by side upon a shaft and alongside thereof parallel with said fluted shaft, the idler-wheels in gear with said loose wheel and with the pinion of the first adding-wheel, and the series of carrying-pinions for the adding-wheels, said pinions being journaled on a movable frame, substantially as specified.



480,123. CASH REGISTER AND INDICATOR. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 4, 1891. Serial No. 410,866. (No model.)

Claim.—1. In a cash-register, the combination, with a series of keys marked with multiples of ten, a five-cent-key lever, and an independent bail or key lever representing five cents, common to all said keys and adapted to be operated in connection therewith, of a series of adding-wheels, connecting mechanism, and an adjustable stop-bar having stop-bearings of varying radial distances from the axis of said stop-bar, substantially as specified.

2. In a cash-register, the combination, with a series of keys marked with multiples of ten, and a five-cent-key lever, all in connection with adding mechanism, of an additional five-cent bail or key lever, an adjustable stop-bar having stop-bearings of varying radial distances from its axis, and a series of indicators, substantially as specified.



3. In a cash-register, the combination, with a series of keys marked with multiples of ten, and a five-cent-key lever, of an additional five-cent bail or key lever, an adjustable stop-bar having stop-bearings of varying radial distances from its axis, a series of indicators marked with multiples of ten, and two five-cent indicators, substantially as specified.

4. In a cash-register, the combination, with a series of keys marked with multiples of ten, and a five-cent-key lever, all in connection with adding mechanism, of an additional five-cent bail or key lever, an adjustable stop-bar having stop-bearings of varying radial distances from its axis, a series of indicators marked with multiples of ten, and two five-cent indicators, substantially as specified.

5. In a cash-register, the combination, with a series of keys marked with multiples of ten and a five-cent lever, all in connection with adding mechanism, of an additional five-cent bail or key lever, an adjustable stop-bar having stop-bearings at varying radial distances from its axis, the series of indicators operated each by its respective key, and the independent indicator arranged to be operated in common by all the keys, and the necessary releasing and actuating mechanism for said indicators, substantially as specified.

480,124. CASH REGISTER, INDICATOR, AND CHECK-PRINTER. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 5, 1891. Serial No. 410,964. (No model.)

Claim.—1. In an accounting-machine, the combination, with a series of key-levers, each having an arc ratchet and a trip at each end of said ratchet, and an upwardly-extending spring-actuated forked pawl, of a continuous triangular pawl and a series of springs acting, respectively, upon said pawl, a series of numbered multiplying-wheels and their connections, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

2. In an accounting-machine, the combination, with a series of key-levers, each having an upwardly-extending spring-actuated pawl and an arc ratchet provided with a trip at each extremity of said ratchet, of a continuous triangular pawl having a double-acting spring engaging its apex, numbered multiplying-wheels and their connections, a stop-bar for limiting the downward stroke common to all said key-levers, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a trip to disengage the same, substantially as specified.

3. In an accounting-machine, the combination, with a series of key levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet provided with a trip at each extremity, of a continuous triangular pawl, double-acting springs therefor, a series of sets of numbered multiplying-wheels and their connections, a spring-actuated bar common to all and engaging all said key-levers for bringing the same back to their normal position, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a trip to disengage the same, and a returning device, substantially as specified.

4. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a continuous triangular pawl having a double-acting spring engaging its apex, a series of sets of numbered multiplying-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting-arm at each end, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, and a returning device, substantially as specified.

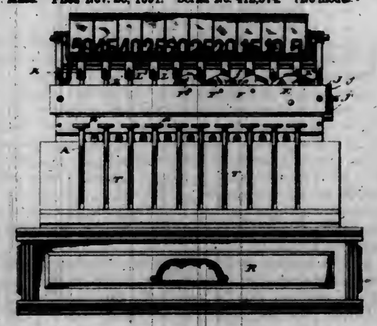
5. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a continuous triangular pawl, a series of double-acting springs engaging the same, a series of sets of numbered multiplying-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting-arm at each end, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

6. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a continuous triangular pawl, a series of double-acting springs engaging the same, a series of sets of numbered multiplying-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting-arm at each end, with a stop-bar for limiting the downward stroke common to all said keys for bringing the same back to their normal position, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

7. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, and an arc ratchet having a trip at each extremity, of a continuous triangular pawl, a series of double-acting springs engaging the same, a toothed wheel and transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels, the toothed gearing attached thereto, their spur-like projections, the carrying-pinions and a stop-bar adapted to engage with said adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

8. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, an arc ratchet having a trip at each extremity, of a continuous triangular pawl, a series of double-acting springs engaging said pawl, a series of sets of numbered multiplying-wheels and their connections, a toothed wheel, a transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions, a stop mechanism for said adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and releasing-trip to disengage the same, substantially as specified.

9. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a continuous triangular pawl, a series of double-acting springs engaging the same, a series of sets of numbered multiplying-wheels and their connections, a toothed wheel, transverse bail-lever and a pawl attached thereto actuating said wheel, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions, and a stop device for said adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and the releasing-trip to disengage the same, substantially as specified.



10. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a continuous triangular pawl, a series of double-acting springs engaging the same, a series of sets of numbered multiplying-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars, connected by a supporting arm or bar at each end, a toothed wheel and transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions, and a stop device adapted to engage with the adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and the releasing-trip to disengage the same, substantially as specified.

11. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a continuous double pawl, a series of double-acting springs engaging the same, a series of sets of numbered multiplying-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by supporting-arm at each end, a stop-bar for regulating the extent of the downward stroke common to all of said keys, a toothed wheel and transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions and stop mechanism adapted to engage with said adding-wheel, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common-pawl bar, and a releasing-trip to disengage the same, substantially as specified.

12. In an accounting-machine, the combination, with a series of key levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc-ratchet having a trip at each extremity, of a continuous double pawl, a series of double-acting springs engaging the same, a series of sets of numbered multiplying-wheels and their connections, a series of vertical slides, each having a roller at each extremity, said slides being located between the two grooved bars connected by a supporting-arm at each end with a spring-actuated bar common to and engaging all said keys for bringing same back to their normal position, of a toothed wheel, a transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions and stop mechanism adapted to engage with said adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

13. In an accounting-machine, the combination, with the adding mechanism, the indicator-disks, and the sets of numbering-wheels, of the key-levers, the trip-frame resting thereon, the continuous triangular pawl, its double-acting springs, the common pawl-bar, and the pivoted frame carrying the vertical slides for preventing more than one key from being operated at a time, substantially as specified.

480,125. CASH REGISTER AND INDICATOR. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 20, 1891. Serial No. 412,574. (No model.)

Claim.—1. In a cash-register or accounting-machine, the combination, with a series of key-levers and their ratchet-arms, of a series of adding-wheels having gearing and carrying devices, a transverse fluted shaft engaging said arc ratchets when operated and common to all said key-levers, a toothed wheel loosely journaled at the end of said fluted shaft, a ratchet-and-pawl connection between said toothed wheel and shaft, the spring and stop for said shaft, and the stop device operated by the operation of any key-lever to prevent the adding mechanism being carried beyond the proper point by its momentum, substantially as specified.

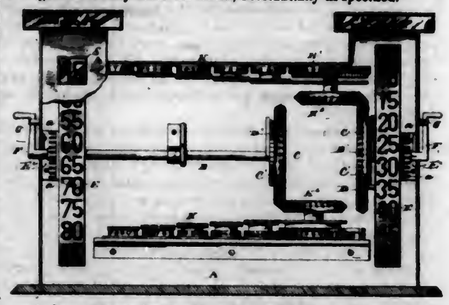
2. In a cash-register or accounting-machine, the combination, with the series of aligned adding-wheels, their gearing and carrying devices, and their operating mechanism, of the bar resting on the key-levers and operated by any one of said levers, said bar having a projection adapted to engage the gear of the adding mechanism when any lever reaches the limit of its stroke, and projections for releasing the indicators and for operating devices to permit the return of the keys upon the completion of their stroke, substantially as specified.

3. The combination, with a series of key-levers having the arc ratchets or racks arranged to actuate the adding mechanism and the pivoted bail-bar resting on said levers and operated by any one thereof, of the device for insuring the complete stroke of each key, said device comprising a loosely-journaled plate-like bar having one of its edges normally held in contact with the arc ratchet-arms of the keys and designed to engage with any one of said arms upon the depression of its key, the devices operated by said bail-bar for releasing said plate-like bar when the stroke is completed, and a lug or projection on said bail for acting upon the plate-like bar to throw it back into engagement when the key has returned to its normal position, substantially as specified.

4. The combination, with the series of key-levers and the adding and indicating mechanism operated thereby, of the pivoted bail-bar resting on said levers and common to and actuated by all the series, and devices connected with and operated by said bar for insuring each key its full stroke, for returning the indicator-disks to their normal positions, and for operating the lock of the cash-drawer, substantially as specified.

5. In a cash-register, the combination, with the series of key-levers, the adding and indicating mechanism operated thereby, and means for preventing more than one key from being operated at a time, of the bar P, common to said series of levers and resting thereon, the stop-bar normally in engagement with teeth on the ratchet-arms of said key-levers, means whereby an engagement is effected with said stop-bar by the bar P when any key-lever approaches the limit of its stroke to release said bar from engagement with said lever, the holding-pawl for said bar, and means operated by the bar P for releasing said pawl and retracting the stop-bar when the lever returns to its normal position, substantially as specified.

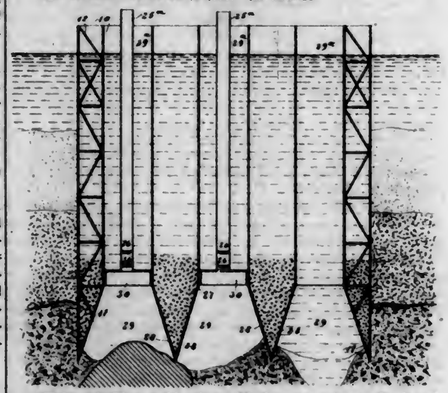
6. The combination, with the series of key-levers and the bar P, common thereto and resting thereon, said bar having a projection designed to serve as a stop for the adding mechanism and having devices for releasing the indicators and the key-levers, of the cash-drawer, its lock and bolt, the rock-shaft to which said bolt is loosely connected, and a connection between said shaft and an arm of the bar P, whereby when the latter is operated by any key-lever said bolt is withdrawn from the lock, substantially as specified.



7. The combination, with the series of key-levers, the adding and indicating mechanism operated thereby, and the bar P, resting on said levers at the rear of their pivotal points, of the pivoted stop-bar parallel with and in close proximity with said indicator-disks and engaged by a projection on any one of said disks when the disk is operated to hold it in indicative position, and a connection between said stop-bar and the bar P, whereby the former is withdrawn from engagement with said projection to allow said disk to return to its normal position when a subsequent key is struck, substantially as specified.

480,126. CASH REGISTER AND INDICATOR. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Dec. 3, 1891. Serial No. 413,918. (No model.)

Claim.—1. An accounting-machine comprising a suitable case, a shaft journaled in each end portion of said case, one end of each shaft having an operating crank or handle and the other end portion a bevel gear-wheel thereon, and a series of aligned adding-wheels in both the upper and lower portion of the case and operated by the gear on the respective shafts, one series of said wheels being designed to register the amounts received and the other series amounts paid out, the two series being arranged one directly over the other, whereby an excess of registration by either series may be readily observed, substantially as specified.



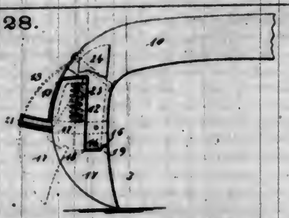
2. An accounting-machine comprising a suitable case, a series of aligned adding-wheels arranged periphery to periphery in the upper portion of said case, a similar series in the lower portion of the case and directly under the upper series, a bevel gear-wheel on the shaft of the first or cent wheel of each series, a shaft journaled on each end portion of the case and provided with an operating handle or crank, a bevel toothed wheel on the inner portion of each shaft, said wheels engaging the gear-wheels on the first wheels of the respective adding series, and indicators on each said shaft, substantially as specified.

3. In an accounting-machine, the combination of a shaft having loose bearings, a bevel toothed wheel loosely mounted on the inner portion of said shaft and connected thereto by a pawl and ratchet, an indicator-wheel fast on said shaft and rotating therewith, a handle or crank on the outer portion of said shaft and capable of an endwise sliding movement thereon, a series of engaging-stops on the frame, designed to be engaged by said handle, a return-spring for the indicator-wheel and shaft, and adding mechanism operated from said shaft through said loosely-mounted wheel, substantially as specified.

4. In an accounting-machine, the combination, with the adding mechanism, of the shaft having gear operating said mechanism, an indicator-wheel fast on said shaft and having its periphery marked at regular intervals with a series of indications, a crank or handle on said shaft and capable of an endwise sliding movement thereon, and a circular series of projecting pins or stops carried by the frame and designed to be engaged by said handle, said stops corresponding in number to the number of indications on the periphery of the indicator-wheel, substantially as specified.

480,127. CAISSON. JOHN F. O'ROURKE, New York, N. Y. Filed Apr. 28, 1892. Serial No. 431,055. (No model.)

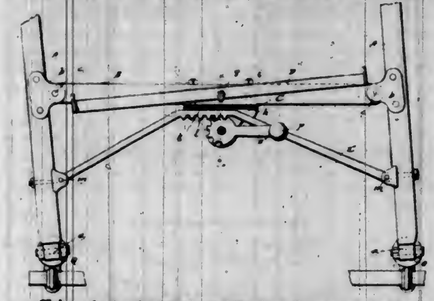
Claim.—1. The combination, with the open caisson, of a detachable bell held to fit within the open caisson and provided with a suitable shaft, substantially as described.



2. A convertible caisson comprising an open main caisson having an inclined lower edge and a removable bell or roof held to fit within the open caisson and provided with a suitable shaft, substantially as described.

3. The combination of the main caisson, a detachable bell held to fit therein, and the inflatable packing-tubes held between the walls of the bell and caisson, substantially as described.

480,128. CULTIVATOR. ERNST D. OWEN, Cuba, S. D. Filed Oct. 26, 1891. Serial No. 409,841. (No model.)



Claim.—1. In an agricultural implement, the combination, with a beam the lower end of which is curved and provided with a recess at its rear and a spring-plate secured to the beam and extending downward over the recess, of a shank a portion of which extends below the beam and another portion is fitted in the recess of the beam, a curved pin attached to the beam and extending rearwardly through and beyond the shank, and a spring located within a chamber of the shank and connected with the pin, the spring-plate having a bearing against the upper rear portion of the shank, as and for the purpose set forth.

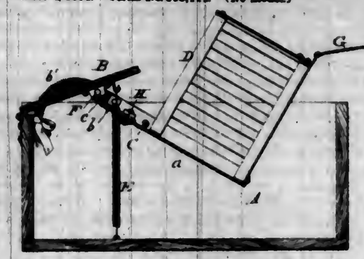
480,128.

2. In an agricultural implement, the combination, with a beam the lower end of which is curved downward, provided with a recess in the upper rear portion of its curved section and a smaller recess at the front lower end of said section, of a shank having a recess in its front upper portion, one section of the shank fitting in the recess of the beam, the said shank being fitted with a rib fitting in the lower recess of the beam and the front surfaces of the shank and beam being smooth, a spring-plate secured to the beam and having a bearing against the upper portion of the shank, an upwardly-curved pin attached to the beam and extending through and beyond the rear portion of the shank, and a spring contained within a chamber of the shank and attached at one end to the pin, as and for the purpose specified.

480,129. VEHICLE-THILL. WILL PATTERSON and LORENS SWENSON, Cresco, Iowa. Filed Apr. 1, 1892. Serial No. 427,376. (No model.)

Claim.—1. A pair of shafts or thills pivotally connected by a cross-bar and also pivotally connected in rear of the cross-bar and suitable means for shifting the latter connection, whereby the thills may be moved parallel at desired angles to the body of a vehicle, substantially as specified.

2. The combination, with a pair of shafts or thills, of a slidable rod pivotally connecting said thills and arranged in a suitable bearing and means for shifting the rod so as to move the shafts parallel and at desired angles to a vehicle, substantially as specified.



3. The combination, with a pair of shafts, of a cross-bar pivotally connecting said shafts, a bearing secured to the cross-bar, a rod connecting the shafts and having a portion arranged in the bearing, and suitable means for fixing the rod to the bearing, substantially as specified.

4. The combination, with a pair of shafts, of a cross-bar pivotally connecting the same, a bearing secured to the cross-bar, a toothed rod arranged in the bearing and pivotally connecting the shafts in rear of said cross-bar, and a toothed lever adapted to engage the toothed rod to shift the same and having a lock at its handle end to secure the lever on the rod, substantially as specified.

5. The combination, with a pair of shafts, of a cross-bar pivotally connecting the same, a bearing secured to the cross-bar, a slidable rod having rack-teeth arranged in the bearing and pivotally connecting the shafts in rear of the cross-bar, the toothed lever arranged in the bearing and adapted to engage the toothed rod, and a spring-pressed handle arranged on the outer end of the lever and forked or recessed at its lower end to engage the connecting-rod, substantially as specified.

6. The combination, with a pair of shafts, of a bearing secured to a cross-bar pivotally connecting the shafts, a slidable rod arranged in the bearing and pivotally connecting said shaft in the rear of the cross-bar, and a fastening for adjustably fixing the rod in the bearing, substantially as specified.

480,130. SPORTING-TRAP. ROGER S. PEASE, Rose, Minn. Filed June 4, 1891. Serial No. 395,111. (No model.)

Claim.—1. The herein-described trap, consisting of box or frame A, platform B, and cage D, said cage being adapted to move to and from a position over the platform.

2. In a trap, the combination of a platform at or about the level of the ground, a cage adapted to move to and from a position over said platform, and a box or pit below the surface of the ground to receive the cage when removed from over the platform.

3. In combination with a box or frame A, a platform B, hinged or jointed thereto, a cage D, hinged or pivoted in said box or frame and adapted to swing over the platform B, and an arm carried by one of said hinged parts and adapted to engage with a projection upon the other hinged part, whereby the platform B is lifted as the cage is thrown back from over the platform.

4. In combination with box or frame A, tipping platform B, provided with bolt F, and tipping cage D, provided with adjustable arm *b*.

5. The combination, in a sporting-trap, of a roughened platform and a cage movable to and from a position over said platform.

6. In a sporting-trap, the combination of a supporting-frame, a cage mounted in said frame and adapted to be moved from over the bird, and a flexible arm carried by said cage and adapted to vibrate near the bird when the cage is thrown back.

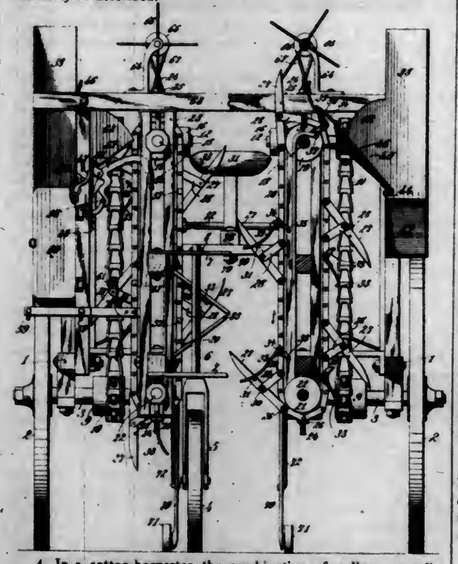
7. In combination with tipping cage D, flexible arm *b'*, provided with bits of ribbon or bright material.

8. In a sporting-trap, a cage to inclose the bird, having the side toward the sportsman closed to prevent the bird from being seen and provided elsewhere with openings to admit light.

9. In a sporting-trap, a cage having the side toward the sportsman closed and the remaining sides provided with openings, whereby the bird is hidden from the sportsman, but is enabled to get its bearings before the trap is sprung.

10. The herein-described sporting-trap, consisting of box or frame A, platform B, hinged to said box or frame, cross-rod C, extending beneath the free end of the platform, cage D, pivoted upon said rod, spring E, attached to the platform and to the box or frame, arm *b*, projecting from the cage and serving to lift the platform, and flexible extensions *b'*, carrying bits of bright material, all substantially as described and shown.

11. In a sporting-trap, the combination of a cage and a vibratory arm adapted to be set in motion by the retraction or removal of the cage for the purpose of frightening the bird and causing it to fly promptly.



480,131. COTTON-HARVESTER. ALVY G. PERRY, Coldwater, Miss. Filed Dec. 5, 1891. Serial No. 414,151. (No model.)

Claim.—1. In a cotton-harvester, the combination of a frame adapted to straddle a row of plants, short independent axles provided with traction-wheels and sprocket-wheels, transverse shafts journaled in the upper part of the machine-frame and having sprocket-wheels connected with and driven from the sprocket-wheels of the axles, upper longitudinally-arranged and parallel shafts driven by miter-gearing from said transverse shafts and provided with sprocket-wheels, lower longitudinally-arranged and parallel shafts having sprocket-wheels, endless gathering chains or belts mounted on the sprocket-wheels of said upper and lower longitudinally-arranged shafts, gathering devices carried by said endless belts or chains and adapted to pluck or strip the cotton-bolls from the opposite sides of the row of plants, stripping devices carried by and moving with the endless chains or belts for removing the bolls from the gathering devices, and shoes located on opposite sides of the machine to receive the cotton from the gathering devices, substantially as described.

2. In a cotton-harvester, the combination of a frame adapted to straddle a row of cotton-plants and provided with short independent axles, vertically-movable endless chains or gathering-belts arranged in opposite sides of the machine frame and actuated from said independent axles, a series of gathering devices supported at intervals on each of said gathering-belts and adapted to pluck or gather the bolls from opposite sides of the row of plants, shoes located on opposite sides of

the machine to receive the cotton from said gathering devices, a set of pivotal fingers supported at the entrance to each shoe, levers actuated from the gathering-belts to pull down said fingers into an inclined position to permit the passage of the cotton into the shoes, and a spring to return said fingers to their normal position when the actuating-levers are released, substantially as described.

3. In a cotton-harvester, the combination of endless vertically-movably gathering belts or chains, transverse rods carried by and connecting said chains, a series of rigid gathering-fingers arranged in gangs at suitable intervals on the rods that connect said belts or chains, stripping devices accompanying each set or gang of rigid fingers and pivotally supported by said belts or chains, a shoe to receive the cotton-bolls from the gathering devices, and a trip-rod to tilt or rock the pivotally-supported stripping devices and cause them to strip the bolls from the rigid gathering-fingers and throw them into the shoe, substantially as described.

4. In a cotton-harvester, the combination of endless vertically-movable gathering belts or chains, rigid gathering-fingers arranged in sets or gangs at suitable intervals on said belts or chains, pivotally supported tilting or rocking stripping devices accompanying each set of rigid fingers and provided with trip-lugs, a trip-rod with which said lugs engage to tilt or rock the pivotally-supported stripping devices, and a shoe to receive the cotton-bolls from the gathering mechanism, substantially as described.

5. In a cotton-harvester, the combination of endless vertically-movable gathering belts or chains, rigid gathering-fingers arranged in sets or gangs at suitable intervals on said belts or chains, pivotally-supported tilting or rocking stripping devices accompanying each set of rigid fingers, a shoe to receive the cotton-bolls, pivotally-supported fingers located at the entrance to said shoe, levers actuated from the gathering belts to pull down said fingers into an inclined position to permit the passage of the cotton into the shoe, a spring to return said fingers to their normal position, and a reel adapted to engage and clean the fingers carried by the gathering-belts, substantially as described.

6. In a cotton-harvester, the combination of a frame adapted to straddle a row of cotton-plants, vertically-movable endless gathering belts or chains arranged on opposite sides of the machine and carrying gathering devices adapted to strip the cotton bolls from opposite sides of the row of plants, pivoted stripping-fingers carried by and moving with the endless chains or belts, and a pair of pivotally-supported lifting-rods provided with operating handles or levers, whereby said lifting-rods are adapted to raise the lower limbs and fallen stalks of plants, substantially as described.

7. In a cotton-harvester, the combination, with the endless vertically-movable gathering belt or chain, of rigid gathering-fingers 27, carried by the chain and provided with a rod 31, which extends through the several fingers, and rocking stripping fingers carried by and moving with the endless chain and normally resting on said rod, substantially as described.

8. In a cotton-harvester, the combination of the endless vertically-movable gathering belts or chains 20, connected by transverse rods 26 and 29, the rigid gathering-fingers 27, mounted in gangs or sets on the rods 26, and connected by rods 30 and 31, the braces 28, connecting the rods 29 and 30, and the thimbles 32 on the rods 26, 29, and 30 to space said rigid gathering-fingers, substantially as described.

9. In a cotton-harvester, the combination of the endless vertically-movable gathering belts or chains 20, the rigid gathering-fingers 27 and rock-bars 34, carried by said belts or chains, the stripping-fingers 33 and trip-lugs 35, secured to the rock-bars 34, and the trip-rod 37, with which the lugs 35 are adapted to engage to tilt or rock the bar 34 and attached fingers 33, substantially as described.

10. In a cotton-harvester, the combination of the vertical endless gathering belts or chains 20, provided with lugs 57, the rigid gathering-fingers 27, and pivotally-supported stripping fingers 33, carried by said belts or chains, the shoe 38, the rock-bar 44, journaled at the lower part of the entrance to said shoe and provided with arms 47 and 49, the fingers 45 and guards 46, carried by said rock-bar, the double-armed lever 51, having a curved arm 53 and a depending arm 52, provided with notches 54 and 55, the fulcrum 56, the link 50, connecting the arm 49 and lever 51, and the spring 48, bearing on the arm 47, substantially as described.

11. In a cotton-harvester, the combination of the vertical endless gathering belts or chains 20, the fingers 27 and 33, carried by said belts or chains, the reel 65, and the shoe 38, substantially as described.

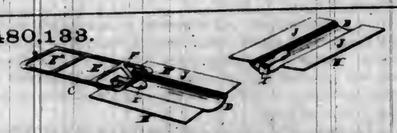
12. In a cotton-harvester, the combination of the vertical endless gathering belts or chains 20, the gathering devices carried by said belts or chains, the pivoted stripping-fingers 33, carried by and moving with the endless belts or chains, the shoe 38, having an inclined chute 42, and means for suspending a sack at the lower end of said chute, substantially as described.

13. In a cotton-harvester, the combination of a frame adapted to straddle a row of plants, the vertical endless gathering belts or chains 20, provided with gathering devices adapted to operate on the opposite sides of the row of plants, the pivoted stripping-fingers 33, carried by and moving with the endless belts or chains, trip mechanism for the fingers, and the shields 69, located in front of the gathering-belts to hold up and guide the limbs of the plants, substantially as described.

14. In a cotton-harvester, the combination of a frame adapted to straddle a row of plants, the vertical endless gathering belts or chains 20, provided with gathering devices, the pivoted stripping-fingers 33, carried by and moving with the endless belts or chains, trip mechanism for the fingers, and the pivoted lifting-rods 70, having rollers 71, substantially as described.

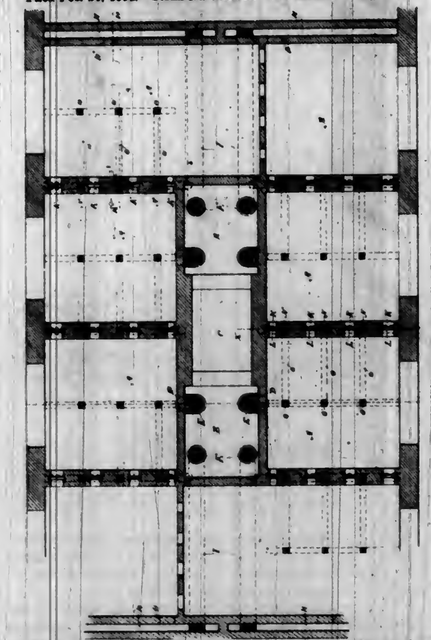
15. In a cotton-harvester, the combination of a machine-frame adapted to straddle a row of plants, the vertical endless gathering belts or chains 20, provided with gathering devices, stripping devices carried by and moving with the endless belts or chains, the shields 69, the lifting-rods 70, and the shoes 38, having chutes 42, substantially as described.

480,182. SPOON-BAIT. ERNEST F. PFLUEGER, Akron, Ohio. Filed Apr. 16, 1892. Serial No. 429,407. (No model.)



Claim.—1. The herein-described device for attaching trolling or other bait to a rod or snood, said device comprising a piece of wire or sheet metal bent into bow form and having apertures near each extremity, which loosely engage the rod or snood, substantially as specified.

2. The combination, with a trolling-spoon or other bait having a hole or aperture therein, of a fastening device for attaching said spoon or bait to a rod or snood, said device consisting of a short metal bow loosely engaging said aperture at its central portion and provided with apertures near each end, which loosely engage the rod or snood, substantially as specified.



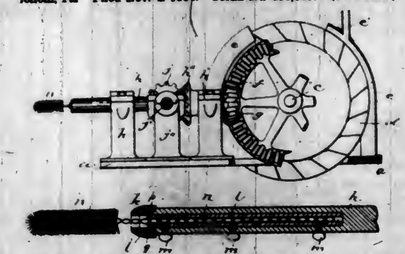
480,183. SHOE-FASTENING. JOHN H. POULTER, Arcola, Ill., assignor of one-half to John H. Sullivan, same place. Filed Dec. 8, 1890. Serial No. 373,990. (No model.)

Claim.—1. As an improved article of manufacture, a fastener for overshoes or other articles of wearing-apparel, a metallic retaining-plate H, with flaring sides J J, and center depression and engaging-hook I, bent back on a line and parallel with the upper surface of plate H and adapted to receive and securely hold the loop F, and a loop F, secured to an elastic strap B, substantially as described, and for the purpose set forth.

2. The combination, in a shoe-fastener, of the plate H, adapted to be secured at one side of the shoe and formed with the locking-tongue I, an elastic strap secured at one end to the side of the shoe, and the buckle-frame C, having the cross-bars and formed near its center with the inclined loop F, projecting in at an angle, as shown, substantially as and for the purpose set forth.

480,184. BRICK-KILN. WILLIAM RADFORD, San Francisco, Cal. Filed Feb. 20, 1891. Serial No. 382,246. (No model.)

Claim.—1. In a brick-kiln, a series of independent adjacent chambers with intervening walls having the vertical passages N made in them, the passages N', opening from the passages N into the sides of the chambers near the bottom, and the passages O O', leading beneath the floor from the passages N to the central portions of the chambers, in combination with the air-supply tubes P, adjustable within the passages N, through which air is admitted, substantially as herein described.

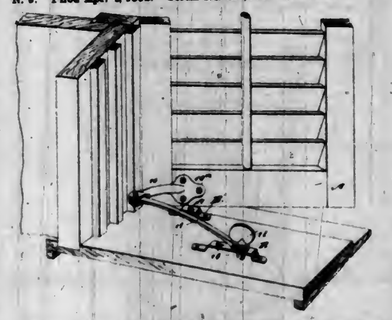


2. In a brick-kiln, a series of independent adjacent chambers with intervening walls, vertical passages N within said walls, passages N' and O O', connecting the vertical passages with the sides and centers of the chambers, passages K between the chambers with vertical connections and dampers, and horizontal passages R, intersecting the vertical passages near their upper ends and having controlling-dampers S at their inner ends, whereby they may be used for draft purposes to discharge the water vapors and smoke during the first part of the operation and be closed when the passages N are in use for direct draft, substantially as herein described.

3. In a brick-kiln, a series of independent adjacent chambers with intervening walls, passages K K', connecting the chambers, and dampers by which they are opened or closed, and horizontal passages R in the upper parts of the walls, having a damper or cap S and communicating through its passages K with the chambers, substantially as herein described.

4. In a brick-kiln, a series of independent adjacent chambers with intervening walls, passages K K' through the walls, said dampers L, by which they are closed, transverse passages R in the upper parts of the walls, dampers by which they may be opened or closed, vertical passages N in the walls, located between the passages K and communicating with the sides and central portions of the chamber-floors through the passages N' and O O', and means for closing these passages, whereby a draft through the passage R is induced when it is open for the escape of vapor and an inward draft of air through the passage N when it is open and the passage R is closed, substantially as herein described.

5. In a brick-kiln, a series of independent adjacent chambers A, parallel with and upon opposite sides of a central chamber, which communicates with a common chimney, and chambers A', situated exterior to the ends of the chamber B, passages H in the outer walls of the chambers A', with openings leading into them from the chambers, and passages I beneath the floors of the chambers, connecting the passages H with the central chamber B, substantially as herein described.



480,185. BOTTLE-WASHING MACHINE. ELVIN RAIDLINE, Bethlehem, Pa. Filed Nov. 4, 1891. Serial No. 410,865. (No model.)

Claim.—1. In a bottle-washing machine, the combination of a shaft having a socket formed in its ends, a tube *l*, fitted to slide in the socket, said tube having a series of threaded perforations formed in it, a brush having its stem fitted to slide in said tube, and a set-screw *m*, tapped through the socket on the shaft and entering one of the perforations in the sliding tube and bearing on the stem of the brush, whereby the tube and brush may be adjusted independently of each other and independently of the socket and be held rigidly against longitudinal movement in any of their adjusted positions, substantially as described.

2. In a bottle-washing machine, the combination of the brush-carrying shaft, said shaft having a reduced outer end, an annular shoulder or collar on said reduced end, the brush carried by the said shaft, and suitable driving mechanism, and an elastic buffer tapered toward its outer end and sprung over the annular shoulder or collar on the reduced outer end of the brush-carrying shaft, substantially as described.

480,186. SHUTTER-BOWER. HERMAN REICHWEIN, Spring Lake, N. J. Filed Apr. 4, 1892. Serial No. 427,676. (No model.)

Claim.—1. In a blind-fastener, the combination, with two arms pivotally connected, one of which is adapted for attachment to a blind and the other being provided with a circular opening in its outer extremity, of a key having one section fitted to turn snugly in the opening in the arm and provided with a lower section eccentrically located with respect to the upper one, and a keeper provided with an opening adapted to receive the lower section of the key, whereby when the key is turned in one direction the arms, after having been fastened in one position, are forced farther outward or inward, as desired, substantially as and for the purpose specified.

2. In a blind-fastener, the combination, with the body portion thereof, comprising two curved and pivotally-connected arms, one longer than the other, the shorter arm being adapted for attachment to the blind and the longer arm having a circular opening produced near its outer end, of a key constructed in two sections of different

diameters, the upper section being fitted to turn snugly in the opening of the longer arm and the lower section being eccentrically located with respect to the upper section and provided with a rib, and a keeper having a keyhole-slot produced therein adapted to receive the lower portion of the key, as and for the purpose set forth.

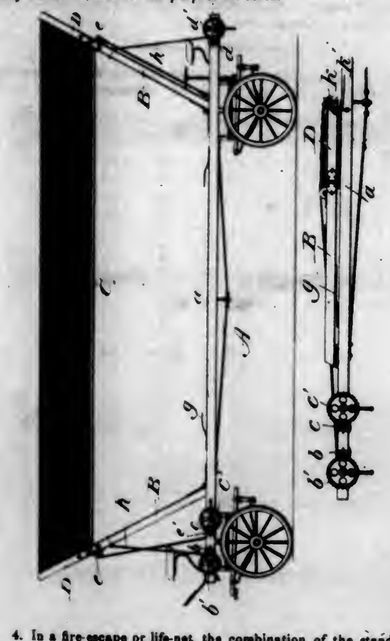
3. In a blind-fastener, the combination, with an arm adapted for connection with the blind and provided with a circular opening at one end, of a key made in two sections of different diameters, the upper section being of the greatest diameter and adapted to turn snugly in the opening in the arm, the lower section of the key being eccentrically located with respect to the upper section and provided with a rib, and a keeper having a keyhole-slot formed therein to receive the lower or eccentric section of the key, as and for the purpose specified.

480,137. ROTARY CUTTER-HEAD. JOSEPH T. RHODES, Shell, Ala. Filed Jan. 9, 1892. Serial No. 417,536. (No model.)

Claim.—1. In a rotary cutter-head, substantially as described, the combination, with the sections A A', having recesses C formed at intervals in the peripheries of said sections, and the flaring recesses I, formed at intervals in the peripheries of the sections and arranged alternately with respect to the recesses C, of the bits E and a suitable means for adjustably fixing said bits with respect to the cutter-head, substantially as and for the purpose specified.

2. In a rotary cutter-head, substantially as described, the combination, with the sections A A', having circular recesses C formed at intervals in the peripheries of said sections and having the seats D, the seats F, and the clearance-apertures H, and the vertically-flaring recesses I, formed at intervals in the peripheries of the sections and arranged alternately with respect to the recesses C and reduced in size at the insides of the sections, of the circular bits E, having lateral collar-flanges G, and the binding-screws M for adjustably fixing said bits, substantially as and for the purpose set forth.

480,138. MACHINE FOR MAKING RETORTS, &c. EVO ROGERS, Nevada, Mo. Filed Apr. 17, 1891. Serial No. 389,359. (No model.)



Claim.—The combination, in a retort-machine, of the mold 1, open at its upper end, the removable bottom 8, the chains 9, provided with weights 10, connected with said bottom and passing around sheaves or pulleys, the shaft 2, having radial blades 3, the hollow metallic shell secured to said shaft, and the wooden plug fitting in the lower end of said shell, substantially as and for the purpose specified.

480,139. LIFE-NET FIRE-ESCAPE. JAMES RYAN, New York, N. Y. Filed Apr. 14, 1892. Serial No. 429,183. (No model.)

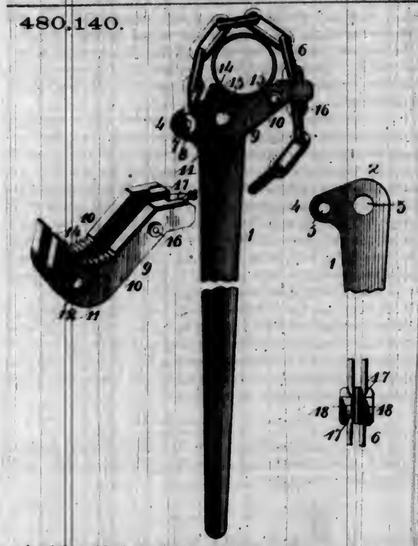
Claim.—1. In a fire-escape, the combination of a truck having side beams *a a*, hinged standards B B, carrying rollers *c c*, and a net C, adapted to be passed over said rollers and secured at one end to the frame of the truck and at the other end to a drum carried by the truck-frame, substantially as shown, and for the purpose set forth.

2. In a fire-escape, the combination of a truck, standards B B, hinged thereto and provided with rollers over which a life-net passes, a drum or windlass carried by the truck, around which the life-net is passed, and guy-ropes *h h* for raising the supporting-standards and maintaining them in an elevated position, substantially as shown, and for the purpose set forth.

3. The combination, with a truck A, having standards B B hinged thereto, of a life-net supported by said standards and connected at one end to the truck-frame by springs, the other end of the net being secured to a suitable drum or windlass carried by the frame, substantially as shown, and for the purpose set forth.

4. In a fire-escape or life-net, the combination of the standards B B, suitably supported upon a truck, said standards having hinged to the outer sides thereof extensions D, carrying side and end nets, substantially as shown, and for the purpose set forth.

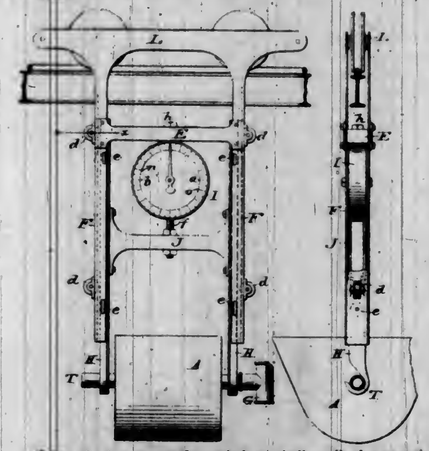
5. The combination, with a life-net or fire-escape constructed substantially as shown, of the standards B B, provided at their upper ends with extensions D, which are hinged thereto, rack-bars F F, pivoted to the extensions and held in looped engagement with each other, and means for spreading said extensions by engagement with the rack-bars, substantially as shown, and for the purpose set forth.



6. The combination, with a truck having side beams *a a*, standards B B, hinged thereto and provided with supports for a life-net, of springs *g g*, upon which said standards bear when folded, and means for positively engaging the free ends of said standards with the side beams, substantially as shown, and for the purpose set forth.

7. In combination with a truck, side beams *a a*, having standards hinged thereto to be supported in an inclined position thereon, said standards having extensions D hinged to swing upward from the upper ends of said standards, side and end nets carried by said extensions, and a life-net C, supported by rollers *c c*, the ends of said life-net being connected with the truck-frame, drums also carried by the truck-frame and provided with guy-ropes which connect thereto and with the standards, and a net or flexible bottom G, supported by the side beams and cross-bars of the truck, substantially as shown, and for the purpose set forth.

480,140. CHAIN PIPE-WRENCH. JOHN F. SAUERMAN, Coal Hill, Ark., assignor of one-half to Edward S. Stiewel, same place. Filed Feb. 23, 1892. Serial No. 422,440. (No model.)



Claim.—A chain pipe-wrench consisting of a lever 1, an extension 4, formed on one side of the same, a chain one end of which is movably attached to the said extension, a jaw 9, adapted to be movably attached to the said lever and composed of plates 10, teeth 14, formed on the impinging surfaces of said plates, angular extensions 15, formed by the said plates, a bolt 16 for rigidly attaching the said plates together, cut-away portions 17, formed on the inner surfaces and at the

480,140.

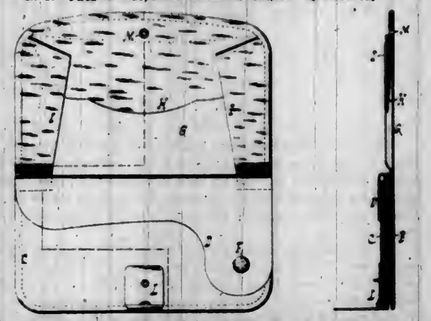
ends of the said plates, leaving projections 18, and a bolt or rivet 13 for attaching said jaw to the said lever, substantially as described.

480,141. APPARATUS FOR WEIGHING ASPHALT. SAMUEL B. SCHARF, Washington, D. C. Filed Apr. 4, 1892. Serial No. 427,710. (No model.)

Claim.—1. A conveyor for asphalt or similar adhesive material, consisting of a frame adapted to be moved on a rail, with a secondary sliding frame adapted to support a bucket, the two frames being connected by an interposed scale, substantially as shown and described, whereby the weight of the material placed in the bucket and also the weight of the varying adhering amount of material remaining in the bucket are automatically indicated at each operation, as set forth.

2. The herein-described apparatus for conveying and automatically indicating the weight of asphalt or similar material, the same consisting of a suspended frame having pendent arms F and a sliding frame H H, adapted to support a bucket, the two frames being connected by an interposed scale and each provided with anti-friction rollers, all constructed and arranged to operate substantially as and for the purpose set forth.

480,142. PROJECTILE. JOSEPH E. SCHLORFF, Pesotum, Ill. Filed Mar. 24, 1892. Serial No. 426,290. (No model.)



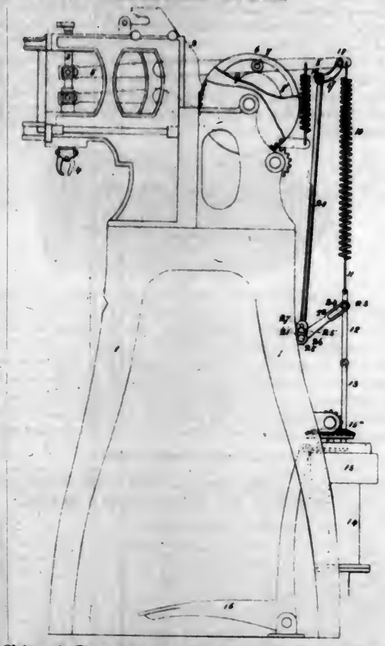
Claim.—1. In combination with a shell or projectile having a chamber for the reception of explosive material, a movable spring-projected point attached to a bar E and a bar or bars H, having inclined surfaces upon which the inclined surfaces of the bar E slide when the point is moved inward, substantially as shown, and for the purpose set forth.

2. The combination, in a shell or projectile having a chamber which contains explosive material, of a bar E, having inclined faces, said bar being connected to a movable point, and bars H H, with inclined faces, adapted to slide upon the inclined surfaces on the bar E, said bars H H bearing upon the rear wall of the chamber B and connected to the bar E by straps, substantially as shown, and for the purpose set forth.

3. The combination, in a shell or projectile constructed substantially as shown and provided with a point which is held normally projected by a spring, said point carrying a bar E, having inclined faces *e e* on opposite sides and near the front and rear ends of the chamber containing the explosive, of straps or guides F F, secured to the bar E adjacent to its inclined portions, and bars H H, which engage with the guides and have inclined portions, said bars being held against longitudinal movement by abutting against the front and rear walls of the chamber B, substantially as shown, and for the purpose set forth.

480,143. POCKET-BOOK OR PURSE. ERNST SCHNOFF, Brooklyn, N. Y. Filed Mar. 10, 1892. Serial No. 424,459. (No model.)

Claim.—1. The combination, with the pocket-book having a pouch B and a closing-flap G, of a gusset or catch-flap H, secured to the closing-flap and having its end portions free from attachment thereto, so that the gusset or catch-flap can be bodily lifted into a position approximately at right angles to the closing-flap to serve as a guard for coin sliding out of the pouch upon the closing-flap, substantially as described.

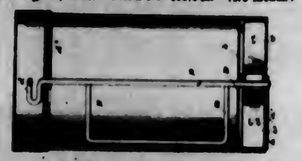


2. The combination, with a pocket-book having a pouch B and a closing-flap G, of a gusset H, secured to the closing-flap and adapted to be bodily lifted into a position approximately at right angles thereto to serve as a guard for coin sliding out of the pouch upon the closing-flap, and the gussets I, secured to opposite sides of the closing-flap and extending along the same to prevent coin from sliding or falling laterally therefrom, substantially as described.

480,144. VEHICLE-SEAT. JASPER E. SCOTT, Meadville, Miss. Filed Dec. 28, 1891. Serial No. 415,991. (No model.)

Claim.—The combination, with a seat-bottom and overlapping rails secured thereto, of a coil at each of the overlapping ends which encircle the rail which it overlaps, arms projecting from the said coils, and a back supported by the arms, substantially as shown and described.

480,145. LASTING-MACHINE. CHARLES SEMINS, St. Louis, Mo., assignor to the Standing Lasting Machine Company, same place. Filed Mar. 21, 1892. Serial No. 426,736. (No model.)

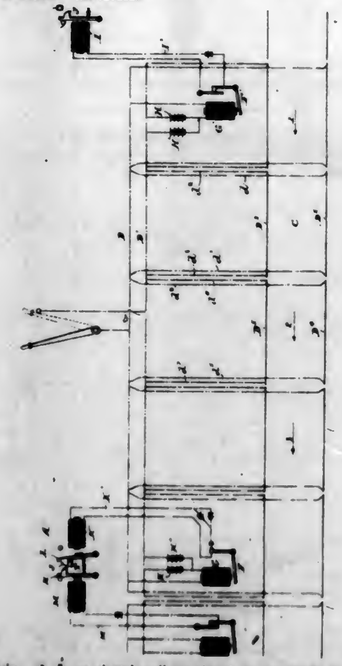


Claim.—1. The combination, with the lever 5 and the spring 10, of means for elongating the spring 10, the rod 20, forming a stop for the lever 5, a connection between the lever and the rod, the cam 21, supporting the rod 20, and an arm 22 of the cam, connected with the extensible end of the spring 10, substantially as and for the purpose set forth.

2. The described combination of the lever 5, the spring 10, the link 17, rod 20, with roller 27, cam, and slotted end 25, working on the axis of the cam, the cam-arm 22, slotted at 24, the rod 12, connected with the spring 10 and having a stud 23, engaging in the slot 24, and means for stretching the spring 10, substantially as and for the purpose set forth.

3. The combination, with the stand, the head, the pincher-rod, the crimping-pinchers, the lever, the spring, the rod, and the means for adjusting the tension of the spring, of a movable stop device for the said lever connected with the latter and with the rod and having bearing on the stand, substantially as described.

480,146. MEASURING-CAN. LEANOR G. SOUDER, Philadelphia, Pa. Filed Aug. 18, 1891. Serial No. 403,042. (No model.)



Claim.—1. A measuring-can or other vessel provided with a bottom discharge-opening, a parallel stationary perforated diaphragm located within said can and secured therein so that its perforation or opening lies directly opposite the solid portion of the bottom, and a revolving measuring-disk provided with graduated pockets adapted to revolve between said stationary diaphragm and the bottom of the can, substantially as set forth.

2. A measuring-can or other vessel provided with a bottom triangular discharge-opening, a triangular pivoted gate inclosing said discharge-opening, a parallel stationary perforated diaphragm located within said can and secured therein so that its perforation or opening lies directly opposite the solid portion of the bottom, a revolving disk provided with opposite angular pockets adapted to register alternately with said discharge-opening and the perforation in said stationary diaphragm, and an operating-rod and agitator secured in the can and to said revolving disk, said agitator traveling around within said can adjacent to the inner periphery thereof to stir the contents of the can simultaneously with the rotation of said disk, substantially as set forth.

3. A measuring-can or other vessel provided with a triangular discharge-opening, a triangular pivoted gate inclosing said discharge-opening, a diaphragm having a semicircular opening located within the can parallel with the bottom thereof, a revolving disk provided with opposite angular recesses, and flanges depending from the sides of said recesses and forming graduated pockets, said disk being seated within the space inclosed by said diaphragm in the bottom of the can, an operating-rod rigidly secured to said revolving disk, a transverse bearing-brace located near the top of said can, and an agitator secured to said operating-rod and traveling around within said can adjacent to the inner periphery thereof, substantially as set forth.

4. A measuring-can or other vessel having a discharge-opening, a parallel stationary perforated diaphragm located over said discharge-opening and having its perforation or opening opposite the solid portion of the bottom, and a revolving measuring-disk provided with graduated pockets adapted to revolve between said diaphragm and discharge-opening, substantially as set forth.

480,147. AUTOMATIC DEVICE FOR ELECTRIC BLOCK-SIGNALS. JOSEPH B. STEWART, Haverstraw, N. Y. Filed Jan. 26, 1892. Serial No. 419,351. (No model.)

Claim.—1. In an electric railway-signal, an automatic device for locking and unlocking the signal, comprising an electric circuit including the magnets at each station, a locking device controlled thereby, and a battery at each station, the batteries being opposed to each other on the line, substantially as described.

2. In an electric railway-signal, an automatic device for locking and unlocking the signal-levers, comprising a closed electric circuit including a magnet at each end, a battery at each end, the batteries being opposed to each other on the line, local circuits controlled by said magnets, a locking device controlled by each local circuit, and tap-lines from the main circuit to the sections of the track, substantially as described.

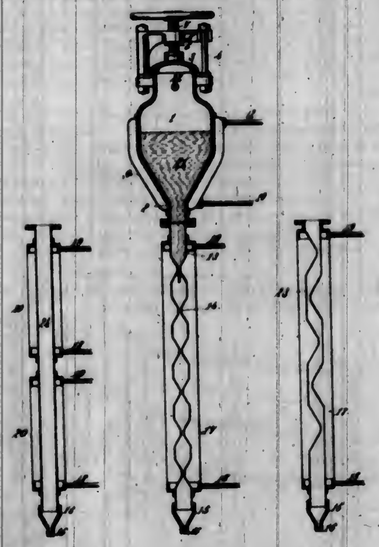
3. In an electric railway-signal, an automatic device for locking and unlocking the signal-levers, comprising a closed electric circuit having opposed batteries and including a magnet at each end, the local circuits controlled by each magnet, a locking device controlled by each local circuit, and a track, the rails of which are divided in divisions, the rails of each division being connected to the main circuit by tape, substantially as described.

4. In an electric railway-signal, a closed main line having opposing batteries of equal strength, a magnet at each end of the line controlling the signals, and a track divided in divisions, the rails of the track of each division being connected to the circuit by two tap-lines or connectors, one at each end of each division, substantially as described.

5. In an electric railway-signal, the combination of the charged main line having opposing batteries of equal strength, the track divided in divisions, and tap-lines connected to each end of each rail of the division and to the main line, substantially as described.

6. In an electric railway-signal, a main charged line including a magnet at each end, batteries located at each end of the circuit and opposed to each other, connectors from the main circuit to the rails of the track, and local circuits at each end of the line, controlled by the line and controlling the signals, substantially as described.

7. In an electric railway-signal, a closed electric circuit including a magnet at each end and having two batteries arranged in multiple at each station, the batteries of the stations being opposed to each other of equal strength, and the rails of the track being in divisions, and connections from each track-division to the circuit, the arrangement being such that a train passing over the rails will short-circuit the main closed electric circuit, thus preventing signals passing over the line, substantially as described.



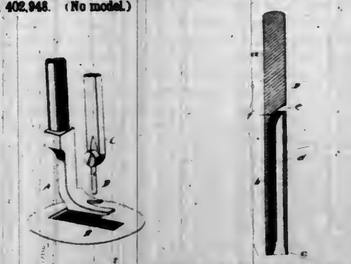
8. In an electric railway-signal, a closed electric circuit including a magnet at each end and having opposed batteries, tap-lines leading from the main line, and a switch included in the tap-lines, whereby the main line may be short-circuited by the switch, substantially as described.

480,148. SASH-FASTENER. EDWARD R. THEBY, Neenah, Wis. Filed Feb. 27, 1892. Serial No. 423,063. (No model.)

Claim.—In combination with a vertically-sliding window-sash having a finger-access aperture at its front, a sash-fastener consisting of one or more bolts adapted for entering the casing at the side and connected with one or more angular levers recessed within the bottom rail at the center to operate the same, the said levers being constructed and arranged so as to be operated directly by the application of the fingers through the aperture directly to their free ends while the hand is in position to raise the sash, substantially as described.

480,149. CANDY-MACHINE. BURCHARD THOMS, New Orleans, La. Filed Nov. 25, 1891. Serial No. 413,091. (No model.)

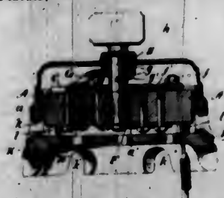
Claim.—1. A candy-making machine consisting of a vessel or container having a discharge-neck and a closing-cover and a pipe connected with the discharge-neck and provided with a series of contractions, substantially as described.



2. A candy-making machine consisting of a vessel or container having a discharge-neck and a closing-cover, a pipe connected with the discharge-neck and provided at intervals with a series of contractions, and a nozzle secured to the lower end of the pipe and provided with a contracted orifice, substantially as described.

3. A candy-making machine consisting of a vessel or container having a discharge-neck and a closing-cover, a jacket surrounding the vessel or container and having inlet and outlet pipes, a conveying-pipe connected with the discharge-neck of the vessel or container and having at its lower end a nozzle provided with a contracted orifice, and a jacket surrounding the conveying-pipe and having an inlet and an outlet, substantially as described.

4. A candy-making machine consisting of a vessel or container provided with an air-inlet opening 22, a discharge-neck 2, and a closing-cover 3, a jacket 9, surrounding the vessel or container and having an inlet and an outlet, a conveying-pipe connected with the discharge-neck and having at its lower end a nozzle provided with a contracted orifice, and a jacket surrounding the conveying-pipe and provided with an inlet and an outlet, substantially as described.



5. An apparatus for manipulating candy material, consisting of a suitable closed vessel, means for subjecting the contents thereof to pressure, a pipe or conveyer into which the contents of said vessel are discharged under pressure, said pipe or conveyer having at suitable intervals contracted or strangulated portions forming part of the continuous passage and being provided with a tip having a contracted exit-opening, and one or more jackets inclosing said pipe or conveyer and having suitable inlet and outlet, substantially as described.

480,150. CYLINDRICAL SEWING-MACHINE NEEDLE. MINNETTIE R. THURSTON, Kalamazoo, Mich. Filed Aug. 17, 1891. Serial No. 402,948. (No model.)

Claim.—As an improved article of manufacture, the needle for producing paper stencils herein shown and described, consisting, essentially, of the bar of steel having the solid shank *a*, adapted to be secured to the needle-bar of a sewing-machine, and the hollow stem *b*, terminating at its lower end in a circular cutting-edge *c* and having the lateral notch *e* at its upper end for the discharge of the cut pieces, and also having the wall formed as at *f* to facilitate the discharge of said pieces, substantially as specified.

480,151. RHEOSTAT. CHARLES W. TOBEY, New Bedford, Mass., assignor to Burt & Tobey, same place. Filed July 11, 1891. Serial No. 399,290. (No model.)

Claim.—1. A resistance-conductor for electric currents, composed of powdered graphite and asbestus compressed into a cohering compact body, substantially as and for the purpose specified.

2. A resistance-conductor for electric currents, consisting of a composition of proportionate parts of powdered graphite, asbestus, and cement compressed into a cohering compact body, substantially as and for the purpose shown.

3. A resistance-conductor for electric currents, consisting of a com-

position of proportionate parts of powdered graphite, asbestus, and cement mixed with water and compressed into a cohering compact body, substantially as and for the purpose set forth.

4. A resistance for electric currents, consisting of powdered graphite and a non-conductor compressed into a coherent body, to whose opposite ends are secured metallic pieces, substantially as and for the purpose described.

5. A resistance for electric currents, consisting of powdered graphite compressed into a metal holder in a cohering body, which holder but partially incloses the same and constitutes means for its attachment to a support, substantially as and for the purpose specified.

6. In combination with the resistance composition, the holder therefor, consisting of a shell or casing partly inclosing the same, and the disk or piece affixed to such composition, substantially as and for the purpose shown.

7. In combination, the resistance composition and the holder therefor, consisting of a shell or casing partly inclosing the same and the disk with a shank affixed thereto, united to such composition by having such shank embedded therein, substantially as and for the purpose set forth.

8. A resistance for electric currents, consisting of powdered graphite, asbestus, and cement compressed and united with a holder consisting of a shell partly inclosing the same and the disk or piece superimposed upon a portion thereof not contained in said shell, substantially as and for the purpose described.

9. In combination, the several resistances composed each of powdered graphite, asbestus, and cement compressed into a cohering body connected in series, and the switch for placing any number from one to the whole series in the circuit, substantially as and for the purpose specified.

10. In combination with several resistances, the fusible conductor connecting them, substantially as and for the purpose set forth.

11. In combination with the resistance device of a rheostat forming part of a circuit, a fusible conductor connected directly to said resistance and also forming a part of the circuit, substantially as and for the pupose specified.

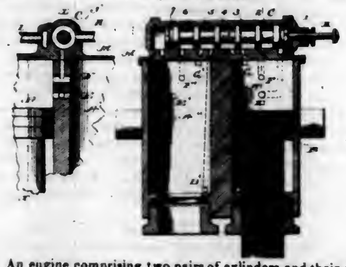
12. In combination, the several resistances, the supporting-plate for each resistance, acting as a contact, the body to which said plates are attached, the attaching-screws, and the fusible conducting-strip extending from one resistance to one of the attaching-screws of the next adjacent resistance, substantially as and for the purpose set forth.

13. In combination, the supporting-body of insulating material having a slot or opening, the series of resistances in the latter, the contact-plates for said resistances, from which the same are supported, and the switch, substantially as and for the purpose shown.

14. In combination, the series of resistances, their contacts, the circuit-closing contact, the cut-out contact, said contacts being arranged in a circle with the last named two adjacent to each other, and the spring-switch, said cut-out contact having a depression to seat said switch, substantially as and for the purpose described.

15. In a switch, in combination with the spring movable brush or contact device, the circuit-closing contact and the cut-out contact having a depression for seating said brush, substantially as and for the purpose specified.

480,152. ELECTRIC-CORD TIP. CHARLES W. TOBEY, New Bedford, Mass., assignor to Burt & Tobey, same place. Filed Nov. 24, 1891. Serial No. 412,941. (No model.)



Claim.—As an article of manufacture, the device for use in connection with electric conductors, consisting of a strip bent into U form and having both of its legs forked or provided with open-ended slots to admit the shank of the fastening-screw, substantially as and for the purpose specified.

480,153. STEAM-ENGINE. CHARLES W. TREMAIN and SANDER JOHNSON, Portland, Oreg., assignors to the Prospective Mining and Machinery Company, same place. Filed Apr. 19, 1892. Serial No. 429,783. (No model.)

Claim.—1. The combination of multiplex cylinders, a valve-chest for the same, steam and exhaust passages communicating between said valve-chest and the cylinders and each passage terminating in two cylinders, pistons working in said cylinders, and a valve governing the admission of steam to the steam-passages, substantially as described.

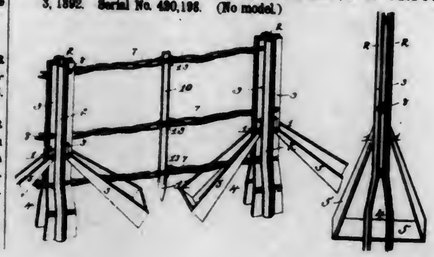
2. The combination of a pair of cylinders having four pairs of passages on one side thereof forming steam and exhaust passages, one member of each pair communicating with one cylinder and the other member with the other cylinder in substantially the same position in both cylinders, and all the pairs having their entrances into the cylinders at different distances from the ends thereof, pistons working in said cylinders, and a valve governing the admission of steam to the steam-passages, substantially as described.

3. An engine comprising a valve and valve-chest, four cylinders, and their pistons and having steam and exhaust passages arranged between the cylinders, each passage running from the valve-chest and terminating in a pair of mouths, each mouth of the pair opening into a different cylinder, substantially as described.

4. An engine comprising two pairs of cylinders and their pistons, a valve and its chest arranged centrally between the pairs, and a series of passages running from the chest to and terminating in two cylinders arranged in a line at right angles to the valve and its chest substantially as described.

5. An engine comprising two pairs of cylinders and their pistons, a valve and its chest arranged centrally over the tops of the cylinders and between the pairs, and a series of passages arranged between the cylinders running from the valve-chest to and each passage terminating in two cylinders, substantially as described.

6. The combination of the four cylinders A, A′, A″, and A‴, corresponding pistons working therein, a cap M, covering said four cylinders, a valve-chest L, mounted on the cap and having passages leading therefrom, each passage communicating with two cylinders, and a valve governing the ingress and egress of the steam, substantially as described.



7. The combination of a valve and valve-chest with a pair of cylinders A A″, pistons B B, working therein, said cylinders having passages D D′, admitting steam beneath said pistons, passages E E′, admitting steam to the ends of the valve-chest, passages F F′, communicating with the exhaust, and passages G G′, communicating through the valve with the passages D D′, whereby the steam operates to strike the blow as well as raise the piston.

8. The combination of a valve and valve-chest with a pair of cylinders A A″, pistons B B, working therein, said cylinders having passages D D′, terminating near the bottom thereof, passages E E′, admitting steam to the ends of the valve-chest, and exhaust-passages F F′, having mouths arranged near the top of the cylinder to be closed by the pistons, whereby the steam in the cylinder above the said mouths of the passages F F′ serves as a cushion for the pistons, substantially as described.

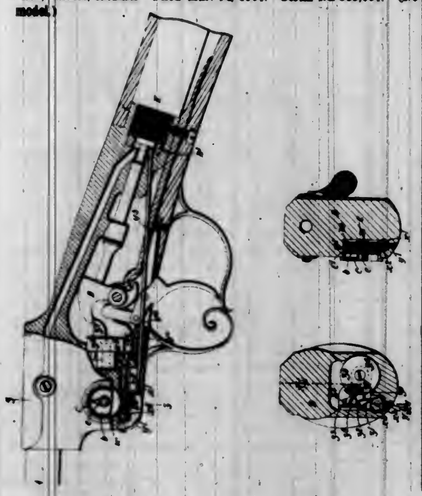
9. The combination, with a cylinder and piston, of a valve-chest and a valve operated by steam from said cylinder, said valve having an exhaust-passage independently of the exhaust from the cylinder, substantially as described.

10. The combination of two cylinders having passages D D′ E E′ F F′ G G′, pistons working in said cylinders, a valve-chest communicating with said passages, and a valve having the annular grooves 1, 2, 3, 4, 5, 6, and 7, said grooves 1 and 7 being open to the ends of the valve-chest, substantially as described and shown.

480,154. FENCE. JAMES VAN NESS, Batavia, N. Y. Filed Feb. 3, 1892. Serial No. 420,196. (No model.)

Claim.—1. The herein-described metal fence, the same consisting of the series of posts comprising opposite semi-tubular metal clamping-plates arranged face to face for the major portions of their lengths and provided at opposite edges with securing-flanges, said flanges being diverged at their lower ends, the series of plaited strands passed between the clamping-plates, rivets passed through the plates and strands, the perforated metal-pointed stays located between the posts, and the short tie-wires passed through the perforations of the stays and connecting with the strands, substantially as specified.

2. The herein-described fence, the same consisting of a series of posts, each comprising opposite metal clamping-plates, semi-tubular and provided with opposite flanges, the hooks passing through the flanges, and the strands connected to the hooks, substantially as specified.



3. The combination, with a fence-post, of a sheet-metal brace formed integral and consisting of a substantially oblong blank bent at opposite sides of its center on a transverse line and forming an intermediate flat anchoring portion and opposite terminals, the latter embracing the opposite sides of and secured to the post and the former being buried in the ground and constituting an anchoring device, substantially as specified.

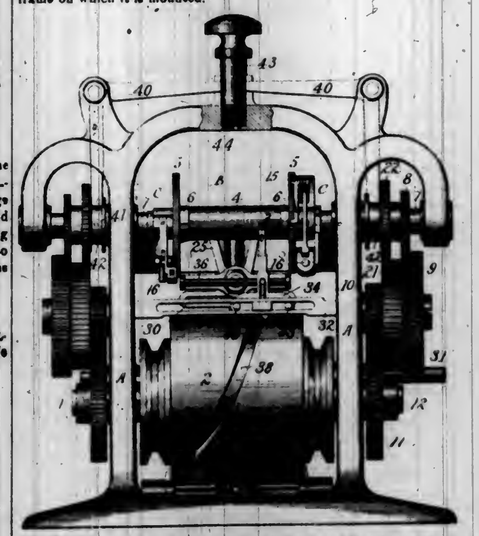
480,155. SLIDING GATE. DOUGLAS WALKER, Liberty, Ill. Filed Aug. 10, 1891. Serial No. 402,285. (No model.)

Claim.—In a gate, the combination of the supporting-posts, the gate, the long lever N, at its lower end fulcrumed to a post, the L-shaped stop *a*, rigid with and projecting laterally from the upper edge of the opposite end of said lever N, the short lever O, at its upper end fulcrumed to the gate and at its opposite end pivoted to the long lever N at a point below its upper end and provided with notch Q′ to receive said stop *a*, and the operating-levers S S and their connections to said long lever, to operate as described.

480,156. CHARGE-INDICATOR FOR GAS-GUNS. JOHN S. WALLACE, Belfast, Ireland. Filed Mar. 14, 1891. Serial No. 385,061. (No model.)

Claim.—In a gun, the combination, with a hammer and a reservoir for compressed or liquefied gas, of indicating or counting mechanism and devices engaging said mechanism and said hammer and operated by the movement of the latter, substantially as described.

2. The combination, with a hammer and a reservoir for compressed or liquefied gas, of a counter or indicator comprising an index-finger and an endless screw engaged therewith and actuated by the movement of the hammer, substantially as described.



3. In a gun, the combination, with a hammer and a reservoir for compressed or liquefied gas, of a counter or indicator comprising an index-finger, a movable endless screw engaged therewith and actuated by the movement of the hammer, and a movable piece supporting said endless screw connected with the reservoir, substantially as described.

4. In a gun, the combination, with a hammer and a reservoir for compressed or liquefied gas, of indicating or counting mechanism comprising a rotatable disk having a projection for engaging said hammer, a sliding piece engaging a second projection on the rotatable disk, an index-finger, an endless screw carrying a ratchet-wheel, and a pawl on the sliding piece engaging said ratchet-wheel, substantially as described.

5. In a gun, the combination, with a reservoir E for compressed or liquefied gas, a counter or indicator, and the frame in which the said reservoir and indicator are mounted, of a rod y^3, that engages with the reservoir and with a pivoted bearing y^4, that supports one end of the worm-shaft that actuates the indicator, as and for the purpose specified.

480,157. APPARATUS FOR WINDING COPS OR BALLS. SIMON W. WARDWELL, Jr., Boston, assignor to Joseph R. Leeson, Newton, Mass. Filed Dec. 26, 1891. Serial No. 416,230. (No model.)

Brief.—The spool-holder is given an increment of movement at each rotation by means of the pawl 18 moving over the face of the cam 19. The thread-guide lies close to the surface of the cop, and as the latter increases in size the former moves backward with a sliding frame on which it is mounted.

Claim.—1. In a cop-winding machine, the combination, with a revolving holder for supporting the cop and with a reciprocating thread-guide supported to move in a course parallel to the axis of the cop, of mechanism adapted to give the holder an increment of movement at each rotation, for the purpose set forth.

2. A machine for winding cops, provided with a holder for the cop, and a reciprocating guide for the thread supported to move parallel to the axis of the cop and outward as the cop increases in diameter, and means for turning the holder and for reciprocating the guide, and mechanism for varying the relative movements of the holder and guide to insure an increment of movement to the holder at each rotation, whereby each reversal of the movement of the guide takes place after the holder has turned beyond the point of its revolution occupied at the moment of the preceding reversal of the movement of the guide, substantially as set forth.

3. A machine for winding cops, provided with a revolving holder for supporting the cops and with a reciprocating thread-guide and means for varying the relative movements of the thread-holder and

guide, constructed substantially as described, to secure each successive reversal of the movement of the guide at the outer end of the holder after and only after the holder in its rotation has reached a point beyond the point reached at the moment of the preceding reversal of the movement of the guide at such end, substantially as set forth.

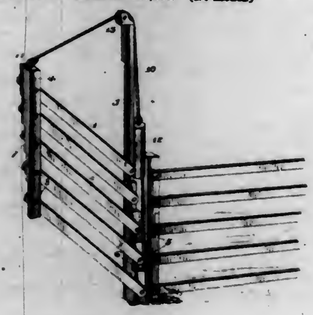
4. In a cop-winding machine, the combination of a guide and means for imparting to the same a regular reciprocating movement parallel to the cop, and a holder for supporting the cop, and means for imparting to the same a progressive rotary movement at each rotation, substantially as set forth.

5. The combination, in a cop-winding machine, of a reciprocating thread-guide for guiding the thread parallel to the holder, a cop-holder, a shaft for imparting motion to said holder, and means for imparting an increment of movement to the holder at each rotation of said shaft, substantially as set forth.

6. The combination of the cop-holder, rotating shaft for driving the holder, a cam operating independently of said shaft, and devices between the cam and the holder to rotate the latter independently of the shaft, substantially as set forth.

7. The combination of the holder consisting of disks carried by rotating shafts, pawls for engaging teeth upon said disks, cams, and means for moving the same independently of the disks, and devices between each cam and each pawl, whereby the latter is moved by the cam to impart additional movement to the adjoining disk independently of the movement of the shaft, substantially as described.

480,158. METHOD OF WINDING COPS OR BALLS. SIMON W. WARDWELL, Jr., Boston, assignor to Joseph R. Leeson, Newton, Mass. Filed Jan. 2, 1892. Serial No. 416,848. (No model.)



Claim.—1. The within-described mode of winding cops, consisting in winding the thread spirally upon a tube or cylinder in successive coils with substantially the same number of coils in each layer, and in carrying the thread of each coil at each end of the cop across the thread of a previous coil, and bending the last laid portion with an abrupt bend at a point beyond that where the previously-laid portion is bent to form a cop with a substantially flat end, substantially as described.

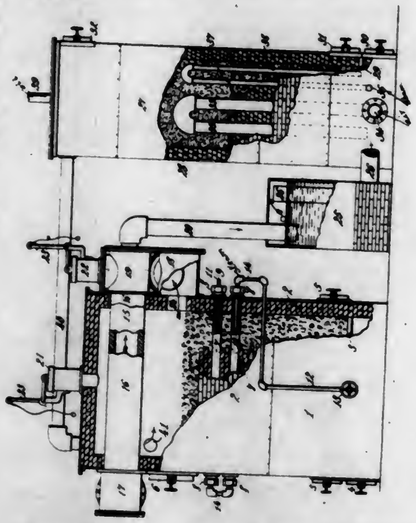
2. The improvement in the art of winding cops, consisting in winding the thread in successive coils, laying each thread at the end of the coil across and over that previously laid and there bending the thread back at a point adjacent to the previous bend, and winding it in a course parallel with that of a previously-laid coil to form a cop with a substantially flat end, substantially as described.

3. The process of manufacturing cops, which consists in winding the thread in successive coils, each coil parallel to but not in contact with the thread of a preceding coil, and then subjecting the cop to end pressure to bring the thread of the adjacent coils together, substantially as described.

480,159. FOLDING GATE. AMASA H. YOUNG, Centralia, Ill. Filed Apr. 5, 1892. Serial No. 427,886. (No model.)

Claim.—In a folding gate, the combination of a post provided with a series of shoulders or faces arranged in parallel vertical planes, an end bar provided with a series of faces or shoulders arranged in parallel vertical planes to coincide with those of the post, a series of rails arranged parallel and having their ends pivoted to said faces or shoulders, a swiveled caster mounted on the post, and a rope connected with the end bar and passing over the pulley and provided with a weight, substantially as described.

480,160. LADDER-GUARD. JOSEPH C. ADAMS, New London, assignor of one-third to Charles A. Todd, Scytheville, N. H. Filed Apr. 9, 1892. Serial No. 428,496. (No model.)



Claim.—1. The combination, with a ladder, of a shoe loosely connected thereto and having triangularly-arranged projecting engaging-points, substantially as described.

2. The combination, with a ladder, of a triangular-shaped shoe, which is dished to provide projecting engaging-points, said shoe being loosely connected, substantially as described.

3. The combination, with a ladder, of metallic strips, headed studs or pins projecting therefrom, and triangular-shaped dished shoes loosely connected to said headed studs or pins, substantially as described.

480,161. APPARATUS FOR THE MANUFACTURE OF GAS. JOSEPH ASKINS, Lima, Ohio. Filed Jan. 9, 1892. Serial No. 417,578. (No model.)

Claim.—1. In an apparatus for the manufacture of carbureted water-gas, the combination of a water-gas generator having a valve in its upper part and provided below the bed of fuel with inlets for air and steam, gas-superheating retorts located in said generator and communicating with the interior thereof above the bed of fuel, a valve connected with one of said retorts, a hydrocarbon-vapor generator having at its top an inlet for oil and provided below the bed of fuel with inlets for air and steam, and a pipe for conducting hot hydrocarbon vapors from the hydrocarbon-vapor generator into the water-gas generator, substantially as described.

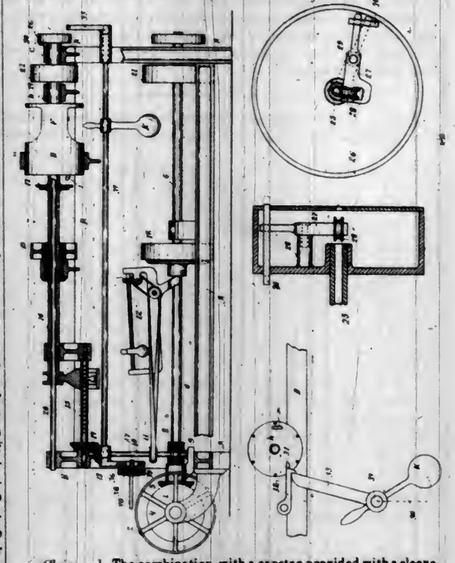
2. In an apparatus for the manufacture of carbureted water-gas, the combination, with a water-gas generator, of a generator for hydrocarbon vapors provided with a grate and having doors above and below said grate, superheating air and steam pipes located in the refractory lining of said hydrocarbon-vapor generator and discharging below the bed of fuel therein, a pipe for the admission of oil into the upper part of said hydrocarbon-vapor generator, and a pipe for conducting the hot hydrocarbon vapors from said last-named generator into the water-gas generator, substantially as described.

3. In an apparatus for the manufacture of carbureted water-gas, the combination of a water-gas generator having a valve in its upper part and provided with inlets for air and steam below the bed of fuel, gas-superheating retorts located in the said generator and communicating with the interior thereof above the bed of fuel, couplings that connect the ends of said retorts outside the generator, a valve in one of said couplings, a hydrocarbon-vapor generator provided at the top with an inlet for oil and having air and steam inlets below the bed of fuel, a pipe for conducting hot hydrocarbon vapors from the hydrocarbon-vapor generator into the water-gas generator, and a pipe for conveying gas from the superheating-gas retorts of the water-gas generator into a washer or holder, substantially as described.

4. In an apparatus for the manufacture of carbureted water-gas, the combination of a water-gas generator having the valve 21 at its top, the steam-superheaters 7, located in the refractory lining of said generator, the steam-pipes 9 and 10, extended through and forming part of said superheaters, the gas-superheating retorts 15 and 16, located in and extended across the upper portion of said generator and communicating therewith, the valve 22, communicating with one of the retorts, a hydrocarbon-vapor generator having superheating air and steam pipes 33 and 37, provided with branches 35 and 38, communicating with the lower part of the generator, the oil-inlet pipe 39 for the admission of oil into the top of the hydrocarbon-vapor generator, the pipe 40 for conducting hot hydrocarbon vapors from the hydrocarbon-vapor generator into the water-gas generator, the water seal 25, and the pipe 20, connecting the said water seal with the gas-superheating retorts in the water-gas generator, substantially as described.

480,162. VEHICLE-WHEEL. WILLIAM E BAKER, Newport News, Va. Filed Oct. 20, 1891. Serial No. 409,247. (No model.)

Claim.—1. A hub for vehicle-wheels, comprising a central ring or sleeve provided with a series of spoke-sockets arranged in two alternate series and opening at the respective faces of said ring or sleeve, a front and rear section, and a bushing disposed in the bore of said parts and adapted to bind the same together, substantially as set forth.

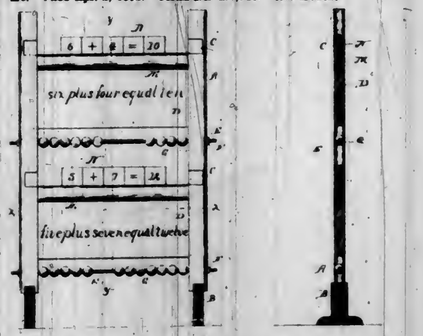


2. A hub for vehicle-wheels, comprising a central ring or sleeve provided with radially-arranged spoke-sockets, a front section provided with internal screw-threads, a rear section, and a bushing passing through the rear section and central ring or sleeve and provided with external screw-threads meshing with the threads in the front section, whereby said bushing is secured directly to the latter, substantially as set forth.

3. In a vehicle-wheel, the combination of a hub consisting of a central ring or sleeve carrying the spokes, front and rear sections, and packing-rings interposed between the opposing faces of the ring or sleeve and the front and rear sections, and a bushing disposed in the bore of the hub and binding the parts thereof together, substantially as set forth.

4. In a vehicle-wheel, the combination of a hub consisting of a central ring or sleeve carrying the spokes and provided with transverse screw-threaded apertures at each side, front and rear sections provided with coincident apertures, securing-screws engaging said apertures, and packing-rings interposed between the ring or sleeve and the front and rear sections and provided with apertures for the passage of said screws, and a bushing disposed in the bore of the hub and binding the parts thereof together, substantially as and for the purpose set forth.

480,163. SPINDLE AND FLIER. JACOB BALDNER, Xenia, Ohio. Filed Mar. 22, 1892. Serial No. 426,894. (No model.)



Brief.—To the end of the hollow flier-shaft is fixed a pulley. To this pulley is pivoted a rocker-arm 27, carrying a roller over which the yarn passes. When the yarn breaks, the rocker-arm is thrown inward by centrifugal force, thereby drawing out the slide 30, which releases the catch 32 from the arm of the belt-shipping shaft 34.

Claim.—1. The combination, with a capstan provided with a sleeve-shaft and a driving-pulley, of a rocker-arm pivoted to said pulley, a friction-pulley mounted in said rocker-arm and arranged opposite the opening in the sleeve-shaft of the capstan, said rocker-arm pivoted to turn inwardly by centrifugal force, and unshipping mechanism operated by the movement of said rocker-arm, substantially as described.

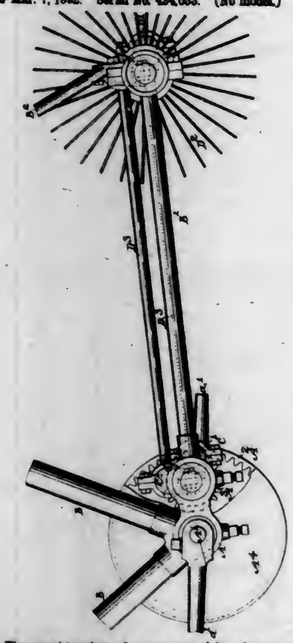
2. The combination, with the driving-pulley 26, of the rocker-arm 29, carried within said pulley, the unshipping mechanism operated thereby, consisting of the latch 30, catch 32, the rock-shaft 34, and the rocker-arm 33, and the belt-shifting mechanism connected to and operated by the movement of said rock-shaft 34, substantially as described.

480,164. EDUCATIONAL APPLIANCE. SAM S. BARRETT, Salem, Mo. Filed Apr. 2, 1892. Serial No. 427,513. (No model.)

Claim.—1. In an educational appliance, substantially as described, the combination, with the side uprights having vertical grooves or ways in their inner edges and a notch or recess in the front wall of each of said ways or grooves, a blackboard seated in the ways or grooves of the uprights and resting between the same, and a suitable means for connecting the said uprights, of a card-holder having a groove to receive cards and adapted to be introduced into the ways or grooves of the uprights through the notches or recesses in the front walls thereof, substantially as specified.

2. In an educational appliance, substantially as described, the

combination, with the side uprights having vertical grooves or ways in their inner edges and a notch or recess in the front wall of each of said ways or grooves, of a blackboard seated in the ways or grooves of the uprights and resting between the same, a card-holder having a groove to receive cards and adapted to be introduced into the ways or grooves of the uprights through the notches or recesses in the front walls thereof, a connecting-rod taking through the transverse walls of the uprights and having its ends threaded, nuts mounted on the threaded ends of the rod, and counters loosely mounted on said rod, all substantially as specified.

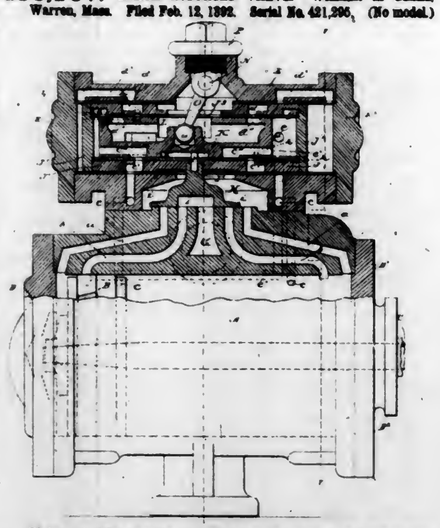


480,165. SURGICAL INSTRUMENT. STERLING V. B. BATES, Charleston, Tenn. Filed Dec. 21, 1891. Serial No. 415,717. (No model.)

Claim.—1. In a surgical instrument, substantially as described, the combination of the hand-levers pivotally connected together and having their contiguous edges corrugated or roughened and the jaws formed integral with said hand-levers in advance of the pivotal connection thereof and having their inner sides dished or beveled, substantially as set forth.

2. In a surgical instrument, substantially as described, the combination of the hand-levers pivotally connected together and the jaws formed integral with said hand-levers in advance of the pivotal connection thereof and having their inner sides dished or beveled, substantially as and for the purpose set forth.

480,166. BICYCLE. ARTHUR J. BATTERSBY, Nottingham, England. Filed Mar. 7, 1892. Serial No. 424,033. (No model.)



Claim.—1. The combination of a two-armed bracket A with the framing B B and B′ B′ of a bicycle, the back ends of the framing B′ B′ forming bearings for the axle D of the driving-wheel D^3 of a bicycle.

2. In a bicycle, the combination of a two-armed bracket A, forming bearings for a pedal-axle A′, with an axle C, provided with two cranks C′, and the pedal-axle carrying a toothed wheel A^2, gearing into a wheel A^1 on the axle C, both wheels being covered by a plate A^4, substantially as described.

3. In a bicycle, the combination, with a pedal-axle, of a two-armed bracket in which said axle is journaled, a second axle C, journaled in the arms of said bracket, a toothed wheel A^2, carried by the pedal-axle, a toothed wheel A^3, carried by the second axle and gearing with the wheel A^2, the cranks C′ C′, and connections between the same and the driving-wheel, substantially as described.

480,167. STEAM-ACTUATED VALVE. WILLIAM H. BLAKE, Warren, Mass. Filed Feb. 12, 1892. Serial No. 421,295. (No model.)

Claim.—1. The combination of the main cylinder, the slide-valve governing the steam supply and exhaust of said cylinder, an auxiliary steam-cylinder, a primary shell-piston working in said auxiliary cylinder and having an opening through its bottom wall, a secondary valve-piston supported in the primary shell-piston and having a longitudinal groove in its under side, an arm or rib extending from the slide-valve and engaging the opening in the primary shell-piston and the groove in the secondary valve-piston, and a main piston working in the main cylinder, substantially as and for the purpose set forth.

2. The combination of the main cylinder, an auxiliary steam-cylinder, a primary shell-piston working in said auxiliary steam-cylinder and governing the steam supply and exhaust of said main cylinder, a secondary valve-piston working in the primary shell-piston and controlling the supply of steam thereto, steam-supply ducts extending from the main cylinder to the opposite ends of the primary shell-piston and communicating with the ends of the secondary valve-piston, independent exhaust-ducts extending from the ends of the primary shell-piston to the ends of the main cylinder, each of said ducts extending to the end of said main cylinder which is opposite to the end of the shell-piston from which it leads, and a main piston working in the main cylinder, substantially as and for the purpose set forth.

3. The combination of the main cylinder, an auxiliary steam-cylinder, a primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said main cylinder, a secondary valve-piston working in the primary shell-piston and controlling the supply of steam thereto, the duct *c*, ports *c′*, and ports *c″*, extending longitudinally through the secondary valve-piston to its ends, suitable steam-supplies for said primary shell-piston, suitable exhausts for said primary and secondary pistons, and the main piston working in the main cylinder, substantially as set forth.

4. The combination of the main cylinder, an auxiliary cylinder, a primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said main cylinder, a hollow secondary valve-piston supported in said primary shell-piston, suitable steam supply and exhaust ducts for said secondary valve-piston, the ports *d*, ducts *d′*, and a steam-supply to the inside of said secondary valve-piston, substantially as set forth.

5. The combination of the main cylinder, an auxiliary cylinder, a primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said main cylinder, a hollow secondary valve-piston working in said primary shell-piston, a steam-supply to said hollow secondary piston, steam-supply ducts *c*, steam-supply ports *c′*, *c″*, and *d*, steam-supply ducts *d′*, suitable independent exhausts for said primary and secondary valve-pistons, and the main piston working in the main cylinder, substantially as set forth.

6. The combination of the main cylinder and the piston therein, the auxiliary cylinder, the primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said cylinder, the secondary hollow valve-piston working in the primary shell-piston and controlling the steam-supply thereto, a steam-supply to the inside of said secondary hollow piston, the ducts *c* and ports *c′* and *c″*, suitable exhausts adapted to be cut off by the movement of the secondary valve-piston before the end of its stroke, and the ports *d* and live-steam-cushion ports *g*, substantially as and for the purpose set forth.

7. The combination of the main cylinder and the piston therein, the auxiliary cylinder, the primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said cylinder, the secondary valve piston working in said primary shell-piston, the ducts *c*, ports *c′* *c″*, arranged so as to be cut off by the movement of the secondary valve-piston, the exhaust-ports *e* and ducts *e′*, also adapted to be cut off by the movement of the secondary piston, whereby the secondary piston will be held between two confined steam-cushions, and suitable means for moving the primary shell-piston and throwing both ends thereof into communication with the exhaust end of the main cylinder, substantially as set forth.

8. The combination of the main cylinder and the piston therein, the auxiliary cylinder, the primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said cylinder, the slide-valve, the secondary valve-piston working in said primary shell-piston, suitable steam supplies for operating both of said valve-pistons, the exhaust-ports *f*, the ducts *f″*, the ports *h*, and the recesses *h′* in the sides of the secondary valve-piston, all arranged and adapted to operate substantially in the manner set forth.

9. The combination of the main cylinder formed with the ducts *a* and *b*, the slide-valve provided with projecting lips *i*, the auxiliary cylinder, the primary valve-cylinder supported in said auxiliary cylinder, the supplemental valve-piston supported in said primary valve-cylinder, the steam-supply ducts *c*, and the exhaust-ducts *e* and *f*, arranged in suitable relation with said primary and secondary valve-pistons, whereby the main piston working in the main cylinder will be cushioned at the end of its stroke at the moment the steam-supply ducts are opened for admitting steam to the valve-pistons for shifting the slide-valve, substantially as and in the manner hereinbefore set forth.

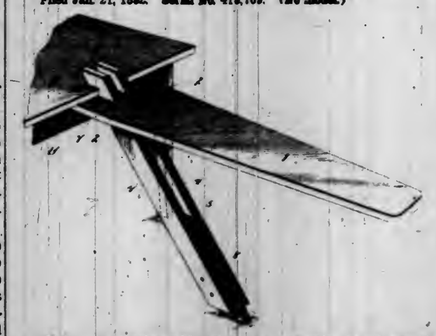
480,168. BOTTLE-CLOSURE. RUDOLPH BLOEMER, Scranton, Pa. Filed Nov. 6, 1891. Serial No. 411,066. (No model.)

Claim.—1. In a closure for bottles, &c. the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover and having the downwardly extending portions at each side passing back of the center line of the bottle, the semicircular loop uniting said downwardly-extending portions and adapted to fit beneath the flange, and the finger-piece at the center of said loop, substantially as described.

2. In a closure for bottles, &c., the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover forward of the center line of the bottle and having the downwardly-exteeding portions at each side passing back of the center line of the bottle, the semicircular loop uniting said downwardly-extending portions and adapted to fit beneath the flange, and the finger-piece at the center of said loop, substantially as described.

3. In a closure for bottles, &c., the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover and having the downwardly-extending portions at each side formed into coils extending back of the pivotal point, the semicircular loop uniting said depending portions, and the finger-piece at the center of said loop, substantially as described.

4. In a closure for bottles, &c., the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover and having the downwardly-extending portions at each side bent inward to bear against opposite sides of the jar, the semicircular loop uniting said downwardly-extending portions and adapted to fit beneath the flange, and the finger-piece, substantially as described.



480,169. PUMP. DANIEL R. CARROW, Akron, Ohio. Filed Feb. 20, 1891. Serial No. 382,208. (No model.)

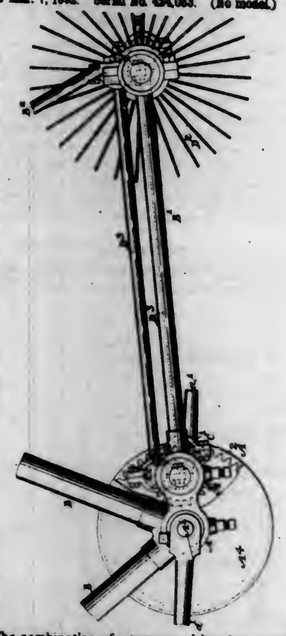
Claim.—1. A continuous and straight-barreled cylinder interiorly screw-threaded at its upper and lower ends, an exteriorly-screw-threaded valve disk or cap 7, vertically adjustable in the lower end of the cylinder on the threads therein and having a central threaded opening 8, an upper exteriorly-threaded valve disk or cap 4, vertically adjustable in the upper end of the cylinder on the threads therein and having a central stuffing-box inclosed within the cylinder, an annularly-flanged valved disk 9, mounted in the central threaded opening 8 of the lower disk 7, an inner auxiliary cylinder 11, secured to said disk 9 and extending upwardly therefrom to a point short of the upper adjustable disk 4, so as to leave a communicating passage between the interior of the auxiliary cylinder and the encircling water-passage, and the hollow plunger moving in said inner auxiliary cylinder and the centrally-located stuffing-box above the same, substantially as set forth.

2. In a pump of the class described, the combination, with a continuous and straight-barreled cylinder, of the plunger comprising the hollow casting 22, having an annular shoulder 24, and a downwardly-extending exteriorly-screw-threaded flange 25, an annularly-flanged disk 26, engaging said flange 25 and forming with the shoulder 24 a dovetailed annnular groove or recess, packing inserted in said dovetailed groove and clamped therein by said flanged disk 26, and a plunger-rod 19 and cage 20, connected with said plunger, substantially as set forth.

480,170. IRONING-BOARD. FREDERICK N. CRAPIN, Austin, Tex. Filed Jan. 21, 1892. Serial No. 418,769. (No model.)

Claim.—An ironing-table comprising an ironing-board provided at its rear end with parallel slots, the ribs 6 and 7, secured to the lower face of the ironing-board and forming grooves or ways, a prop or leg

combination, with the side uprights having vertical grooves or ways in their inner edges and a notch or recess in the front wall of each of said ways or grooves, of a blackboard seated in the ways or grooves of the uprights and resting between the same, a card-holder having a groove to receive cards and adapted to be introduced into the ways or grooves of the uprights through the notches or recesses in the front walls thereof, a connecting-rod taking through the transverse walls of the uprights and having its ends threaded, nuts mounted on the threaded ends of the rod, and counters loosely mounted on said rod, all substantially as specified.

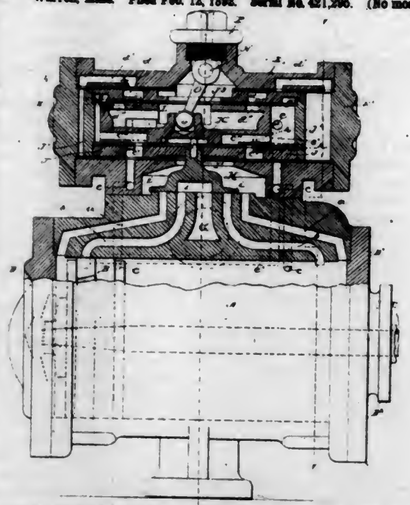


480,165. SURGICAL INSTRUMENT. STERLING V. R. BATES, Charleston, Tenn. Filed Dec. 21, 1891. Serial No. 415,717. (No model.)

Claim.—1. In a surgical instrument, substantially as described, the combination of the hand-levers pivotally connected together and having their contiguous edges corrugated or roughened and the jaws formed integral with said hand-levers in advance of the pivotal connection thereof and having their inner sides dished or beveled, substantially as set forth.

2. In a surgical instrument, substantially as described, the combination of the hand-levers pivotally connected together and the jaws formed integral with said hand-levers in advance of the pivotal connection thereof and having their inner sides dished or beveled, substantially as and for the purpose set forth.

480,166. BICYCLE. ARTHUR J. BATTERSBY, Nottingham, England. Filed Mar. 7, 1892. Serial No. 424,063. (No model.)



Claim.—1. The combination of a two-armed bracket A with the framing B B and B' B' of a bicycle, the back ends of the framing B' B' forming bearings for the axle D of the driving-wheel D^2 of a bicycle.

2. In a bicycle, the combination of a two-armed bracket A, forming bearings for a pedal-axle A^1, with an axle C, provided with two cranks C', and the pedal-axle carrying a toothed wheel A^3, gearing into a wheel A^5 on the axle C, both wheels being covered by a plate A^4, substantially as described.

3. In a bicycle, the combination, with a pedal-axle, of a two-armed bracket in which said axle is journaled, a second axle C, journaled in the arms of said bracket, a toothed wheel A^3, carried by the pedal-axle, a toothed wheel A^5, carried by the second axle and gearing with the wheel A^3, the cranks C' C', and connections between the same and the driving-wheel, substantially as described.

480,167. STEAM-ACTUATED VALVE. WILLIAM H. BLAKE, Warren, Mass. Filed Feb. 12, 1892. Serial No. 421,295. (No model.)

Claim.—1. The combination of the main cylinder, the slide-valve governing the steam supply and exhaust of said cylinder, an auxiliary steam-cylinder, a primary shell-piston working in said auxiliary cylinder and having an opening through its bottom wall, a secondary valve-piston supported in the primary shell-piston and having a longitudinal groove in its under side, an arm or rib extending from the slide-valve and engaging the opening in the primary shell-piston and the groove in the secondary valve-piston, and a main piston working in the main cylinder, substantially as and for the purpose set forth.

2. The combination of the main cylinder, an auxiliary steam-cylinder, a primary shell-piston working in said auxiliary steam-cylinder and governing the steam supply and exhaust of said main cylinder, a secondary valve-piston working in the primary shell-piston and controlling the supply of steam thereto, steam-supply ducts extending from the main cylinder to the opposite ends of the primary shell-piston and communicating with the ends of the secondary valve-piston, independent exhaust-ducts extending from the ends of the primary shell-piston to the ends of the main cylinder, each of said ducts extending to the end of said main cylinder which is opposite to the end of the shell-piston from which it leads, and a main piston working in the main cylinder, substantially as and for the purpose set forth.

3. The combination of the main cylinder, an auxiliary steam-cylinder, a primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said main cylinder, a secondary valve-piston working in the primary shell-piston and controlling the supply of steam thereto, the duct *c*, ports *c'*, and ports *c''*, extending longitudinally through the secondary valve-piston to its ends, suitable steam-supplies for said primary shell-piston, suitable exhausts for said primary and secondary pistons, and the main piston working in the main cylinder, substantially as set forth.

4. The combination of the main cylinder, an auxiliary cylinder, a primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said main cylinder, a hollow secondary valve-piston supported in said primary shell-piston, suitable steam supply and exhaust ducts for said secondary valve-piston, the ports *d*, ducts *d'*, and a steam-supply to the inside of said secondary valve-piston, substantially as set forth.

5. The combination of the main cylinder, an auxiliary cylinder, a primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said main cylinder, a hollow secondary valve-piston working in said primary shell-piston, a steam-supply ports *c'*, *c''*, and *d*, steam-supply ducts *d'*, suitable independent exhausts for said primary and secondary valve-pistons, and the main piston working in the main cylinder, substantially as set forth.

6. The combination of the main cylinder and the piston therein,

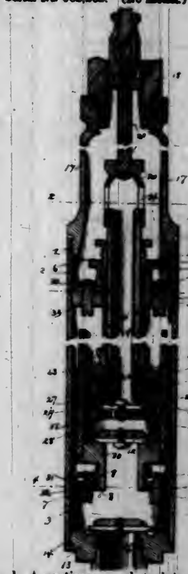
the auxiliary cylinder, the primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said cylinder, the secondary hollow valve-piston working in the primary shell-piston and controlling the steam-supply thereto, a steam-supply to the inside of said secondary hollow piston, the ducts *c* and ports *c'* and *c''*, suitable exhausts adapted to be cut off by the movement of the secondary valve-piston before the end of its stroke, and the ports *d* and live-steam-cushion ports *g*, substantially as and for the purpose set forth.

7. The combination of the main cylinder and the piston therein, the auxiliary cylinder, the primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said cylinder, the secondary valve piston working in said primary shell-piston, the ducts *c*, ports *c' c''*, arranged so as to be cut off by the movement of the secondary valve-piston, the exhaust-ports *e* and ducts *e'*, also adapted to be cut off by the movement of the secondary piston, whereby the secondary piston will be held between two confined steam-cushions, and suitable means for moving the primary shell-piston and throwing both ends thereof into communication with the exhaust end of the main cylinder, substantially as set forth.

8. The combination of the main cylinder and the piston therein, the auxiliary cylinder, the primary shell-piston working in said auxiliary cylinder and governing the steam supply and exhaust of said cylinder, the slide-valve, the secondary valve-piston working in said primary shell-piston, suitable steam supplies for operating both of said valve-pistons, the exhaust-ports *f*, the ducts *f'*, the ports *h*, and the recesses *h'* in the sides of the secondary valve-piston, all arranged and adapted to operate substantially in the manner set forth.

9. The combination of the main cylinder formed with the ducts *a* and *b*, the slide-valve provided with projecting lips *i*, the auxiliary cylinder, the primary valve-cylinder supported in said auxiliary cylinder, the supplemental valve-piston supported in said primary valve-cylinder, the steam-supply ducts *c*, and the exhaust-ducts *e* and *f*, arranged in suitable relation with said primary and secondary valve-pistons, whereby the main piston working in the main cylinder will be cushioned at the end of its stroke at the moment the steam-supply ducts are opened for admitting steam to the valve-pistons for shifting the slide-valve, substantially as and in the manner hereinbefore set forth.

480,168. BOTTLE-CLOSURE. RUDOLPH BLOMER, Scranton, Pa. Filed Nov. 6, 1891. Serial No. 411,066. (No model.)

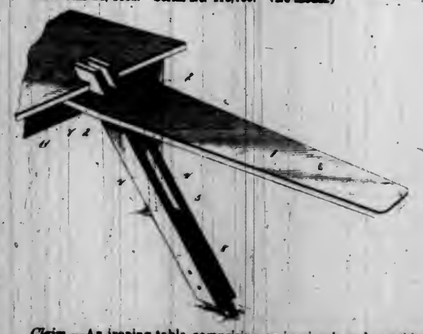


Claim.—1. In a closure for bottles, &c. the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover and having the downwardly extending portions at each side passing back of the center line of the bottle, the semicircular loop uniting said downwardly-extending portions and adapted to fit beneath the flange, and the finger-piece at the center of said loop, substantially as described.

2. In a closure for bottles, &c., the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover forward of the center line of the bottle and having the downwardly-extending portions at each side passing back of the center line of the bottle, the semicircular loop uniting said downwardly-extending portions and adapted to fit beneath the flange, and the finger-piece at the center of said loop, substantially as described.

3. In a closure for bottles, &c., the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover and having the downwardly-extending portions at each side formed into coils extending back of the pivotal point, the semicircular loop uniting said depending portions, and the finger-piece at the center of said loop, substantially as described.

4. In a closure for bottles, &c., the combination, with the bottle having the overhanging flange and cover pivotally connected to the bottle, of the catch pivotally connected to the cover and having the downwardly-extending portions at each side bent inward to bear against opposite sides of the jar, the semicircular loop uniting said downwardly-extending portions and adapted to fit beneath the flange, and the finger-piece, substantially as described.



480,169. PUMP. DANIEL R. CARROW, Akron, Ohio. Filed Feb. 20, 1891. Serial No. 382,202. (No model.)

Claim.—1. A continuous and straight-barreled cylinder interiorly screw-threaded at its upper and lower ends, an exteriorly-screw-threaded valve disk or cap 7, vertically adjustable in the lower end of the cylinder on the threads therein and having a central threaded opening 8, an upper exteriorly-threaded valve disk or cap 4, vertically adjustable in the upper end of the cylinder on the threads therein and having a central stuffing-box inclosed within the cylinder, an annularly-flanged valved disk 9, mounted in the central threaded opening 8 of the lower disk 7, an inner auxiliary cylinder 11, secured to said disk 9 and extending upwardly therefrom to a point short of the upper adjustable disk 4, so as to leave a communicating passage between the interior of the auxiliary cylinder and the encircling water-passage, and the hollow plunger moving in said inner auxiliary cylinder and the centrally-located stuffing-box above the same, substantially as set forth.

2. In a pump of the class described, the combination, with a continuous and straight-barreled cylinder, of the plunger comprising the hollow casting 22, having an annular shoulder 24, and a downwardly-extending exteriorly-screw-threaded flange 25, an annularly-flanged disk 26, engaging said flange 25 and forming with the shoulder 24 a dovetailed annular groove or recess, packing inserted in said dovetailed groove and clamped therein by said flanged disk 26, and a plunger-rod 19 and cage 20, connected with said plunger, substantially as set forth.

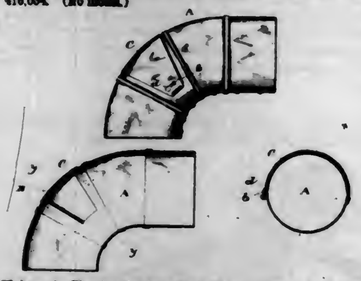
480,170. IRONING-BOARD. FREDERICK H. CHAPIN, Austin, Tex. Filed Jan. 21, 1892. Serial No. 418,769. (No model.)

Claim.—An ironing-table comprising an ironing-board provided at its rear end with parallel slots, the ribs 6 and 7, secured to the lower face of the ironing-board and forming grooves or ways, a prop or leg

composed of parallel bars adapted to fold in said grooves or ways and having their upper ends pivoted between the ribs 6 and 7 and arranged to project through the slots and provided with recesses, an extensible foot-piece arranged between the lower ends of the bars and provided with a longitudinal slot, and the transverse pins arranged in the longitudinal slot and passing through the bars and securing the foot-piece to the latter, substantially as described.

480,171. LATCH. JOHN K. CLARK, Buffalo, N. Y., assignor, by mesne assignments, to Mary K. Clark, same place. Filed Apr. 7, 1891. Serial No. 388,022. (Model.)

Claim.—1. The combination, with a striker, of a latch casing having a slot, a latch pivoted between its ends in the casing and having its rear extremity provided with an angular transverse orifice, and a handle or knob formed as a separate piece from the latch and having an angular shank secured in the angular orifice of such latch, substantially as described.

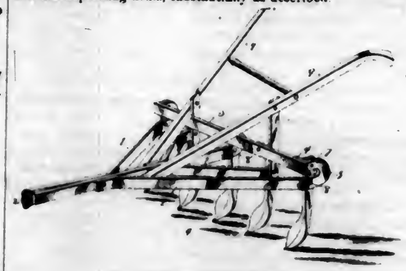


2. The combination, with a striker, of a latch-casing having a slot, a latch pivoted between its ends within the casing and having its rear extremity provided with an angular orifice in coincidence with the slot in the casing, a handle or knob having an angular shank extending through the angular orifice in the latch, and a screw entering the shank of the handle or knob to rigidly attach the latter to the latch, substantially as described.

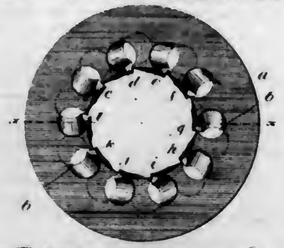
480,172. CHAFE-IRON. HENRY S. COWLES, East Hartford Meadow, Conn., assignor of one-half to William Duffy, same place. Filed Dec. 30, 1891. Serial No. 416,532. (No model.)

Claim.—A chafe-iron for vehicles, consisting of a plate bearing integral ears with integral tapering hubs projecting from their inner faces, a wrought or drawn-steel core supported by the ears and permanently secured thereto, a cylinder surrounding the core, and flexible washers supported by the tapering hubs between the ends of the cylinder and the inner faces of the ears, substantially as specified.

480,173. ELBOW FOR FACILITATING THE CLEANING OF STOVEPIPES. OTTO G. CRANSTON, Kincaid, Kans., assignor of two-thirds to Walter F. Richards, Quincy, Ill. Filed Dec. 24, 1891. Serial No. 416,084. (No model.)



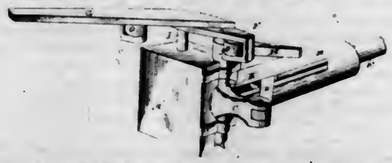
Claim.—1. The herein-described elbow or joint for stovepipes, having in the outer wall of its bend an opening or slot B and a spring-metal pivoted plate designed to close said opening, substantially as specified.



2. The herein-described elbow or joint for stovepipes, having in the outer wall of its bend an opening B and a spring-metal plate adapted to closely fit the surface of the pipe and close said opening, one end of said plate being connected to the pipe by a pivot-pin and an approximately-keyhole-shaped slot in its other end portion designed to engage a headed pin or projection of the pipe, substantially as specified.

480,174. SIDE HARROW AND CULTIVATOR. THOMAS J. CROFT, Hillsville, Miss. Filed Mar. 5, 1892. Serial No. 423,854. (No model.)

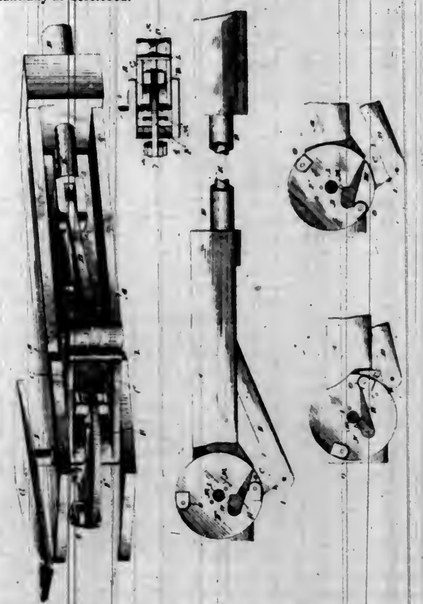
Claim.—A harrow or cultivator comprising a series of edgewise reach-bars connected together at their forward ends and at their rear ends formed with a curve and angular arm, the diagonal bar bolted to said arms, the standards bolted to said curved portions, the handles, and the depending arms, substantially as described.



480,175. SCREW-THREADING DIE. RICHARD J. DEARBORN, Boston, Mass., assignor of one-half to the Trimont Manufacturing Company, Portland, Me. Filed Mar. 31, 1891. Serial No. 387,090. (No model.)

Claim.—The herein described die for cutting teeth on the thin edges of quadrilateral bars, it comprehending a block having inclined series of spiral teeth, each series being arranged with relation to the others, substantially as described, whereby the leading tooth of one series and the cutting-tooth of another series are in a line extending longitudinally through the die and intersecting its center, and clearance-spaces between the series of teeth of less width than the thin edges of the bar to be cut, teeth of two or more series always being in contact with each thin edge of the bar, to operate substantially as described.

480,176. BALING-PRESS. PETER K. DEDERICK, Loudonville, N. Y. Filed Nov. 13, 1889. Serial No. 330,209. (No model.)

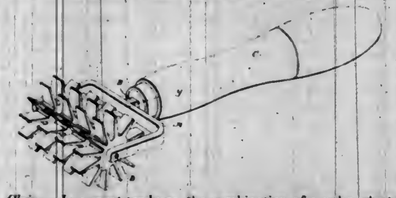


Claim.—In a baling-press power, the combination, with the crank-shaft, crank-arm, pitman, and cam-arm at the upper end of the crank-shaft, of the power-head pivoted on a center independent of the crank-shaft and having the rollers or projections co-operating with and rotating around the cam-arm, substantially as described.

480,177. BALING-PRESS. PETER K. DEDERICK, Loudonville, N. Y. Filed Nov. 13, 1889. Serial No. 330,210. (No model.)

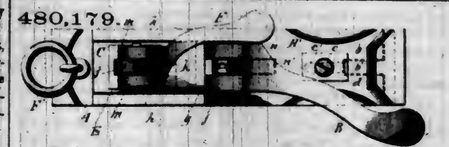
Claim.—1. In a baling-press power, the combination, with the crank-shaft, cam carried thereby, crank, and pitman forming a toggle, of the rotary power-head co-operating with the cam and pivoted on a center located on the side of a line drawn through the crank-shaft and cam when at the forward extreme of its movement, toward which the cam moves during its forward stroke, substantially as described.

2. In a baling-press power, the combination, with the crank-shaft, cam carried thereby, crank, and pitman forming a toggle, of the rotary power-head co-operating with the cam and pivoted on a center located on the side of a line drawn through the crank-shaft and cam when at the forward extreme of its movement, toward which the cam moves during its forward stroke, and forward of a line drawn through the crank-shaft at right angles to the first-mentioned line, substantially as described.



3. In a baling-press power, the combination, with the crank-shaft, cam carried thereby, crank, and pitman forming a toggle, of the power-head having the rollers or equivalent passing around the cam and the projections passing between the crank-shaft and power head pivot, co-operating with the cam to return the same to normal position, substantially as described.

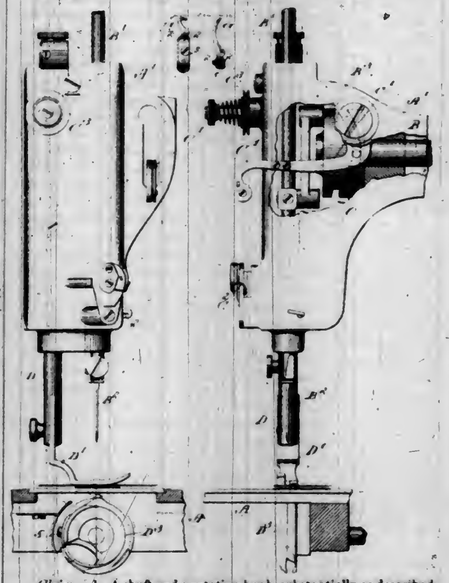
4. In a baling-press power, the combination, with the pitman, crank-shaft, crank, and cam carried thereby of less length than the crank, of the power-head pivoted on the side toward which the cam moves, having the rollers or equivalent co-operating with the cam and passing off the same within the radius of the crank, substantially as described.



5. In a baling-press power, the combination, with the pitman, crank-shaft, crank, and cam carried thereby in advance of the crank, of the power-head pivoted on the side toward which the cam moves in its forward stroke and having rollers or equivalent co-operating with and passing around the cam and between its end and the joint between the crank and pitman, substantially as described.

480,178. BEEF-TENDERER. ALBERT C. DE SHEPPARD, Bloomsburg, Pa. Filed Mar. 5, 1892. Serial No. 423,928. (No model.)

Claim.—In a meat-tenderer, the combination of a yoke adapted to be secured to a handle and having a rod or bar fixed in the arms thereof and non-rotatable, and a series of toothed wheels freely mounted on said rod or bar to provide an independent rotation thereof and having their opposite faces bevsled equally and convergingly from the centers to the peripheries of the same, said wheels being held in proper transverse position by the enlargement in the center of each bearing against a similar enlargement of the adjacent wheel on each side in a loose manner, substantially as described.



480,179. HITCHING DEVICE. DANIEL W. DE SYLVIA, Richmond, Va. Filed Oct. 8, 1891. Serial No. 408,160. (No model.)

Claim.—1. In a clamp or hitching device, the combination, with two sliding plates and a jaw on one end of each plate, of a cam-lever adapted to slide said plates in either direction, a sliding plate adapted to control the degree to which said clamp may be opened, and a clamp for maintaining said sliding plate at any desired adjustment, substantially as set forth.

2. In a clamp or hitching device, the combination, with two plates and a jaw at one end of each plate, of a cam-lever for sliding said plates to open or close the clamp, a sliding plate for regulating the degree to which the clamp may be opened, said plate having serrations thereon, a serrated clamping-block located on said plate, and a cam-lever adapted to engage said clamping-block and thus clamp the sliding plate at any desired adjustment, and means for attaching a hitching-strap to said clamp or hitching device, substantially as set forth.

480,180. LOOP-TAKER FOR SEWING-MACHINES. WILBUR F. DIAL, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed Nov. 2, 1891. Serial No. 410,595. (No model.)

Claim.—1. A shaft and a rotating hook, substantially as described, fixed thereto and having a point and a heel and having fixed to it at its heel end a loop-receiving finger having its point or free end located back of the regular point of the hook, the said finger receiving upon its point directly from the point of the hook the loop cast upon the finger, being free to pass substantially to the base thereof, the finger serving to detain and expand the loop so cast upon it until the needle has again descended and passed through the said loop and the regular point of the hook has entered a new loop of needle-thread, as and for the purposes set forth.

2. In a sewing-machine, the following instrumentalities, viz: a needle-bar having an eye-pointed needle, means to reciprocate the same, and a rotating shaft provided with a hook fast thereon and having a loop-taking point, as *d*, to enter the loop of needle-thread and having a loop-receiving finger, as *a*, fixed to it at its heel, said finger being secured thereto at a distance from the point of the hook in the direction of its rotation, the said finger terminating at its free end at a distance behind the point *d* of the hook and within the circular path traveled by the beak of said hook, the said finger being adapted in the rotation of the hook to have cast about it from the point *d* of the hook the loop of needle-thread, said finger by entering the loop serv-

ing to detain and spread the same while the needle in its next descent penetrates the loop held by the finger, the finger thereafter discharging the said loop, but not until after the point of the hook has passed through the loop of needle-thread carried through the detained loop, substantially as described.

480,181. SEWING-MACHINE. WILBUR F. DIAL, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed May 21, 1892. Serial No. 433,836. (Model.)

Claim.—1. An eye-pointed needle and a circularly-moving loop-taker provided with a point having as a continuation of it an overhanging cast-off flange or lip, said point having a throat leading inwardly toward the center of motion of the said loop-taker, combined with a bobbin case or shell having an open notch or pocket and containing an under thread, the throat of the loop-taker pulling one-half of the loop of needle-thread into the said open notch or pocket as the loop-taker commences to draw the loop, the part of the loop put into the said notch or pocket remaining therein and being drawn out therefrom after the loop has been cast about the under thread, substantially as described.

2. An eye-pointed needle and a loop-taker provided with a point prolonged by an overhanging flange or lip to serve as a cast-off and having a throat and a needle-clearance space, the throat leading into the said clearance-space toward the center of motion of the loop-taker, and a bobbin case or shell containing an under or second thread, said case having an open notch or pocket into which one-half of the loop of needle-thread is extended and held within the space circumscribed by the loop-taker while the loop of needle thread is being cast about the under or second thread, combined with a take-up to draw the said loop out of said notch or pocket and off from the point of the loop-taker and finish the stitch before the point of the loop-taker in its continued movement again engages the loop of needle-thread, substantially as described.

3. An eye-pointed needle and a loop-taker provided with a point prolonged by an overhanging flange or lip to serve as a cast-off and having a throat and a needle-clearance space, the throat leading into the said clearance-space toward the center of motion of the loop-taker, and a bobbin case or shell containing an under or second thread, said case having an open notch or pocket into which one-half of the loop of needle-thread is extended and held within the space circumscribed by the loop-taker while the loop of needle-thread is being cast about the under or second thread, combined with a take-up to draw the said loop out of said notch or pocket and off from the point of the loop-taker and finish the stitch before the point of the loop-taker in its continued movement again engages the loop of needle-thread and with devices to rotate said loop-taker at a variable speed during the formation of each stitch, substantially as described.

4. An eye-pointed needle and a circularly-movable loop-taker provided with a point, a cast-off flange, a throat, and clearance-space, combined with a bobbin case or shell having at its rear side an open notch or pocket and having an open face for the reception of a mass of under or second thread, substantially as described.

5. An eye-pointed needle and a circularly-movable loop-taker provided with a point, a cast-off flange, a throat, and clearance-space, combined with a bobbin case or shell having at its rear side an open notch or pocket and having an open face for the reception of a mass of under or second thread and provided with a radial fin to enter a groove within the overhanging flange constituting the cast-off, substantially as described.

6. An eye-pointed needle and a circularly-movable loop-taker provided with a point, a cast-off flange, a throat, and clearance-space, combined with a bobbin case or shell having at its rear side an open notch or pocket and having an open face for the reception of a mass of under or second thread and provided with a radial fin to enter a groove within the overhanging flange constituting the cast-off and having a post and locking device, the post receiving about it the under or second thread, substantially as described.

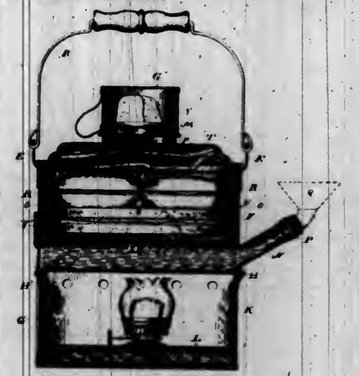
7. A sewing-machine containing the following instrumentalities, viz: an eye-pointed thread-carrying needle, a take-up, a cam to operate the same, a circularly-moving loop-taker provided with a point, a flange or cast-off in continuation thereof and grooved internally, a needle-clearance space, and a throat leading from the point inwardly toward the center of motion of the loop-taker and to the needle-clearance space, a bobbin case or shell having an open face for the reception of a bobbin containing an under or second thread and having a radial fin and at its inner end an open notch or pocket into which the point and throat of the loop-taker puts one-half the loop of needle-thread prior to casting said loop about the under or second thread, said throat holding said loop within the said notch or pocket and within the space circumscribed by said bobbin case or shell until the take-up takes the loop of needle-thread off the point of the hook, and means to restrain the rotation of the said bobbin case or shell with the said loop-taker, substantially as described

480,182. SEWING-MACHINE LOOP-TAKER. WILBUR F. DIAL, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed June 4, 1891. Renewed June 13, 1892. Serial No. 436,420. (No model.)

Claim.—1. A sewing-machine containing the following instrumentalities, viz: an eye-pointed thread-carrying needle, a loop-taker shaft, a circularly-moving loop-taker actuated thereby and having a point to take the needle-thread, and a track, and a loop-shedder the inner wall of which occupies a position in a circle outside the circle of the said track, a bobbin-case holder, and a non-rotating bobbin-case adapted to contain an under thread and provided at its rear side next the face of the loop-taker with a notched flange or projection, as 3, to co-operate with the track in the face of the loop-taker, the said projection and track preventing radial movement of the bobbin-case with relation to the center of motion of the loop-taker, the location of the inner wall of the shedder outside the track affording clearance for the thread between the periphery of the bobbin-case and the inner wall of the said shedder in order that the needle-thread may be passed freely about the bobbin-case while one part of it is contained in the notch in the said lange or projection, the needle-thread being free from impingement or pinching action throughout the entire rotation of the loop-taker, substantially as described.

2. A sewing-machine containing the following instrumentalities, viz: a reciprocating eye-pointed thread carrying needle, a loop-taker shaft, a circularly-moving loop-taker actuated thereby and provided with a point and having a loop-shedder at the rear thereof, and a throat, and a track having its walls located wholly within a circle smaller in diameter than the circle occupied by the inner wall of the shedder and having a clearance-space for the said needle cut radially through the said track, and a non-rotating bobbin-containing case having at its rear side or edge next the loop-taker a notched flange or projection co-operating with the said track and adapted to be restrained thereby against lateral movement with relation to the center of motion of the said loop-taker, the notch in the said flange or projection receiving in it and between it and the face of the loop-taker one half of the loop of needle-thread, retaining it there during the formation of the said loop and while it is being carried about the bobbin-case, the other half of the loop being simultaneously carried over the bobbin-case into the needle clearance-space, further rotation of the loop-taker uncovering the thread-receiving notch and permitting the two halves of the loop to come together in the said notch and rise therefrom, substantially as described.

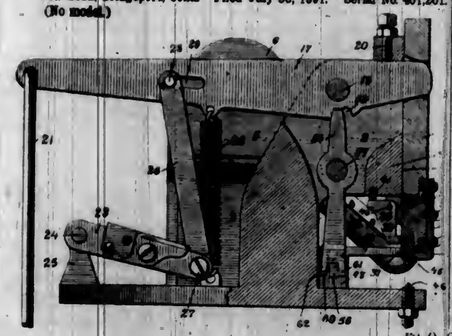
3. A sewing-machine containing the following instrumentalities, viz: a reciprocating eye-pointed thread-carrying needle, a loop-taker shaft, a circularly-moving loop-taker actuated thereby and provided with a point and having a loop shedder at the rear thereof extended around substantially one-half the periphery of the loop-taker and a throat and a track having its walls located wholly within a circle smaller in diameter than the circle occupied by the inner wall of the shedder and having a clearance-space for the said needle cut radially through the said track, and a non-rotating bobbin-containing case co-operating with the said track and adapted to be restrained thereby against lateral movement with relation to the center of motion of the said loop-taker and having a thread-receiving notch, substantially as described, at its inner side or edge next the face of and entering the raceway in the face of the loop-taker, in which notch and between it and the face of the loop-taker one half of the loop of needle-thread is contained during the formation of the said loop and while it is being carried about the bobbin-case, the other half of the loop being simultaneously carried over the bobbin-case into the needle-clearance space, further rotation of the loop-taker uncovering the thread-receiving notch and permitting the two halves of the loop to come together therein, the said bobbin-case having a tension device attached thereto, substantially as described.



480,188. PAVEMENT. ROBERT D. DUFF, Tacoma, Wash. Filed Mar. 10, 1891. Renewed May 21, 1892. Serial No. 433,796. (No model.)

480,188.

Claim.—In a wooden pavement of the character hereinbefore indicated, the combination, with the paving-blocks proper B, having a dovetailed base portion *b b* and separated by narrow spaces, of the wooden stringers A, having upper dovetailed portions *a a*, that interlock with the blocks B, and the tie-rods G, passing transversely through the base portions of the said stringers and beneath the paving-blocks, all as shown and described.



480,184. DINNER-BUCKET. JOHN C. DUNPER, Unionville Centre, assignor to Robert E. Robinson, Plain City, Ohio. Filed June 17, 1891. Serial No. 396,553. (No model.)

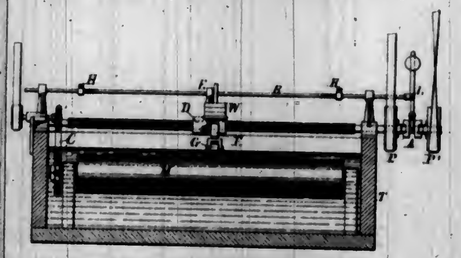
Claim.—1. In a lunch-heater, the combination, with a lamp-heater within a lower portion or casing, a solid upper portion connected thereto and having a false bottom forming a liquid-chamber, and a nozzle for said chamber, of a removable food-receptacle fitting loosely within said upper portion and rising nearly to the upper edge thereof, a steam-tube extending through and above the false bottom, provided with steam-ports and supporting the receptacle, a disk fitting in the upper portion above said receptacle, upon whose edges it rests, the edges of said disk being turned upwardly, and a top or cover closing said upper portion above the disk and provided with an annular flange depending into the space between the wall of the boiler and that of the pan or disk, as and for the purpose set forth.

2. In a lunch-heater, the combination, with a lamp-heater within a lower portion or casing, of an upper portion connected thereto and having a false bottom forming a liquid-chamber above the heater, an upwardly-inclined nozzle at one end of said chamber, a removable plug on said nozzle, a steam exit vent at the other end rising for some distance along the outer face of the upper portion, said false bottom having a steam-exit opening, and a food-receptacle fitting loosely within said upper portion above the false bottom, as and for the purpose hereinbefore set forth.

480,185. MACHINE FOR SETTING LACING-HOOKS. FREDERICK BEER, Bridgeport, Conn. Filed July 30, 1891. Serial No. 401,201. (No model.)

Claim.—1. The combination of the plate capable of a vertical reciprocation within the hopper, the blade pivoted within said plate and having its edge normally in a horizontal plane, the guard-lip projecting from the upper edge of said plate above the plane of the edge of the blade and separated from the latter by a space sufficient to admit the heads of the hooks, but too narrow to admit the shanks of the latter, means for moving said plate and blade together through the mass of hooks, and means for elevating said blade independent of the plate to deposit the hooks on the chute, substantially as set forth.

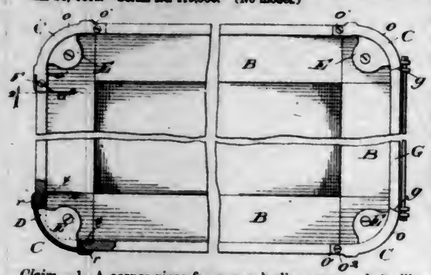
2. The combination of the hopper, the plate adapted to be vertically-reciprocated therein and having an upward-projecting guard-lip, the blade pivoted within said plate, the upper edge of said blade extending normally in a plane below that of said lip, while the blade itself is separated from the lip by a space sufficient only to accommodate the heads of the hooks, the chute which leads to the setting devices, means for elevating said plate and blade together through the mass of hooks, and means for tilting said blade independent of the plate at the end of its upper movement into proper alignment with said chute, substantially as set forth.



3. In a machine of the character described, the combination of the vertically-reciprocating press-gate, the pivoted press-bar loosely connected to said gate and having a recess in its under side, the pivoted block capable of a horizontal movement, the hook selecting and delivering lever pivoted to said block and capable of a vertical movement within prescribed limits, and the pivoted lever whose upper end extends within said recess and whose lower end is connected to the hook selecting-lever, substantially as set forth.

4. The combination of the chute, whose lower end leads to the setting devices, the lever pivoted to a horizontally-swinging block and capable of a vertical movement, said lever extending transversely above said chute, and means for operating said lever, whereby the same is raised above the lowermost hook, swung to a plane in the rear thereof, depressed immediately behind said hook, and finally thrown forward, thereby delivering said hook to the setting devices, substantially as set forth.

5. The combination of the reinforce-block secured to the press-gate, the setting-head pivoted to the latter, the spring-bolt normally maintaining the position of said head, and the face plate secured to said head and capable of a vertical play and having integral therewith the setting-toe, which latter extends immediately beneath said block, substantially as shown and described.



6. In a machine for setting lacing-hooks, the herein-described device for selecting and lifting said hooks, with their heads extending in one direction, from a mass of such hooks within a hopper, said device comprising a blade pivoted to a plate, and a guard-lip projecting from said plate above the plane of the edge of the blade and separated from the latter by a space sufficient to admit the heads of the hooks, but too narrow to admit the shanks of the latter, in combination with means for reciprocating said plate and blade together vertically through the mass of hooks and means for tilting said blade on its pivotal point independent of the plate at the end of its upward movement, substantially as set forth.

480,186. METHOD OF MANUFACTURING TUBES. FRANCIS E. ELMORE and ALEXANDER S. ELMORE, Leeds, assignors to Elmore's American and Canadian Patent Copper Depositing Company, Limited, London, England. Filed Aug. 12, 1891. Serial No. 402,447. (No specimens.) Patented in England Mar. 23, 1891, No. 5,167; in Luxemburg June 1, 1891, No. 1,456, and in Italy June 10, 1891, LVIII. 229.

Claim.—The herein-described method of manufacturing tubes, which consists in subjecting a thin shell of metal first deposited on a mandrel to the pressure of a narrow roller or set of rollers caused to travel along it short of one end to loosen the same, thereafter depositing to desired thickness on the shell thus loosened, and separating therefrom the portion over which the roller or rollers have not been caused to pass.

480,187. CORNER-IRON FOR WAGON BODIES OR SEATS. EDWIN FISH, Elkhart, Ind., assignor to S. D. Kimball, Chicago, Ill. Filed Jan. 28, 1892. Serial No. 419,555. (No model.)

Claim.—1. A corner-piece for wagon bodies, seats, and the like, comprising a curved plate having an inward-projecting flange D, constituting a brace, presenting an angular configuration at its inner edge for the reception of the sill end, substantially as described.

2. A corner-piece for wagon bodies, seats, and the like, comprising a curved plate having at its lateral edge a double flange producing a mortise for the reception of the panel, substantially as described.

3. A corner-piece for wagon bodies, seats, and the like, comprising a curved plate having at each lateral edge a mortise to receive the panels and provided on its top with a curved strip projecting beyond the sides, substantially as described.

4. A corner-piece for wagon bodies, seats, and the like, comprising a curved plate provided with means for attaching the panels and sills thereto and provided with an upward-projecting stud F for the attachment of the dasher-rod, substantially as described.

5. A corner-piece for wagon bodies, seats, and the like, comprising, in combination, a curved plate C, inward-projecting flange at the lower end in the form of a brace D, presenting an angular configuration, double flanges affording mortises at each side of the plate for the reception of the side and end boards, curved plate o at the top of the plate and extending beyond the sides thereof, and shelf E, projecting inward from the plate C, substantially as and for the purpose set forth.

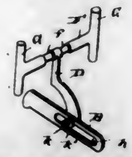
480,188. PENCIL. ALFRED FORNANDER, New York, N. Y. Filed Mar. 17, 1892. Serial No. 425,343. (No model.)

Claim.—1. In a pencil, a number of individual marking-points, a magazine containing said points, a push-piece, and means adapted to be actuated thereby to renew the points, substantially as described.

2. The combination, in a pencil, of a magazine containing a number of individual marking-points, a point-holding nose, a pusher adapted to hold the points in said nose individually, and means for discharging the worn or broken points out of said point-holding nose below or in advance of the points in reserve in the magazine, substantially as described.

3. The combination, in a pencil, of a magazine containing a number of individual marking-points, a point-holding nose, a pusher adapted to hold the points in said nose individually, and means for discharging the worn or broken points backward out of said point-holding nose below or in advance of the points in reserve in the magazine, substantially as described.

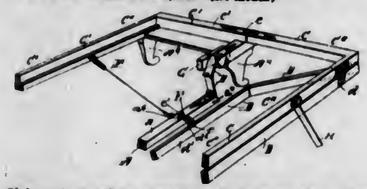
4. The combination, in a pencil, of a magazine containing a number of individual marking-points, a point-holding nose, a pusher adapted to hold the points in said nose individually, a discharge-opening for the worn or broken points through the side of the magazine above or back of the point-holding nose, and an adjustable cover for said opening, substantially as described.



5. The combination, in a pencil, of a magazine containing a number of individual marking-points, a point-holding nose, a pusher adapted to hold the points in said nose individually, a discharge-opening for the worn or broken points through the side of the magazine above or back of the point-holding nose, and a cover for said opening consisting of the point-holding pusher, substantially as described.

6. The combination, in a pencil, of a magazine containing a number of individual marking-points, a point-holding nose, a pusher adapted to hold the points in said nose individually, a tube inclosing the magazine and having the pusher attached, said tube and magazine movable lengthwise relatively to each other, and a spring actuating the pusher, substantially as described.

7. The combination, in a pencil, of a magazine containing a number of individual marking-points, a point-holding nose, a pusher adapted to hold the points in said nose individually, a discharge-opening for the worn or broken points through the side of the magazine above or back of the point-holding nose, a tube inclosing the magazine and having the pusher attached, said tube and magazine movable lengthwise relatively to each other, and a spring actuating the pusher, substantially as described.



8. The combination, in a pencil, of a magazine containing a number of individual marking-points, a point-holding nose, a discharge-opening through the side of the magazine above or back of the point-holding nose, the spring point-pusher, and discharge-opening cover, the tube inclosing the magazine and having the pusher attached, said tube and magazine movable lengthwise relatively to each other, and the ledge of the discharge opening adapted to effect the lateral movement of the pusher, substantially as described.

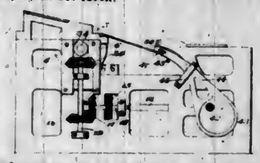
480,189. GATE-LATCH. JAMES T. FOX, Sherman, Tex., assignor to W. H. Torian, same place. Filed Apr. 30, 1892. Serial No. 431,259. (No model.)

Claim.—A gate-latch comprising the latch-bar B, having therein a longitudinal slot *h*, the arm D, connected to the intermediate portion of said bar by a bolt or pin *k*, passing adjustably through said slot, said arm being curved forwardly at its upper portion, and a transverse handle-bar F, rigidly secured to the upper end of said arm, said handle-bar having a central reduced portion *f*, forming a journal for its rocking support on the gate-post, substantially as specified.

480,190. BED-LOUNGE. ALBERT L. GILLES, Bradford, Mass. Filed Feb. 5, 1892. Serial No. 420,412. (No model.)

Claim.—1. A sofa-bed consisting of a stationary frame and a folding section hinged together to sustain a suitable mattress, the stationary frame provided with a suitable head-rest, back-rest, and vertical sustaining-legs and with suitable stops, guide-pieces on said stops, a vertically-movable traveling rail connected by toggle-joints with said stops, straps connecting said traveling rail with the stationary frame, and the folding section provided with swinging legs, a rectangular seat-frame hinged to said folding section, and links connecting said seat-frame to the traveling rail, whereby said traveling rail is vertically raised and lowered by the movement of the folding section, substantially as set forth.

2. In a sofa-bed, the combination of a stationary and of a folding section hinged together, the front rail of the stationary section being suitably severed and engaged with the same by toggle-joints, as described, and laterally governed by suitable chalks and straps, and links connecting the folding section with the front rail, whereby said rail is vertically raised or lowered through the movement of the folding section, substantially as described.



3. In a sofa-bed, a stationary section having its front rails designed to be vertically raised and lowered, a folding section hinged to the stationary section, and links connecting the folding section with the front rail of the stationary section, whereby the said front rail is vertically raised and lowered by the movement of the folding section, substantially as described.

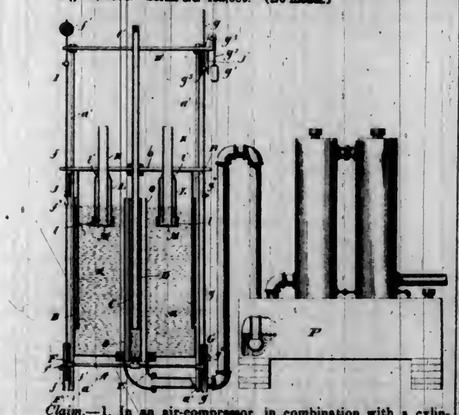
480,191. PRINTING-PRESS. JAMES HACKETT, Taunton, Mass. Filed Sept. 16, 1891. Serial No. 405,892. (No model.)

Claim.—1. In a printing-press, the combination, with the fountain-roller having a ratchet-wheel at one end, of the main driving-shaft, a cam mounted upon said shaft, the spring-regulated pawl-plate loosely mounted adjacent to said cam and operated thereby, and a pawl adjustably secured to the upper end of said plate and adapted to engage said ratchet-wheel, substantially as set forth.

2. In a printing-press, the combination, with the fountain-roller having a ratchet-wheel at one end, of the main driving-shaft, the cam mounted upon said shaft, a vertical pawl-plate having a lower bifurcated end taking over said shaft, and a friction-roller engaged by the periphery of said cam, and a pawl having a diagonal slot adjustably secured to the upper end of said pawl-plate and adapted to engage said ratchet-wheel, substantially as set forth.

3. In a printing-press, the combination, with the fly thereof, of the main drive-shaft, an eccentric carried by said shaft, an eccentric arm or pitman operated by said eccentric, and means for loosely connecting one end of said eccentric arm or pitman eccentrically with said fly, substantially as set forth.

4. In a printing-press, the combination, with the fly thereof, of the pin extending laterally from one end of the fly block or shaft and eccentrically to the journals thereof, the main drive-shaft, an eccentric mounted on said shaft, and an eccentric arm or pitman having a sleeve working over said eccentric, and a longitudinally-disposed slot at its outer end engaging said fly pin or arm, substantially as set forth.



480,192. MOP-WRINGER. ALFRED H. HAFER, Cleveland, Ohio. Filed Oct. 19, 1891. Serial No. 408,180. (No model.)

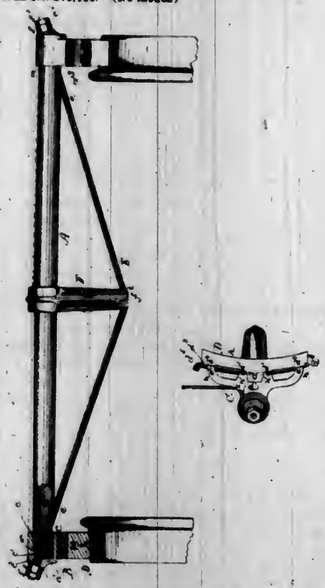
Claim.—1. In a mop-wringer, a stationary roller secured to a removable support near the edge of a bucket, a movable roller mounted upon the shorter arm of a foot-lever, also secured to said removable support and adapted to be brought into engagement with the stationary roller by the movement of the lever, and a projecting prop secured to said support in close proximity to the pedal extremity of the lever, substantially as described.

2. In a mop-wringer, vertical straps detachably secured to the side of a bucket and connected above the pail by a horizontal strap resting therein, bearings on side extensions of said strap to support a roller, and angular extensions of the said strap extending inwardly toward the roller and separating an enlarged central portion of the roller from end extremities of lesser diameter, substantially as described.

480,193. AIR-COMPRESSOR. JOHN G. HAINES, Omaha, Nebr. Filed Aug. 17, 1891. Serial No. 402,389. (No model.)

Claim.—1. In an air-compressor, in combination with a cylinder or tank containing a liquid, a cylinder or shell movable within the other and an air-inlet-controlling valve carried by the same, having a liquid seal contained in a cup that is adapted to be plunged into the liquid contained in the tank, substantially as and for the purpose set forth.

2. In an air-compressor, in combination with a cylinder or tank containing a liquid, a cylinder or shell movable therein and an air-inlet-controlling valve consisting of a pipe or tube open throughout its length, a shell inclosing the same, and a cup inclosing the end of the latter, containing a liquid submerging the end of the shell and a portion of said pipe or tube, substantially as and for the purpose specified.



3. In a valve, in combination, a pipe or tube, a shell surrounding the same, and a cup surrounding an end of said shell adapted to hold water or other fluid to submerge a portion of the shell and the tube inclosed thereby, substantially as and for the purpose shown.

4. In a valve, in combination, a pipe or tube, a shell surrounding the same, adapted to permit passage of air, and a cup surrounding an end portion of said shell adapted to hold a liquid to submerge the portion of the shell inclosed thereby and a portion of the tube within the shell, the inclosed portions of the latter having openings through its sides, substantially as and for the purpose shown.

5. In a valve, in combination, a pipe or tube, a shell surrounding the same, adapted to permit passage of air, and a cup surrounding an end portion of said shell adapted to hold a liquid to submerge the portion of the shell inclosed and a portion of the tube within the shell, the lower end of the latter being provided with numerous slits, substantially as and for the purpose set forth.

6. In an air-compressor, in combination with a tank or cylinder for holding a liquid, a cylinder movable within the same, a piston connected to said second-named cylinder, a cylinder for said piston arranged within the liquid-holding tank, and an air-discharge pipe inclosing the piston-cylinder, the latter being adapted for connection with a source of steam-supply, substantially as and for the purpose described.

480,194. BRAKE-BEAM. PHILIP HIEN, Rock Island, assignor to the National Hollow Brake Beam Company, Chicago, Ill. Filed Apr. 10, 1888. Serial No. 270,188. (No model.)

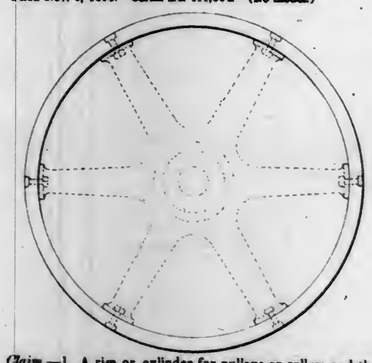
Claim.—1. A metallic brake-beam consisting of a compression member, a tension member, and an interposed strut, the compression member having a camber and the beam structure containing means of adjustment whereby the camber of the compression member is produced and the resiliency of the beam made available.

2. A metallic brake-beam consisting of a hollow compression member, a tension member, and an interposed strut, the compression member having a camber, and the beam structure containing means of adjustment whereby the camber of the compression member is produced and the resiliency of the beam made available.

3. The combination, with a trussed tubular brake-beam having a

slot for the passage of the truss-rod and a notch for the reception of a lug on the brake-head, of a brake-head having a cupped recess for the reception of the end of the beam and provided with a lug adapted to enter the recess in the end of the beam, as set forth.

4. The combination, with a tubular beam notched at its end, of a brake-head having a cupped recess or socket with a lug corresponding to the notch in the end of the tubular beam, as set forth.

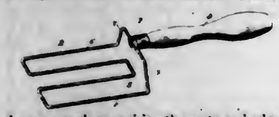


5. A trussed hollow or tubular brake-beam having a camber and having one or more notches at its ends, in combination with brake-heads having cup-shaped recesses, inclined bearings, and one or more projections, and the truss-rod passing through and holding said heads in position.

6. A trussed hollow or tubular brake-beam having a camber, in combination with brake-heads having cup-shaped recesses, a truss-rod passing through and holding said heads in position, and the inclined bearings for supporting the nuts on the end of the truss-rod.

7. In a trussed brake-beam, the combination of a tension member having threaded ends and nuts therefor, a strut, and a cambered compression member which maintains the tension of the parts and prevents the rotation of the nuts, substantially as specified.

8 In a trussed brake-beam, the combination, with a cambered compression member, of brake-heads having cup-shaped recesses for the reception of the ends of the cambered compression member and a tension-rod, substantially as and for the purposes specified.

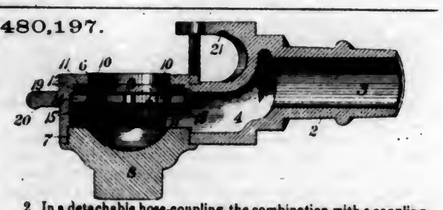


480,195. DRAWING-ROLL. PHILIP H. HOLMES, Gardiner, Me. Filed Nov. 6, 1891. Serial No. 411,064. (No model.)

Claim.—1. A rim or cylinder for pulleys or rollers and the like, consisting of wood fiber compressed into shape, then thoroughly dried, and afterward subjected to a bath of drying and hardening material, substantially as set forth.

2. As an article of manufacture, a rim or cylinder for pulleys or rollers, composed of wood fiber compressed into shape and then dried and hardened and finally treated to a bath of shellac or equivalent drying and hardening varnish, substantially as set forth.

480,196. CURRY-COMB. THEODORE H. IRELAND, Green County, Iowa. Filed Apr. 15, 1892. Serial No. 429,334. (No model.)



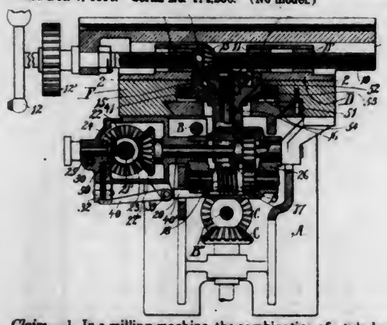
Claim.—A curry-comb comprising the rectangular brushing-frame constructed of a single piece of wire and provided with the central resilient tongue extending inward from the outer end of the frame throughout the entire length of the latter, said wire being extended upward from the sides of the frame and being formed into a tang, and a handle receiving the tang, substantially as described.

480,197. HOSE-COUPLING. ARARIAH W. JACKSON, Chicago, Ill., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa. Filed Dec. 3, 1891. Serial No. 413,909. (No model.)

Claim.—1. In a detachable hose-coupling, the combination, with a coupling-shell having a chamber formed therein and an opening in the face of the coupling of smaller diameter than the chamber, of a gasket fitting in the opening and a compressor-ring having a peripheral screw-thread engaging a screw-thread in the chamber and adjustable independently of the screw-plug in the back of the coupling, substantially as set forth.

480,197.

2. In a detachable hose-coupling, the combination, with a coupling-shell having a chamber formed therein and an opening in the face of the coupling of smaller diameter than the chamber, of a gasket fitting in the opening and provided with a flange bearing against the wall of the shell and a compressor-ring located entirely within the chamber inside of the flange and disconnected from the closing parts of the back of the coupling and having a peripheral screw-thread engaging a screw-thread in the chamber, whereby the compressor-ring may be moved outwardly to clamp the flange of the gasket, substantially as set forth.



3. In a detachable hose-coupling, the combination of a coupling-shell having a chamber formed therein, a removable threaded ring located in the chamber, a compressor having a peripheral screw-thread engaging the thread on the ring, and a gasket fitting in an opening in the face of the coupling and held in place by the compressor, substantially as set forth.

4 In a detachable hose coupling, the combination of a coupling-shell having a chamber therein and an opening in the face of the coupling of smaller diameter than the chamber, a ring fitting in the chamber and screw-threaded on its inner side, and a compressor having a peripheral screw-thread adapted to engage the thread on the ring, whereby the compressor may be moved back and forth, so as to clamp or release a gasket in the opening in the face of the coupling, substantially as set forth.

5. In a detachable hose-coupling, the combination of a coupling-shell having a chamber therein and an opening in the face of the coupling of smaller diameter than the chamber, a screw-threaded ring in the chamber, a screw-threaded compressor fitted in the ring, and a screw-plug fitting in an opening in the back of the shell for the insertion of the ring and compressor, substantially as set forth.

6. In a detachable hose-coupling, the combination of a coupling-shell having a chamber therein and an opening in the face of the coupling, a cylindrical gasket fitting in the opening and provided with a flange on its inner end, a ring bearing on the flange, and a compressor adjustable through the opening in the face of the coupling independently of the back parts of the coupling and adapted to clamp the ring against the flange on the gasket, the compressor being provided with a peripheral screw-thread engaging a screw-thread in the chamber, substantially as set forth.

480,198. MILLING-MACHINE. FRANK KEMPSMITH and THOMAS L. SMITH, Milwaukee, Wis.; said Smith assignor to said Kempsmith. Filed Dec. 7, 1891. Serial No. 414,338. (No model.)

Claim.—1. In a milling-machine, the combination of a tubular vertical feed-driving shaft journaled in the turn-table, gearing for actuating said shaft and for connecting said shaft with the table-feeding screw, and a rod passing through the tubular shaft arranged to disengage the actuating-gearing, substantially as described.

2. In a milling-machine, the combination, with a tubular vertical shaft journaled in the center of the turn-table and geared to the table-feeding screw and to actuating mechanism, of a rod passing through the shaft, movable endwise therein, and means for imparting motion thereto by the movement of the work-table, and thereby to disengage the actuating mechanism, substantially as described.

3. In a milling-machine, the combination of a tubular vertical shaft journaled in the turn-table and geared to the table-feeding screw, a movable rod extending through it, a cam above the rod, arranged to engage with and force it downward, means on the traversing table, adapted to engage and actuate the cam, and a lever below the rod arranged to be tilted thereby and to lift a latch and disengage the feed-driving mechanism, substantially as described.

4. In a milling-machine, the combination of a vertical shaft journaled in the turn-table, geared to the table-feeding screw, and carrying a worm-wheel rigid thereon, with a driven shaft, a worm geared thereto at a right angle to the vertical shaft, and a swinging frame in which the worm is journaled, which frame is pivoted about the driven shaft and arranged to carry the worm into and out of engagement with the worm-wheel, substantially as set forth.

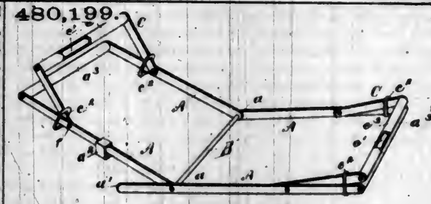
5. In a milling-machine, the combination of a driving-shaft, a driven shaft, a worm geared to the driven shaft and journaled in a swinging frame concentric with the driven shaft, which frame is adapted to swing the worm into and out of engagement with its worm-wheel without affecting its driving connections, and gears on the driving and driven shafts for reversing the direction of motion of the worm, substantially as described.

6. In a milling-machine, the combination of a vertical feed-driving shaft carrying a worm-wheel, a worm mounted in a swinging frame, the swinging frame fulcrumed to carry the worm into and out of engagement with the worm-wheel without affecting its driving connections, and a nest of three bevel-gears, two running loosely on a driving-shaft and provided with inwardly-projecting clutch-faces arranged to be singly engaged by a sliding clutch between them, feathered to said driving-shaft, whereby the third gear, the worm, and worm-wheel can be driven in either direction at will, substantially as shown, and for the purposes set forth.

7. In a milling-machine, the combination of a vertical feed-driving shaft journaled in the turn-table and carrying a worm-wheel, a feed-worm journaled in a swinging frame, arranged to carry the worm into and out of engagement with the worm-wheel without affecting its driving connections, a rock-shaft with a lever on its inner end, engaging the swinging frame, and a hand-lever on its outer end, provided with a pin or detent, and a latch or hook engaging the pin or detent when the worm is engaged with worm-wheel, substantially as set forth, and for the purpose specified.

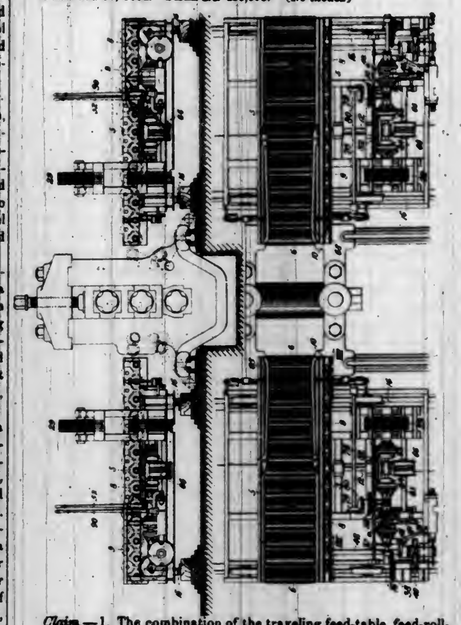
8. In a milling-machine, the combination of a rock-shaft 39, a latch 32, a lever 40, extending under the latch 32, a lever 40', extending under the center of the turn-table, and a vertical rod 41, extending upward through the center of the turn-table, resting on lever 40', and arranged by suitable connections to the work-table to be depressed by the work-table, so as to lift the latch 32, for the purposes set forth.

9. In a milling-machine, the combination, with the shaft 43, journaled in the turn-table and provided with cam 44 and pinion 45, a movable rack provided pin 46, and means on the traversing table for actuating the pin, of the vertical rod 41, passing through the center of the turn-table and movable downwardly by the limited rotation of the cam, latch 32, and a lever actuated by the rod to lift the latch 32, substantially as described.



10. In a milling-machine, the combination of a turn-table consisting of a table supporting and guiding plate, as D, and a guiding and bearing piece, as 52, rigid to the plate and provided with a peripheral conical surface, with a saddle in which the bearing-piece is received, and a contractible clamping-ring provided with an interior conical surface formed to engage the conical surface of the bearing-piece and when contracted to bear evenly against the saddle on surfaces thereof about and on opposite sides of the axis of the bearing-piece, substantially as described.

11. In a turn-table for a milling-machine, the combination of the table supporting and guiding plate D, the bearing-block 51, rigidly attached thereto and provided with exterior cylindrical guiding-surface, exterior conical clamping-surface, and interior shaft-bearing, the split clamping-ring 54, with interior conical surface and upper plane surface encircling cone on bearing-block, and the clamping-screw 55, substantially as shown and described, and for the purposes set forth.



480,199. TROUSERS-STRETCHER. GEORGE S. MACDONALD, Detroit, Mich., assignor, by direct and mesne assignments, to the Trousers Stretcher Company. Filed Feb. 12, 1892. Serial No. 421,281. (No model.)

Claim.—In a trousers-stretcher, the combination, with two frames composed, respectively, of side bars and end bars, one frame being of smaller dimensions than the other, a cross-rod pivotally uniting the inner ends of the side bars, locking means for retaining the frames in a parallel position, frames pivoted to the outer ends of the side bars, carrying cross-bars parallel with the cross-bars of the main frame, means for holding the cross-bars together, and a rubber covering on the cross-bars, substantially as described.

480,199.

480,200. MILL APPLIANCE. WILLIAM H. MADDOCK, Pittsburg, Pa., assignor of one-half to the Riverside Iron Works, Wheeling, W. Va. Filed Oct. 17, 1891. Serial No. 408,995. (No model.)

Claim.—1. The combination of the traveling feed-table, feed-rollers mounted thereon, a drum mounted on the table, and mechanism for driving the rollers, an endless cable encircling the drum and passing to and around an anchored wheel, and an anchored power-drum, substantially as and for the purposes described.

2. The combination of the traveling feed-table having feed-rollers, a driving-drum mounted on the table and connected with the rollers by suitable mechanism, an endless cable encircling the drum, an anchored wheel, an anchored power-drum, and a tautening-drum, substantially as and for the purposes described.

3. The combination of the traveling feed-table having feed-rollers, a power-drum 27 and friction drum 29, mounted thereon, an endless cable, an anchored wheel, and an anchored power-drum, substantially as and for the purposes described.

4. The combination, with the pivoted feed-table, of a lifting-pitman connected thereto, a wheel on the pitman-shaft, a reciprocating rod arranged to engage the wheel and lock the table in its various positions, and a clutch arranged to engage the pitman shaft and raise and lower the table, substantially as and for the purposes described.

5. The combination, with the pivoted feed-table, of a shaft carrying a pitman, arranged to raise and lower the table, a locking-wheel upon said shaft, a reciprocating locking-rod arranged to engage the locking-wheel, a clutch upon the pitman-shaft, and operative connections between the clutch and the locking-rod, substantially as and for the purposes described.

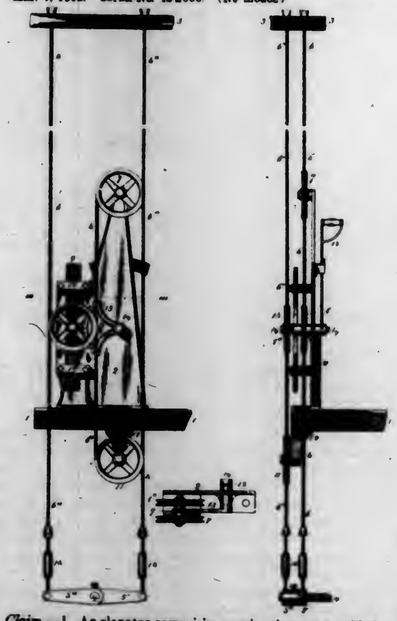
6. The combination, with the laterally-movable feed-table, of a drum carried thereon, a cable wound about the drum and secured at each end, a power-shaft upon the carriage, clutches upon the power-shaft, and mechanism engaging the clutches and drum-shaft and arranged to turn the drum-shaft in opposite directions, substantially as and for the purposes described.

7. The combination, with a feed-table, of a manipulator mounted

thereon, a pivoted rock-arm connected to the manipulator, said arm being arranged to contact with a stationary portion as the table is lowered, and thereby shift the manipulator, and means for raising and lowering said table, substantially as and for the purposes described.

8. The combination, with the movable feed-table mounted on rails, of the manipulator-bars pivotally mounted thereon and rock-arms connected to said bars and having projecting portions arranged to contact with stationary parts as the table is lowered, and thereby move the manipulator-bars inwardly, substantially as described.

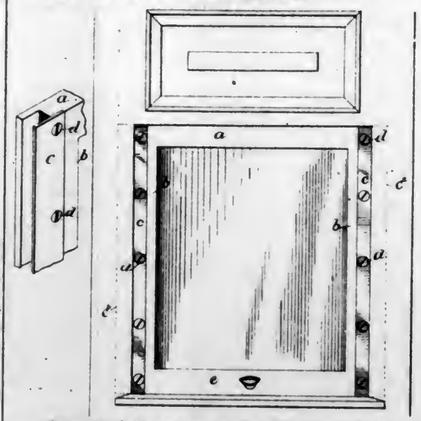
9. The combination, with the pivoted feed-table and feed-rollers thereon, of the two sets of auxiliary feed-rollers between the table and the rolls and sprocket-wheel connections arranged to rotate the sets of auxiliary rollers in opposite directions, substantially as and for the purposes described.



480,201. REFLECTOR. CHARLES A. MEADOWS, Yonkers, N. Y. Filed Dec. 31, 1891. Serial No. 416,721. (No model.)

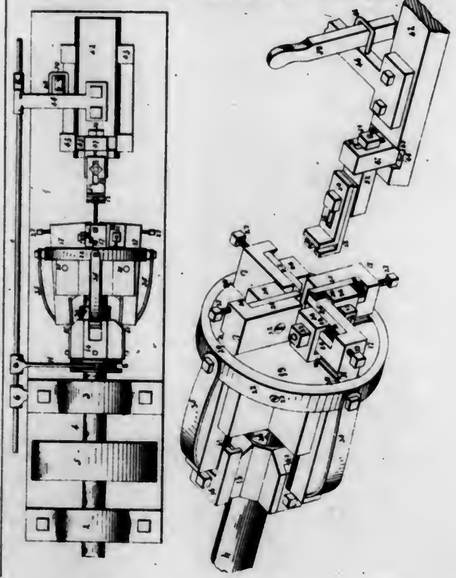
Claim.—1. As an article of manufacture, a reflector for lamps, comprising a body of a rounded or bulb form provided with a rolled and inwardly-curved extension or wing protruding at bottom and sides, as set forth.

2. The combination, with a lamp and a suspending-cord, of a reflector provided with aperture G, and a hook or catch M to engage the cord, as set forth.



480,202. ELEVATOR. EDWARD W. MOON, St. Louis, Mo. Filed Mar. 7, 1892. Serial No. 424,066. (No model.)

Claim.—1. An elevator comprising a cab, a hanger provided with a pulley and depending from the cab-floor, the valve-shaft having arms, the pulley mounted on the side of the cab, the bearings on the side of the cab, the rack-bar adapted to slide in the bearings having inner and outer pulleys, the rope extending from one of the arms over the pulley on the side of the cab under the inner pulley on the rack-bar to the top joist, another rope extending from the other arm over the outer pulley on the rack-bar under the pulley on the hanger to the top joist, and means for shifting the rack-bar, substantially as described.



2. An elevator comprising a cab, a hanger provided with a pulley and depending from the cab-floor, the valve-shaft having arms, the pulley mounted on the side of the cab, the bearings on the side of the cab, the rack-bar adapted to slide in the bearings having inner and outer pulleys, the rope extending from one of the arms over the pulley on the side of the cab under the inner pulley on the rack-bar to the top joist, another rope extending from the other arm over the outer pulley on the rack-bar under the pulley on the hanger to the top joist, and the shaft journaled in the side of the cab having a cog-quadrant meshing with the rack-bar, and a hand-lever, substantially as described.

480,203. WINDOW-SASH. EDWIN MOORE, Brooklyn, N. Y. Filed Feb. 8, 1892. Serial No. 420,811. (No model.)

Claim.—A window-sash rabbeted or cut away at its front vertical edge and a yielding strip of metal attached thereto so as to form in conjunction with the uncut-away-side edge a rectangular groove or edge to said sash, substantially as described, and for the purposes set forth.

480,204. BOLT-THREADING MACHINE. FREDERICK MUTIMER, Rockford, Ill., assignor of one-half to the Rockford Bolt Works, same place. Filed Oct. 9, 1891. Serial No. 408,260. (No model.)

Claim.—1. In a bolt-threading machine, the combination of a revolving head, jaws pivoted therein, dies affixed by clamps to the jaws, said clamps formed with two depending lips, a groove in each jaw for one of the lips, the other lip engaging the bevel-edge of the die, a bolt for holding the clamp in position, and means for opening and closing the dies.

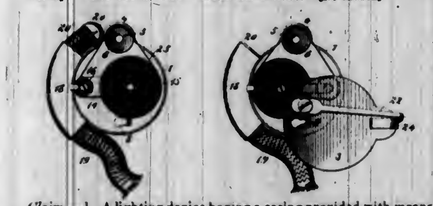
2. In a bolt-threading machine, the combination of a revolving head, jaws pivoted therein, and a movable wedging-hub having radial ribs thereon, one or more of said ribs provided with a slotted plate for receiving the end of one of the pivoted jaws, forming a rotative connection between the hub and the revolving head.

3. In a bolt-threading machine, the combination of a revolving head, jaws pivoted therein, a movable wedging-hub having radial ribs thereon, one or more of said ribs provided with a slotted plate for receiving the end of one of the pivoted jaws, the plate having flanges for engaging the sides of its rib, and means for securing the plate to the rib.

4. In a bolt-threading machine, the combination of a hub having a sliding connection with the driving-shaft and having also a slotted face, jaws located in the slots, and a ring encircling the periphery of the face, forming stops for the jaws.

5. In a bolt-threading machine, the combination of a hub having a rotative connection with the driving-shaft, said hub having a slotted face, jaws located in the slots, a ring encircling the periphery of the face, and springs supported by the ring for operating the jaws.

6. In a bolt-threading machine, the combination of a supporting-frame, a revolving head, dies movably secured therein, ways on the frame, a carriage on the ways, a post on the carriage, having a vertically-elongated opening and capable of lateral adjustment, and a bar movably secured to the post, said bar supporting a bolt-holding device.



7. In a bolt-threading machine, the combination of a revolving head, jaws pivoted therein and having a recess in one face thereof, dies located in the recess and having a bevel-edge, and a clamp secured to the jaw overlying the die and having a lip with a bevel-face engaging the bevel edge of the die, holding it in position.

480,205. WICK-RAISER FOR LAMPS. EDWARD MCDOWELL, Spartanburg, S. C. Filed Sept. 4, 1891. Serial No. 404,695. (No model.)

Claim.—The herein-described wick-raiser, consisting of a vertical tube, an inner tube sliding vertically in the said vertical tube and longer than the same, the lower end of the inner tube being flared and one side thereof provided with a vertical row of holes, a stop at the lower end thereof, and a series of vertical slots on the opposite side of said inner tube, and a shaft having a toothed wheel at its inner end and projecting into the outer tube of the lamp-body, said shaft having a milled wheel at its outer end, all arranged and combined substantially as described.

480,206. POCKET LIGHTING DEVICE. WILLIAM W. MCKENNEY, New York, N. Y., assignor to the Magic Introduction Company, of New Jersey. Filed Oct. 2, 1891. Serial No. 407,520. (No model.)

Claim.—1. A lighting device having a casing provided with means for holding and rewinding within itself a coil of tape consisting of a pin or spindle upon which the coil of tape is mounted and a second pin or spindle which is revoluble, upon which the tape is rewound from the first spindle, both of said spindles being so mounted as to be capable of movement in a straight line, substantially at right angles to the axis thereof, as the tape is wound from the one upon the other, substantially as shown and described.

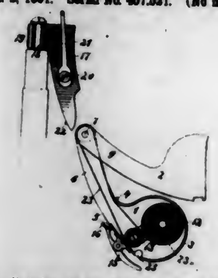
2. The combination, with the casing of a lighting device, one of the walls of which is provided with a straight slot, of a revoluble pin or spindle mounted in said slot and adapted to slide along the same, means located upon the exterior of the casing for revolving said spindle, a spindle or support upon which a coil of tape provided with ignitible pellets may be mounted, which is capable of movement in the same direction as the revoluble pin or spindle, and means for igniting the pellets upon the tape one by one as the same is drawn from the supporting-spindle and rewound upon the revoluble spindle as the same is rotated, substantially as shown and described.

3. A lighting device having means for holding and rewinding a roll of fulminating tape, consisting of a slot, as 13, in one wall of the device, the pins or spindles 15 and 16, adapted to slide in said slot, one of which is revoluble, the plates 14, in which the pins are mounted and by which they are held in position, the plates being also adapted to slide along the slot, and means for rotating the revoluble pin, substantially as shown and described.

4. In a lighting device, the combination, with a casing, of means located within the same for holding and rewinding therein a coil of fulminating tape, a support over which the tape is drawn to be rewound, a removable cover forming one side of the casing, pivotally attached to the main portion thereof in such manner as to be capable of being moved aside at right angles to the axis of the roll of tape within the casing, so as to uncover the same, and a spring-scratcher secured to the cover in such manner that the point thereof will be brought into contact with the fulminating tape upon the support when the cover is in place on the casing, substantially as shown and described.

5. In a lighting device, the combination, with a casing forming a tape chamber, means for holding and rewinding a coil of fulminating tape located within the tape-chamber, a support secured to the casing, over which the tape is drawn in the operation of rewinding, and a spring-scratcher secured to the side of the casing opposite to that upon which the support is mounted, normally in contact with the fulminating tape upon the support when the casing is closed, the side of the casing to which such scratcher is attached being hinged or pivoted to the main portion of the casing in such manner as to be capable of being swung aside at right angles to the axis of the coils of tape within the casing, so as to uncover the tape chamber and remove the scratcher from the support, substantially as shown and described.

6. In a lighting device, the combination, with a casing, of a pin or spindle adapted to receive a coil of tape located therein, a second pin or spindle which is revoluble and adapted to rewind upon itself the tape from the other spindle when rotated, also located in such casing, both of said spindles being so mounted as to be capable of movement substantially at right angles to the axes thereof as the tape is wound from the one upon the other, a support over which the tape is drawn to be rewound, a removable cover forming one side of the casing, pivotally attached to the main portion thereof in such manner as to be capable of being moved aside at right angles to the axis of the roll of tape within the casing so as to uncover the same, and a spring-scratcher secured to the cover in such manner that the point thereof will be brought into contact with the fulminating pellets of the tape upon the support when the cover is in place on the casing, substantially as shown and described.



7. In a lighting device, the combination, with a casing, one of the walls of which is provided with a slot, of a revoluble pin or spindle mounted in said slot and adapted to slide along the same, means for rotating said spindle, located upon the exterior of the casing, a spindle or support upon which a coil of tape provided with pellets of fulminating material may be mounted, capable of movement in the same direction as is the revoluble spindle, also mounted within the casing, a cover for the tape chamber, formed by the casing, so pivoted thereto as to be capable of a sidewise sliding movement at substantially right angles to the axes of the two spindles, a support over which the tape is drawn secured to the casing, and a spring-scratcher secured to the cover in such manner that when the cover is closed the point of the scratcher will come in contact with the tape as the same is drawn over the support, substantially as shown and described.

8. In a lighting device, the combination, with a casing forming a tape-chamber, of means for holding and rewinding a coil of tape located within the tape-chamber, a support secured to the casing, over which the tape is drawn in the operation of rewinding, a pin, as 7, provided with an elongated head, as 8, secured to the casing, a cover provided with a substantially circular opening having an extension, as 10, of the same form as the elongation of the head of the pin 7, and a curved spring-scratcher secured to the cover in such manner that the point thereof will be in proximity to the support when the cover is closed, so as to explode the fulminating material upon the tape as the same is drawn over the support, the construction of the pin 7, head 8, and the cover being such that the cover may be entirely detached from the main portion of the casing when desired, substantially as shown and described.

9. In a lighting device, the combination, with a casing, one of the walls of which is provided with a slot, of a revoluble pin or spindle mounted in said slot and adapted to slide along the same, means for rotating said spindle, located upon the exterior of the casing, a spindle or support upon which a coil of tape provided with pellets of fulminating material may be mounted, capable of movement in the same direction as is the revoluble spindle, also mounted within the casing, a support secured to the casing, over which the tape is drawn in the operation of rewinding, a pin, as 7, provided with an elongated head,

as 8, secured to the casing, a cover provided with a substantially circular opening, having an extension, as 10, of the same form as the elongation of the head of the pin 7, and a curved spring-scratcher secured to the cover in such manner that the point thereof will be in proximity to the support when the cover is closed, so as to explode the fulminating material upon the tape as the same is drawn over the support, the construction of the pin 7, head 8, and the cover being such that the cover may be entirely detached from the male portion of the casing when desired, substantially as shown and described.

480,207. LIGHTING DEVICE. WILLIAM W. MCKENNEY, New York, N. Y., assignor to the Magic Introduction Company, of New Jersey. Filed Oct. 2, 1891. Serial No. 407,531. (No model.)

Claim.—1. In a lighting device for gas or other burners, the combination, with a casing adapted for holding and rewinding within itself a coil of fulminating tape and having an elongated neck or extension provided at its outer extremity with a roller or support over which the tape is drawn, of a sheath or casing into which the elongated neck or extension is inserted and held, means attached to the sheath for exploding the fulminating material upon the tape as the same is drawn over the roller or support, and means for attaching the sheath to the burner, substantially as shown and described.

2. In a lighting device for gas or other burners, the combination, with a casing adapted for holding and rewinding within itself a coil of fulminating tape and having an elongated neck or extension, of a roller or support over which the tape is drawn, located at the outer extremity of the elongated neck or extension of the casing, a sheath or casing into which such neck or extension is inserted, a scratcher secured to the sheath in such manner as to be in contact with the tape upon the roller or support when the neck is in position in the sheath, and means secured to the sheath for attaching the same to the burner, substantially as shown and described.

3. In a lighting device for gas or other burners, the combination, with a casing adapted for holding and rewinding within itself a coil of fulminating tape and having an elongated neck or extension, of a roller or support over which the tape is drawn, located at the outer extremity of the elongated neck or extension, a sheath or casing into which such neck or extension is inserted, a scratcher secured to the sheath in such manner as to be in contact with the tape upon the roller or support when the neck is in position in the sheath, means secured to the sheath for attaching the same to the burner, and a spring-lever, as 15, which operates to hold the sheath and casing together when in position, substantially as shown and described.

4. In a lighting device for gas and other burners, the combination, with a casing provided with an elongated neck or extension, of a roller or support located at the outer extremity of such neck or extension, mechanism located within the casing for holding, drawing over the roller or support, and rewinding within the casing a coil of fulminating tape in such manner that the rewound coil shall occupy substantially the same space that such tape occupied when first inserted in the casing, a sheath or casing adapted to receive and hold the neck or extension, and means attached to the sheath for exploding the fulminating material upon the tape as the same is drawn over the roller or support, substantially as shown and described.

5. In a lighting device for gas and other burners, the combination, with a casing provided with an elongated neck or extension, of a roller or support located at the outer extremity of such neck or extension, mechanism located within the casing for holding, drawing over the roller or support, and rewinding within the casing a coil of fulminating tape in such manner that the rewound coil shall occupy substantially the same space that such tape occupied when first inserted in the casing, a sheath or casing adapted to receive and hold the neck or extension, means for securing the sheath to the burner attached thereto, and a scratcher secured to the sheath in such manner as to be in contact with the tape upon the roller or support when the neck is in position in the sheath, substantially as shown and described.

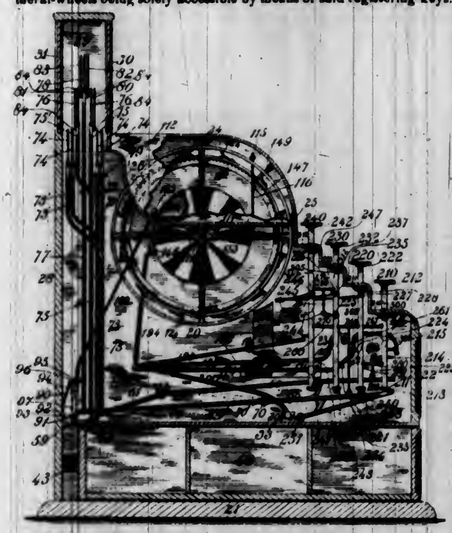
6. In a lighting device for gas and other burners, the combination, with a casing provided with an elongated neck or extension, of a roller or support located at the outer extremity of such neck or extension, a spindle adapted to receive a coil of fulminating tape located within the casing, a revoluble spindle adapted to draw over the roller or support and rewind upon itself the coil of tape upon the other spindle, the supporting-spindle being adapted to slide away from and the rewinding-spindle toward the center of the casing as the tape is rewound upon the rewinding-spindle, means for rotating the rewinding-spindle, a sheath or casing adapted to receive and hold the neck or extension, and means attached to the sheath for exploding the fulminating material upon the tape as the same is drawn over the roller or support, substantially as shown and described.

7. In a lighting device for gas or other burners, the combination, with a casing provided with an elongated neck or extension, of a roller or support located at the outer extremity of such neck or extension, a spindle adapted to receive a coil of fulminating tape located within the casing, a revoluble spindle adapted to draw over the roller or support and rewind upon itself the coil of tape upon the other spindle, the supporting-spindle being adapted to slide away from and the rewinding-spindle toward the center of the casing as the tape is rewound upon the rewinding-spindle, means for rotating the rewinding-spindle, a sheath or casing adapted to receive and hold the neck or extension, and a scratcher secured to the sheath in such manner as to be in contact with the fulminating tape upon the roller or support when the neck is in position in the sheath, substantially as shown and described.

8. In a lighting device for gas or other burners, the combination, with a casing having an elongated neck or extension provided at its outer extremity with a roller or support, one side of said casing being pivoted near the outer extremity of the neck and being free to be swung aside so as to uncover the interior of the casing, of mechanism located within the casing for holding, drawing over the anvil or support, and rewinding within the casing a coil of fulminating tape in such manner that the rewound coil shall occupy substantially the same space that such tape occupied when first inserted in the casing, a sheath or casing adapted to receive and hold the neck or extension, and a scratcher secured to the sheath in such manner as to be in contact with the fulminating tape upon the roller or support when the neck is in position in the sheath, substantially as shown and described.

9. In a lighting device for gas or other burners, the combination, with a casing having an elongated neck or extension provided at its outer extremity with a roller or support, one side of said casing being pivoted near the outer extremity of the neck and being free to be swung aside so as to uncover the interior of the casing, of a spindle adapted to receive a coil of fulminating tape located within the casing, a revoluble spindle adapted to draw over the roller or support and rewind upon itself the coil of tape upon the other spindle, the supporting-spindle being adapted to slide away from and the rewinding-spindle toward the center of the casing as the tape is rewound upon the rewinding-spindle, means for rotating the rewinding-spindle, a sheath or casing adapted to receive and hold the neck or extension, and means attached to the sheath for exploding the fulminating material upon the tape as the same is drawn over the roller or support, substantially as shown and described.

480,208. CASH-REGISTER. WILLIAM K. NICHOLS, San Francisco, Cal. Filed Jan. 4, 1892. Serial No. 417,045. (No model.)



Claim.—1. A cash-register having a permanently-closed case, a series of registering-wheels inclosed within said case and adapted to be actuated independently of each other, a series of registering-keys extending through said case, and adjunctive mechanism connecting said keys with said registering-wheels for operating said wheels to register given sums, said registering-wheels being solely accessible by means of said registering-keys.

2. A cash-register having a permanently-closed case, a series of registering-wheels inclosed within said case and adapted to be actuated independently of each other, a series of registering-keys extending through said case, adjunctive mechanism connecting said keys with said registering-wheels for actuating the latter to register given sums, and connecting mechanism between said wheels for transferring the sum of one wheel to the next, said registering-wheels being solely accessible by means of said registering-keys.

3. A cash-register having a permanently-closed case, a series of numeral-wheels inclosed within said case and adapted to be actuated independently of each other, indicating mechanism also inclosed within said case, a series of registering-keys extending through said case, and adjunctive mechanism connecting said numeral-wheels and said indicating mechanism with said keys, said indicating mechanism and numeral-wheels being solely accessible by means of said registering-keys.

4. A cash-register having a permanently-closed case, a spring-actuated drawer at the bottom of said case, a series of numeral-wheels inclosed within said case and adapted to be actuated independently of each other, a series of registering-keys extending through said case, a drawer locking and releasing mechanism also inclosed within said case and actuated by said keys, and adjunctive mechanism connecting said keys with said numeral-wheels, said numeral-wheels being solely accessible by means of said registering-keys.

5. A cash-register having a permanently-closed case, a spring-actuated drawer at the bottom of said case, a series of numeral-wheels inclosed within said case and adapted to be actuated independently of each other, indicating mechanism also inclosed within said case, a drawer locking and releasing mechanism also inclosed within said case, and a series of registering-keys extending through said case, and an adjunctive mechanism connecting said keys with the said numeral-wheels and indicating mechanism, said indicating mechanism and numeral-wheels being solely accessible by means of said registering-keys.

6. In a cash-register, the combination of a case, registering and adjunctive mechanisms therein, several rows of vertically-sliding keys for actuating the several mechanisms, a sliding spring-actuated drawer, a horizontal yoke-shaped lever pivoted within said case and provided with a latching-dog for engaging said drawer, said lever having bars fixed thereto and disposed in position to be engaged by any key of either row for releasing said drawer, and means for restoring said lever to its normal position.

7. In a cash register and indicator, the combination of a number of indicator-levers, keys actuating said levers, vertical rods actuated by said levers and provided with branches, and numeral-display plates attached to the different branches, the display-plates attached to the branches projecting in one direction exhibiting their numerals on one side and the duplicate display-plates attached to the branches projecting in the other direction exhibiting their numerals on the opposite side.

8. In a cash register and indicator, the combination of a number of indicator-levers, keys actuating said levers, vertical rods of different lengths actuated by said levers, numeral-display plates attached to said rods in different planes, and fixed screens for hiding the plates of the lower planes when in their normal positions.

9. In a cash register and indicator, the combination of indicator-levers, keys actuating said levers, vertical rods actuated by said levers, numeral-display plates attached to said rods in different planes, and screens for hiding some of said plates when in their normal positions, said screens serving as guides for said rods.

10. In a cash register and indicator, the combination of a series of sliding keys, a series of levers the front ends of which are engaged by said keys, rods directly engaged by said levers and lifted thereby, numeral-display plates disclosed by the movement of said rods, a rocking frame latching under said levers for holding said rods in elevated position, an independent releasing-lever for retracting said rocking frame, adjunctive mechanism between said rocking frame and releasing-lever, and an actuator for said releasing-lever common to the several keys.

11. In a cash register and indicator, the combination of indicator-levers, rods actuated by said levers, numeral display plates disclosed by the movement of said rods, a rocking frame for holding the rods in elevated position, a stop on said rocking frame, a weighted pivoted dog on said rocking frame adjacent to said stop, and an indicator-releasing lever adapted to engage said dog for swinging back said rocking frame to release the elevated display-plates.

12. In a cash register and indicator, the combination of indicator-levers, keys for actuating said levers, a pivoted rocking frame having a cam-faced bar for latching under said levers when raised, rods connected with said levers and carrying numeral-display plates, a stop on said rocking frame, a weighted pivoted dog on said rocking frame adjacent to said stop, a drawer-releasing lever actuated by said keys, and an indicator-releasing lever adapted to engage said dog for swinging back said rocking frame to release the elevated display-plates, the front end of said indicator-releasing lever extending under and being actuated by said drawer-releasing lever.

13. In a cash-register, the combination of an arbor, a series of numeral-wheels disposed on said arbor, one of said numeral-wheels having sets of numerals, the numbers in each set ranging from "0" to "95" in multiples of five, and another of said numeral-wheels having sets of numerals, the numbers in each set ranging from "0" to "9," transferring mechanism for transferring the totals of one wheel to the next, a series of cents-keys having numerals from "0" to "95" in multiples of five, actuating mechanism between said cents-keys and the first numeral-wheel, a series of dollar-keys, actuating mechanism between said dollar-keys and the second numeral-wheel, a final numeral-wheel on said arbor disconnected from the keys and having a single continuous series of numerals, and transferring mechanism for carrying the totals of the preceding wheels to said final numeral-wheel.

14. The combination of a series of sliding keys of different values, a yoke-shaped lever having a bar disposed adjacent to said keys, lateral studs disposed on the stems of said keys at different distances from said bar, a spring for retracting said yoke-shaped lever, a registering-wheel, and connecting mechanism between said yoke-shaped lever and registering-wheel.

15. The combination of a series of vertically-sliding keys of different denominations and of different values in each denomination, a series of numeral-wheels of different denominations corresponding with the denominations of the keys, yoke shaped levers for the several numeral-wheels, having their bars disposed adjacent to the said keys, springs for retracting said levers, lateral studs disposed on the stems of said keys at different distances from said bars, and connecting mechanism between said levers and said numeral-wheels.

16. The combination of a series of sliding keys of different denominations and of different values in each denomination, the stems of said keys being provided with lateral studs disposed in different planes, a series of numeral-wheels of different denominations corresponding with the denominations of the keys, yoke-shaped levers for the several numeral-wheels, having bars disposed in the paths of the studs of their respective keys, and connecting mechanism between the numeral-wheels for transferring the sum from the wheel of one denomination to the wheel of the next denomination.

17. The combination of a series of numeral-wheels representing different denominations of figures, a yoke-shaped lever for each numeral-wheel of higher denomination, two yoke-shaped levers for the numeral-wheel of lowest denomination, connecting mechanism between said levers and said wheels for actuating the latter, connecting mechanism between the numeral-wheels for transferring the sum of a wheel of one denomination to a wheel of the next higher denomination, and a series of sliding keys provided with lateral studs disposed in different planes on the key-stems for engaging said levers to actuate said wheels.

18. In a cash register and indicator, the combination of a series of sliding keys, the stems of which are provided with separate series of lateral studs, the studs of one series being disposed in different planes, a drawer-releasing lever engaged by one series of said studs, indicator-levers for actuating the indicating display-plates disposed in position to be engaged by said key-stems, a registering mechanism comprising a series of numeral-wheels, and levers for actuating said numeral-wheels disposed in position to be engaged by the lateral studs of different planes on the key-stems.

19. In a cash-register, the combination of a case, a registering mechanism therein, two or more rows of vertically-sliding keys for actuating said mechanism, a spring-actuated sliding drawer, a horizontal yoke-shaped lever pivoted within said case and provided with a latching pivoted dog engaging said drawer, said lever having bars corresponding to the rows of keys and disposed adjacent to said rows respectively, whereby said lever is directly actuated by any key of either row for releasing said drawer, and means for restoring said lever to its normal position.

20. In a registering mechanism, the combination of a series of numeral-wheels provided with lateral projections, two ratchet-disks fixed on the sleeve of each numeral-wheel after the first, one of said disks shutting within the projections of the adjacent wheel, spring-dogs disposed on said projection, means for depressing said dog to actuate the succeeding numeral-wheel, arms swiveled on the sleeves of said numeral-wheels and carrying pawls engaging the other disks, and means for actuating said pawl-carrying arms.

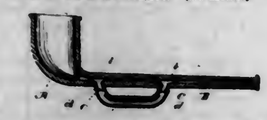
21. In a cash-register, the combination of rows of sliding keys, the stems of which are provided with locking notches or projections,

and locking-plates disposed between said rows, said plates being shifted by contact of a key-stem belonging to either row into engagement with the notches or projections of the key-stems of the other rows, thereby locking the keys of said other rows.

22. In a cash-register, the combination of two rows of sliding keys, the stems of which are provided with locking notches or projections, and a locking-plate disposed between said rows, said plate being shifted by contact of a key-stem belonging to either row, so as to lock the keys of the other row.

23. In a cash-register, the combination of two rows of sliding keys, the stems of which are provided with locking and releasing recesses or projections disposed in different planes, and a locking-plate disposed between said rows, said plate being shifted into position to engage the locking notches or projections on the stems of either row on the partial downstroke of any key of the other row and released on the full downstroke of said key.

24. In a cash-register, the combination of four rows of sliding keys, the stems of which are provided with locking notches or projections, a locking-plate disposed between the first and fourth rows of said keys and provided with slots through which the keys of the second and third rows play, said plate being swung into engagement with the stems of the third and fourth rows of keys on the depression of a key of the first or second row and into engagement with the stems of the keys of the first and second rows on the depression of a key of the third or fourth row, a locking-plate disposed between the first and second rows of keys and adapted to engage the stems of either row on the depression of a key of the other row, and a locking-plate disposed between the third and fourth rows of keys and adapted to engage the stems of either row on the depression of a key of the other row.



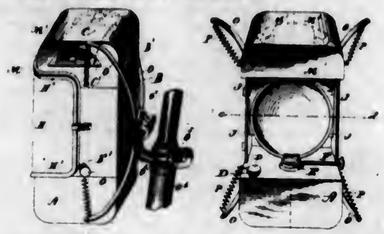
25. In a cash register, the combination of four rows of sliding keys, the stems of which are provided with locking and releasing notches or projections, a locking-plate disposed between the first and fourth rows of said keys and provided with slots through which the keys of the second and third rows play, a locking-plate disposed between the first and second rows of keys, and a locking-plate disposed between the third and fourth rows of keys.

26. In a cash-register, the combination of two rows of sliding keys, the stems of which are provided with cams and with locking notches or projections, pockets extending along said rows of keys and provided with transverse slots through which said stems play, a series of locking-slides in each of said pockets, provided with end notches of less depth than the cam-faced stems, and a locking-plate disposed between said rows, whereby on the depression of a key of either row said plate is shifted into engagement with the notches or projections of the key-stems of the other row and said slides are moved into position to lock the key-stems of the same row.

27. In a cash-register, the combination of two rows of sliding keys, the stems of which are provided with locking notches or projections, a locking-plate disposed between said rows, said plate being shifted on the depression of a key of either row into position to lock the keys of the other row, and mechanism for locking the other keys of the row to which the depressed key belongs.

28. In a cash-register, the combination of a numeral-wheel, an actuating-disk therefor, an arm carrying a pawl for engaging said disk, a spring actuated depressing-lever, a rod connected at its upper end to said pawl-carrying arm and at its lower end with said depressing-lever, two lifting-levers for lifting said depressing-lever and the mechanism connected therewith, and two sets of keys for actuating said lifting-levers.

480,209. TOBACCO-PIPE. ADOLPH OSTERLOH, Richmond, Va. Filed Nov. 17, 1891. Serial No. 412,150. (No model.)



Claim.—1. A tobacco-pipe having its stem provided with a central or direct smoke passage and with lateral openings communicating therewith and having pendent tubular flanges around said lateral openings, and a tubular connection with said lateral flanges external of said central passage, substantially as specified.

2. A tobacco-pipe having its stem provided with a central or direct smoke-passage and with lateral openings communicating with said central passage and having pendent tubular flanges around said lateral openings, and a flexible pipe connection with said lateral flanges external of said central passage, substantially as specified.

3. A tobacco-pipe having its stem provided with a central or direct smoke-passage and with openings communicating therewith and having a chamber below said central or direct passage connecting said openings, substantially as described.

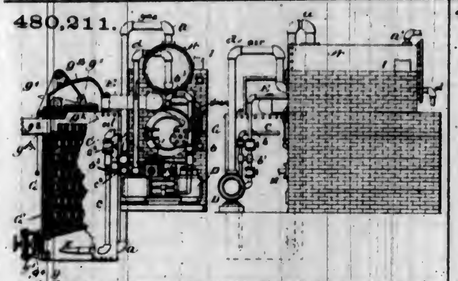
480,210. CYCLE-LAMP. ALBERT H. OVERMAN, Springfield, Mass., assignor to the Overman Wheel Company, Hartford, Conn. Filed Sept. 1, 1890. Serial No. 363,616. (No model.)

Claim.—1. A cycle-lamp having parallel sides and containing an exposed fount, a combustion-chamber, and a hood, all forming divisions of the same body portion, a reflector located in the said chamber, means for supplying a draft of air thereto, a horizontal diaphragm separating the combustion-chamber from the hood, and a bowed glass constructed to extend across the front and partially around the sides of the combustion-chamber, which is thereto appropriately formed, substantially as set forth.

2. A cycle-lamp having continuous exterior lines and containing an exposed fount, a combustion-chamber, and a hood, all forming divisions of the same body portion, an upright partition located in the rear portion of the combustion-chamber, a reflector set into the said partition and forming therewith a draft-flue supplying air to the combustion-chamber, a diaphragm separating the combustion-chamber from the hood and constructed with an opening into the latter, and a bowed glass extending across the front and partially around the sides of the combustion-chamber, which is thereto appropriately constructed, substantially as set forth.

3. A cycle-lamp having parallel sides and containing an exposed fount, a combustion-chamber, and a hood, all forming divisions of the same body portion, a reflector located in the said chamber, means supplying a draft of air thereto, a horizontal diaphragm separating the combustion-chamber from the hood, a bowed glass constructed to extend across the front and partially around the sides of the combustion-chamber, which is thereto appropriately formed, and an upright flange located upon the edges of the upper face of the fount and within the exterior lines of the body portion of the lamp, substantially as set forth.

4. A cycle-lamp having continuous exterior lines of substantially uniform cross-section and containing an exposed fount, a combustion-chamber, and a hood, all forming divisions of the same body portion, an upright partition located in the rear portion of the combustion-chamber, a reflector set into this partition and co-operating therewith to form a draft-flue supplying air to the combustion-chamber, a diaphragm separating the combustion-chamber from the hood and constructed with an opening into the latter, which is ventilated, and a bowed glass extending across the front and partially around the sides of the combustion-chamber, which is thereto appropriately formed, and conforming to the upright lines of the lamp, substantially as described.

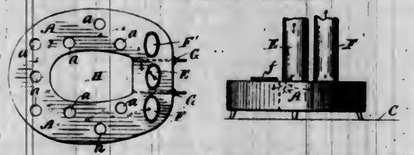


5. The combination, with a cycle-lamp, of a suspension device comprising four springs attached to the lamp on opposite sides thereof and diverging therefrom in radial lines, and means located on opposite sides of the lamp for supporting the outer ends of the said springs and sufficiently separated from the lamp for the radial interposition of the springs between them and it, substantially as set forth, and whereby the lamp is permitted to move in any direction under the control of the springs, which are opposed to each other in tension.

6. The combination, with a cycle-lamp, of a suspension device comprising two longitudinally-bowed carriers, four radially-arranged and tensionally-opposed springs respectively secured to the ends of the said carriers and to the lamp, and means for attaching the said carriers to a vehicle-frame, substantially as described.

480,211. APPARATUS FOR THE MANUFACTURE OF GAS. LEWIS C. PARKER, Indianapolis, Ind. Filed Apr. 4, 1892. Serial No. 427,708. (No model.)

Claim.—1. In a gas apparatus, the combination of the converter having over its upper open end a hood and also a hinged valve or cover, the vaporizer and carburetor having air and oil inlet pipes and gas and residuum outlet pipes, the pipe leading from the vaporizer and carburetor and connecting with the converter near its lower end, the chamber below and partially encompassing said vaporizer and carburetor, and the pipe connecting with said hood and forming an outlet of said converter for the gaseous products of combustion thereof and delivering said products of combustion into said chamber, substantially as set forth.

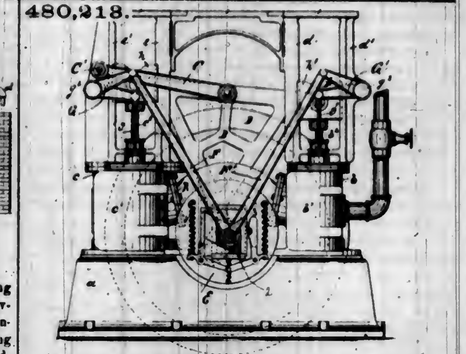


480,211.

2. In a gas apparatus, the combination of the converter having over its upper open end a hood and also a hinged valve or cover having connected thereto a line passing out through said hood within convenient reach for manipulation, the vaporizer and carburetor having air and oil inlet pipes and gas and residuum outlet pipes, the pipe leading from the vaporizer and carburetor and connecting with the converter near its lower end, the chamber below and partially encompassing said vaporizer and carburetor, and the pipe connecting with said hood and forming an outlet of said converter for the gaseous products of combustion thereof and delivering said products of combustion into said chamber, substantially as specified.

3. The gas apparatus or plant comprising the converter having a hinged cover or valve and a hood with gas-outlets at its upper end, and means for operating said cover or valve, the oil vaporizer and carburetor having a series of internal plates, spaced off from the ends thereof at their alternately-opposite ends and having oil and air inlet, gas-outlet, and residuum-discharge pipes, a pipe connecting the hood above the cover of the converter with a chamber below said vaporizer and carburetor, the air-inlet pipe of said vaporizer and carburetor connecting with an air-pump or air source of supply, an oil or petroleum supply pipe connecting with the oil-inlet pipe of the vaporizer and carburetor and connecting with a burner-pipe leading to the combustion-chamber of the converter, and air and steam branch pipes connecting with said burner pipe and with the air-inlet pipe of the vaporizer and carburetor and a steam-pipe of a boiler, respectively, the gas-outlet pipe of the vaporizer and carburetor connecting also with the combustion-chamber of the converter, substantially as specified.

480,212. AUXILIARY BASE FOR STOVES. JOHN D. RASEY, Oshkosh, Wis., assignor of one-half to F. M. Hasbrouck, same place. Filed Feb. 17, 1892. Serial No. 421,869. (No model.)

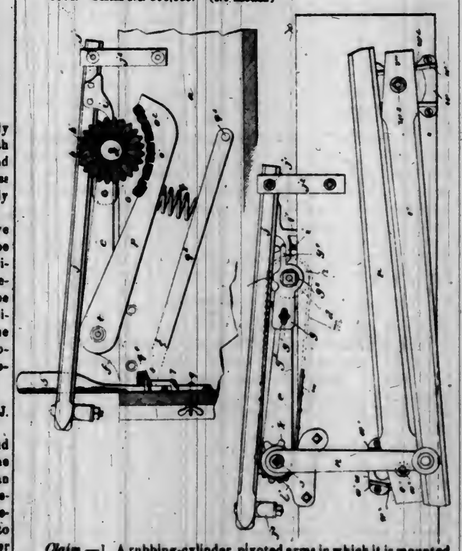


Claim.—1. An auxiliary heating base or drum located directly beneath the stove, connected with the stovepipe, and provided with an inlet-passage, two or more outlet-passages F and F', caps *f*, and damper G, whereby the products of combustion are caused to pass entirely around the drum and thoroughly heat the same, substantially as described.

2. A portable heating-drum located beneath and outside the stove near the floor and connected directly with the stove by an inlet-pipe E, through which the products of combustion pass from the stove directly into the drum, the said inlet-pipe being independent of the stovepipe, and the drum also connected to the stovepipe by an outlet-pipe F, through which the products of combustion pass from the drum directly to the stovepipe, said outlet-pipe F being independent of the inlet-pipe, and a damper G, located in the drum for directing the products of combustion entirely around the drum, substantially as described.

480,213. STEAM-ENGINE. THEODORE SCHEFFLER, Paterson, N. J. Filed Oct. 7, 1891. Serial No. 407,994. (No model.)

Claim.—1. A steam-engine comprising a shaft, two cylinders and their respective valve-chambers, a double guide-frame secured to the top of each cylinder and provided with inner concave surfaces, an elongated slot arranged in the inner portion of each guide frame, cross-heads carrying the piston-rods and adapted to slide within said guide-frames, pockets A^2, arranged in said cross-heads, a slide A^3, adapted to oscillate within said pocket, a triangular beam provided at each outer end with a flattened portion adapted to operate in said slide, a slot



480,213.

arranged in said flattened portion, a pin secured to the cross-head and passing through said slide and slot and adapted to form the fulcrum for the oscillating slide, said triangular beam being adapted by means of its connection to the cross-heads to transmit their motion to the shaft, and a governor adapted to control through eccentrics the valve-chambers and their respective cylinders, all said parts being combined to operate substantially as described, and for the purposes set forth.

2. A steam-engine comprising a shaft, two cylinders and their respective valve-chambers, a double guide-frame secured to the top of each cylinder and provided with inner concave surfaces, an elongated slot arranged in the inner portion of each guide-frame, cross-heads carrying the piston-rods and adapted to slide within said guide-frames, pockets arranged in said cross-heads, a slide adapted to oscillate within said pocket, a triangular beam provided at each outer end with a flattened portion adapted to operate in said slide, a slot arranged in said flattened portion, a pin secured to the cross-head and passing through said slide and slot and adapted to form the fulcrum for said oscillating slide, said triangular beam being adapted by means of its connection to the cross-heads to transmit their motion to the shaft, and a lever pivoted at one end to one of the said guide-frames and at its other end to the center of the upper portion of said triangular beam, all said parts being combined to operate substantially as described, and for the purposes set forth.

480,214. WASHING-MACHINE. JACOB W. SPANGLER, York, Pa., assignor of one-half to Moses E. Hartsler, same place. Filed June 12, 1891. Serial No. 396,005. (No model.)

Claim.—1. A rubbing-cylinder, pivoted arms in which it is mounted to rotate, and a lever-frame for supporting said cylinder and its arms

and for imparting downward pressure thereupon, combined with a rubbing-surface, substantially as described.

2. A rubbing-cylinder, pivoted arms in which it is mounted to rotate, and a lever-frame for supporting said cylinder and its arms and for imparting a downward pressure thereupon, combined with a rubbing-surface supported upon pivoted arms and made yielding with the cylinder, substantially as described.

3. A rubbing-cylinder, pivoted arms in which it has bearings, and a lever-frame supporting the said arms and consequently the cylinder and adapted to impart a downward pressure thereupon, combined with the rubbing-surface, pivoted arms supporting the same, and springs tending normally to force the said arms upwardly, substantially as described.

4. In a washing-machine, a rotary cylinder, pivoted arms in which it is mounted to rotate, and a lever-frame for supporting the cylinder and arms and for regulating the pressure thereupon, combined with an exposed rubbing surface or bed arranged wholly below said cylinder, whereby the clothing being washed is taken from the tub and passed between the cylinder and rubbing-surface back into the tub at the other end and then returned, being exposed to view and subjected to the variable pressure of the cylinder in such passage, substantially as described.

5. In a washing-machine, a rotary corrugated or fluted cylinder adapted to be revolved in either direction, pivoted arms in which it is mounted to rotate, and a lever-frame for supporting the cylinder and arms and for regulating the pressure thereupon, combined with an exposed rubbing surface or bed arranged wholly below said cylinder and yielding supports therefor, whereby the clothing may be run back and forth between the tub and cylinder and bed and rubbed and wet, being exposed to view and subjected to the variable pressure of the cylinder in its passage, substantially as described.

6. The cylinder and its end gudgeons, castings having boxes to receive the said gudgeons, end projections from said castings, a lever-frame having brackets to receive the said projections, and supports for said castings, substantially as and for the purpose described.

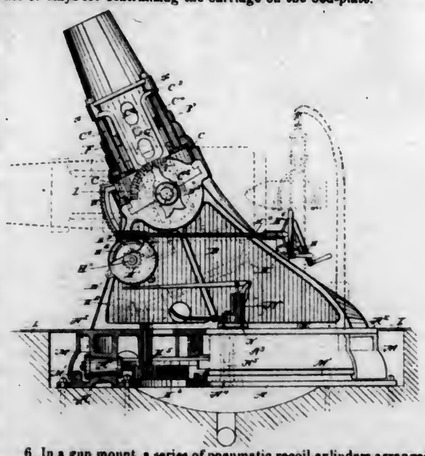
7. A body *a*, provided with sockets *w*, having flanges *w'* cut away at w^2, and legs adapted to fit said sockets longitudinally to support the body and to be turned up transversely of the said sockets and secured thereto, so as to fold the legs substantially within the compass of the body for the purposes of transportation and storage, and bolts to unite the legs and sockets in either position, substantially as described.

8. A rubbing-cylinder, pivoted arms in which it is mounted to rotate, a lever-frame for supporting it and its arms, a rubbing-surface, and pivoted arms in which it is supported, combined with a pressure-regulator comprising springs interposed between the pivoted arms of the rubbing-surface and supports therefor and an adjusting mechanism for raising and lowering the spring-supports to increase and diminish the tension of the springs, substantially as described.

9. A rubbing-cylinder, pivoted arms in which it is mounted to rotate, a lever-frame for supporting it and its arms, a rubbing-surface, and pivoted arms in which it is supported, combined with a pressure-regulator comprising springs, pivoted supports for such springs, the said springs being interposed between the pivoted arms of the rubbing-surface and the pivoted supports, a cross-bar connecting the free ends of the pivoted supports, and a rock-lever engaged by the cross-bar by which the cross-bar may be raised and lowered, substantially as described.

10. A rubbing-cylinder, pivoted arms in which it is mounted to rotate, a lever-frame for supporting it and its arms, a rubbing-surface, and pivoted arms in which it is supported, combined with a pressure-regulator comprising springs, pivoted supports for such springs, the said springs being interposed between the pivoted arms of the rubbing-surface and the pivoted supports, a cross-bar connecting the free ends of the pivoted supports, a rock-lever engaged by the cross-bar, by which the cross-bar may be raised and lowered, and an adjustable fulcrum-piece for said rock-lever, substantially as described.

480,215. MORTAR-CARRIAGE. HARRY A. SPILLER, Boston, Mass., assignor to the Pneumatic Gun Carriage and Power Company, Wheeling, W. Va. Filed Oct. 9, 1891. Serial No. 408,245. (No model.)



Claim.—1. In a gun-mount, an all-round traverse, a circular bed-plate thereon, a carriage on the bed-plate, and means operating independently of the traverse for centralizing the carriage on the said plate.

2. In a gun-mount, an all-round traverse, a circular bed-plate thereon, a carriage on the bed-plate, and rollers operating independently of the traverse for centralizing the carriage on the said plate.

3. In a gun-mount, an all-round traverse, a circular bed-plate thereon, a carriage on the bed-plate, and rollers carried by the bed-plate and operating independently of the traverse for centralizing the carriage thereon.

4. In a gun-mount having an all-round traverse, a circular bed plate or table, checks secured thereon and supporting in bearings the pneumatic recoil-cylinders, which are cast in pairs and arranged on each side of the gun, slide-blocks into which the gun is trunnioned, said slides adapted to work in ways formed between the recoil-cylinders and provided with cross-heads, tubular piston-rods, chambered piston-heads having communicating passages, and a differential cylindrical valve, substantially as and for the purpose described.

5. In a gun-mount, an all-round traverse, a circular bed-plate having pillars or stays, a carriage on the bed-plate, and rollers in the pillars or stays for centralizing the carriage on the bed-plate.

6. In a gun mount, a series of pneumatic recoil-cylinders arranged as described, slide-blocks working in ways between the recoil-cylinders, the elevating-band secured to the slide-blocks, mechanism for elevating and depressing the gun to be controlled by hand-wheels, and a system of tell-tales for indicating the elevation and traverse of the gun, substantially as set forth.

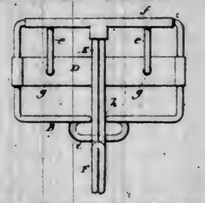
7. In a gun-mount, a series of pneumatic recoil-cylinders arranged as described and provided with trunnions which are supported in bearings in the cheeks of the carriage, slide-blocks working in ways between said recoil-cylinders and into which the gun is trunnioned, the elevating-racks H, pinions H', friction worm-gear H^3, worm H^2, shaft H^4, and hand-wheel H^5, substantially as described.

8. In a gun-mount, a series of pneumatic recoil-cylinders arranged as described and provided with trunnions which are supported in bearings in the cheeks of the carriage, slide-blocks working in ways between said recoil-cylinders and into which the gun is trunnioned, the elevating mechanism and traversing rack K^9, pinion K^8, and worm-gear K^4 on same shaft, worm K^3, and bevel-gears K^2, shaft K', designed to be controlled by hand-wheel K, and a system of tell-tales for indicating the angle of elevation and traverse of the gun, substantially as described.

9. In a gun-mount, an all-round traverse, a circular bed-plate thereon, and a carriage on the said plate having its cheeks provided with trunnion-bearings, in combination with a series of pneumatic cylinders arranged in pairs about the gun, said cylinders having trunnions engaging the trunnion bearings.

10. A carriage and a gun trunnioned thereon, in combination with pneumatic recoil-cylinders arranged in pairs on each side of the gun and trunnioned in the carriage-cheeks, mechanism connecting the cylinders with the gun, air-supply and equilibrium pipes communicating with the cylinders and with a suitable source of supply, and a check-valve for regulating the supply of air to the said pipes.

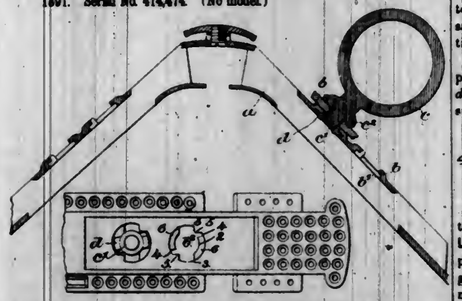
480,216. GAS CAR-HEATER. SAMUEL STEWART, Newark, N. J., assignor to the Stewart Manufacturing Company, of New Jersey. Filed Sept. 4, 1891. Serial No. 404,792. (No model.)



Claim.—1. The combination, with a street-car, of the gas-stove set in the floor of the same and comprising the body *b'*, open at the top, and the inclosed chamber *n*, having the burners *s*, the pipes *k*, extending the whole length of the car and provided with the smoke-flues *l* at the ends, and the hood *q*, connecting the top of the chamber *n* with the said pipes, substantially as and for the purpose set forth.

2. The combination, with a street-car, of the gas-stove set in the floor of the same and comprising the body *b'*, open at the top, and the inclosed chamber *n*, having the burners *s*, the pipes *k*, extending the whole length of the car and provided with the flues *l* at the ends, the hood *q*, connecting the top of the chamber *n* with the said pipes, and a partition *r* in the hood, extending across the pipes *k* to divide the heated air and gases from the stove and direct them equally into each of the pipes *k*, substantially as shown and described.

3. The combination, with a street-car, of a receiver G for compressed gas, the stove set in the floor of the car and provided with the chamber *n* and gas-burners *s*, as described, the heating-pipes *k*, connected with the chamber and extended to the ends of the car, a gas-pipe extended from the receiver to the platform and thence to the burners *s*, a cock in the gas-pipe, accessible from the platform of the car, and an independent pilot-burner adjacent to the said burners, the whole arranged and operated as and for the purpose set forth.

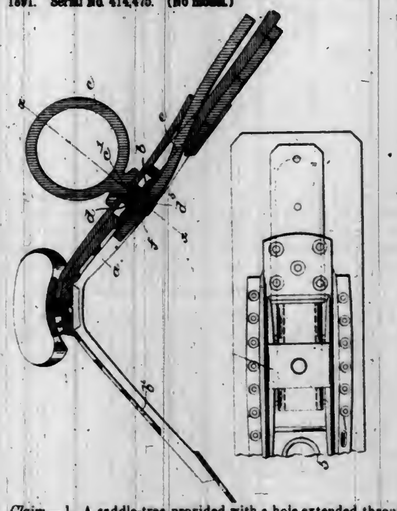


480,217. BUCKLE. JAMES STOVELL, Waterbury, Conn., assignor to the Waterbury Buckle Company, same place. Filed July 23, 1891. Serial No. 400,416. (No model.)

Claim.—1. In a buckle, the combination of a frame made from wire with a lever hung in said frame and adapted to swing backward and forward as a means for engaging the strap passing through the frame, the said lever extending across and beyond the side of the frame opposite its hinge, the said opposite side of the frame bent backward at its center and forming an open elastic loop, the plane of the bend to form the loop being at right angles to the plane of the frame, and the loop of greater width than the width of the lever, but the opening into the said loop somewhat narrower than the width of the lever, said loop being an integral part of the frame, substantially as and for the purpose described.

2. In a buckle, the combination of a frame made from wire, composed of two sides A B, connected by ends C C, a lever E, also made from wire doubled, the doubled end bent to form the hook F, the two branches above turned to the right and left, the ends of the branches returned substantially parallel with the lever and so as to form prongs *r e*, the lever hung to the side A of the frame as a hinge upon which the lever may swing, the other side B of the frame bent backward to form an opening *h*, and a loop *i* in rear of said opening *h*, the said opening *h* corresponding in position to the lever, but somewhat narrower than the width of the lever, substantially as described.

480,218. SADDLE-TREE. ORRIN TABER, Nashua, N. H., assignor to the Nashua Saddlery Hardware Company, same place. Filed Dec. 9, 1891. Serial No. 414,474. (No model.)



Claim.—1. A saddle-tree having a boss on its upper side, a hole through it for the screw-threaded shank of the terret, and a terret-nut provided with projections, the hole having oppositely-extended side openings and a connected central portion to permit the passage therethrough of the nut, and a recess in the under side of the boss to receive and hold the nut when inserted therein, substantially as described.

2. A saddle-tree having a boss thereon, a hole through it for the screw-threaded shank of a terret and shaped to provide openings 3 3 and 4 4, and the locking-nut *d* for the screw-threaded shank of the terret, having projections d^2 d^3 and shoulders d^4 d^5, said shoulders resting in the openings 4 4 when the nut is in place, substantially as described.

3. A saddle-tree having a hole through it for the screw-threaded shank of the terret and shaped to provide openings 3 3 and 4 4, and also having a nut-receiving recess in its under side, comprising the shoulders 6 6, and a locking-nut adapted to be turned on the shank of the terret in said recess and having projections d^2 d^3 and shoulders d^4 d^5, substantially as described.

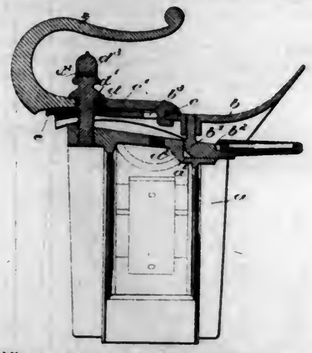
480,219. SADDLE-TREE. ORRIN TABER, Nashua, N. H., assignor to the Nashua Saddlery Hardware Company, same place. Filed Dec. 9, 1891. Serial No. 414,475. (No model.)

Claim.—1. A saddle-tree provided with a hole extended through it and a terret having a screw-threaded shank, combined with a nut threaded at one end to receive the shank of the terret and having a downwardly-extended foot to enter a lug-strap to hold the latter in place, and a support for the foot beyond said strap, substantially as described.

2. A saddle-tree having a boss, as described, cut through to form an opening 2 and shaped to leave a nut-receiving recess at its under side and a fixed plate *f*, combined with a terret-receiving nut contained in said recess and having a foot to pass through the lug-strap and enter a hole in the said plate, substantially as described.

3. A saddle-tree having a hole made through it, having oppositely-extended portions 3 3, combined with a terret-nut having projections d^2 d^3 thereon and adapted to be passed through said hole and its extended portions from its outer side and having a foot extended below said projections to enter a hole in the lug-strap, to operate substantially as described.

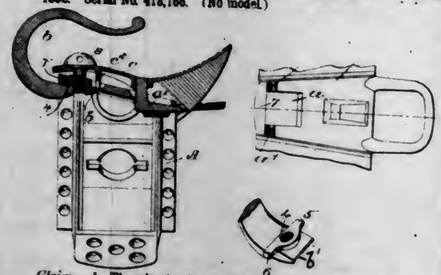
4. A saddle-tree having a hole made through it, said hole having passages 3 3 4 4, combined with a terret-nut *d*, having projections d^2 d^3 and shoulders d^4 d^5, and a foot to enter and hold the lug-strap, substantially as described.



480,220. SADDLE-TREE. ORRIN TABER, Nashua, N. H., assignor to the Nashua Saddlery Hardware Company, same place. Filed Dec. 30, 1891. Serial No. 416,527. (No model.)

Claim.—1. A saddle-tree having a mortise *a'* with an opening at the rear thereof, combined with a seat having upon its under side an L-shaped hook to enter and rest in said mortise, the end of said hook projecting through the opening in said mortise to bear against and engage the under side of the adjacent part of the tree, and thereby connect it to the saddle at one point, substantially as described.

2. A saddle-tree having a mortise *a'* with an opening at the rear thereof, combined with a seat having upon its under side a detachable



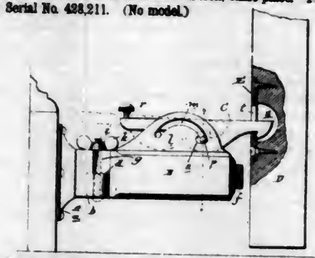
L-shaped hook to rest in said mortise, the shank of said hook being screw-threaded to enter a socket in the seat, the end of the hook projecting through the opening in the mortise, bearing against and engaging with the under side of the adjacent portion of the tree, and thereby connecting it to the saddle at one point, substantially as described.

3. A saddle-tree having a hook-retaining opening, and a seat having upon its under side a hook to enter and engage with said opening, said seat having an opening therein, combined with a checkrein-hook having a hook upon its under side to engage with the opening in the seat and connect said checkrein-hook thereto at one point, substantially as described.

4. A saddle-tree and a seat connected therewith and a hook-retaining opening in said seat, combined with a checkrein-hook having at one end a retaining-hook to enter said opening and engage the seat, and a bolt extending through the other end of said checkrein-hook and the seat to connect them to the tree, substantially as described.

480,221. SADDLE-TREE. ORRIN TABER, Nashua, N. H., assignor to the Nashua Saddlery Hardware Company, same place. Filed Jan. 15, 1892. Serial No. 418,166. (No model.)

Claim.—1. The checkrein-hook having a shoulder or other projecting portion provided with oppositely-extended lugs, combined with the tree having a hole or recess, one side wall of which presents an abutment against which the said shoulder or other projection bears and transverse recesses to receive the lugs, a seat having a depending leg which bears upon the rear end of the hook, and a screw which connects the seat and hook together, substantially as described.



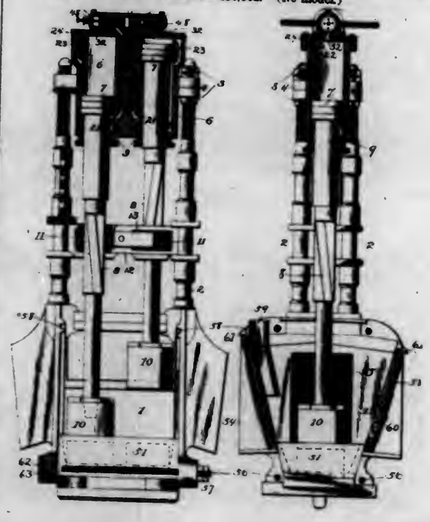
2. The checkrein-hook having a shoulder or other projecting portion provided with oppositely-extended lugs, combined with the tree having a hole or recess, one side wall of which presents an abutment against which the said shoulder or other projecting portion bears, said tree also having two shoulders 2 3, which receive between them the shank of the hook, and recessed bearings for the lugs on the hook, substantially as described.

3. The tree having a hole through it and transverse recesses *a' a'*, combined with a checkrein-hook adapted to pass through said hole and provided with oppositely-projecting lugs 5 6, which are supported in said recesses, and means to connect the hook to the seat, substantially as described.

4. The tree having a hole through it and transverse recesses *a' a'*, combined with the checkrein-hook adapted to pass through the said hole and provided with oppositely-projecting lugs 5 6, which are supported in said recesses, and a seat having on its under side a projection which bears upon the end of the hook, and a screw connecting the seat and hook together and thereby securing them to the tree, substantially as described.

5. The tree having a hole *a* through it and recesses *a' a'*, combined with a checkrein-hook having a rear end portion *b'*, which occupies a position in said hole *a*, and the oppositely-projecting lugs 5 6, which enter said recesses *a' a'*, and a shoulder 4, which bears against one side wall of said hole *a*, the seat *c*, and screw connecting the seat and tree, substantially as described.

480,222. DOOR-CHECK. CHARLES H. TURNER, John Day, Oreg., assignor of one-half to Clarence Johnson, same place. Filed Apr. 7, 1892. Serial No. 428,211. (No model.)



Claim.—1. In a door stop and retainer, substantially as described, the combination, with the stop provided on its upper side with flanges having corresponding longitudinal slots provided with an offset at their forward ends, of the slidable gravitating latch having a pivot stud or lug projecting from opposite sides and arranged to play in the slots and offsets of the flanges on the stop, substantially as and for the purpose specified.

2. In a door stop and retainer, substantially as described, the combination, with a bracket having an attaching flange, a semicircular wall, as *c*, and a lug arranged in advance of the wall *c* and below the horizontal plane of the same and provided with the vertical eye or aperture and the corrugated or ratchet-like face, of the stop having the rounded lug *g* at its inner end, provided with a corrugated or ratchet-like face, adapted to engage the corresponding face of the bracket-lug and having an aperture corresponding with the aperture of said bracket-lug, a pivot-bolt taking through the aperture of the bracket-lug and the stop-lug, and a wing-nut mounted on said pivot-bolt, substantially as specified.

3. The improved door stop and retainer described, comprising a bracket to be secured to the base or sill board of a room, a stop and a pivot-bolt, and set-nut for adjustably connecting the stop to the bracket, said stop being also provided on its upper side with flanges having corresponding longitudinal slots provided with an offset at their forward ends, and the slidable gravitating latch having a pivot stud or lug projecting from opposite sides and arranged to play in the slots and offsets thereof, substantially as specified.

480,223. STEAM-STAMP. CHARLES W. TREMAIN, Portland, Oreg. Filed Jan. 23, 1892. Serial No. 419,062. (No model.)

Claim.—1. The combination, with two cylinders and their pistons, of a single valve controlling the inlet and exhaust steam of both cylinders and the steam from one cylinder moving the valve to admit steam to the other cylinder, substantially as described.

2. The combination, with two cylinders and their pistons, of a single valve operated by the direct pressure of the steam controlling the inlet and exhaust steam of both cylinders and the steam from one cylinder moving the valve to admit steam to the other, substantially as described.

3. The combination, with two cylinders and their pistons, of a single piston-valve having the ends of its chest communicating with both cylinders and operated by the direct action of the steam on its ends and controlling the inlet and exhaust steam of both cylinders, substantially as described.

4. The combination, with two cylinders and their pistons, of a cap-plate covering both cylinders and carrying a valve-chest and a valve governing the inlet and exhaust of both cylinders and said cap having passages 32 to admit steam to the ends of the chest to operate the valve, substantially as described.

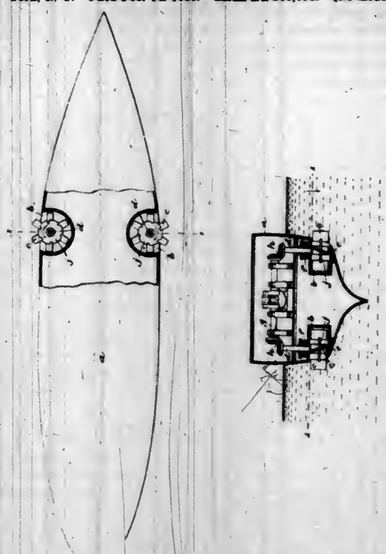
5. The combination, with a piston and valve, of a cylinder in which the piston works, having a passage 23, terminating at the top of the cylinder, and a passage 32 in the cap to permit steam from the cylinder to operate the valve, substantially as described.

6. The combination, with two cylinders having passages 21 and 22 and pistons working in said cylinders, of a reciprocating valve having ports 37, 38, 39, 40, 41, and 42, communicating with said passages 21 and 22, and a valve-chest in which said valve reciprocates, having suitable inlet and exhaust passages, substantially as described.

7. The combination, with two cylinders having passages 21, 22, and 23 and pistons working in said cylinders, of a valve having ports 37, 38, 39, 40, 41, and 42, communicating with said passages 21 and 22, and a valve-chest in which said valve works and communicating at its opposite ends with the passages 23 to admit steam to operate said valve, substantially as described.

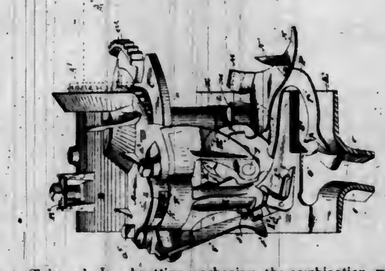
8. The combination, with two cylinders having passages 21, 22, and 23 and pistons working in said cylinders, of a valve having the annular groove 43, holes 44, and the ports 37, 38, 39, 40, 41, and 42, communicating with said passages 21 and 22, a cap-plate covering said cylinder having openings 32, and a valve-chest on said cap-plate communicating with the passages 21 and 22, and suitable inlet and exhaust passages, substantially as described.

480,224. STEP-LADDER. HENRY V. VANDERBILT, Brooklyn, N. Y., assignor to himself and Sadie A. Bunnell, same place. Filed Aug. 24, 1891. Serial No. 403,630. (No model.)



Claim.—1. A step-ladder having its legs provided with a cross-piece recessed to form shoulders, combined with a jointed connection hinged at one end in said recess to be embraced at its side edges by said shoulders and hinged at its opposite end to one of the steps of the ladder, substantially as described.

2. A step-ladder having its legs provided with a cross-piece and the body of the ladder provided with a step parallel with said cross-piece and recessed in its rear edge to form shoulders, in combination with a jointed connection hinged at one end to said cross-piece and hinged at the other to the step in said recess to be embraced at its side edges by said shoulders, substantially as described.



3. A step-ladder having its legs provided with a cross-piece centrally recessed to form shoulders and a step parallel with said cross-piece and centrally recessed at its rear edge to form shoulders, in combination with a jointed connection hinged at one end to the cross-piece in the recess therein and hinged at the other end to the step in the recess formed therein, substantially as described.

480,225. RECESSED PADDLE-WHEEL. JACOB S. BAKER, New York, N. Y. Filed Feb. 14, 1889. Serial No. 299,851. (No model.)

Claim.—The combination, with a boat, of horizontal paddle-wheels consisting of paddles connected to the vertical shaft by a central disk and located in recesses in the sides of the boat forward of the middle and having a spiral pitch of the paddles directed to have lifting effect on the boat, substantially as described.

480,226. GRAIN-BINDER. MILTON E. BENEDICT, Perry, N. Y., assignor of one-half to Richard T. Tuttle, same place. Filed Feb. 4, 1888. Serial No. 263,030. (No model.)

Claim.—1. In a knotting mechanism, the combination, with the cord-clamp and knotter-bill, of the gear-segment, the stripper and cam mounted on the same axis and moving with the gear-segment, and the tucker pivoted on an axis parallel with the stripper-axis and adapted to be operated by the cam, substantially as described.

2. In a knotting mechanism, the combination, with the cord-clamp and knotter bill, of the gear-segment arranged on an axis parallel with the bill-shaft and adapted to operate the latter, a stripper and cam mounted on the same axis and moving with the gear-segment, and the tucker pivoted on an axis parallel with that of the segment and operated by the cam on the segment, substantially as described.

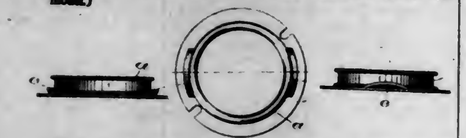
3. In a knotting mechanism, the combination, with a cord-clamp and knotter-bill, of the gear-segment operating the bill, arranged on an axis parallel with the bill-shaft, a stripper and a cam mounted on the same axis and moving with the segment, and the tucker pivoted on an axis parallel with that of the segment, having the outwardly-extended neck and operated by the cam, substantially as described.

4. In a knotting mechanism, the combination, with the breast-

plate having the cord-opening, of the rotating knotter-bill, the gear-segment operating the bill-shaft, the cam and stripper-arm both mounted on the same axis and moving with the segment, and the pivoted swinging tucker operated by the cam and having the forked end and the extended neck curved in the line of movement of the stripper, substantially as described.

5. In a knotting mechanism, the combination, with the breast-plate having the cord-opening, of the rotating knotter-bill, the gear-segment operating the bill, the cam and stripper, both mounted on the same axis and moving with the segment, and the swinging tucker pivoted on the breast-plate having the opening with which the cam co-operates, the forked outer end, and the extended neck curved in the line of movement of the stripper, substantially as described.

6. In a knotting mechanism, the combination, with the breast-plate having the cord-opening, of the rotating bill, the gear-segment operating the knotter, the stripper-arm mounted on the same axis as and moving with the segment, the cam below said stripper on the same axis as and moving with the segment, and the swinging tucker pivoted to and resting upon the breast-plate and operated by said cam, substantially as described.

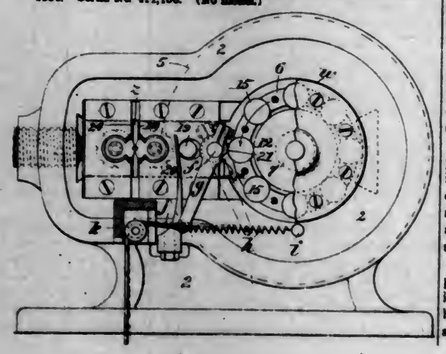


7. In a knotting mechanism, the combination, with the breast-plate, the knotting-bill, the cord-clamp, the cutter, and the stripper, of a vibrating tucker located below said stripper, having the extended neck curved in the line of movement of said stripper for permitting the passage of the cord when the loop is removed from the bill, as set forth.

8. In a knotting mechanism, the combination, with the breast-plate, of the knotting-bill, the cord-clamp, the cutter, and the stripper, a gear for operating the latter, and a tucker pivoted upon the breast-plate and operated by a cam moving with the stripper-operating gear, substantially as described.

9. The combination, with the knotter-hook and the stripper operating to remove the knot-loop therefrom to form the knot, of the breast-plate having the opening for the cord and the recess or depression in its upper surface at the side of the cord-opening and in line with the movement of the stripper for the accommodation of the cord ends, substantially as described.

10. In a knotting mechanism, the combination, with the cord-clamp and knotter-bill, of the gear-segment for operating the bill, the cam mounted on the same axis as and moving with the segment, and the tucker pivoted on an axis parallel with that of the segment and adapted to be operated by the cam, substantially as described.

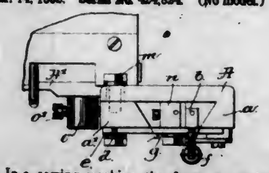


480,227. HOLDER FOR RINGS IN SPINNING AND TWISTING FRAMES. JOHN H. BENNETT, Worcester, assignor to George Draper & Sons, Hopedale, Mass. Filed Feb. 23, 1892. Serial No. 422,423. (No model.)

Claim.—1. A ring-holder composed of a plate and provided with bridge-like ring-holding loops, to operate substantially as described.

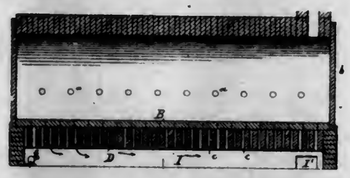
2. A ring-holding plate having bridge-like loops, combined with a double-raced ring, substantially as described.

480,228. SWAGING-MACHINE. JOHN BERRY, Springfield, Mass., assignor to the National Needle Company, same place. Filed Nov. 7, 1891. Serial No. 411,158. (No model.)



Claim.—1. In a swaging-machine, the combination, with a series of revoluble hammer-rolls, of a pair of swaging-dies, one of which is movable toward and from the other and has provided therefor an abutment piece or member that is suitably movable at pleasure for receiving the impact from the hammer-rolls and transmitting movement to the working die or for being placed out of the path of the hammer-rolls, thereby rendering the working die immovable, substantially as described.

2. In a swaging-machine, the combination, with a series of revoluble hammer-rolls, of a pair of swaging-dies, one of which is movable toward and from the other and has a stud with its one side face reduced mounted thereon for a rotational movement, and devices connected with said stud for securing a rotational movement thereof, for the purpose set forth.

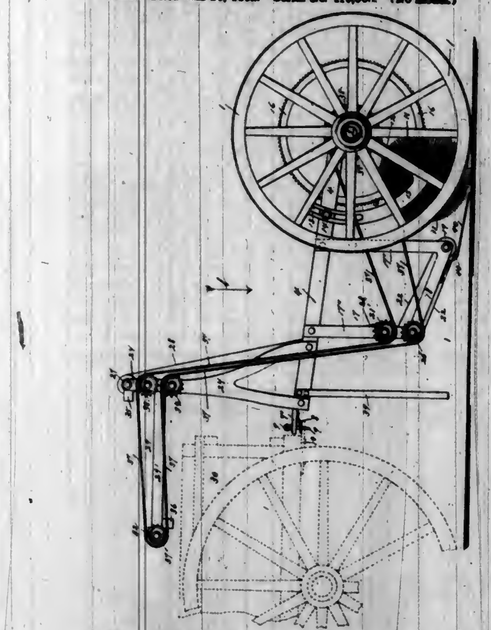


3. In a swaging-machine, the combination, with a series of revoluble hammer-rolls, of a pair of swaging-dies, one of which is movable toward and from the other and is provided with a flat-faced stud mounted thereon for a rotational movement, a lever rigidly fixed to said stud, the cord, sheave, and treadle-lever, and the spring *h*, applied for a retractile action on said stud-lever, all substantially as described, for the purposes set forth.

480,229. SEWING-MACHINE. AUSTIN W. BIGELOW, Everett, Mass., assignor to the Goodyear Shoe Machinery Company, Hartford, Conn. Filed Mar. 14, 1892. Serial No. 424,834. (No model.)

Claim.—In a sewing-machine, the frame or casting A, having a side piece *a*, forming one half of a guideway, and a detachable side piece *a'*, forming the other half of the guideway, a dovetailed needle-bar acted upon directly by the edge of the detachable side piece, and set-screws extended through the said side piece and into the casting A, combined with an adjusting-screw, as *o'*, adapted to act upon the edge of the detachable side piece and move the same toward the needle-bar when the set-screws are loosened, as and for the purpose described.

480,230. LEER OR ANNEALING-FURNACE FOR SHEET OR PLATE GLASS. JAMES W. BOSTA, Wayne, assignor to James H. Shakespeare, trustee, Philadelphia, Pa. Filed July 24, 1891. Serial No. 400,550 (No model.)



Claim.—1. The combination, in a leer or furnace for annealing sheet or plate glass, of the flat bed or table on which the sheet or plate of glass is laid, and a supporting structure for said table, having air-spaces open only at the bottom, whereby the supporting structure is ventilated without unduly cooling the table, substantially as specified.

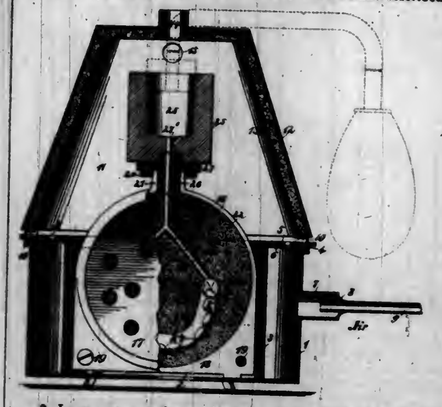
2. The combination, in a leer or furnace for annealing sheet or plate glass, of the flat bed or table on which the sheet or plate of glass is laid, and a supporting structure for said table, having air-spaces open only at the bottom, and a foundation having air-circulating passages communicating with said air-spaces, substantially as specified.

3. The combination, in a leer or furnace for annealing sheet or plate glass, of the flat bed or table on which the sheet or plate of glass is laid, and a supporting structure for said table, having air-spaces open only at the bottom, and a foundation having air-passages communicating with said air-spaces, and air-jet pipes and outlets whereby a circulation of air through said passages is effected, substantially as specified.

4. The combination, in a leer or furnace for annealing sheet or plate glass, of the flat bed or table on which the sheet or plate of glass is laid, and a supporting structure for said table, composed of bricks having ribs at the ends, whereby when said bricks are assembled air-spaces are formed in the supporting structure, substantially as specified.

480,231. SWEEPING-MACHINE. CHARLES BRUSO, Worcester, Mass. Filed Jan. 26, 1892. Serial No. 419,508. (No model.)

Claim.—1. In a street-sweeping machine, the combination, with a wheeled axle, of a frame and two arms loosely mounted thereon, said frame being provided with endless elevating-carriers and adapted to be detachably secured to the rear end of a cart, and said arms each being provided with an upwardly-curved and slotted extension whereby it can be adjustably secured to the frame, and a revolving brush or sweeper journaled in the lower ends of said arms, substantially as set set forth.



2. In a street-sweeping machine, the combination, with a wheeled axle, of a frame loosely mounted thereon, said frame being adapted to be detachably secured to the rear of a cart, two substantially rectangular frames secured to the under side of and two standards secured to and projecting above the frame secured to the axle, said standards being provided with a forwardly-projecting frame, three rollers journaled in the lower portion of the rectangular frames, three rollers journaled in the upper portion of the standards, and one roller journaled in the forward portion of the forwardly-projecting frame, each of said rollers except one in the rectangular frames being provided at one end with a driving wheel or pulley, a driving belt or chain extending from the axle and passing over two of the rollers in each of the frames and over the front roller, an elevating-carrier passing over all of the rollers except the top one in the standard, a supplemental belt passing over a pulley in the rectangular frame and in the standards, and a revolving brush or sweeper suspended from the axle of the machine, substantially as set forth.

3. In a street-sweeper, the combination, with a wheeled axle, of a frame loosely mounted thereon at its rear end, perforated arms projecting from the front end of said frame, each provided with a perforated spring, whereby the sweeper may be connected with the rear end of a cart, a pin through said perforations, legs depending from the front end of the frame, and a revolving sweeper, and an endless carrier within said frame, the front loop of which carrier projects beyond the front end of the frame for depositing the sweepings in the cart, substantially as set forth.

480,232. APPARATUS FOR MELTING AND CASTING METALS. CRAFT C. CARROLL, New York, N. Y. Filed Sept. 5, 1891. Serial No. 404,890. (No model.)

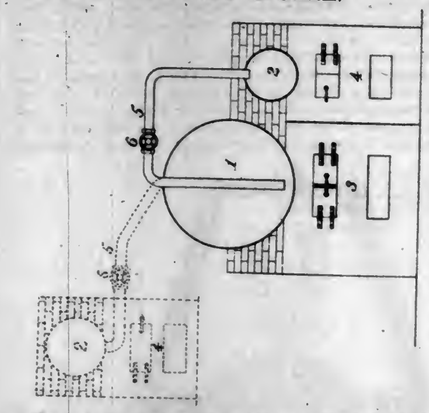
Claim.—1. The combination, with an annular burner, of a mold-flask supported therein so that the flame-openings of the burner are at or near the top of the flask, a crucible mounted upon the mold-flask and in communication with the metal-chamber of the mold, and a removable conical hood or cover mounted upon the burner and inclosing the flame-openings thereof and the crucible in such manner as to direct the flame from the burner-openings upon the crucible, substantially as shown and described.

2. In an apparatus for melting and casting metals for dental or other purposes, the combination, with an annular burner having flame-openings in the top thereof, of a mold-flask supported therein so that the top of the burner is at or near the top of the flask, a crucible mounted on the top of the flask and in communication with the metal-chamber thereof, a conical removable hood or cover mounted upon the burner and inclosing the flame-openings thereof, so as to direct the flame upon the crucible, and means for forcing the molten metal from the crucible into the metal-chamber of the mold-flask after the hood or cover has been removed, substantially as shown and described.

3. In an apparatus for melting and casting metals for dental or other purposes, the combination, with an annular burner, of a mold-flask supported therein in such manner that the flame-openings of the burner are at or near the top of the mold-flask, a crucible supported on the mold-flask, provided with a duct or passage through the bottom thereof which communicates with a duct or passage in the mold-flask leading to the chamber thereof, the joint between the crucible and the mold-flask being air-tight, and means for forcing the molten metal from the crucible into the metal-chamber of the flask consisting of a flexible tube and pneumatic bulb, substantially as shown and described.

480,233. ALLOY. ALEXANDER I. COCKER, GEORGE W. COLLYER, and CLARENCE HAINES, Tarrytown, N. Y. Filed Sept. 24, 1891. Serial No. 406,721. (No specimens.)

Claim.—The method of forming an alloy of iron and tin, consisting in mixing the same in substantially the proportions specified and fusing the metals in the presence of a flux composed of borax, carbonate of iron, sal-ammoniac, and salt.

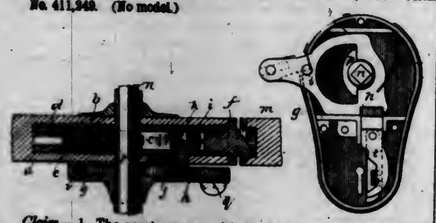


480,234. MANUFACTURE OF ASPHALTUM. JESSE A. DUBBS, Allegheny, assignor of one-half to James H. White, Pittsburg, Pa. Filed July 10, 1891. Serial No. 399,080. (No specimens.)

Claim.—1. The method herein described of manufacturing asphaltum, which consists in heating the crude petroleum or residuum free from paraffine wax to sufficient heat to remove the moisture therefrom, adding sulphur to the heated material in about the proportions stated, and then raising the temperature of the mixture to a point a little below that of distillation of the oil or residuum and maintaining it at such temperature until the desired chemical combination has been effected, substantially as set forth.

2. The method herein described of manufacturing asphaltum, which consists in mixing a crude petroleum or residuum free from paraffine-wax and sulphur in about the proportions stated, heating the mixture to a point a little below the point of distillation, and maintaining it at such temperature until the desired combination has been effected, substantially as set forth.

3. The method herein described of manufacturing asphaltum, which consists in subjecting crude petroleum or residuum thereof to the action of steam, thereby removing the paraffine-wax therefrom, adding sulphur to the material thus purified in about the proportions stated, subjecting the mixture to a temperature a little below the temperature of distillation, and maintaining the mixture at such temperature until the desired combination has been effected, substantially as set forth.



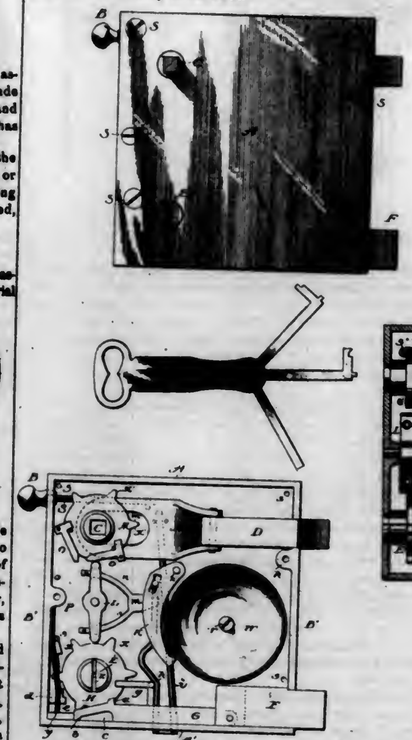
480,285. MANUFACTURE OF ASPHALTUM. JESSE A. DUBBS, Allegheny, assignor of one-half to James H. White, Pittsburg, Pa. Filed July 27, 1891. Serial No. 400,862. (No specimens.)

Claim.—1. As an improvement in the art of manufacturing asphaltum, the method herein described, which consists in heating crude petroleum or residuum thereof, charging fluid sulphur therein, and maintaining the heat of the charge until the desired combination has been effected, substantially as set forth.

2. As an improvement in the art of manufacturing asphaltum, the method herein described, which consists in heating crude petroleum or residuum thereof, charging vaporous sulphur therein, and maintaining the heat of the charge until the desired combination has been effected, substantially as set forth.

480,286. DOOR-LOCK. CHARLES F. GARLAND, Chelsea, Mass., assignor to Richard P. Elliott, Nashua, N. H. Filed Nov. 9, 1891. Serial No. 411,249. (No model.)

Claim.—1. The combination, with the bolt *c*, arranged in a hole formed in the door, and metal bearings *d f*, arranged in said hole to support and guide the bolt, of a casing secured to the outer surface of the door, a sliding frame arranged entirely in said casing and connected with the bolt by a pin operating in a slot formed in the door, and a knob-spindle and connections for operating the said frame, as set forth.



2. The combination, with a bolt *c*, arranged to slide in ways formed in a door, of a casing secured to the outer surface of the door, a sliding frame arranged entirely in said casing and connected with the bolt by a pin operating in a slot formed in the door, a latch or catch *g*, pivoted upon the sliding frame and arranged to engage the casing, and a knob-spindle and connections for operating the said frame, as set forth.

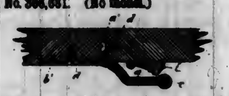
3. The combination, with a bolt *c*, arranged to slide in ways formed in a door, of a casing secured to the outer surface of the door, a sliding frame arranged entirely in said casing and connected with the bolt by a pin operating in a slot formed in the door, a knob-spindle and connections for operating the said frame, and a sliding bolt *l*, arranged to be operated by a key to engage the frame *h* and lock the same and the bolt *c* against movement, as set forth.

480,287. ALARM-LOCK. RALPH M. METCALF, Luton, assignor of one-half to Oromburg E. Adams, Holly Springs, Iowa. Filed May 4, 1891. Serial No. 391,594. (Model.)

Claim.—1. In a lock, the combination, with the case, of a latch-bolt D, a plate attachment N, riveted to the inner end of said bolt, a spur-wheel M, provided with spurs, as *x*, and the dogs *o o*, said spur-wheel being rigidly mounted horizontally on the core C, said core being vertically set in the case, the bell W, the hammer K, secured to posts *k* and spring *h* and connected with the plates *m m*, said plates being placed one above the other and each being provided with extension-arms *n n*, which in turn connect with the levers L L, also placed one above the other, the finger-knob B, attached to rod *s'*, said rod passing through the side of the case, and an eye formed on the under side of plate N, the dogs *o o*, provided on the spur-wheel M, being adapted to engage the pointed end of the upper lever L to operate to ring the bell W, all substantially as set forth.

2. In a lock, the combination, with the case, of a latch-bolt D, a plate attachment N, secured to said bolt, a spur-wheel M, provided with spurs, as *x'*, and the dogs *o o*, said spur-wheel being rigidly mounted on the core C, which is vertically set in the case, the bell W, the hammer K, secured to the posts *k* and *l* and spring *h* and connected with plates *m m*, each of which is provided with extension-arms *n n*, said arms in turn connecting with the levers L L, and the rod *s'*, provided with knob B, said knob adapted to move backward into a notch provided in the side of the case to receive it to disengage the knob from the latch or to move forward into a second notch provided in the side of the case, causing the plate N to be raised, so that the shoulder-piece *a'*, formed on the under side of spur-wheel M, engages a shoulder formed on the end of plate N to operate the common latch, all substantially as set forth.

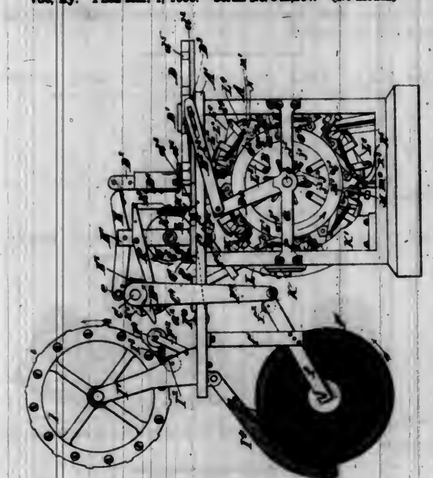
3. In a lock, the combination, with the case, of the lock-bolt F, the slotted frame G, provided with the ear *a*, and the spur-wheel H, provided with spurs, as *x*, said wheel being rigidly set on the core E', which is vertically set in the case, the ends of said core being provided with a deep groove or slot and adapted to receive a flat key, as key A A, and to be turned by said key to operate the lock-bolt F, all as set forth.



4. In a lock, the combination, with the case, of the lock-bolt F, the slotted frame G, provided with the ear *a*, the spur-wheel H, provided with spurs, as *x*, said wheel being rigidly set on the core E', which is set in a vertical position, the ends of said core being grooved to receive a key, the bell W, the hammer K, secured to post *k* and connected with spring *h*, and the plates *m m*, each provided with U-shaped arms *n n*, connected to the levers L L, the pointed ends of levers L L adapted to be engaged by the spurs of the wheel H to ring the bell W, all arranged and intended to operate substantially as set forth.

5. In a lock, the combination of the lock-bolt F, the slotted frame G, provided with the ear *a*, the spur-wheel H, rigidly set on the core E', which is vertically set in the case, the ends of said core being slotted to receive a key, the shoulder-plate *y*, formed in the corner of the case, and the plate *d*, held in place by the spring-wire *e*, all as set forth.

6. In a lock, the combination of the bolt F, the slotted frame G, provided with the ear *a*, the spur-wheel H, the core E', slotted at both ends, the shoulder-plate *y*, the plate *d*, held in place by the spring-wire *e*, and the plate *g*, all arranged as set forth.

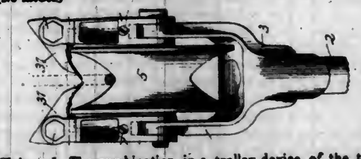


7. In a lock, the combination, with the case, of the following parts, viz: the bolt D, the plate N, provided with the shoulder *a'*, the spur-wheel M, provided with spurs, as *x'*, and dogs *o o*, and a shoulder on the under side, the core C, the rod *s'*, provided with knob B, the bell W, held in place by screw *r*, the hammer K, post *k*, springs *i* and *h*, plates *m m*, each provided with U-shaped arms *n n*, connecting with the levers L L, the bolt F, slotted frame G, provided with the ear *a*, the plate *g*, spur-wheel H, provided with spurs, as *x*, the slotted core E', shoulder *y*, plate *d*, and spring-wire *e*, all arranged and intended to operate substantially as set forth.

480,288. HINGE. FRANK X. RANKER, Pittsburg, Pa. Filed Sept. 30, 1890. Serial No. 366,651. (No model.)

Claim.—A door-hinge comprising two leaves, one fastened to the edge of the door-post and the other to the edge of the door and both extending freely from such points to a pivot which is out of the line of the doorway, substantially as described.

480,289. WRAPPING-MACHINE. CHARLES R. SCHILLING, Bellevue, Ky. Filed Mar. 1, 1890. Serial No. 342,237. (No model.)



Claim.—1. In a wrapping-machine, the combination of a revolving folder-carrying wheel or cylinder mounted upon a shaft within a suitable frame, a feeding-table above said cylinder, a revolving feed-disk and ram on said table, paper-feeding mechanism on said table, a discharge or base plate below said cylinder, a receiving or holding pedestal and arms or jaws on said base-plate, and suitable cam and crank driving mechanism for actuating said parts, constructed, arranged, and adapted to operate substantially as herein set forth.

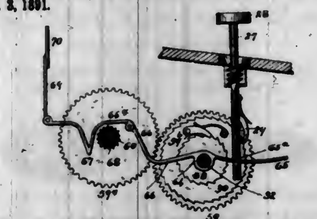
2. In a wrapping-machine, a revolving wheel or cylinder B, mounted on a rock-shaft, carried by a suitable frame and having radial recesses J in its periphery at suitable intervals apart, spring-jaws J', forming the opposite end walls of said recesses, yielding plungers J^3, forming the bottoms of the jaws for receiving and supporting the respective articles to be wrapped and their wrappers, pins or fingers j^7, projecting from the innermost ends of said plungers J^3 j through radial slots in said wheel, cam j^9 on said wheel-shaft, curved or bow spring j^{10} on said cam, and strike-pin j^7, also on said cam in rear of its projecting portion, and mechanism for intermittently revolving said wheel on said shaft, substantially as herein set forth.

3. In a wrapping-machine, the combination, with a revolving wheel or cylinder B, in whose periphery are constructed recesses J, having yielding holder-jaws which are self-conforming to ordinary irregularities in the articles to be wrapped, and means for operating the yielding bottoms of said self-conforming jaws, of peripheral folder-plates L^2 and L^4, side folder-fingers N N' and O O', rings L' L' on the opposite sides of said wheel, folding fingers or tuckers M on said rings in line with said recesses or jaws J, projecting rollers L^2 on said folders, and cam-tracks K K K' L, said folder-fingers, and also the tuckers, being suitably mounted on the wheel and rings, respectively, and all the parts being arranged, connected, and adapted to operate substantially as herein set forth.

480,240. TROLLEY FOR ELECTRIC CARS. GEORGE R. PURPLE and CHARLES W. PURPLE, Minneapolis, Minn.; said George R. Purple assignor to said Charles W. Purple. Filed Sept. 8, 1891. Serial No. 405,138. (No model.)

Claim.—1. The combination, in a trolley device, of the trolley-wheel and the supporting-fork thereof with a spring-controlled dog or bill arranged on each side thereof, said dogs extending across the top of the wheel and meeting over the middle thereof, said dogs being so pivoted and arranged that the inner ends thereof may yield backwardly and upwardly, substantially as described.

2. The combination, with a trolley-wheel and its supporting-yoke, of arms pivotally supported upon the axis of said wheel, a yielding device or devices connecting said arms with said yoke, and spring-controlled dogs carried by said arms, substantially as described.



3. The combination, with the trolley-wheel and its yoke, of the spring-controlled arms mounted upon the axle of the trolley-wheel, spring-controlled posts mounted upon said arms, and spring-controlled dogs mounted upon said posts and projecting toward each other over said wheel.

4. The combination, with the trolley-wheel and its supporting-yoke, of the dogs provided with inclined upper surfaces and projecting over said wheel and means for supporting said dogs.

5. The combination, with the trolley-wheel and its supporting-yoke, of the arms pivoted upon the axis of said wheel, posts pivotally supported upon said arms, and the inclined dogs pivoted upon said posts and projecting over said wheel, substantially as described.

REISSUES.

11,256. CASH-REGISTER. HENRY A. BIERLEY, Lexington, Ky. Filed June 21, 1892. Serial No. 437,409. Original No. 462,615, dated Nov. 3, 1891.

Claim.—1. In a cash-register, the combination of the casing, the spring-barrels carrying tapes with indicating characters, the transverse shaft carrying loose ratchet-wheels, the hubs connected with said ratchet-wheels, the ratchet-wheels fixed on said shaft, the spring-pawls engaging therewith, the indicating-keys having spring-pawls, the transverse shaft, the cog-wheels carried by said shaft, the radial arms, the pivoted plates for retaining the cash in sight, and the pivoted arm adapted to be actuated by said radial arms, substantially as described.

2. In a cash-register, the combination of the casing, the spring-barrels, the registering-tapes, the transverse shafts 32 and 60, the loose ratchet-wheels 30 upon transverse shaft 32, the fixed ratchet-wheels 58 upon transverse shaft 32, abutting against ratchet-wheels 30, the spring-catches 37, the bar 38, and pin 38^a, having knob 39, substantially as described.

3. In a cash-register, the combination of the casing, the spring-barrels and tapes, the shafts 32 and 60, the loose ratchet-wheels 30, having pawls 59ª, the fixed ratchet-wheels 58, the spring-actuated indicating-keys, the cog-wheels 59 59ª, the radial arms 61, the lever 62, the arm 63, the plate 42, and the plate 52, connected therewith, substantially as described.

4. In a cash-register, the combination of the casing, the shafts 32 and 60, the spring-barrels 35, the tapes 33, the ratchet-wheels 30, the hubs 31, the pawls 59ª, the ratchet-wheels 58, the indicating-keys having pawls 29, the arms 66, pivoted in shaft 32 and having forwardly-extending arms 65, the arms 66ª, hinged to arm 66, the lug 67, adapted to engage with grooves in shaft 60, and the vertical bar hinged to arm 66ª and carrying a display-plate, substantially as described.

5. In a cash-register, in combination, the indicating-keys carrying pin 65ª, an arm engaging with said pin when the key is depressed, extending forwardly from a bar or rod pivoted upon a transverse shaft, and provided with a rearwardly-extending arm pivoted to an arm provided with a downward extension or lug intermediate of its ends, adapted to engage with the upper one of a series of longitudinal grooves in the transverse shaft 60, the vertical rod hinged to the rearwardly-extending arm, the display-plate attached to the vertical arm, and the transverse grooved shaft, substantially as described.

6. In a cash-register, in combination, the indicating-keys carrying pin 65ª, an arm engaging with said pin when the key is depressed, extending forwardly from a bar or rod pivoted upon a transverse shaft, and provided with a rearwardly-extending arm pivoted to an arm provided with a downward extension or lug intermediate of its ends, adapted to engage with the upper one of a series of longitudinal grooves in the transverse shaft 60, the vertical rod hinged to the rearwardly-extending arm, the display-plate attached to the vertical arm, the transverse grooved shaft, the cog-wheels whereby the transverse grooved shaft is rotated, and the mechanism for actuating transverse shaft 32 by depressing the indicating-keys, substantially as described.

DESIGNS.

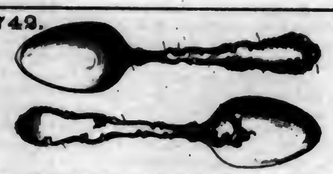
21,738. SPOON. WILLIAM A. HENDERSON, Atlanta, Ga. Filed June 10, 1892. Serial No. 436,255. Term of patent 7 years.

Claim.—The design for a spoon, substantially as herein shown and described.

21,739. SPOON. BERTHA MEYER, Kansas City, Mo. Filed June 22, 1892. Serial No. 437,657. Term of patent 3½ years.

Claim.—The design for a spoon, substantially as set forth.

21,740. SPOON. OTTO SUPE, Sault Ste. Marie, Mich. Filed June 2, 1892. Serial No. 435,314. Term of patent 3½ years.



Claim.—The design for a spoon, as herein shown and described.

21,741. SPOON. HENRY L. WALLACE, Wallingford, Conn., assignor to the R. Wallace & Sons Manufacturing Company, same place. Filed June 13, 1892. Serial No. 436,589. Term of patent 3½ years.

Claim.—The design for a spoon, as herein shown and described.

21,742. SPOON. GEORGE P. TILTON, Newburyport, Mass., assignor to the Towle Manufacturing Company, same place. Filed Apr. 12, 1892. Serial No. 428,596. Term of patent 7 years.

Claim.—The design for a spoon, herein shown and described.

21,743. TRIMMING. FRIEDRICH O. HEINIG, Philadelphia, Pa. Filed May 28, 1892. Serial No. 434,800. Term of patent 3½ years.

Claim.—The design for trimming, substantially as shown and described.

21,744. BADGE OR SIMILAR ARTICLE. GEORGE H. REINHAGEN, Brooklyn, assignor to the Firemen's Publishing Company, New York, N. Y. Filed June 20, 1892. Serial No. 437,408. Term of patent 7 years.

Claim.—The design for a badge or similar article, substantially as shown and described.

21,745. BADGE. GUSTAVUS A. SCHLICHTER, Reading, Pa. Filed June 27, 1892. Serial No. 438,214. Term of patent 3½ years.

Claim.—The design for a badge, substantially as shown and described.

21,746. THIMBLE. EDWIN S. SIMONS, Philadelphia, Pa. Filed July 2, 1892. Serial No. 438,827. Term of patent 3½ years.

Claim.—The design for a thimble, substantially as shown in the accompanying drawings.

21,747. THIMBLE. HENRY A. WEINMAN, Philadelphia, Pa., assignor to Simons, Brother & Co., same place. Filed June 3, 1892. Serial No. 435,987. Term of patent 3½ years.

Claim.—The design for a thimble, comprising the upper roughened crown, the lower encircling band having the representation of the World's Fair buildings at Chicago, and an unornamented portion C thereon, bounded by the scroll outline D.

21,748. WATCH-CASE. HENRY HOFFA, Washington, D. C. Filed June 8, 1892. Serial No. 435,999. Term of patent 3½ years.

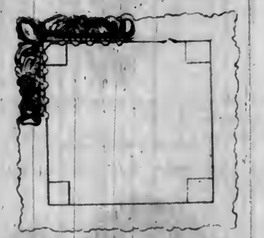
21,748.

Claim.—The design for a watch-case, substantially as herein described and shown.

21,749. WATCH-CHARM. FRANK P. SPARHAKER, Philadelphia, Pa. Filed July 2, 1892. Serial No. 438,309. Term of patent 3½ years.

Claim.—1. The design for a watch-charm, substantially as described, and as illustrated in the accompanying drawings.

2. In a design for a watch-charm, the design for the obverse, substantially as described and shown.

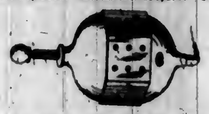


3. In a design for a watch-charm, the design for the reverse, substantially as described and shown.

21,750. TABLE-TOP. FRANZ YOKEL, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed June 29, 1892. Serial No. 439,466. Term of patent 3½ years.

Claim.—The design for a table-top, as herein shown and described.

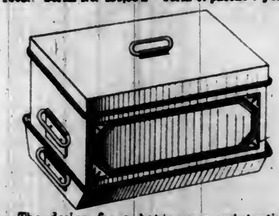
21,751. TABLE-TOP. FRANZ YOKEL, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed June 29, 1892. Serial No. 439,467. Term of patent 3½ years.



Claim.—The design for a table-top, as herein shown and described.

21,752. SHOE. NACHMAN LOWENTHAL, Chambersburg, Pa. Filed Apr. 23, 1892. Serial No. 430,418. Term of patent 7 years.

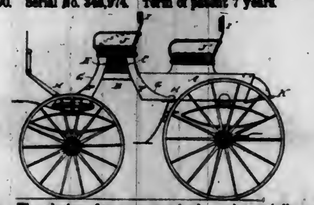
Claim.—The design for a shoe, substantially as shown and described.



21,753. SPINNING TOP. ALBERT J. HUNTOON, Kansas City, Mo. Filed June 20, 1892. Serial No. 438,450. Term of patent 7 years.

Claim.—The design for a spinning top, herein shown and described.

21,754. BAKING-PAN. GEORGE R. GIFFORD, Albany, N. Y. Filed July 9, 1892. Serial No. 439,534. Term of patent 7 years.



Claim.—The design for a baking-pan, substantially as herein shown and described.

21,755. BOWL. GEORGE WILKINSON, Providence, R. I., assignor to the Gorham Manufacturing Company, same place. Filed Mar. 28, 1892. Serial No. 426,534. Term of patent 7 years.

Claim.—The design for the bowl, herein shown and described.

21,756. WAGON-BODY. LUKE DOYLE, Boston, Mass. Filed Apr. 7, 1890. Serial No. 348,974. Term of patent 7 years.

Claim.—The design for a wagon-body, substantially as herein described and illustrated.

21,757. COFFIN-PEDESTAL. LOUIS G. KREBEL, St. Louis, Mo. Filed June 22, 1892. Serial No. 437,654. Term of patent 14 years.

Claim.—The design for a coffin-pedestal, substantially as herein described and shown.

TRADE-MARKS

REGISTERED AUGUST 2, 1892.

21,533. SUBSTITUTE FOR COD-LIVER OIL. DANBURY PHARMACAL ASSOCIATION, Danbury, Conn. Filed Feb. 18, 1892.

LINONINE

Essential feature.—The word "LINONINE." Used since December 18, 1891.

21,534. COAL-TAR OILS. GRIESHEIMER & Co., New York, N. Y. Filed June 7, 1892.

Essential feature.—The representation of a triangle with the rising sun on one side thereof, and the three letters "C G S," one within the triangle and the other two outside of it and on opposite sides of the apex. Used since May 25, 1892.

21,535. REMEDY FOR GENERAL DEBILITY AND FOR DISEASES OF THE GENITAL ORGANS. RICHARD HUDNUT, New York, N. Y. Filed May 9, 1892.

Essential feature.—The representation of a cupid with the word "PHOSPORINE" arranged above it. Used since April 15, 1892.

21,536. TOPICAL REMEDY. CHRISTIAN HESSE, Minonk, Ill. Filed June 18, 1892.

WONDER OIL

Essential feature.—The words "WONDER OIL" and the representation of a dog. Used since June 1, 1892.

21,537. WHISKY. W. H. JOHNS & Co., Boston, Mass. Filed July 5, 1892.

ELM HILL

Essential feature.—The words "ELM HILL." Used since August 4, 1891.

21,538. MACHINE-BELTING. F. REDDAWAY & Co., Manchester, England, and New York, N. Y. Filed May 18, 1892.

Essential feature.—The representation of a camel surrounded by an ellipse and the words "REDDAWAY'S PATENT EGYPTIAN COTTON BELTING." Used since January 1, 1876.

21,539. SPOOL-COTTON. THE WILLIAM CLARK COMPANY, Newark, N. J., and Stonington, Conn. Filed June 1, 1892.

Essential feature.—The letters "N," "E," and "W," arranged on a circular disk having lateral arms. Used since May 1, 1892.

21,540. SPOOL-COTTON. THE WILLIAM CLARK COMPANY, Newark, N. J., and Stonington, Conn. Filed June 1, 1892.

Essential feature.—A circular disk having lateral arms and bearing the word "BEST." Used since May 1, 1892.

21,541. DRESS FABRICS, SUCH AS PRINTS, CALICOES, POPLINS, AND ALPACAS. WINDSOR COMPANY, North Adams, Mass., and New York, N. Y. Filed June 25, 1892.

Essential feature.—The representation of a rooster and a flag. Used since November 19, 1891.

21,542. PERFUMERY. BEAN & VAIL BROTHERS, Philadelphia, Pa. Filed June 18, 1892.

Essential feature.—The representation of a balloon. Used since March 1, 1892.

21,543. TEA, COFFEE, AND SPICES. WILLIAM G. KIRK, Norfolk, Va. Filed May 26, 1892.

YU-NO

Essential feature.—The compound word "YU-NO." Used since 1888.

21,544. CERTAIN NAMED TOILET PREPARATIONS. JOSEPH S. LAURIE, Kansas City, Mo. Filed Apr. 21, 1892.

Almadino

Essential feature.—The word "ALMADINO." Used since May 1, 1890.

21,545. WHISKY. JOHN MILLER & Co., Boston, Mass. Filed July 5, 1892.

ELKWOOD

Essential feature.—The word "ELKWOOD." Used since May 13, 1890.

21,546. CLEANING AND DISINFECTING SOAP. HENRY C. STEWART, Cincinnati, Ohio. Filed July 5, 1892.

TONKA-TALPA

Essential feature.—The compound word "TONKA-TALPA." Used since July 1, 1890.

21,547. PRINTS AND REPRODUCTIONS BY PHOTO-MECHANICAL PROCESSES. CHARLES R. WOODWARD, St. Louis, Mo. Filed July 5, 1892.

Essential feature.—The word "CHEMIGRAPH." Used since June 25, 1892.

21,548. REMEDY FOR GONORRHŒA, GLEET, LEUCORRHŒA, AND THE LIKE. WILLIAM I. COCHRAN, Burlington, Iowa. Filed Mar. 29, 1892.

CINCH

Essential feature.—The word "CINCH." Used since March 1, 1891.

21,549. REMEDY FOR RHEUMATISM. PURITON MEDICINE CO., Detroit, Mich. Filed July 7, 1892.

TIKO

Essential feature.—The word "TIKO." Used since 1872.

21,550. NATURAL AND ARTIFICIAL FERTILIZERS. THE DURHAM FERTILIZER COMPANY, Durham, N. C., and Richmond, Va. Filed June 20, 1892.

Essential feature.—The full broadside representation of a bull. Used since 1883.

21,551. NATURAL AND ARTIFICIAL FERTILIZERS. THE DURHAM FERTILIZER COMPANY, Durham, N. C., and Richmond, Va. Filed June 20, 1892.

OFFICIAL

Essential feature.—The word "OFFICIAL." Used since December, 1889.

21,552. HOUSEHOLD, DRUGGISTS', AND BUTCHERS' HARDWARE. ENTERPRISE MANUFACTURING COMPANY OF PENNSYLVANIA, Philadelphia, Pa. Filed May 26, 1892.

ENTERPRISE

Essential feature.—The word "ENTERPRISE." Used since 1867.

21,553. LIQUID TONIC. MONRAD J. OLSEN, Des Moines, Iowa. Filed May 16, 1892.

Essential feature.—The representation of a crowing rooster standing upon a whipped prostrate rooster. Used since May 1, 1893.

21,554. MONUMENTS, ARCHITECTURAL TRIMMINGS, AND VARIOUS CUT STONE. WILLIAM H. PERRY, Concord, N. H. Filed Apr. 30, 1892.

Essential feature.—The representation of a block of stone bearing the words "CRYSTAL GRANITE." Used since 1889.

21,555. PARLOR GAMES. GEORGE R. SOVEREIGN, Pottersville, N. J. Filed July 1, 1892.

THE BLUE AND THE GRAY

Essential feature.—The words "THE BLUE AND THE GRAY." Used since June 16, 1892.

21,556. ALE, PORTER, AND STOUT. ANDERSON BREWING COMPANY, Beaver Falls, Pa. Filed June 27, 1892.

Essential feature.—The representation of a shield and three capital letter "A's" arranged in a monogram thereon. Used since November 15, 1891.

21,557. HORSE-COLLARS, RIDING-SADDLES, GIG-SADDLES, BACK-PADS, AND ALL PARTS OF HARNESS. CORK FACED COLLAR COMPANY, Lincoln, Ill. Filed June 16, 1892.

Essential feature.—The representation of a horse-collar, the portrait of Abraham Lincoln in the opening of the same, and a hand over the head over said portrait, pointing to a cut in the liner of the collar. Used since October 15, 1891.

21,558. ROASTED COFFEE. JOHN P. DIETER, Chillicothe, Ohio. Filed Mar. 26, 1892.

Essential feature.—The representation of a dining-car. Used since 1889.

21,559. REMEDY FOR DISEASES OF THE EYE. DR. DAVID KENNEDY CORPORATION, Kingston, N. Y. Filed June 20, 1892.

MAGIC

Essential feature.—The representation of an eye and the word "MAGIC." Used since 1870.

21,560. KNIVES, SCISSORS, AND FORKS. GRANT & SCHMIDT, New York, N. Y. Filed June 25, 1892.

Essential feature.—A representation of the head and shoulders of a man having a beard and wearing a hat with a backwardly-turned brim. Used since January 1, 1892.

21,561. LUBRICATING-OIL. ABRAM W. HARRIS, Providence, R. I. Filed June 25, 1892.

Essential feature.—The words "SUBMERGED SPINDLE OIL" and the representation of a spindle and its bearing. Used since January 1, 1892.

21,562. BOOTS AND SHOES AND LEATHER FOR THE SAME. RICE & HUTCHINS, Boston, Mass. Filed July 9, 1892.

Essential feature.—The word "CONTINENT." Used since May 1, 1891.

21,563. VEGETABLES AND GREEN AND DRIED FRUITS. RYAN & RICHARDSON, Leavenworth, Kans. Filed May 11, 1892.

Essential feature.—The representation of a star with a crescent resting across its upper three points and over an apple in the center of said star. Used since March 15, 1892.

21,564. COOKIES, WAFERS, AND SIMILAR ARTICLES, SUCH AS CAKES AND CRACKERS. THE S. H. CHILDS COMPANY, Rochester, N. Y. Filed June 30, 1892.

Essential feature.—The words "THE WAFERY." Used since November, 1891.

21,565. REMEDY FOR THE CROUP. CLINTON A. BELDIN, Jamaica, N. Y. Filed June 30, 1892.

Essential feature.—The fac-simile signature "C. A. BELDIN, M. D." Used since 1870.

21,566. ADHESIVE PLASTERS. ALVIN H. KELLER, Sioux Falls, S. D. Filed July 2, 1892.

Essential feature.—A circular disk superimposed upon the figure of a square and the words "MENTH-IOD-GOLD." Used since July, 1891.

21,567. HOSIERY. SIBLEY, LINDSAY & CURR, Rochester, N. Y. Filed May 26, 1892.

Essential feature.—The word "SUNRISE." Used since March 15, 1892.

21,568. MEDICINAL BEVERAGE AND SIRUPS AND EXTRACTS FOR FORMING THE SAME. FRED H. PERKINS, Shrewsbury, Mass. Filed July 1, 1892.

NERVO MATTE

Essential feature.—The words "NERVO MATTE." Used since May 23, 1892.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE STANLEY.

Decided July 22, 1892.

PRACTICE—REISSUE—ENLARGED CLAIM.

Where an applicant has by "inadvertence" claimed less than he was entitled to claim, he may have a reissue with enlarged claims. (Citing and quoting *Topliff* v. *Topliff et al.*, 59 O. G., 1237.)

APPEAL from Examiners-in-Chief.

TUNNELING-MACHINE.

Reissue application of Reginald Stanley filed September 8, 1890, No. 364,378.

Messrs. Doubleday & Bliss for the applicant.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief denying applicant's right to make claims 6, 7, 8, 10, 11, 12, and 14 in this reissue application. The original patent was granted November 12, 1889. The reissue application was filed September 8, 1890. Applicant began to take steps for the making of his reissue application May 19, 1890, and the time between that date and the filing of the reissue application is fully accounted for, applicant being meanwhile a resident of Great Britain.

The inadvertence upon which applicant relies is simply the taking of a claim of less breadth than he was entitled to in his original patent. The original patent makes a suitable disclosure on which these claims might be based, if no other objection existed. Neither of these claims was ever presented in the original application. There is not in the original patent any statement which distinctly negatives the idea that applicant has the right to make these claims. It does not appear that between the issue of the original patent and the filing of the reissue application any one other than the applicant began the manufacture, sale, or use of anything or took a patent for anything which would not infringe the original patent but would infringe the proposed reissue containing these claims.

The United States Supreme Court said, on May 2, 1892, the following with reference to reissues:

> It may be regarded as the settled rule of this Court that the power to reissue may be exercised when the patent is inoperative by reason of the fact that the specification as originally drawn was defective or insufficient, or the claims were narrower than the actual invention of the patentee, provided the error has arisen from inadvertence or mistake, and the patentee is guilty of no fraud or deception; but that such reissues are subject to the following qualifications:
>
> First. That it shall be for the same invention as the original patent, as such invention appears from the specification and claims of such original.
>
> Second. That due diligence must be exercised in discovering the mistake in the original patent, and that, if it be sought for the purpose of enlarging the claim, the lapse of two years will ordinarily, though not always, be treated as evidence of an abandonment of the new matter to the public to the same extent that a failure by the inventor to apply for a patent within two years from the public use or sale of his invention is regarded by the statute as conclusive evidence of an abandonment of the patent to the public.
>
> Third. That this Court will not review the decision of the Commissioner upon the question of inadvertence, accident, or mistake unless the matter is manifest from the record; but that the question whether the application was made within a reasonable time is, in most, if not in all, such cases, a question of law for the court.

To hold that a patent can never be reissued for an enlarged claim would be not only to override the obvious intent of the statute, but would operate in many cases with great hardship upon the patentee. The specification and claims of a patent, particularly if the invention be at all complicated, constitute one of the most difficult legal instruments to draw with accuracy; and, in view of the fact that valuable inventions are often placed in the hands of inexperienced persons to prepare such specifications and claims, it is no matter of surprise that the latter frequently fail to describe with requisite certainty the exact invention of the patentee, and err either in claiming that which the patentee had not in fact invented, or in omitting some element which was a valuable or essential part of his actual invention. Under such circumstances, it would be manifestly unjust to deny him the benefit of a reissue to secure to him his actual invention, provided it is evident that there has been a mistake, and he has been guilty of no want of reasonable diligence in discovering it, and no third persons have in the meantime acquired the right to manufacture or sell what he had failed to claim. The object of the patent law is to secure to inventors a monopoly of what they have actually invented or discovered, and it ought not to be defeated by a too strict and technical adherence to the letter of the statute, or by the application of artificial rules of interpretation. (*Topliff* v. *Topliff et al.*, 59 O. G., 1257; 12 Sup. Ct. Rep., 825.)

What is thus said applies to reissues with enlarged claims, among other things, and that clearly.

No attempt will be made in this case to lay down any principles governing reissues for obvious reasons; but applying the principles of that decision of the Supreme Court to this case, as the present trier understands those principles, this applicant has the right to have the said claims considered in the present reissue application upon the same basis on which they would have been considered if the application for the original patent were now made containing them.

The decision of the Examiners-in-Chief is reversed.

EX PARTE MCGOWAN.

Decided June 15, 1892.

PRACTICE UNDER RULE 139 (a).

A decision by the Examiners-in-Chief affirming a rejection by an Examiner, subject to certain recommendations made by them, is such an affirmance of the Examiner's decision that a petition to the Commissioner asking "that a record decision affirming the patentability of the invention in issue may be entered" will not lie.

ON petition.

VALVE-SEAT.

Application of John H. McGowan filed December 21, 1891, No. 415,786.

Mr. L. M. Hosea for the applicant.

SIMONDS, *Commissioner:*

This is a petition which refers to certain actions made by the Examiners-in-Chief, and its prayer is:

> I ask that such action may be taken as that a record decision

affirming the patentability of the invention in issue may be entered, reversing the Examiner's action, in accordance with the finding of the Board.

Under date of March 26, 1892, the Primary Examiner rendered the following decision by way of final rejection:

This application has been examined in view of the argument presented, and the claims are both rejected as presenting nothing patentable over Coude of record.

Thereupon applicant took an appeal to the Examiners-in-Chief as follows:

I have the honor to appeal from the decision of the Primary Examiner rejecting the applicant's claims herein, upon references, to the Board of Examiners-in-Chief, upon the ground that the references do not show the invention of applicant either directly or by inference, and applicant is entitled to the grant of a patent.

Under date of May 19, 1892, the Examiners-in-Chief rendered a decision, ending as follows:

Subject to such recommendation, the Examiner's decision is affirmed.

This was in affirmance of the final rejection made, as above quoted, by the Primary Examiner on March 26, 1892. It was not, as applicant puts it, a decision "reversing the Examiner's action." It was a decision affirming the Examiner's action, but making a certain recommendation in the premises under Rule 139 (*a*), which is as follows:

139 (*a*.) The Examiners-in-Chief in their decision will affirm or reverse the decision of the Primary Examiner only on the points on which appeal shall have been taken. (See Rule 133.) Should they discover any apparent grounds not involved in the appeal for granting or refusing Letters Patent in the form claimed, or any other form, they will annex to their decision a statement to that effect, with such recommendation as they shall deem proper.

As the present petition is based upon this material mistake of facts, it follows that it must be and it is dismissed.

HALL *v.* LATTA.

Decided July 23, 1892.

PRACTICE—TESTIMONY TAKEN ABROAD—RULE 158.

Where a party seeks to take testimony abroad under the provisions of Rule 158, a mere formal allegation in his affidavit that the testimony cannot be taken in this country without "injury to the moving party greatly exceeding that to which the opposite party will be exposed by the taking of such testimony abroad" is not sufficient to satisfy the requirements of the rule in that particular.

APPEAL on motion.

VELOCIPEDE.

Patent granted John W. Hall October 30, 1888, No 391,895. Application of Emmit G. Latta filed February 2, 1888, No. 262,707.

Mr. A. J. Todd and *Mr. J. L. Norris* for Hall.
Messrs. Foster & Freeman for Latta.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiner of Interferences granting a motion for a commission to take testimony abroad. This matter is governed by the following portion of Rule 158 of the Rules of Practice of the Patent Office.

158. By leave of the Commissioner, first obtained, testimony may be taken in foreign countries, upon complying with the following requirements:

(1) Such permission will be granted only upon motion duly made. (See Rule 155.) The motion must designate a place for the examination of the witnesses at which an officer duly qualified to take testimony under the laws of the United States in a foreign country shall reside, and it must be accompanied by a statement under oath that the motion is made in good faith, and not for purposes of delay or of vexing or harassing any party to the case; it must also set forth the names of the witnesses, the particular facts to which it is expected each will testify, and the grounds on which is based the belief that each will so testify.

(2) It must appear that the testimony desired is material and competent, and that it cannot be taken in this country at all, or cannot be taken here without hardship and injury to the moving party greatly exceeding that to which the opposite party will be exposed by the taking of such testimony abroad.

The following are the direct interrogatories proposed to be put by Hall, with comments thereon:

Interrogatory 1. State your name, age, residence, and occupation.

No comment is needed on this interrogatory.

Int. 2. Are you the same person as the John William Hall whose United States Letters Patent are in interference with Emmit G. Latta's application?

Latta is willing to admit that he is.

Int. 3. When did you first make the invention described in the first claim of said United States Letters Patent here in interference?

This interrogatory is immaterial, because it is conceded that the invention was made abroad. Latta is, however, willing to admit that Hall shall make any answer he chooses to this interrogatory, to have the same force and effect as if sworn to, subject to proper objection.

Int. 4. Was the invention referred to in said first claim of said United States Letters Patent ever patented in Great Britain? If so, in what year, and what is the number of the patent and what is the number of the claim in said British Letters Patent?

Int. 5. Please annex to this record a certified copy of the Blue Book of said British Letters Patent, numbered 13,191, of year 1887.

Int. 6. Is it or is it not the fact that so far as the invention covered by said British Letters Patent, numbered 13,191, of year 1887, is concerned it is your sole invention?

Interrogatories 4 and 5 are inadmissible until connected with interrogatory 6. Latta is willing to admit the affirmative of question 6, and also corresponding answers to questions 4 and 5.

Int. 7. State whether the invention covered by said British Letters Patent, numbered 13,191, of year 1887, was ever described in any printed public work in Great Britain prior to the date of your application for the United States Letters Patent here in interference. If so, annex a copy of each of such printed public work or works.

If this interrogatory is intended to relate to any other invention than that of Hall, it is immaterial. When confined to Hall's invention, his preliminary statement shows that such publications are subsequent to the British patent in date, and therefore merely cumulative and immaterial; but Latta is willing to admit them in evidence.

Int. 8. Have you any knowledge of tandem bicycles in the construction of which was contained the invention of British Letters Patent numbered 13,191, of year 1887, and having been exported to the United States of America prior to the 1st day of February, 1888; and, if so, when was the first of said tandem bicycles so sent to the United States of America?

This question obviously relates to acts occurring abroad, and is therefore immaterial; but Latta is willing that Hall should make what answer he chooses, to stand as his sworn testimony, subject to proper objection.

Int. 10. When was the application for your United States Letters Patent here in interference mailed to the United States of America and to whom?

This question is immaterial, for it relates to acts occurring abroad.

Int. 11. Have you examined a copy of the specification and drawings of the Latta application for Letters Patent of the United States here in interference, and do you thoroughly understand the contents of same, and please annex such copy you have so examined to this deposition as an exhibit?

Int. 12. State what are the differences in construction and principle between your tandem bicycle so patented in Great Britain, in 1887, numbered 13,191, and the United States Letters Patent here in interference and the said Latta's tandem tricycle as described and shown in said copy of his application.

Int. 13. Could the one construction be substituted for the other construction without exercising the inventive faculty; and, if you answer in the negative, give your reasons?

Int. 14. Is there anything in the said Latta copy, specification, and drawings which would enable a mechanic skilled in the art to change the said Latta tandem tricycle to a Hall tandem bicycle, unless he exercised the inventive faculty in so doing; or, in other words, would he not have to make an invention in so proceeding from the Latta construction to your construction?

Int. 15. What changes would be necessary to make a Latta tandem tricycle, as shown, into your tandem bicycle, and are they substantial changes and not merely formal ones?

These questions call for expert evidence and are immaterial on the question of priority of invention.

It only remains to consider interrogatory 9, which is as follows:

Int. 9. Did you ever meet Charles E. Pratt or any other person connected with the Pope Manufacturing Company of the United States of America prior to the 1st day of February, 1888; and, if so, what conversation, if any, was had between you relative to the invention and Hall patented machine here in controversy?

Latta is willing that Hall should make whatever answer he chooses to this question, to stand as his sworn testimony, subject to any proper objection. Hall contends that it is not enough to admit that he will so testify, but that the admission must go to the extent of admitting the truth of the testimony. However that may be, it does not satisfactorily appear that this testimony—

cannot be taken in this country at all, or cannot be taken here without hardship and injury to the moving party greatly exceeding that to which the opposite party will be exposed by the taking of such testimony abroad.

It is true that there is a formal allegation to that effect in the affidavit of Hall's attorney, which is filed with this motion. How the attorney has any knowledge of what degree of hardship and injury Latta will suffer by having this testimony taken abroad does not appear. Moreover, the motion does not propose to bring Pratt's knowledge home to Latta or to materially connect Latta with Pratt in the matter.

The motion to take testimony abroad is denied, conditioned that Latta shall within ten days make the stipulations hereinbefore indicated to the approval of the Examiner of Interferences, subject to a forthwith appeal to the Commissioner.

EX PARTE KINNEY.

Decided May 14, 1892.

SPECIFICATION—PROLIXITY OF DESCRIPTIVE MATTER.

A specification comprising two separate descriptions of the same subject-matter of invention that are substantially alike, except that one contains references to the drawings, is unnecessarily prolix.

ON petition.

METHOD OF DEVELOPING THERMAL ENERGY INTO MECHANICAL EFFECT.

Application of Robert D. Kinney filed September 22, 1891, No. 406,527.

Mr. R. D. Kinney pro se.

FROTHINGHAM, *Assistant Commissioner:*

This is a petition taken from the action of the Examiner objecting to the specification as prolix and to certain portions of the same as indefinite and ambiguous, and requiring the applicant to—

curtail his descriptive matter and to rewrite the whole specification in order to overcome the above-named defects and to render the operation of the device capable of being understood.

It is not apparent from the Examiner's letter to the applicant just how much of the specification he requires to be canceled; but it would seem from his answer to the petition that pages 4, 5, 6, and 7 comprise the alleged surplus descriptive matter.

Upon inspection of the whole case it appears that the matter included between line 12 of page 4 and line 9 of page 8 consists, mainly, of a detailed description of the apparatus suitable for carrying out applicant's alleged method and the mode of operation and function of its several parts, while the succeeding descriptive matter consists, mainly, of an enumeration of the several parts of the apparatus shown in the drawings, together with statements respecting their relation to each other, such parts being identified by letters of reference. Furthermore, it appears that the said two portions of the specification relate to substantially the same subject-matter, although only the second is specifically directed to the apparatus illustrated.

It is obvious that two separate descriptions of the same apparatus are unnecessary and that the clearness and conciseness required by Rule 34 can best be secured by a judicious combination of the extended general description with that which consists of the enumeration of parts identified by means of letters of reference. If applicant has invented a method, it is permissible and proper for him to state in general terms what that method is, and it is necessary for him to describe the preferred means for carrying out that method in order that the patent, if granted, may fully and accurately disclose the invention in such a manner that it may be understood and practiced. Having described such means with reference to the drawings illustrating the same, it is obviously proper for him to state that other means may be employed for the same purpose, in order that the invention may not be construed as limited to the specific apparatus illustrated; but it is neither necessary nor advisable to present a separate detailed description of apparatus without reference to the drawings.

The Examiner's objection to the description of the operation of the apparatus found on pages 10, 11, and 12, in so far as it is made specific, is directed solely to the use of punctuation-marks and the absence of capital letters. These do not appear to be matters that demand a formal amendment by the applicant.

If the Examiner holds any part of the specification to be indefinite and ambiguous in other respects than those indicated, or objectionable for any other reason, he should point out the alleged defects specifically, in order that the applicant may understand just what is necessary to be done to overcome the objections made.

To the foregoing extent the petition is granted, and the case is remanded to the Examiner for action in conformity herewith.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court of Appeals—Third Judicial District.

PAINE *v.* SNOWDEN.

Decided April 29, 1892.

DESIGN PATENTS—NOVELTY—CHAIR-BACKS.

Design Patent No. 13,405, issued November 14, 1882, to Henry H. Paine, for a Design for common round bow-back chairs, consisting in the upper part of the bow and rounds provided with a sheet of suitable material, as wood, bent to conform to the curvature of the bow-back and rounds, leaving the rounds between the sheet and seat exposed, is void for want of novelty. (Affirming 46 Fed. Rep., 189.)

APPEAL from the Circuit Court of the United States for the Eastern District of Pennsylvania.

Suit by Henry H. Paine against William H. Snowden for infringement of a patent. The bill was dismissed below (46 Fed. Rep., 189) and complainant appeals. Affirmed.

Before ACHESON, *Cir. J.*, and WALES and GREEN, *Dis. J.*

Mr. Horace Pettit for the appellant.
Mr. H. T. Fenton for the appellee.

ACHESON, *J.:*

This was a suit in equity for the infringement of Letters Patent dated November 14, 1882, granted to Henry H Paine, the complainant below and appellant, for a Design for chairs.

The patent has four claims. The first and leading claim is as follows:

1. The improved design for common round bow-back chairs, consisting in the upper part of the bow and rounds provided with a sheet of suitable material, as wood, bent to conform to the curvature of said bow-back and rounds, leaving the rounds between said sheet and seat exposed, substantially as and for the purpose specified.

The second claim differs from the first only in providing that the back-piece or sheet shall be perforated wood.

The third claim is like the second, but calls for a perforated-wood seat also.

The fourth claim is the same as the first, with the addition of "ornamental nails" to secure the "curved perforated back-piece" to the bow and rounds.

In his specification the patentee states:

I prefer to curve the bottom of the plate E to improve the design; but, if desired, it may be made perfectly straight.

He further says:

The depth of the plate may be varied, and also its ornamentation, my invention comprehending, broadly, the Design when such a plate is arranged on the upper part of the bow and rounds, leaving the lower parts of the same exposed.

The plate E is the sheet or back-piece mentioned in the claims. The sheet or back-piece shown in the patent drawing has a scalloped lower edge and ornamentally-arranged perforations; but it is quite clear that the patent was not intended to be confined and is not confined to the configuration or ornamentation there shown. Moreover, as we have seen, the depth of the plate or back-piece "may be varied" at pleasure, and, indeed, under the terms of the claims, may be extended any distance down the back of the chair, provided only there is some exposure of the lower parts of the bow and rounds. Certainly as a patent for a Design—a production intended mainly to appeal to the eye—the patent in suit has a remarkable scope. But the court below having held that, in view of the prior state of the art, the patent was destitute of invention, we will confine ourselves to the single inquiry whether that conclusion was correct.

It appears that prior to 1882 Gardner & Co. manufactured and sold in the city of New York veneers, chairs, and settees. Their illustrative catalogue, issued and distributed in June, 1882, is an exhibit in the case, and it is shown that the cuts therein contained are true representations of the chairs which they manufactured and sold long before the date of Paine's alleged invention. Those chairs were of different forms, styles, and sizes. The variety was great. Some of the chairs had curved backs, to conform to the shape of the human body. The chairs were provided with perforated-veneer seats. They also had pieces of perforated veneer, of various shapes and of ornamental appearance, fastened by nails to the backs of the chairs, and in the instances where the backs were curved the back-pieces of veneer were fitted so as to conform to the curvatures. Sometimes the veneer back was continuous with the seat, an unbroken piece of perforated veneer being used for the purpose. In other instances the perforated-veneer back-piece and the seat-piece were separate.

Now, it is true that among the Gardner illustrations we do not find the common bow-backed chair; but everything else disclosed by Paine's patent is there to be seen. However, the bow-backed chair—that is, a chair having a continuous piece bent to form the sides and top of the back, both ends being fastened in the seat—was old. Did it, then, in view of what had already been done, require inventive genius of any order to apply to the curved back of such a chair a piece of perforated veneer or sheet of other flexible material? The court below ruled that it did not, and in that judgment we entirely concur.

But, besides the proofs already discussed, this record contains as an exhibit a patent, No. 179,721, granted on July 11, 1876, to Michael Ohmer, for an improvement in chairs. The illustrative drawing of that patent shows a common bow-backed chair with a wooden back-piece secured by screws against the front of the top of the bow and leaving the lower parts of the rounds exposed. Under the ruling in *Gorham Co.* v. *White* (14 Wall., 511) the conclusion, we think, is well warranted that Ohmer's chair-back and Paine's Design are substantially identical in appearance; but at any rate, when the Ohmer chair-back is added to the other proofs touching the prior state of the art, it becomes clear, beyond any sort of doubt, that Paine's Design possesses no patentable novelty. We are altogether satisfied with the result reached in the court below, and accordingly the decree dismissing the bill is affirmed.

U. S. Circuit Court of Appeals—Third Judicial District.

CONSUMERS' GAS COMPANY OF DANVILLE *v.* AMERICAN ELECTRIC CONSTRUCTION COMPANY, LIMITED.

Decided April 22, 1892.

PATENT—DAMAGES FOR INFRINGEMENT.

In an action to recover a balance alleged to be due on written contract whereby plaintiff agreed to furnish and set up certain machinery for defendant the latter sets up, among other defenses, that he had been served with notice by a certain patentee of a claim for damages for infringing Letters Patent by the use of the machinery furnished by plaintiff. *Held* that a purchaser of machinery who has had the full use and enjoyment and undisturbed possession of it cannot, in the absence of fraud, withhold the purchase-price because of an alleged liability on his part to a patentee for infringement in the use of the property.

IN error to the Circuit Court of the United States for the Western District of Pennsylvania.

Action by the American Electric Construction Company, Limited, against the Consumers' Gas Company of Danville. An affidavit of defense was adjudged insufficient, (47 Fed. Rep., 43,) and defendant brings error. Affirmed.

Before ACHESON, *Cir. J.*, and BUTLER and GREEN, *Dis. J.*

Mr. James Scarlett for the plaintiff in error.
Mr. C. E. Morgan for the defendant in error.

ACHESON, *J.:*

An affidavit of defense is insufficient to prevent judgment unless it sets forth all the facts necessary to constitute a substantial defense. Mere general averments amounting to legal conclusions will not do. The specific facts must be stated, so that the court may draw the proper conclusions. Nothing should be left to conjecture, for that which is not stated must be taken not to exist. These principles have been repeatedly declared and enforced. (*Bryar* v. *Harrison*, 37 Pa. St., 233; *Marsh* v. *Marshall*, 53 Pa. St., 396; *Peck* v. *Jones*, 70 Pa. St., 83; *Asay* v. *Lieber*, 92 Pa. St., 377.)

The action here was to recover a balance alleged to be due to the plaintiff below from the defendant upon a written contract dated July 6, 1888, whereby the plaintiff company agreed to furnish and set up at the works of the defendant company certain machinery and appliances for an electric-light plant, and also to construct certain circuits of poles and wires upon specified terms. A copy of the contract was attached to the affidavit of claim, and also a particular statement of the plaintiff's account, with the credits to which the defendant was entitled, and performance by the plaintiff was distinctly averred. The affidavit of claim was complete. It was then incumbent upon the defendant to file an affidavit setting forth specifically and with reasonable certainty the grounds of defense. The court below decided that the affidavit of defense filed was insufficient to prevent judgment, and after careful consideration we have reached the same conclusion.

As regards the Conard claim, it is quite evident that credit therefor was actually given to the defendant in the plaintiff's statement of account filed, with a slight error in amount, which the court below corrected. This was not seriously controverted upon the argument in this court.

No valid defense was disclosed by the allegations in the defendant's affidavit that at the time the written contract was entered into the plaintiff agreed with the defendant to fully indemnify and save it harmless as against any and all demands and claims under or growing out of Letters Patent of the United States, and against any and all suits for the infringement thereof by reason of its use of the electric-light plant or any of its parts erected by the plaintiff under said contract, and to give to the defendant on demand a good, sufficient, and satisfactory bond so to do; that the plaintiff, in recognition of this obligation, tendered to the defendant a bond, which was not acceptable to and was not accepted by the defendant, as it was neither good, sufficient, nor satisfactory to indemnify and save harmless the defendant, and that the plaintiff failed on demand to give to the defendant such a bond as it agreed to do. No provision whatever for indemnity is to be found in the written contract sued on, nor is it averred in the affidavit of defense that such provision was omitted therefrom by fraud, accident, or mistake. Now, as it is not alleged that the agreement with respect to indemnity was in writing it must be taken to have been by parol. A writing will not be assumed to exist in the absence of express averment of the fact. (*Marsh* v. *Marshall*, *supra*.) Moreover, if the alleged collateral agreement was in writing the defendant was bound to annex a copy to its affidavit. (*Erie City* v. *Butler*, 120 Pa. St., 374; 14 Atl. Rep., 153; *Willard* v. *Reed*, 132 Pa. St., 5; 18 Atl. Rep., 921.) It follows, therefore, that without any averment of fraud, accident, or mistake the defendant sought, by means of a parol agreement made contemporaneously with the written contract and as a part of the transaction, materially to vary the written contract and to introduce therein an entirely new stipulation, changing the plaintiff's liability under its implied warranty of title and imposing upon it an additional obligation. Plainly this defense would contravene the rule, so often enforced by the Supreme Court of the United States, that in the absence of fraud, accident, or mistake it must be conclusively presumed that the written contract contains the whole engagement of the parties. (*Brown* v. *Spofford*, 95 U. S., 474; *Bast* v. *Bank*, 101 U. S., 93; *Richardson* v. *Hardwick*, 106 U. S., 252, 254; 1 Sup. Ct. Rep., 213.) In Pennsylvania, although there has been some relaxation of this rule, it must, nevertheless, appear that the party who sets up the oral promise or undertaking was induced thereby to sign the written contract. (*Phillips* v. *Meily*, 106 Pa. St., 536; *Wanner* v. *Landis*, 137 Pa. St., 61; 20 Atl. Rep., 950; *Sidney School Furniture Co.* v. *Warsaw School Dist.*, 130 Pa. St., 76; 18 Atl. Rep., 604.) But the affidavit of defense here contains no allegation that the defendant was induced by reason of the alleged parol agreement to execute the written contract. Under the Pennsylvania decisions, then, the defense set up is clearly inadmissible.

Such being our conclusion, we need express no opinion upon the question whether under the collateral parol agreement stated it was enough for the defendant simply to allege that the tendered bond was not good, sufficient, or satisfactory, without assigning any specific reason why it was not. It may be here added that if the fact of tender could be regarded as an admission against the plaintiff it would be an admission merely that the defendant was entitled to such a bond as the plaintiff offered and the defendant declined.

That part of the defendant's affidavit which asserts that a certain named patentee has served the defendant with notice of a claim for damages for infringement of Letters Patent by the defendant's use of the machinery and appliances furnished to it by the plaintiff, and that by such use the defendant is also liable to another patentee, affords no ground of defense to this action. A purchaser of property who has had the full use and enjoyment of the same and is in the undisturbed possession thereof, in the absence of fraud, cannot withhold the purchase-price because a third person claims to have a superior title thereto or an adverse right therein and threatens to bring suit to enforce the same, or because of an alleged liability on the

part of the purchaser to a patentee for an infringement of Letters Patent by reason of the use of the property. (*Wanzer* v. *Truly*, 17 How., 584, 585; *Krumbhaar* v. *Birch*, 88 Pa. St., 426; *Geist* v. *Stier*, 134 Pa. St., 216; 19 Atl. Rep., 505.)

Finally, the general allegations, without further specification, that the plaintiff—

has not complied with its contract—

and that the defendant—

has already been put to great delay and exposure and damages to the amount of $10,000—

are altogether too vague, indefinite, and uncertain, as the authorities cited at the opening of this opinion demonstrate.

The court below was entirely right in holding that the affidavit of defense was insufficient and in entering judgment for the plaintiff.

Judgment affirmed.

U. S. Circuit Court of Appeals—Third Judicial District.

ANDERSON *v.* EILER *et al.*

Decided May 6, 1892.

DESIGN PATENT—LICENSE—WHAT CONSTITUTES.

Where a manufacturer of mantels purchased two mantels of a Design not then patented, for the usual price and for the avowed purpose of using them as copies in his business, *Held* equivalent to the consent on the part of the inventor that the manufacturer might use the Design and that, having subsequently obtained a patent therefor, he could not maintain a suit for infringement against the manufacturer.

APPEAL from the Circuit Court of the United States for the Western District of Pennsylvania.

Suit by William Anderson against Eiler, Breitwieser & Co. for infringement of a patent. The bill was dismissed, and complainant appeals. Affirmed.

Before ACHESON, *Cir. J.*, and BUTLER and GREEN, *Dis. J.*

Mr. W. L. Pierce for the appellant.

Mr. James Aylward Develin for the appellees.

BUTLER, *J.*:

The suit is for infringement of Letters Patent No. 19,837, granted to William Anderson June 23, 1890, for Designs for mantels. The mantels sold by the respondents are made after the complainant's design and are covered by his patent. They were purchased from Mershon, Brown & Co., who made them. Several defenses are set up, among them a license in Mershon, Brown & Co., and as we think this is sustained by the proofs we need not consider any other.

It appears that Mershon, Brown & Co., who are manufacturers of mantels, wishing to use this Design, (not then patented,) purchased from Mr. Anderson (through an agent) two of his mantels as samples for this purpose. The agent explicitly informed him of their object in the proposed purchase, as the proofs show and as he admits. He thus sold the mantels with knowledge that the only object in purchasing was to copy and use his Design, and did it without objecting to the use contemplated. The inference is, therefore, we think, irresistible that he consented to this use. Whether he actually consented or not, however, the circumstances estop his denial. His silence at the time closes his mouth. If he did not mean to consent, he should have said so. Such denial now and a recovery of damages for infringement would constitute a fraud. It is true that the sum paid for the mantels was not large; no more than the usual price for their common use. Whether it was disproportioned to the value of the special use mentioned depends upon the question whether a monopoly in the Design was then contemplated by either party. Clearly Mershon, Brown & Co. did not contemplate it. They supposed the Design was open to the public, and virtually declared so at the time. Whether Mr. Anderson then intended applying for a patent is not clear. He did subsequently, though somewhat tardily, apply. But whether the sum was disproportioned to the value of the special use is not important, in view of the fact that this use was distinctly in the minds of both parties and that the money was paid and received on the basis of it.

We do not see any force in the suggestion that Mr. Anderson was constrained to sell by reason of Mershon, Brown & Co.'s assertion that they could and would purchase elsewhere, for the purpose contemplated, if he refused. No deceit or force was employed. The assertion was true. Others were selling the mantels. He was left free to sell or refuse. It may be implied from the evidence that he hesitated and considered the consequences before deciding. He must have known that if he refused and the samples were obtained elsewhere and his rights violated the law would afford him protection; and the fact that he did so hesitate and consider before selling lends additional strength to the inference that he consented to the use contemplated, in consideration of the price received.

The decree of the circuit court is therefore affirmed.

Changes in Classification.

(ORDER No. 770.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 30, 1892.

The following sub-classes are hereby established in Class 73, Measuring-Instruments, Division XXIII:

Calipers, dial.	Spacing-instruments.
Calipers, stem.	Squares, bevel.
Gages, depth.	Squares, center.
Gages, thickness.	Squares, folding.
Pressure-gages, Bourdon.	Telemetry.
Pressure-gages, diaphragm.	Thermometers, metallic.
Pressure-gages, piston.	Thermometers, oven.
Spirometers.	Ullage-rods.

In the same division, in Class 33, Drafting, the sub-class T-squares is established.

Sub-class 34, Swings, is transferred from Class 46, Games and Toys, Division VII, to Class 155, Chairs, Division VIII.

Sub-class Lights, ceiling-block, is established in Class 176, Electric Lighting, Division XVI.

N. L. FROTHINGHAM,
Acting Commissioner.

(ORDER No. 771.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., August 5, 1892.

The sub-class Velocipedes in Class 21, Carriages and Wagons, Division X, is abolished and Class 208, Velocipedes, established.

Class 208, Velocipedes, is hereby transferred from Division X to Division VII.

N. L. FROTHINGHAM,
Acting Commissioner.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

World's Columbian Exposition.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 8, 1892.

To the Inventors and Manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which, indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the development of American invention.

W. E. SIMONDS,
Commissioner.

Names of Applicants.

When the full first name of the applicant does not appear either in his signature or in the preamble to the specification, the Examiner will, in his first official letter, require an amendment supplying the omission, and he will not pass the application to issue until the omission has been supplied, unless an affidavit shall have been filed setting forth that the full first name of the applicant is the one originally given by him.

Women Inventors.

The Patent Office has published and has for sale a volume containing a list of women inventors to whom patents have been granted by the United States from 1790 to July 1, 1888. 44 pages. Paper covers, 50 cents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of August 9, 1892.

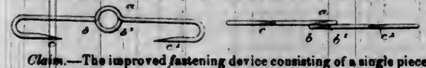
PATENTS

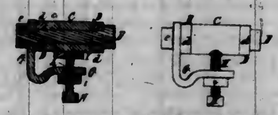


GRANTED AUGUST 9, 1892.

480,241. METALLIC EDGE-PROTECTOR. FRANCIS F. ATKINSON, New York, N. Y., assignor of one-third to Henry Ogden, same place. Filed Apr. 2, 1891. Serial No. 387,490. (No model.)

Claim.—As an improved article of manufacture, a metallic edge-protector for boxes and packages, comprising the rectangularly-bent edge portion adapted to fit the edge of the box or package, provided with the clip B and having the opening E, the bottom portions of the clip having depressions D D to receive the twine, and the cord or twine C, passed through the seat or sleeve in the clip B, substantially as specified.

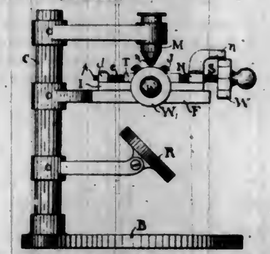
480,242. FASTENING DEVICE. JOHN W. BARNES, New York, N. Y. Filed Nov. 29, 1890. Serial No. 372,998. (No model.)



Claim.—The improved fastening device consisting of a single piece of metal having at each end inturned engaging points and provided at its center with a coil in a plane lengthwise of the body part of the device, whereby the points are forced toward each other by any strain brought to bear thereon, all substantially as described.

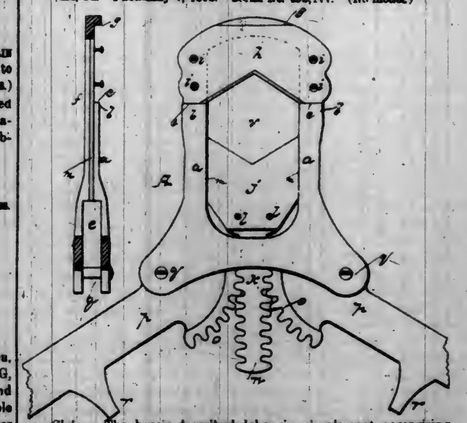
480,243. BINDER FOR ARTIFICIAL FUEL. EMILE K. BADTERLIN and FREDERICK H. HEINIE, Louisville, Ky.; said Badterlin assignor to said Heinie. Filed Nov. 25, 1891. Serial No. 413,140. (No specimens.)

Claim.—The herein-described composition of matter to be used as a binder in the manufacture of artificial fuel, consisting of vegetable pulp, Irish moss, calcined limestone, asbestus fiber, and water, substantially in the proportions stated.



480,244. THILL-COUPLING. JOSEPH H. BERRY, Boston, Mass. Filed Feb. 23, 1892. Serial No. 422,478. (No model.)

Claim.—1. As an improvement in thill-couplings, the combination, with the thill-eye, axle-clip, and connecting-bolt, of a bent spring G, having its upper end attached to one side of the clip and its lower end located under but not in contact with the thill-eye, and an adjustable screw H, passing through the said lower end and bearing on the under side of the thill-iron, as set forth.



2. The bent spring G, with its screw-hole *h*, and having one end secured to one of the ears of the clip by the coupling-bolt D and its other end located in a vertical plane under the thill-eye and out of contact therewith, an adjustable screw H, passing through the hole *h* for regulating the tension of said spring, a concave plate I in contact with and kept in place against the outer surface of the thill-eye by the end of said adjusting-screw, and a check-nut *i* for preventing the screw H from accidentally turning when adjusted, combined and arranged as and for the purpose set forth.

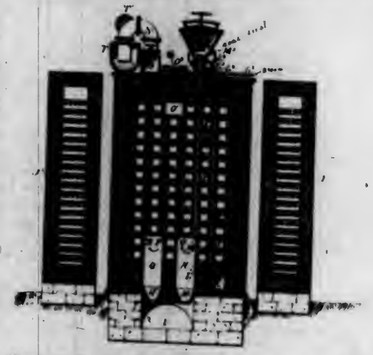
480,245. INSTRUMENT FOR FACILITATING THE USE OF TABULATED DATA. ISRAEL D. BOYER, Dayton, Ohio. Filed Sept. 3, 1891. Serial No. 404,676. (No model.)

Claim.—In an instrument for facilitating the use of tabulated data, the combination, with a microscope, of a mounting-plate T, having motion in two directions, two graduated scales W W' for adjusting the plate in two directions, and a miniature table of data *g*, mounted on plate T and reduced to a scale corresponding to the graduations of the scales W W', the whole being arranged substantially in the manner and for the purpose specified.

480,246. DEHORNING IMPLEMENT. ALVA C. BRONSON, Cochranville, Pa. Filed May 7, 1892. Serial No. 432,177. (No model.)

Claim.—The herein-described dehorning implement, comprising the frame having the slot *e* and shoulders *e g*, the stationary knife *h*, provided with the V-shaped cutting-edge and secured to the frame

between the said shoulders, the movable knife having a corresponding V-shaped cutting-edge and adapted to slide in the grooves *m m*, the follower *k*, having the toothed stem *n*, and the handles *p p*, pivoted to the solid frame at *q q* and provided with the toothed segments *o o*, substantially as specified.



480,247. MODE OF ATTACHING TIPS TO FLEXIBLE TUBING FOR GAS. ALFRED CALDWELL, Providence, R. I. Filed Feb. 24, 1892. Serial No. 422,625. (No model.)

Claim.—1. The combination, with a flexible tube having a coiled-wire lining upon its interior, of a cap upon the end of the tube, the outer end of which is contracted and provided with a short cylindrical portion of a diameter slightly greater than the interior diameter of the lining of the tube, substantially as set forth.

2. The combination, with a tip or socket having a screw-threaded shank, of a tube having a coiled-wire lining upon its interior and a cap upon its exterior, the outer end of said cap being reduced and provided with a short cylindrical portion of a diameter slightly greater than the interior diameter of the lining and adapted to engage with the end of the wire lining at one end and with a shoulder upon the end of the tip at the other end, the exterior diameter of the shank of the tip being slightly greater than the interior diameter of the lining, substantially as set forth.

480,248. APPARATUS FOR MANUFACTURING GAS. JOSEPH H. COLLINS, Jr., Philadelphia, Pa., and ISAAC N. KNAPP, Greenwich, Conn.; Rebecca S. Collins and William J. Collins, administrators of said Joseph H. Collins, Jr., deceased, and said Knapp assignors, by mesne assignments, to the United Gas Improvement Company, Philadelphia, Pa. Filed May 5, 1888. Serial No. 272,964. (No model.)

Claim.—1. In a gas-producing apparatus, two sets of vertically-disposed combustion-flues, said sets being spaced at a distance apart substantially equal to the thickness of one of the flue-walls and forming a narrow vertical retort, a feeding device for supplying pulverized carbonaceous material in regulated quantity to the top of the narrow vertical retort thus formed, a receptacle for solid matter at the bottom of said narrow vertical retort, and a conduit for gas leading from near the bottom of the retort, substantially as described.

2. In a gas-producing apparatus, two sets of vertically-disposed combustion-flues, said sets being spaced at a distance apart substantially equal to the thickness of one of the flue-walls and forming a narrow vertical retort, a feeding device for supplying pulverized carbonaceous material in regulated quantity to the top of the narrow vertical retort thus formed, an enlarged chamber at the bottom of the narrow vertical retort, a receptacle for solid matter at the bottom of the enlarged chamber, and a conduit for gas, leading from near the bottom of the retort, substantially as described.

3. In a gas-producing apparatus, three sets of vertically-disposed combustion-flues, the proximate sets being spaced at a distance apart substantially equal to the thickness of one of the flue-walls and forming a narrow vertical retort, and the intermediate set being shorter than the other two, and thereby forming an enlarged chamber at the base of the intermediate set, said chamber connecting the narrow vertical spaces between the proximate sets, a feeding device for supplying pulverized carbonaceous material to the top of one of the narrow vertical spaces, and an exit-flue leading from the top of the other of the narrow vertical spaces, substantially as described.

4. In a gas-producing apparatus, a narrow vertical retort, in combination with combustion-flues surrounding said retort for heating the same externally, a feeding device for supplying pulverized carbonaceous material in regulated quantity to the top of the retort, an enlarged chamber having a receptacle for solid matter at the bottom of the retort, a steam-conduit opening into, and a condnit for gas leading from said enlarged chamber.

5. In a gas-producing apparatus, a narrow vertical retort, in combination with a feeding device for supplying pulverized carbonaceous material in regulated quantity to the top of the retort, an enlarged chamber having a receptacle for solid matter at the bottom of the retort, a narrow vertical retort provided with baffle-tiles opening at its bottom into the enlarged chamber aforesaid and having a steam-pipe entering its top, a gas-conduit leading from the enlarged chamber, and combustion-flues surrounding the retorts for heating them externally.

6. In a gas-producing apparatus, a narrow vertical retort, in combination with a feeding device for supplying pulverized carbonaceous material in regulated quantity to the top of the retort, an enlarged chamber having a receptacle for solid matter at the bottom of the retort, a narrow vertical retort provided with baffle-tiles opening at its bottom into the enlarged chamber aforesaid and having a steam-pipe entering its top, a narrow vertical retort leading upward from the enlarged chamber, a suitable gas-exit, and combustion-flues surrounding the retorts for heating them externally.

7. In a gas-producing apparatus, a narrow vertical retort, in combination with a feeding device for supplying pulverized carbonaceous material in regulated quantity to the top of the retort, an enlarged chamber having a receptacle for solid matter at the bottom of the retort, a steam-conduit leading into said enlarged chamber, a second narrow vertical retort leading upward from the enlarged chamber, a third narrow vertical retort connecting with the second at their tops and having a second enlarged chamber with an ash-receptacle at its bottom, an oil-injector leading into the retorts above the first enlarged chamber, a gas-conduit leading from the second enlarged chamber, and combustion-flues surrounding all of the retorts so as to heat them externally.

8. In a gas-producing apparatus, a narrow vertical retort, in combination with a feeding device for supplying pulverized carbonaceous material in regulated quantity to the top of the retort, an enlarged chamber having a receptacle for solid matter at the bottom of the retort, a narrow vertical retort provided with baffle-tiles opening at its bottom into the enlarged chamber aforesaid and having a steam-pipe entering its top, a third narrow vertical retort leading upward from the enlarged chamber, a fourth narrow vertical retort connecting with the third at their tops and having a second enlarged chamber with an ash-receptacle at its bottom, an oil-injector leading into the retorts above the first enlarged chamber, a gas-conduit leading from the second enlarged chamber, and combustion-flues surrounding all of the retorts, so as to heat them externally.

9. The gas-producer A, having a grate *a*, air-passages A' and A^2 above and below said grate, and gas-passages A^3 and A^4 below and above said grate, in combination with valves *a'* and a^3, situated in each gas-passage, a conduit connecting with both of said gas-passages, and an exhauster connected with said conduit and whereby the gas can be drawn from above or below the grate in the producer, according to the arrangement of the valves.

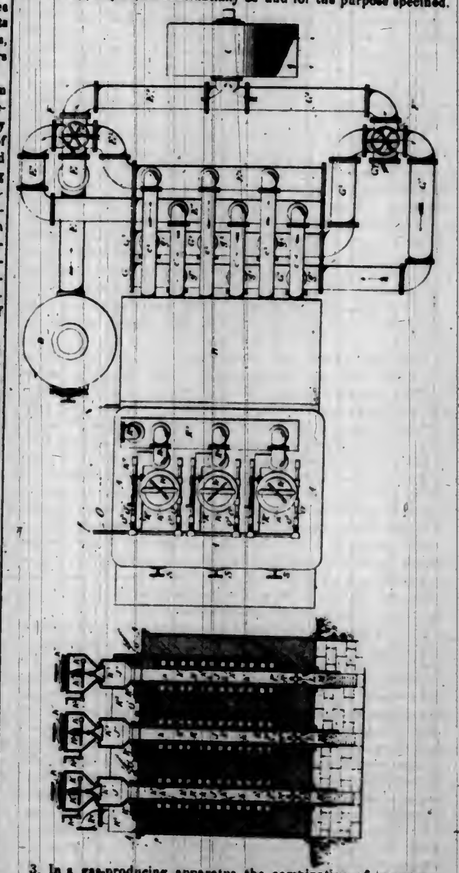
10. In combination with a series of externally-heated gas-retorts, combustion-flues surrounding said retorts, connecting-chambers uniting the combustion-flues, so as to form a continuous conduit passing backward and forward around the retorts, an air-conduit leading into the combustion-flue system at one end thereof, an exhauster arranged to connect with the combustion-flue system at the other end thereof, a gas-producer, a conduit leading from said gas-producer to the combustion-flue system and having gas-passages connected with two or more of the connecting-chambers, and valves whereby said passages are controlled and the gas delivered to the connected chambers at will and in regulated quantity.

11. In combination with a series of externally-heated gas-retorts, combustion-flues surrounding said retorts, connecting-chambers uniting the combustion-flues, so as to form a continuous conduit passing backward and forward around the retorts, two regenerators, each connected with one of the two connecting-chambers at the ends of the combustion-flue system, an exhauster, conduits leading from the regenerators, a four-way valve arranged to connect the exhauster, the regenerator-conduits, and a pipe-section leading to the open air, so that one regenerator will be connected with the exhauster whenever the other is connected to the open-pipe section, a gas-producer, a conduit leading from the producer to the combustion-flues and provided with independent branches connecting, respectively, with the end chambers of said combustion-flue system, and valves to control the flow of gas through said branches.

12. In combination with a series of externally-heated gas-retorts, combustion-flues surrounding said retorts, connecting-chambers uniting the combustion-flues, so as to form a continuous conduit passing backward and forward around the retorts, two regenerators, each connected with one of the two connecting-chambers at the ends of the combustion-flue system, an exhauster, conduits leading from the regenerators, a four-way valve arranged to connect the exhauster, the regenerator-conduits, and a pipe-section leading to the open air, so that one regenerator will be connected with the exhauster whenever the other is connected to the open pipe-section, a gas-producer having a grate, two air-inlet passages, and two gas-exit passages, one of each situated above the grate and one of each below said grate, valves arranged to close and regulate each of said gas-passages, a conduit leading from the producer, and connected with both gas-passages thereof, to the combustion-flues and provided with independent branches connecting, respectively, with the end chambers of said combustion-flue system, and valves to control the flow of gas through said branches.

13. In a gas-producing apparatus, the combination, with a system of narrow vertical retorts connected together and provided with devices for feeding in pulverized fuel and injecting steam, substantially as specified, of combustion-flues arranged in and forming the walls of the retorts, connecting-chambers at the ends of the retorts, arranged with the combustion-flues so as to form a continuous conduit passing around each retort in the system, an air-conduit leading into the combustion-flue system at one end thereof, an exhauster arranged to connect with the combustion-flue system at the end opposite to that at which the air-conduit enters it, a gas-producer, a conduit leading from the gas-producer to the combustion-flue system and having passages connecting with all the connecting-chambers on the side of the retorts where the air enters said system, and valves arranged in said passages, whereby the gas can be directed into any of the connecting-chambers at will and in regulated quantity.

14. In a gas-producing apparatus, the combination, with a system of narrow vertical retorts connected together and provided with devices for feeding in pulverized fuel and injecting steam, substantially as specified, of combustion-flues arranged in and forming the walls of the retorts, connecting-chambers at the ends of the retorts arranged with the combustion-flues so as to form a continuous conduit passing around each retort in the system, two regenerators connecting, respectively, with the chambers at the two ends of the combustion-flue system, an exhauster, a four-way valve having one port connected with the exhauster, one with the air, and its other two with the two regenerators, respectively, and all so arranged that one regenerator is connected with the exhauster and the other with the air alternately, a gas-producer, a conduit leading from the gas-producer to the combustion-flue system and having gas-passages connecting with the two ends of the combustion-flue system, and valves for controlling said passages.



15. In a gas-producing apparatus, the combination, with a system of narrow vertical retorts connected together and provided with devices for feeding in pulverized fuel and injecting steam, substantially as specified, of combustion flues arranged in and forming the walls of the retorts, connecting-chambers at the ends of the retorts, arranged with the combustion-flues so as to form a continuous conduit passing around each retort in the system, two regenerators connecting, respectively, with the chambers at the two ends of the combustion-flue system, an exhauster, a four-way valve having one port connected with the exhauster, one with the air, and its other two with the two regenerators, respectively, and all so arranged that one regenerator is connected with the exhauster and the other with the air alternately, a gas-producer having two air-inlet passages, a grate, and two gas-exit passages, one of each situated above the grate and one of each below said grate, valves arranged to close and regulate each of said gas-passages, a conduit leading from the gas-producer, and connected with both gas-passages thereof, to the combustion-flue system and having gas-passages connecting with the two ends of the combustion-flue system, and valves for controlling said passages.

16. In a gas-producing apparatus, substantially as specified, the combination of the parallel vertical flue-rows E E', &c., made up of square flues *e e*, &c., and placed so as to form a series of narrow retort-chambers between adjacent flue-rows, connecting-chambers arranged to unite the flues into a continuous conduit, and one or more partition-walls separating the series of retorts into two or more independent series, so that the manufacture of gas can be stopped in the retort system on one side of said partition without interfering with the operation of the retort system on the other side thereof.

480,249. GAS-PRODUCING APPARATUS. JOSEPH H. COLLINS, Jr., Philadelphia, Pa., and ISAAC N. KNAPP, Paterson, N. J.; Rebecca S. Collins and William J. Collins, administrators of said Joseph H. Collins, Jr., deceased, and said Knapp assignors, by mesne assignments, to the United Gas Improvement Company, Philadelphia, Pa. Filed June 26, 1888. Serial No. 278,277. (No model.)

Claim.—1. In a gas-producing apparatus, the combination of an externally-heated retort made up of vertical side walls and end walls, the ends walls being narrow with respect to the side walls, (whereby a narrow vertical retort having broad side walls separated by a narrow intervening space is formed,) means for externally heating the retort, a hopper-box at the top of said retort, provided with appliances whereby coal can be introduced into the retort without opening it to the air, a grate at the bottom of the retort to sustain the charge therein, one or more steam-pipes entering the retort a little above the grate, and an ash-pit situated below the grate and constructed so that the ashes can be removed without opening the retort to the air, said retort being provided with a gas-exit passage leading from its upper part, all substantially as and for the purpose specified.

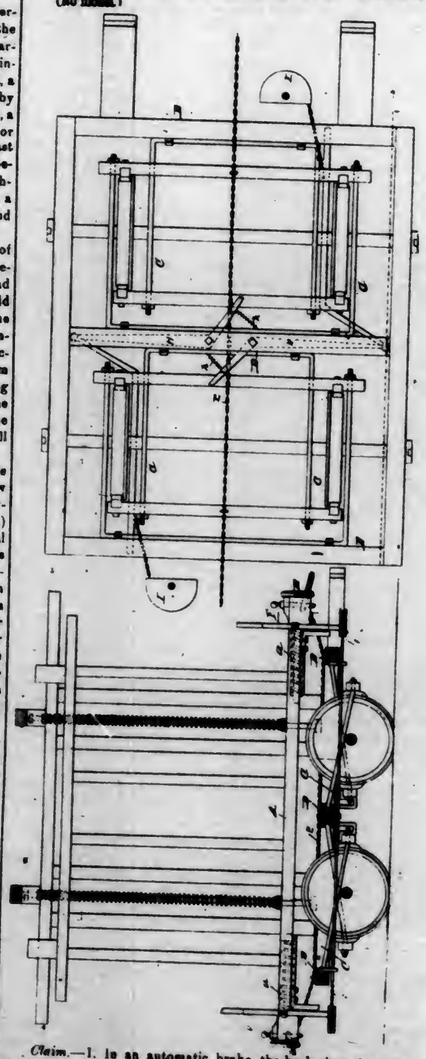
2. In a gas-producing apparatus, the combination of an externally-heated retort made up of vertical side walls and end walls, the end walls being narrow with respect to the side walls, (whereby a narrow vertical retort having broad side walls separated by a narrow intervening space is formed,) means for externally heating the retort, a hopper-box at the top of said retort, provided with appliances whereby coal can be introduced into the retort without opening it to the air, a grate at the bottom of the retort to sustain the charge therein, openings in the furnace-wall arranged one above the other along the edge of the retort and constructed with flaring mouths and contracted neck, as shown, one or more steam-pipes entering the retort a little above the grate, and an ash-pit situated below the grate and constructed so that the ashes can be removed without opening the retort to the air, said retort provided with a gas-exit passage leading from its upper part, all substantially as and for the purpose specified.

3. In a gas-producing apparatus, the combination of an externally-heated retort made up of vertical side walls and end walls, the end walls being narrow with respect to the side walls, (whereby a narrow vertical retort having broad side walls separated by a narrow intervening space is formed,) means for externally heating the retort, a hopper-box at the top of said retort, provided with appliances whereby

coal can be introduced into the retort without opening it to the air, a grate at the bottom of the retort to sustain the charge therein, one or more steam-pipes entering the retort a little above the grate, and an ash-pit situated below the grate and constructed so that the ashes can be removed without opening the retort to the air, said retort being provided with a gas-exit passage leading from its upper part at a point below the top of the charging-zone, and hence below the level of the fuel therein, all substantially as and for the purpose specified.

4. In a gas-producing apparatus, the combination of an externally-heated retort made up of vertical side walls and end walls, the end walls being narrow with respect to the side walls, (whereby a narrow vertical retort having broad side walls separated by a narrow intervening space is formed,) means for externally heating the retort, a hopper-box at the top of said retort, provided with appliances whereby coal can be introduced into the retort without opening it to the air, a grate at the bottom of the retort to sustain the charge therein, one or more steam-pipes entering the retort a little above the grate, and a water-bottom arranged to serve as an ash-pit to the retort, and said retort being provided with a gas-exit passage leading from its upper part, all substantially as and for the purpose specified.

5. In a gas-producing apparatus, the combination of an externally-heated retort made up of vertical side walls and end walls, the end walls being narrow with respect to the side walls, (whereby a narrow vertical retort having broad side walls separated by a narrow intervening space is formed,) means for externally heating the retort, a hopper-box at the top of said retort, provided with appliances whereby coal can be introduced into the retort without opening it to the air, a grate at the bottom of the retort to sustain the charge therein, one or more steam-pipes entering the retort a little above the grate, air-blast pipes entering the retort near its bottom, and an ash-pit situated below the grate and constructed so that the ashes can be removed without opening the retort to the air, said retort being provided with a gas-exit passage leading from its upper part, all substantially as and for the purpose specified.



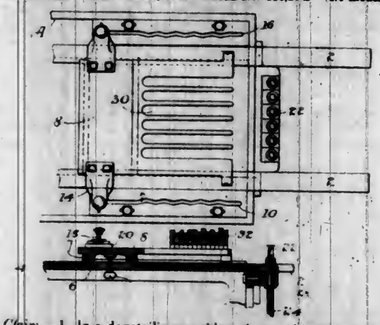
6. In a gas-producing apparatus, one or more retorts made up of vertical side walls and end walls, the end walls being narrow with respect to the side walls, (whereby narrow vertical retorts having broad side walls separated by a narrow intervening space are formed,) said walls being composed of hollow tiles united to form a combustion-flue system, means for supplying said hollow walls with products of combustion, a hopper-box secured to the top of each retort for introducing coal without opening the retort to the air, a grate at the bottom of the retort to support its charge, a closed ash-pit, said retorts being provided with a gas-exit passage leading from the upper part of the retort, and steam-passages formed alongside the hollow tiles from the top to near the bottom of the retort, where they enter the same, all substantially as and for the purpose specified.

7. In a gas-producing apparatus, an externally-heated retort made up of vertical side walls and end walls, the end walls being narrow with respect to the side walls, (whereby a narrow vertical retort having broad side walls separated by a narrow intervening space is formed,) said retort having a hopper-box at its upper end through which coal can be introduced without opening the retort to the air, a grate at its bottom to support its charge, a closed ash-pit, a steam-pipe for introducing steam, and a gas-exit passage, all substantially as specified, in combination with a system of combustion-flues formed in its side walls so as to form a continuous passage for burning gases extending over the whole of both sides of the retort, a gas-producer, a conduit or conduits leading from the producer to one end of the combustion flue passage, an air inlet or inlets leading into the said passage at the same point as the gas-conduit, an exhaust-fan, and a conduit or conduits leading from the fan to the combustion-flue passage at the other end from that connected with the gas-producer.

8. In a gas-producing apparatus, one or more narrow vertical retorts J, in combination with one or more sets of air and gas mixing chambers H H^4, a system of flues leading from each chamber H to each chamber H^4 and arranged to traverse the sides of the retort and heat the same throughout, two independent regenerators leading into each of chambers H and H^4, a gas-producer D, a suction-fan C, four conduits connected by a four-way valve F, one leading to the producer D, one to fan C, and two E' and E^3 connecting with independent regenerators leading to chambers H and H^4, four additional conduits united by a four-way valve F', one leading to fan C, one to the open air, and two G' G^2 connecting with the other two independent regenerators leading, respectively, to chambers H and H^4, all substantially as shown and described, and so that the producer gases and air can by changing the position of cocks F F' be made to pass at will through the regenerators heated by the escaping products of their combustion, while said gases are caused to pass through the passages formerly traversed by the entering gas and air.

9. In a gas-producing apparatus, one or more narrow vertical retorts J, in combination with one or more sets of air and gas mixing chambers H H^4, a system of flues leading from each chamber H to each chamber H^4 and arranged to traverse the sides of the retort and heat the same throughout, independent regenerators B^3 B^4, situated one above the other, leading into each chamber H, similar independent regenerators B' B^5, situated one above the other and alongside of regenerators B^3 B^4, leading into each regenerator H, a gas-producer B, a suction-fan C, four conduits connected by a four-way valve F, one leading to the producer D, one to fan C, and two E' and E^3 connecting with independent regenerators leading to chambers H and H^4, four additional conduits united by a four-way valve F', one leading to fan C, one to the open air, and two G' G^2 connecting with the other two independent regenerators leading, respectively, to chambers H and H^4, substantially as shown and described, and so that the producer gases and air can by changing the position of cocks F F' be made to pass at will through the regenerators heated by the escaping products of their combustion, while said gases are caused to pass through the regenerators formerly traversed by the entering gas and air.

480,250. AUTOMATIC CAR-BRAKE. RICHARD CONDON, Lyons, Iowa. Filed Jan. 29, 1889. Renewed Apr. 22, 1892. Serial No. 430,170. (No model.)



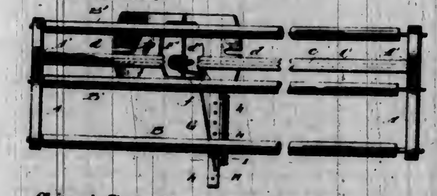
Claim.—1. In an automatic brake, the brake-bars hung above the wheels and chains connected with the brake-bars and with the sliding draw-head, substantially as described.

2. In an automatic brake, the brake-bars loosely hung above the wheels and the chain or rope connected to the rear end of the train and to the locomotive and attached to the brake-bars, substantially as described.

3. In an automatic brake, the brake-bars loosely hung above the wheels, the sliding draw-heads, the chain connected with the draw-heads and with the brake-bars, and the supplemental chain attached to the operating-chain and to the standards, substantially as described.

480,251. DOVETAILING-MACHINE. CHARLES CRISTADORO, St. Paul, Minn. Filed Jan. 16, 1892. Serial No. 418,274. (No model.)

Claim.—1. In a dovetailing-machine, the combination, with the series of cutters, of the table arranged at right angles with the plane of the cutters and slidable to and from them, the secondary table carried by it and slidable laterally thereon, and the regular angular zigzag guides for said second table, whereby said table is reciprocated upon the machine in exactly similar but oppositely-angled zigzag courses, substantially as described.



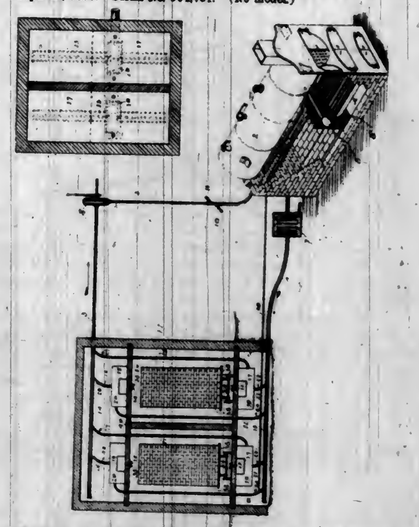
2. In a dovetailing-machine, the combination, with the series of cutters, of a table or carriage arranged in a plane at right angles to the plane of said cutters and adapted to be carried to and fro over the same, and automatic means for moving it laterally during its travel, so as to cause it to describe regular angular zigzag courses, the angles of one course being exactly the opposite of the angles of the other, substantially as described.

3. In a device of the class described, the combination, with the cutters, of the table or carriage slidable over the same, means for guiding said table in a regular angular zigzag course while traveling in one direction and in a similar but exactly oppositely-angled course while traveling in the opposite direction, substantially as described.

4. In a dovetailing-machine, the combination, with the series of cutters, of the main table slidable to and from said cutters, the secondary table carried thereby and slidable thereon at right angles to the path of its movement, oppositely-arranged angular zigzag guides for said secondary table, and means alternately connecting the same with said guides, whereby when reciprocated over the cutters the cutters are carried through the stock in intersecting zigzag paths, substantially as described.

5. The combination, with the cutters, of the table slidable in a right line to and from said cutters, the secondary table carried thereby and slidable thereon at right angles with its path of movement, the guides having regular reverse-angled grooves oppositely arranged, and the guide-pins carried by said secondary table and adapted to be alternately engaged with their respective guides, substantially as described.

480,252. QUILTING ATTACHMENT FOR SEWING-MACHINES. CHARLES W. DELANY, Columbus, Tex. Filed Mar. 21, 1892. Serial No. 425,678. (No model.)



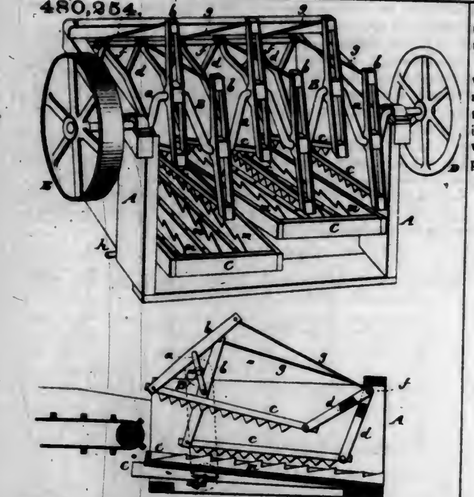
Claim.—1. The combination, with a quilting-frame, of a plate having a lateral arm with plurality of holes, an adjustable roller, and a wire having one end provided with means for detachably engaging said holes and its other adapted to move said roller on its support, as and for the purpose specified.

2. The combination, with a quilting-frame, of a plate having an opening and a lateral arm with holes, a rod across said opening, a gage-roller loosely sleeved on said rod, and a wire having one end bent at right angles to its length to engage said holes and its other end embracing the roller and loosely sleeved on its rod, as shown and described.

3. The combination, with a quilting frame, of a plate having an opening and a lateral arm with holes, a rod across said opening, a gage-roller loosely sleeved on said rod, a wire having one end bent at right angles to its length and its other end loosely sleeved upon said rod upon opposite sides of the gage-roller, and a short roller journaled on said arm parallel therewith, as set forth.

480,253. DRYING-KILN. CHARLES J. DION, St. Paul, Minn. Filed Sept. 12, 1890. Serial No. 364,761. (No model.)

Claim.—1. In a device of the class described, the combination of a drying-chamber having slotted openings in both its floor and ceiling, main inlet and main outlet pipes located one at the bottom and the other at the top of said chamber, valved connections between said slots and main pipes at both the ceiling and the bottom of the chamber, and valved pipes, one leading from the lower main pipe and having a connection with the slotted openings in the ceiling and the other leading from the upper main pipe downward and having a connection with the slotted openings in the floor of the chamber, whereby air may be introduced into said chamber at will from either the bottom or ceiling and caused to circulate, as set forth, substantially as and for the purposes described.

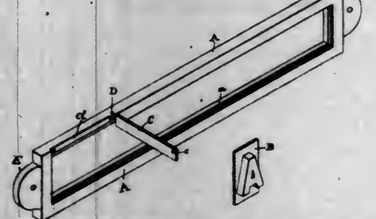


2. In a device of the class described, the combination, with the drying-chamber and the inlet and outlet air-pipes thereof located one at the top and the other at the bottom of the chamber, of narrow slotted openings extending substantially the entire width of both floor and ceiling, valve-controlled connections between said slotted openings and both inlet and outlet pipes, and curved deflectors arranged adjacent to said slots on the inside of said chamber in such manner as to divide and oppositely deflect the currents of air entering the same, substantially as and for the purposes set forth.

3. The combination, with the drying-kiln and its main air-pipes, of inlet and outlet valves in said pipes, a blower for forcing the air through said pipes, means for heating the air as it passes through said pipes to said kiln, slots extending substantially the width of the kiln through both floor and ceiling, branch pipes connecting said slots with both inlet and outlet main air-pipes, valves in said branch pipes, and valve-controlled steam-pipe connections with said branch pipes, substantially as and for the purposes set forth.

480,254. FEEDER AND CUTTER FOR THRASHING-MACHINES. FRED DWORSHAK, Beaver Falls, Minn. Filed Jan. 2, 1892. Serial No. 416,765. (No model.)

Claim.—1. In a feeding and cutting machine for thrashing-ma-

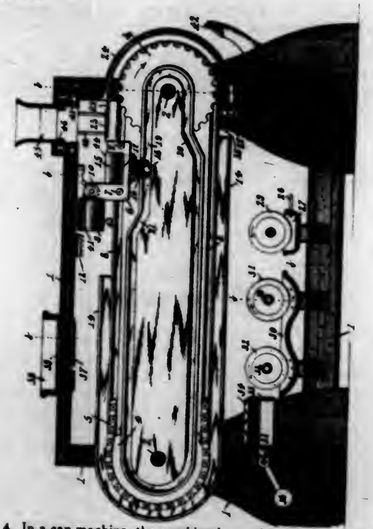


480,254.

chines, a rotative shaft provided with a series of cranks, a series of rocking levers pivotally connected with said cranks, a number of cutters connected at their forward ends with said levers, pivoted hangers with which the rear ends of said cutters are connected, rods connected with said levers and with a rear cross-bar, and operating mechanism, substantially as and for the purposes described.

2. The combination, with a main frame, of a shaft provided with a series of cranks, pivoted holders *b*, secured on said shaft, cutters *c*, connected at their forward ends with said holders, hangers *d*, connected with said cutters, rods connected with said holders and with a cross-bar, one or more vibrating tables mounted under said cutters, and driving mechanism, substantially as set forth and described.

480,255. **INTERCHANGEABLE SIGN-BOARD.** ISAAC ENNER, St. Louis, Mo. Filed Aug. 13, 1891. Serial No. 402,509. (No model.)



Claim.—A street-sign consisting of a frame A, pierced ears E, formed on the opposite ends of the said frame, a plate-gate *d*, formed in said frame and located at one end of the longitudinal portion of the same, a bar C, hinged at D to one end of the plate-gate, a hole *c*, formed in the said bar, through which a screw or other device is inserted and into the frame, and a continuous channel *a*, formed around the inner edges of the frame when the said bar is closed, said channel adapted to receive letter or figure plates in a manner herein shown and described.

480,256. **CAN-MACHINE.** JOHN B. FOOTE, Hamilton, Ohio, assignor to Edwin Norton and Oliver W. Norton, Chicago, Ill. Filed July 17, 1891. Serial No. 399,206. (No model.)

Claim.—1. In a can-machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, and a cylindrical horn mounted on said carriage with its axis parallel to the path of movement of the carriage and attached to said carriage by one end only and overhanging its attachment a distance equal to the length of the can-body.

2. In a can machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, and an overhanging cylindrical horn mounted on said carriage and supported by one end only, with its axis parallel to the path of movement of the carriage and provided with a longitudinal carbon rib.

3. In a can-machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, and an overhanging cylindrical horn mounted on said carriage with its axis parallel to the path of movement of the carriage and provided with a longitudinal peripheral groove adapted to receive a stripping-finger.

4. In a can-machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, and an overhanging cylindrical horn mounted on said carriage with its axis parallel to the path of movement of the carriage and connected with the carriage by a pivot at right angles to said line and path to permit the horn to reverse its position on the carriage.

5. In a can-machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, an overhanging cylindrical horn mounted on said carriage with its axis parallel to the path of movement of the carriage, and a pair of clamps pivoted to the carriage and adapted to open and close upon the horn and travel with the horn.

6. In a can-machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, a cylindrical overhanging traveling horn mounted on said carriage with its axis parallel to the path of horizontal movement of the carriage, and a pair of clamps pivoted to the carriage and adapted to open and close upon and travel with the horn and to present when open their edges in a common horizontal plane parallel to the axis of the horn.

7. In a can-machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, a cylindrical horn mounted on said carriage with its axis parallel to the path of horizontal movement of the carriage and pivoted to the carriage so as to be capable of reversing thereon, and a pair of clamps pivoted to the carriage and adapted to open and close upon the horn when the horn is in normal position.

8. In a can-machine, the combination, substantially as set forth, with a series of soldering appliances disposed in a line, of a carriage, mechanism for moving the carriage in a path parallel with said line, a cylindrical horn mounted on said carriage with its axis parallel to the path of movement of the carriage, and a pair of fixed blank-supporting ledges disposed one at each side of the machine and outwardly beyond the width of the carriage.

9. The combination, substantially as set forth, with an open-bottom box adapted to receive a pile of blanks, of a series of vertical screws disposed below the lower edge of the box and projecting their threaded peripheries inwardly beyond the wall of the box and arranged for rotation in unison.

10. In a can-machine, the combination, substantially as set forth, with appliances for moving a can-body in a path parallel to its longitudinal seam, of a rotary soldering-disk with its periphery in the line of movement of said seam, a solder-vessel below the disk, and a runner-ended soldering-rib arranged in said line beyond said disk and adapted to rub upon the solder deposited on the seam by said disk.

11. In a can-machine, the combination, substantially as set forth, with appliances for moving a can-body in a path parallel to its longitudinal seam, of a hollow rotary soldering-disk, with its periphery in the line of movement of said seam and provided with gas-ajutages in its surface and a gas-supply pipe communicating with said ajutages.

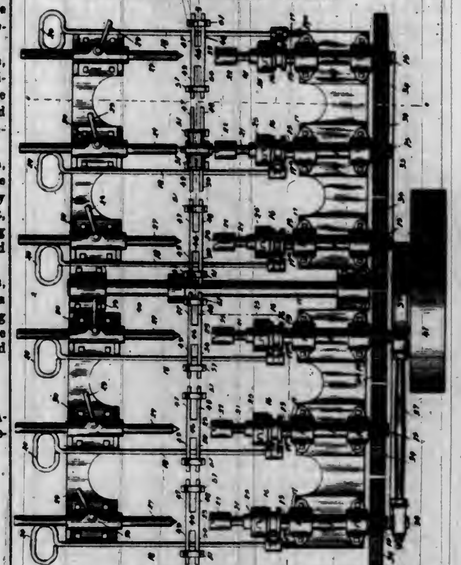
12. In a can-machine, the combination, substantially as set forth, with appliances for moving a can-body in a path parallel to its longitudinal seam, of a rotary soldering-disk with its periphery in the line of movement of said seam and a second soldering-disk in line with the first one, said two soldering-disks being arranged for rotation in opposite directions.

13. In a can-machine, the combination, substantially as set forth, with appliances for moving a can-body in a path parallel to its longitudinal seam, of a rotary soldering-disk with its periphery in the line of movement of said seam and a soldering-vessel below the disk and provided with a perforated partition dividing said vessel into two compartments, one of which is dipped into by said disk.

14. In a can-machine, the combination, substantially as set forth, of a carriage, an endless guide therefor, mechanism for moving the carriage thereon in a circuit, a traveling overhanging horn carried by the carriage with its axis parallel to the path of carriage movement, clamps pivoted to the carriage, and blank-feeding and blank-beveling and seam-soldering appliances disposed along said circuit and adapted to be engaged successively by said carriage.

15. In a can-machine, the combination, substantially as set forth, of two shafts, chains thereon, a carriage moved by said chains in a continuous path partly straight and partly curved, an overhanging cylindrical horn mounted on the carriage with its axis parallel to the path of movement of the carriage, and soldering appliances arranged at the straight part of said continuous path.

480,257. **CLEANING ATTACHMENT FOR TYPE-WRITING MACHINES.** SUMNERFIELD FORD, Chicago, Ill. Filed July 16, 1890. Serial No. 358,965. (No model.)



Claim.—1. The combination, with the printing-types of a type-writing machine arranged in a circle and the frame of said machine provided at its top with a circular opening through which the types operate, of an attachment for cleaning the types, consisting of a frame adapted to be secured to the top of the machine frame, a shaft mounted on said attachment-frame and supported at its inner end by said overhanging arm, a revolving brush mounted on the shaft at the center of the said circular opening, and means located at the outer end of the shaft for giving rotary or oscillating motion thereto, consisting of a crank-shaft mounted upon said attachment-frame and gearing connecting the crank-shaft with the brush-shaft, substantially as described.

2. The combination, with the printing-types of a type-writing machine arranged in a circle and the frame of said machine provided at its top with a circular opening through which the types operate, of an attachment for cleaning the types, consisting of a frame adapted to be secured to the top of the machine-frame and having a rigid arm which overhangs the central opening of said machine-frame, a shaft mounted in the attachment-frame and supported at its inner end by said overhanging arm, a revolving brush mounted on the shaft at the center of the said opening in the machine-frame, and means located at the outer end of the shaft for giving rotary or oscillatory motion thereto, substantially as described.

3. The combination, with the printing-types of a type-writing machine arranged in a circle and the frame of said machine provided at its top with a circular opening through which the types operate, of an attachment for cleaning the types, consisting of a frame having a rigid arm which overhangs the central opening of the machine-frame, a shaft mounted in the attachment-frame and supported at its inner end by said overhanging arm, a revolving brush mounted on the shaft at the center of said opening in the machine-frame, means for giving rotary or oscillatory motion to the shaft, and a clamp upon the attachment-frame adapted to engage the machine-frame, substantially as described.

4. An attachment for cleaning the type of type-writing-machines, comprising the base B and set-screw B', the arms C and C', the spindle C², mounted in said arms, a brush E, mounted upon the other end of said spindle, a wheel D', supported upon the arm C, larger than and in engagement with the pinion D, and means for imparting a rotary or oscillatory movement to said wheel D', substantially as described.

480,258. **MACHINE FOR GRINDING COCKS.** PAUL GEMSTERLORN, Milwaukee, Wis., assignor to himself, and Otto Budde, Chicago, Ill. Filed Feb. 6, 1892. Serial No. 420,595. (No model.)

Claim.—1. The combination, with a number of seat-supporting devices, of a corresponding number of shafts adapted to support keys in the seats, a sleeve carried upon each of said shafts, mechanism for operating said shafts from said sleeves, pinions carried by said sleeves, segmental rack-plates intermeshing with said pinions and adapted to be oscillated to operate said pinions, a connecting-rod connecting said rack-plates, and means for reciprocating said connecting-rod, substantially as and for the purpose specified.

2. The combination, with a number of seat-supporting devices, of a corresponding number of shafts adapted to support keys in the seats, a sleeve carried upon each of said shafts, mechanism for operating said shafts from said sleeves, pinions carried by said sleeves, segmental rack-plates intermeshing with said pinions and adapted to be oscillated to operate said pinions, connecting-rod connecting said rack-plates, pitman 37, eccentric 39, and band-wheel 41, substantially as and for the purpose specified.

3. The combination, with a key-holder, means for oscillating the same, and a seat-holder for holding a cock-seat upon a key, of a lever-and-cam mechanism which intermittently vibrates the seat holder and moves the seat off of and upon the key at regular intervals during the grinding operation to present fresh surfaces of the seat to the action of the oscillating key, substantially as described.

4. The combination, with a key-holder, means for oscillating the same, and a seat-holder for holding a cock-seat upon a key, of automatically-operating mechanism which vibrates the seat-holder and moves the seat off of and upon the key at regular intervals during the grinding operation to present fresh surfaces of the seat to the action of the oscillating key, substantially as described.

5. The combination, with a key-holder and means for oscillating the same, of a laterally-adjustable shaft 43, a lever 42, mounted on the shaft and provided with a cock-seat holder, a cam operating upon the lever to intermittently vibrate the same and thereby move the cock-seat off of and upon the key at regular intervals during the grinding operation to present fresh surfaces of the cock-seat to the action of the oscillating key, and devices for adjusting the lever-supporting shaft for the purpose of varying the lateral throw of the lever at will, substantially as described.

6. The combination, with a supporting-frame having a plate 31 and slot 45 in said plate, shaft 43, mounted in said slot, lever 42, mounted upon said shaft, nuts 44 for securing said shaft in said slot, and seat-holding devices carried by said lever, of key-holding devices carried by said frame and means for rotating said key-holding devices alternately in opposite directions, substantially as and for the purpose specified.

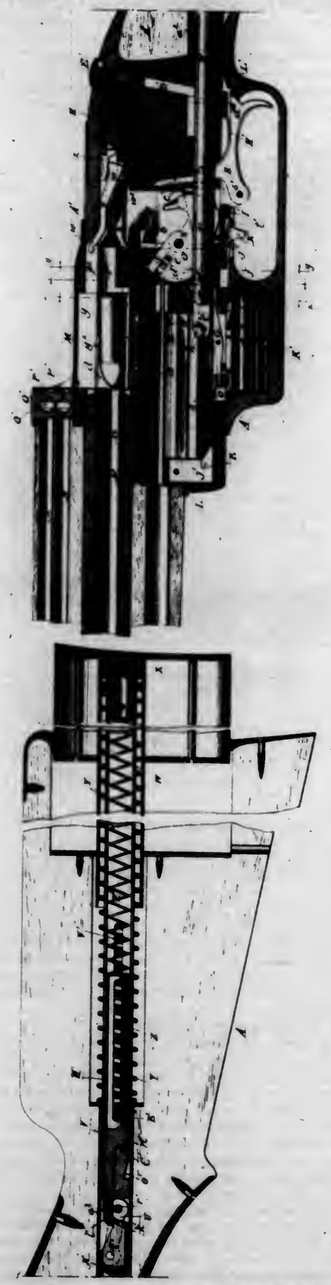
7. The combination, with a series of cock-seat holders, of a corresponding number of shafts for supporting keys in the cock-seats, a sleeve carried upon each shaft, means for operating the shafts from the sleeves, pinions mounted on the sleeves, oscillating segmental rack-plates engaging the pinions, a rod connecting the rack-plates, means for operating the rod to simultaneously oscillate the rack-plates, and a lever-and-cam mechanism which intermittently vibrates the cock-seat holders to move the cock-seats off of and upon the keys at regular intervals during the grinding operation to present fresh surfaces of the seats to the action of the oscillating keys, substantially as described.

8. The combination, with key-holding devices and means for rotating them alternately in opposite directions, of a transversely-swinging lever, means for transversely swinging said lever, seat-holding brackets carried by said lever, and means for adjusting said brackets with relation to each other, substantially as and for the purpose specified.

9. The combination, with key-holding devices and means for rotating them alternately in opposite directions, of a transversely-swinging lever, means for transversely swinging said lever, cross-head carried by said lever, brackets 51, carried by said cross-head, and means for adjusting said brackets with relation to each other, substantially as and for the purpose specified.

10. The combination, with key-holding devices and means for rotating them alternately in opposite directions, of a transversely-swinging lever, means for transversely swinging said lever, cross-head 46, carried by said lever, said cross-head having arms 47 48 49 50, brackets 51, carried by said cross-head, and nuts 52 and 53 upon said brackets, substantially as and for the purpose specified.

11. The combination, with a supporting-frame and seat-holding devices mounted therein, of a sleeve mounted transversely upon said frame, means for rotating said sleeve alternately in opposite directions, a shaft mounted in said sleeve, means for operating said shaft from said sleeve, and key-holding devices carried by said shaft, substantially as described.



12. The combination, with a supporting-frame and seat-holding devices carried thereby, of a sleeve 13, means for rotating said sleeve alternately in opposite directions, a half-clutch 16, mounted upon said sleeve, means for operating said half-clutch 16, a shaft 21, mounted in said sleeve, a half-clutch 25, carried thereby, means for rigidly securing said half-clutch 25 thereupon, and key-holding devices, substantially as and for the purpose specified.

13. The combination, with a supporting-frame and seat-holding devices carried thereby, of a sleeve 13, means for rotating said sleeve alternately in opposite directions, a half-clutch 16, mounted upon said sleeve, means for operating said half-clutch 16, a shaft 21, mounted in said sleeve, a half-clutch 25, carried thereby, means for rigidly securing said half-clutch 25 thereupon, block 22, mounted upon the end of said shaft, slot 23 in said block, and shaft 27, adjustably mounted in the frame of the machine opposite said shaft 21, substantially as and for the purpose specified.

14. The combination, with a supporting-frame and seat-holding devices carried thereby, of a sleeve 13, means for rotating said sleeve alternately in opposite directions, a half-clutch 16, mounted upon said sleeve, rod 17ª, connected to said half-clutch 16, rod 18, suitably mounted in the frame of the machine, a shaft 21, mounted in said sleeve, a half-clutch 25, carried thereby, means for rigidly securing said half-clutch 25 thereupon, block 22, mounted upon the end of said shaft, slot 23 in said block, and shaft 27, adjustably mounted in the frame of the machine opposite said shaft 21, substantially as and for the purpose specified.

15. The combination, with a supporting-frame, of a transversely-swinging lever 42, seat-holding devices carried by said lever, tappet 54 on the lower end of said lever, shaft 56, cam 58, mounted thereupon and adapted to engage the tappet 54, means for rotating said shaft 56, counterpoise 59, pulley 61, cord 60, passing over said pulley and connected to the lower portion of the lever 42, a sleeve 13, having a gear-wheel 15, segmental rack-plate adapted to be oscillated to rotate said sleeve alternately in opposite directions, means for oscillating said rack-plate, half-clutch 16, carried by said sleeve and movable longitudinally thereupon, means for moving said half-clutch, shaft 21, mounted in said sleeve, half-clutch 25, carried thereby and adapted to be engaged by the half-clutch 16, and a shaft 27, mounted in the frame of the machine opposite and parallel to the shaft 21, substantially as and for the purpose specified.

480,259. BREECH-LOADING GUN. DUNCAN E. GRANT, Quebec, Canada, assignor of one-third to Annie Ritchie, same place. Filed June 24, 1891. Serial No. 397,315. (No model.)

Claim.—1. In a gun, the combination, with a longitudinally-reciprocating breech-bolt and means for reciprocating the same, of a vertically-reciprocating locking-block carrying the hammer, means for raising and lowering the block, and ways or guides formed in the casing, said block being adapted to move upward behind the rear end of the breech-bolt, so as to lock the breech-bolt and at the same time bring the hammer in line with the firing-pin.

2. In a gun, the combination, with the longitudinally-reciprocating breech-bolt, of a carriage or carrier for said breech-bolt, comprising two separated plates *q q*, means for moving the said carrier and breech-bolt longitudinally, a vertically-reciprocating locking block provided with a hammer and adapted to move between the plates of the breech-bolt carriage, and means for raising and lowering the block.

3. In a gun, the combination, with the reciprocating breech-bolt, of the carriage or carrier for said breech-bolt, comprising two separated plates *q q*, guides or ways *a' a'*, formed in the sides of the shell or casing of the gun to permit the longitudinal movement therethrough of the bolt-carriage, a vertically-reciprocating locking-block P, mounted in the ways or guides *a' a'* of the frame between the plates *q q* of the carriage, a hammer carried by said block, and means, substantially such as shown and described, for raising and lowering the block.

4. In a gun, the combination, with the longitudinally-reciprocating breech-bolt, the vertically-reciprocating locking-block provided with a hammer, and means for reciprocating the block and the breech-bolt, of a mainspring connected with the hammer, substantially as shown and described, whereby when the block is lowered the mainspring will rock the hammer backward and when the block is raised the mainspring will serve to cock the hammer.

5. In a gun, the combination, with the longitudinally-reciprocating breech-bolt, the vertically-reciprocating locking-block provided with a hammer, and means for reciprocating the block and the breech-bolt, of a mainspring affixed at one end to the main frame of the gun and having a sliding connection at its opposite end with a hammer, the attachment of the mainspring to the frame of the gun being at a point between the limits of the vertical movement of the pivot of the hammer.

6. In a gun, the combination, with a locking-block P, having a shoulder *c'*, of a hammer O, pivoted in the block and provided with a spring-actuated pin Q, adapted to engage the said shoulder *c'*, a mainspring connected with the hammer, means for raising and lowering the block, and a trigger having an arm G', adapted to act upon the exposed end of the pin Q, all substantially as shown.

7. In a gun, the combination, with the hollow block P, of a hammer O, mounted therein and having the separated slotted arms *d'*, a mainspring affixed rigidly at one end to the frame of the gun and provided at its opposite end with a pin *f'* to project into the slots formed in the arms *d'* of the hammer, and means for raising and lowering the block.

8. In a gun, the combination, with the vertically-moving block P, having a shoulder *c'* and a pin T, of a hammer O, pivoted in the block, a mainspring connected with the hammer, and means for raising and lowering the block.

9. In a gun, the combination, with the longitudinally-reciprocating breech-bolt having a carriage composed of two separated plates, of a block P, provided with a hammer and adapted to work vertically through the carriage of the breech-bolt, and a lever connected at its forward end with the carriage and passing therethrough and also through the block P, and means for reciprocating the bar or lever and also for raising and lowering the same.

10. In a gun, the combination, with the reciprocating breech-bolt provided with a carriage, of a bar or lever N, pivoted at its forward end to the forward end of the carriage, a lug *j'*, adapted to engage the lever and to hold the same against longitudinal rearward movement while being raised and lowered, a vertically-sliding block provided with a hammer and adapted to be raised and lowered by the bar or lever, and means, substantially such as shown and described, for raising and lowering the rear end of the bar or lever and also for reciprocating the said bar or lever longitudinally.

11. In a gun, the combination, with the longitudinally-reciprocating breech-bolt provided with a carriage, of a vertically-reciprocating locking-block provided with a hammer, a lever pivoted near its forward end to the carriage and provided with laterally-extending lugs *h'* and a flattened neck *i'* in rear of said lugs, and lugs *j'*, formed in the frame of the gun and having their upper faces on the level of the lower faces of the lugs *h'* and their front faces curved on the arc of the circle concentric with the pivot of said bar or lever N, whereby when the rear end of said bar or lever is raised the engagement of the lugs will prevent rearward longitudinal movement of the lever.

12. In a gun, the combination, with a rotatable magazine, of a longitudinally-reciprocating breech-bolt provided with a carriage, means, substantially such as shown and described, for causing the rotation of the magazine at the backward movement of the carriage, a bar or lever N, pivoted to the carriage and adapted to move the latter lengthwise, and a lever G, adapted to automatically engage the bar or lever N when the magazine is exhausted and prevent the forward movement of said lever.

13. In a gun, the combination, with a rotatable magazine, of a longitudinally-reciprocating breech bolt having a carriage which is adapted to cause the rotation of the magazine by its reciprocation, and means for reciprocating said carriage and breech-bolt.

14. In a gun, the combination, with a rotatable magazine having chambers or seats in its periphery for the reception of the cartridges, of a hollow core upon which said magazine is adapted to turn or rotate, a series of slots, substantially as shown and described, formed on the inner face of the cylinder or magazine, a longitudinally-reciprocating breech-bolt having a carriage which slides within the hollow core, a pin projecting from the carriage and adapted to engage the slots formed in the magazine, and means for reciprocating the said carriage and breech-bolt longitudinally.

15. In a gun, the combination, with a rotatable magazine provided with a series of chambers or seats in its periphery to receive the cartridges and with a series of slots corresponding in number to the seats or chambers in its periphery, one of which slots is wider at one portion of its length than the others, of a longitudinally-reciprocating breech-bolt provided with a carriage having a pin to engage the slots in the magazine, a bar or lever N, adapted to reciprocate the carriage and breech-bolt and thereby cause the rotation of the cylinder or magazine, a V-shaped block or pawl F, adapted to enter each slot in succession as they pass under it, a pivoted lever G, which rests with its forward end on the block F and the rear end of which is adapted when sufficiently raised to engage the lever N, and a spring which presses the lever G and block F downward, as shown and described, so that as the deepest slot passes under the pawl F the said pawl and the forward end of lever G shall descend farther than when the other slots pass under them, while the rear end of the lever is correspondingly raised into engagement with the lever N, and thereby prevents the forward movement of the same.

16. In a gun, the combination, with the rotatable magazine provided with a series of seats or chambers *d* in its periphery open at both ends and on the outer side and with an additional seat or opening *e*, open at both ends, but closed on its outer side, of a stud or projection S', secured to the casing and adapted to project into a peripheral slot cut partially around the magazine for the purpose of limiting the backward movement of the magazine, and means for rotating the magazine.

17. In a gun, the combination, with a rotatable magazine provided with a series of notches or openings *f* in its rear face, of a vertically-reciprocating plate A, provided with a thumb-piece i and with a pawl *g*, the said pawl projecting through a slot *j*, formed in the casing of the gun and adapted to engage the notches or openings *f* for the purpose of revolving the magazine by hand, all substantially as shown and described.

18. In combination with a rotatable magazine provided with the slots E, the breech-bolt provided with a carriage adapted to slide through the center of the magazine, a spring-actuated pin J, carried by the carriage and adapted to engage the slots, and a shaft journaled in the frame of the gun and adapted to retract the said pin and to hold the same retracted, as and for the purpose set forth.

19. In combination with a rotatable magazine provided with the slots E, the breech-bolt provided with a carriage, a pin J, mounted in the carriage and provided with a lug or shoulder *u*, and a shaft L, journaled in the frame and provided with a feather or lateral projection K, adapted to bear against the lug *u* and to thereby retract the pin and to hold the same out of the slots E.

20. In combination with the hollow core B, the rotatable magazine mounted thereon and means, substantially such as shown, working through the hollow core and adapted to rotate the magazine.

21. In combination with the reciprocating breech-bolt and its carriage, the pin J, mounted upon the carriage, and a rotatable cylinder provided with a series of grooves E, said grooves comprising a long straight portion *k*, a short oblique portion *l*, and a short straight section *m* in line with the straight section *k*, and a straight section *l*', having an inclined bottom.

22. In combination with the reciprocating breech-bolt and carriage having the pin J, the rotatable magazine provided with a series of slots E, with which the pin is adapted to engage, each of the said slots comprising two straight portions *k* and *m*, an intermediate oblique portion *l*, and a straight portion *l*', formed between the slots *l* and *m* and inclined upward, as shown.

23. In combination with the rotatable magazine or cylinder having a series of straight slots *m*, a series of diagonal slots *l*, and short straight slots *l*', the floors of which incline upward, as shown, a longitudinally-reciprocating carriage and breech bolt, and a pin carried by the carriage to engage the slots.

24. In combination with the reciprocating bolt H, the extracting-lever *w*, pivoted thereto, and a spring w^2, attached to the forward end of the breech-bolt in the opposite side from the lever and bearing with its rear end on the rear end of the lever.

25. In combination with a reciprocating breech-bolt, the extracting-lever *w*, the spring w^2, and the longitudinally-moving firing-pin *v*, a retracting-lever *x*, pivoted in the breech-bolt and having its forward

arm projecting over the rear end of the extracting-lever *w*, so that when in the course of the rearward movement of the breech-bolt the forward arm of the retractor is depressed by contact with the casing it bears down the rear end of the extracting-lever *w*, tilting its forward end or head, and releases the flange of the cartridge from its grasp at the same time that the vertical arm withdraws the firing-pin *v*, and when on the forward movement of the breech-bolt the retractor passes clear of the casing, the spring w^2, acting on the rear end of the extractor-lever *w*, bears it and the forward arm of the retractor *x* upward and moves the vertical arm clear of the course of the firing-pin.

26. In a gun, the combination of the reciprocating breech-bolt moving in a bore *p'* in the shell or casing of the gun and the carriage I of the breech-bolt with an ejector T', moving in a chamber U', parallel with the bore *p'* and connected with the carriage I by the lug or projection t^2, substantially as shown.

27. In combination with the trigger R, the sliding plate J', provided with a spring-pawl K', adapted to engage the recesses *t'*, and the bar L', carried by said plate J' and adapted to move inward over the rear end of the trigger and under the rear end of latch D, as and for the purpose set forth.

28. In a gun, the combination, with the reciprocating breech-bolt, the lever N for actuating the same, the hollow rod or tube W, connected with the lever for actuating the latter and provided with a notch or recess *c'* on its lower face, of a latch D', provided on its lower end with a cross-bar d^2, adapted to engage the notch or recess *c'* and having its upper end projecting through the rear end of the casing in such a position as to allow of its being conveniently depressed by the thumb of the right hand without shifting the grip of the hand on the gun when it is necessary to release tube *w* from engagement with the cross-bar d^2.

29. In a gun, the combination, with a longitudinally-reciprocating breech-bolt, of the lever N, the link U, a tube or rod W, connected with the lever by said link U, a movable heel-plate X, connected with the rear end of the tube W and adapted to slide within the stock, as shown and described, a spring Y, surrounding tube W and serving to urge said tube rearwardly, a rod V, mounted within the tube and having a nose *l'* to engage the rear end of the lever N, and a spring E', serving to maintain the rod V in engagement with the lever N.

30. In a gun, the combination, with the reciprocating breech-bolt and its actuating-lever N, of the tube or rod W, connected at its forward end with the rear end of the lever by a link U and at its rear end with the heel-plate X and provided with a locking-rod V, the forward pivot of the link U being located above the axis of the tube W, whereby when the tube is moved forward longitudinally and the rear end of the lever N released from the locking-rod V the said rear end of the lever will be raised or elevated, substantially as and for the purpose set forth.

31. In combination with the reciprocating breech-bolt, the lever N for actuating the same, the rod or tube W, connected with the lever by a link U and provided with a shoulder C' and also with a longitudinal slot Z, the rod or locking-rod V, provided with a similar but shorter slot Z and with a shoulder *n'*, and a nose *l'*, projecting over the rear end of lever N, of a pin B', passing transversely through the slots Z in the rod V and tube W and the stock of the gun for the purpose of limiting the movement of locking-rod V, and thereby releasing lever N, substantially as shown and described.

32. In a gun of the class described, the combination, with the trigger R and the latch D', of the single spring H', adapted to hold the trigger and the latch in their proper positions.

33. In a gun, the combination, with a reciprocating breech-bolt and its carriage, of a rotatable magazine actuated by the carriage as the latter reciprocates, a movable heel-plate, and intermediate connections, substantially such as shown and described, between the heel-plate and the bolt-carriage.

34. In a gun, the combination, with a reciprocating breech-bolt and its carriage, of a vertically-moving locking-block carrying the hammer, a movable heel-plate, and intermediate connections, substantially such as shown and described, between the heel-plate and the breech-bolt carriage and hammer-block.

35. In a gun, the combination, with a reciprocating breech-bolt and its carriage, of a vertically-moving locking-block carrying a hammer, a movable heel-plate, intermediate connections between the heel-plate and the bolt-carriage and hammer-block, and a locking device which when the heel-plate or the main body of the gun move one with reference to the other a predetermined distance shall automatically release the said intermediate connections and permit the raising of the hammer-block and hammer.

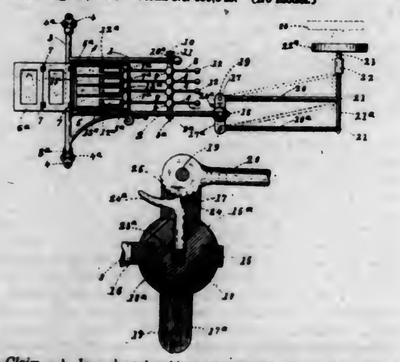
480,260. PLAITING ATTACHMENT FOR SEWING-MACHINES.

James G. Grewe, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Apr. 18, 1892. Serial No. 429,616. (No model.)

Claim.—1. In a plaiting attachment for sewing-machines, the combination, with a stationary guide arranged centrally in front of the needles and having vertical guiding-faces on its opposite sides and overhanging edges projecting laterally from the sides of said guide beyond said vertical guiding faces, of two swinging plaiting-blades placed on opposite sides of said guide and normally extending beneath said overhanging edges and pivoted arms by which said blades are carried.

2. In a plaiting attachment for sewing-machines, the combination, with a central guide having overhanging edges, of two swinging plaiting-blades and two connected pivoted arms by which said blades are carried, said arms having intermeshing portions, so that a movement of one will cause a simultaneous movement of the other.

3. In a plaiting attachment for sewing-machines, the combination, with a stationary guide arranged centrally in front of the needles and having overhanging edges, of two swinging plaiting-blades on opposite sides of said guide and normally extending beneath said overhanging edges, pivoted arms by which said blades are carried, a spring for forcing said arms toward each other, and a stop device for limiting their inward movements.



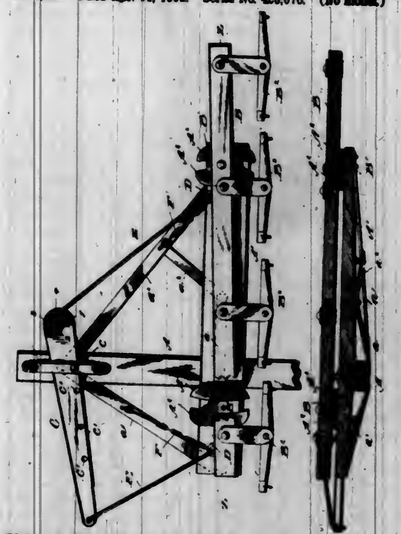
4. In a plaiting attachment for sewing-machines, the combination, with a central guide having overhanging edges, of two swinging plaiting-blades arranged to enter beneath said overhanging edges, two pivoted arms by which said blades are carried, a spring for forcing said arms toward each other, and adjustable stops for limiting their inward movements and for determining the positions of the plaiting-blades relative to the overhanging edges of the said guides.

5. In a plaiting attachment for sewing-machines, the combination, with a stationary guide arranged centrally in front of the needles and having vertical guiding-faces on its opposite sides and overhanging edges projecting laterally from the sides of said guide beyond said vertical guiding-faces, of two connected swinging arms carrying plaiting-blades arranged on opposite sides of said guide and normally entering beneath said overhanging edges and a retaining device to hold said plaiting-blades separated when they are swung outward from said guide for the insertion of the work.

6. The combination, with the central guide K, having overhanging edges, of the pivoted arms C, carrying the plaiting-blades *c*, arranged to enter beneath said edges, said arms having the intermeshing teeth *d*, and the stop-screws or projections *g*, the stop-bar or projection *f*, interposed between said arms, and the spring *e*, serving to force said arms toward each other.

480,261. DENTAL CABINET.

Christian A. Herr, Osborn, Ohio. Filed Aug. 24, 1891. Serial No. 403,545. (No model.)



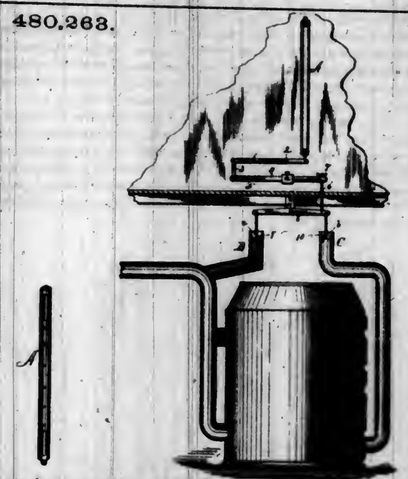
Claim.—1. In a dental cabinet, the combination of a series of trays provided with handles or arms extending outward, each having an enlarged portion 9 at its pivotal center and adapted to lie in a line one above the other, a pin or bolt 8, passing down through the portions 9, and upper and lower supports 1 and 2, to which the whole

are secured together, substantially as above described, a case provided with openings 7 for allowing room for the arms as the trays are swung into it, and a hinged door for inclosing the trays when in place within the case, whereby either one or more or all of the trays may be conveniently turned outward when required, as above set forth.

2. In a dental bracket consisting of a pivoted main bracket carrying an inclosing case and a series of pivoted horizontally-swinging trays, the combination therewith of a universal joint consisting of a ring projecting from the main bracket, an upper portion having a shank adapted to fit and turn in the ring and having two upwardly-projecting portions 17, a lower portion constructed to screw onto the upper portion and inclose the ring and having two downwardly-projecting portions 17a, an upper supplementary bracket-arm pivoted between the upper portions 17, having ratchet-teeth on its pivoted end, a spring-actuated pawl for holding it in its upward adjustment, a means for releasing the pawl from its engagement with the teeth and having its opposite end pivoted to a vertical bar 21a, carrying a tray, and a lower supplementary bracket-arm pivoted between the lower portions 17a and having its opposite end pivoted to the bar 21a, so as to be parallel with the upper supplementary arm, for the purpose set forth.

480,262. DRAFT-EQUALIZER.

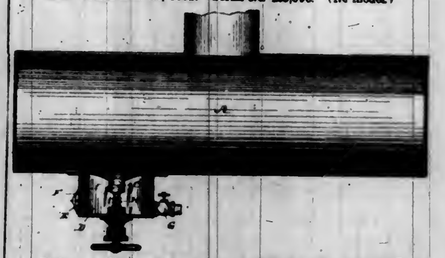
Jeremiah L. Hoover, Fishertown, Pa. Filed Apr. 11, 1892. Serial No. 428,670. (No model.)



Claim.—1. The combination, with the pole and the cross-plate thereon, provided with curved dovetail guides, of the doubletree having curved dovetail shoes to slide in said guides, the singletrees on the doubletree, the pivoted lever with adjustable pivot, and the adjustable rod connecting the doubletree and lever, as and for the purpose specified.

2. The combination, with the pole and the transverse plate thereon, provided with guides, of the doubletree disconnected from the pole or plate and provided upon its under face with curved shoes fitted to the guides, the adjustable pivoted lever, the adjustable connection between one end of the lever and the doubletree, and the rod connecting the other end of the lever with the other end of the doubletree, as set forth.

3. The draft-equalizer described, consisting of the pole, the transverse plate thereon with curved guides, the doubletree having shoes to slide in said guides, the lever pivoted to the rear end of the pole on an adjustable pivot and provided with a plurality of holes at its inner end, the rods connecting the lever with the doubletree, one adjustably, the braces for the plate, and the stay-chains connecting said braces with the doubletree, substantially as and for the purpose specified.



480,263.

lower lever 4, having a fixed pivot 5, the vertical link 3, pivoted to said lever, the adjustable weight *a* on the lower lever, the adjustable vertical rod 6, nut 7, by means of which the rod is raised or lowered on the outer end of the lower lever, the balance-lever 8, having a fixed pivot and connected to the rod at one end, the rods suspended from the ends of the balance-lever, having pistons 9 10, and the vertical check and draft pipes within which the pistons play, substantially as described and shown.

480,264. BOILER ATTACHMENT.

Gustof F. Johnson, Milan, Minn. Filed Mar. 19, 1892. Serial No. 425,590. (No model.)

Claim.—1. The combination of a boiler having a depressed sink or trap in the bottom thereof and converging to a central discharge-opening, and a mud-drum secured to the bottom of said boiler and over said discharge opening, substantially as set forth.

2. The combination of a boiler having a depressed sink or trap in the bottom thereof and converging to a central discharge-pipe, a mud-drum secured to the bottom of said boiler over said discharge-pipe, and a reciprocating valve working through the mud-drum into said discharge-pipe, substantially as set forth.

3. The combination of a boiler having a converging depressed sink or trap in the bottom thereof and terminating in a short projecting discharge-pipe, a mud-drum secured to the bottom of said boiler over said discharge-pipe and provided with a cleaning-hole and a discharge-cock, and a reciprocating valve-stem working through the bottom of the drum and carrying a plug-valve at one end adapted to enter said short discharge-pipe, substantially as set forth.

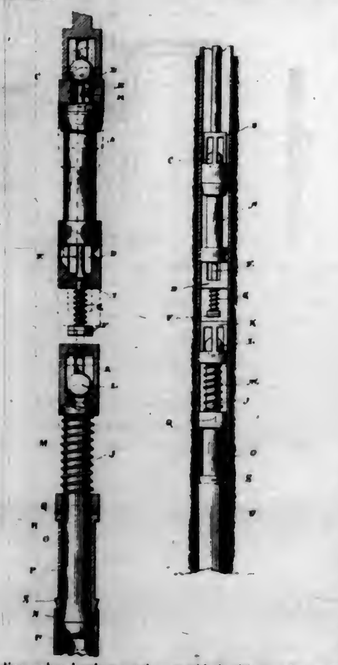
480,265. VALVE FOR OIL-WELLS.

Horace D. Jones, Knapp's Creek, N. Y. Filed Oct. 26, 1891. Serial No. 410,097. (No model.)

Claim.—1. A standing valve consisting of a tube provided with a valve-seat and valve at one end, the other end of the tube being enlarged to form a valve, a sleeve surrounding the lower end of the said tube and closed by the enlarged end of the tube, a means for holding the enlarged end of the tube against the lower end of the sleeve, and a working valve adapted to force the said tube down, as and for the purpose shown.

2. A standing valve consisting of a tube having a valve-seat and a valve therefor at its upper end, the lower end of the tube being en-

---



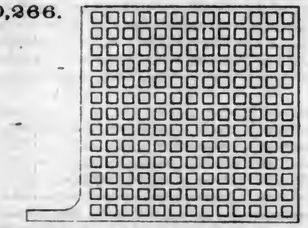
480,268. AUTOMATIC DAMPER.

Charles D. Howard, Syracuse, N. Y., assignor to the Howard Thermostat Company. Filed Feb. 5, 1891. Serial No. 380,333. (No model.)

Claim.—The combination of a suspended thermostatic bar A, the horizontal upper lever 1, having a fixed pivot 2 and connected at its outer end to the lower end of the thermostatic bar, the horizontal

larged to form a valve, a sleeve surrounding the lower end of the said tube, the lower end of the valve being shaped to close the upper end of an anchor-tube, and a means for holding the enlarged lower end of the tube against the lower end of the sleeve, combined with a working valve having a means for opening its valve when it is forced downward upon the said standing valve, substantially as set forth.

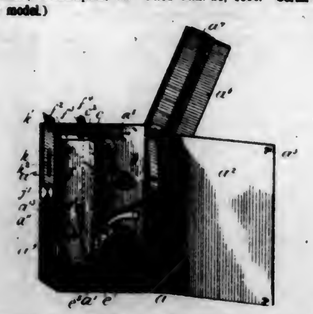
3. A standing valve having a tube carrying a valve at its upper end and a spring closed valve below the said valve, combined with a working valve having a tube carrying a valve and a spring-actuated rod which engages its valve when it is forced downward against the standing valve, whereby the working valve is opened and the spring-actuated valve of standing valve also opened, substantially as and for the purpose described.



4. A standing valve having a tube provided with a valve at its upper end, its lower end enlarged and made cone-shaped externally, a sliding sleeve placed around the tube loosely and having its inner surface fitting tightly the said cone-shaped portion of the tube, and a means for normally holding the sleeve down, the lower end of the sleeve having an enlargement of greater diameter than the diameter of the said cone-shaped portion of the lower end of the tube, combined with a working valve carrying a means for opening the same when it is forced upon the upper end of the standing valve, substantially as described.

5. A standing valve having a valve at its upper end, an enlarged cone-shaped lower end, a sliding sleeve fitting loosely the said tube between its ends and fitting tightly the said cone-shaped lower end of the tube, the said sleeve having an enlargement at its ends to form a packing-space between them, the lower enlargement adapted to fit the upper end of an anchor or other pipe, and the upper enlargement having one or more perforations, and a spring for holding the said sleeve down, combined with a working valve-tube carrying a valve, and a means for automatically opening the said valve when it is forced downward upon the upper end of the standing valve, substantially as specified.

6. A standing valve having a tube provided with a valve at its upper end, a cone-shaped external seat at its lower end, a sliding sleeve which fits loosely around the said tube between its ends and its lower end fitting the said seat, a means for holding the sleeve against the seat, and a working valve having a tube provided with a valve at its upper end, a vertically-moving rod passing through the said tube under the said valve, a yoke at the lower end of the tube, a nut or projection on the lower end of the rod, and a spring between the said yoke and nut, all the parts combined substantially as specified.



480,266. SECONDARY-BATTERY PLATE. EDWARD R. KNOWLES, Brooklyn, N. Y. Filed Oct. 10, 1891. Serial No. 408,320. (No specimens.)

Claim.—1. A battery-plate composed of an alloy of lead, tin, antimony, and arsenic, substantially as set forth.

2. A plate for electric batteries, composed of an alloy of about eighty-two parts lead, sixteen parts tin, 1.9 parts antimony, and 0.1 part arsenic.

480,267. POCKET LAMP OR LIGHTING DEVICE. EDWARD KRONENBERG, Philadelphia, Pa. Filed Mar. 28, 1891. Serial No. 386,514. (No model.)

Claim.—1. A pocket lamp or lighting device comprising a two-part housing having a spring-actuated hinged cover, a movable reservoir having a wick protuding through the same, a stud-pin extending through the slotted side wall of the housing and through the reservoir into a slotted internal partition provided in said housing, a movable catch connected with said stud-pin and adapted to engage the cover of said housing by the shifting of the reservoir, an ignitor or scratcher, a feeding appliance adapted to advance a fulminating or igniting tape to said ignitor or scratcher, and means for operating said feeding appliance by the shifting of said reservoir, substantially as and for the purposes set forth.

2. A pocket lamp or lighting device comprising a housing provided with a slotted partition and a slotted side wall forming ways, a movable oil-reservoir adapted to be shifted in said ways, and lugs or pins connected with said oil-reservoir and working in the slots of said partition and side wall, substantially as and for the purposes set forth.

3. A pocket lamp or lighting device comprising a housing provided with a slotted partition and a slotted side wall forming ways, a movable oil-reservoir adapted to be shifted in said ways, and a pin passing through said oil-reservoir and working in the slots in said partition and side wall, substantially as and for the purposes set forth.

4. A pocket lamp or lighting device comprising a stretcher or ignitor for contacting with the igniting pellets, fulminates, or ignitible material, a movable oil-reservoir, a feeding appliance for advancing said pellets, fulminates, or ignitible material to said scratcher or ignitor, and pawl-and ratchet connections between said oil-reservoir and feeding device for operating the latter by the shifting of the oil-reservoir, substantially as set forth.

5. A pocket lamp or lighting device comprising a scratcher or ignitor, a strip, tape, or ribbon provided with pellets, fulminates, or ignitible material, a movable oil-reservoir, a feeding appliance for winding upon itself the tape, strip, or ribbon, and pawl-and-ratchet connections between said oil-reservoir and feeding device for operating the latter by the shifting of the oil-reservoir, substantially as and for the purposes set forth.

6. A pocket lamp or lighting device comprising a scratcher or ignitor for contacting with and igniting pellets, fulminates, or ignitible material, a support or carrier, a movable oil-reservoir, a feeding appliance for advancing said pellets, fulminates, or ignitible material into contact with said support or carrier and scratcher or ignitor, and pawl-and-ratchet connections between said oil-reservoir and feeding device, substantially as and for the purposes set forth.

7. A pocket lamp or lighting device comprising a scratcher or ignitor, a strip, tape, or ribbon provided with pellets, fulminates, or ignitible material, a support or carrier, a movable oil-reservoir, a feeding appliance for winding upon itself the tape, strip, or ribbon, and pawl-and-ratchet connections between said oil-reservoir and feeding device for operating the latter, substantially as and for the purposes set forth.

8. A pocket lamp or lighting device comprising a scratcher or ignitor, a retaining stud or pin, a tape, strip, or ribbon provided with pellets, fulminates, or ignitible material, a scratcher or ignitor, a carrier or support, a movable oil-reservoir, a feeding appliance for winding upon itself the tape, strip, or ribbon, and pawl-and-ratchet connections between said oil-reservoir and feeding device for operating the latter, substantially as and for the purposes set forth.

9. A pocket lamp or lighting device comprising a housing provided with a hinged cover, a scratcher or ignitor, pellets, fulminates, or ignitible material, a movable oil-reservoir, a feeding appliance for advancing said pellets, fulminates, or ignitible material, pawl-and-ratchet connections between said oil-reservoir and feeding appliance, a knob accessible from the exterior of the housing and connected with said oil-reservoir, and a catch attached to said knob for fastening and releasing said lid or cover by the shifting of the oil-reservoir, substantially as and for the purposes set forth.

10. A pocket lamp or lighting device comprising a housing provided with a hinged cover, a scratcher or ignitor, a strip, tape, or ribbon provided with pellets, fulminates, or ignitible material, a movable oil-reservoir, a feeding appliance for winding upon itself the tape, strip, or ribbon, pawl-and-ratchet connections between said oil-reservoir and feeding device, a hand-knob connected with said oil-reservoir, and a catch attached to said hand-knob for fastening and releasing said lid or cover, substantially as and for the purposes set forth.

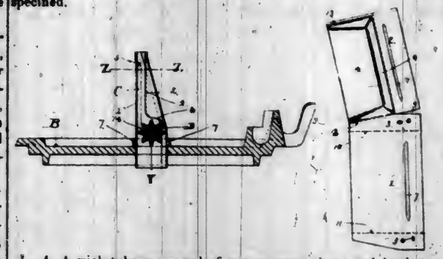
11. A pocket lamp or lighting device comprising a housing and cover, a scratcher or ignitor, a support or carrier, pellets, fulminates, or ignitible material, a movable oil-reservoir, a feeding appliance for advancing said pellets, fulminates, or ignitible material, pawl-and-ratchet connections between said oil-reservoir and feeding appliance, a hand-knob connected with said oil-reservoir, and a catch attached to said hand-knob for fastening and releasing said lid or cover, substantially as and for the purposes set forth.

12. A pocket lamp or lighting device comprising a housing provided with a hinged cover, a scratcher or ignitor, a retaining stud or pin, a strip, tape, or ribbon provided with pellets, fulminates, or ignitible material, a movable oil-reservoir, a feeding appliance for winding upon itself the tape, strip, or ribbon, pawl-and-ratchet connections between said oil-reservoir and feeding device, a hand-knob connected with said oil-reservoir and a catch attached to said hand-knob for fastening and releasing said lid or cover, substantially as and for the purposes set forth.

13. In a pocket lamp or lighting device, the combination of an ignitor or scratcher and an adjustable support or carrier for guiding a tape, strip, or ribbon, substantially as and for the purposes set forth.

14. In a pocket lamp or lighting device, the combination of a slotted housing, an ignitor or scratcher, a carrier or support provided with a threaded stud working in the slot of the housing, and a set-screw engaging said stud, substantially as and for the purposes set forth.

15. In a pocket lamp or lighting device, the combination, with a housing provided with a loop, an ignitor or scratcher having a shank mounted in said loop, of an adjustable support or carrier mounted in a slot in the wall of said housing for guiding a tape, strip, or ribbon, and means for feeding and drawing the tape, strip, or ribbon over said carrier or support into contact with and from said ignitor or scratcher, substantially as and for the purposes set forth.



16. A pocket lamp or lighting device provided with a housing having a hinged cover or lid, a feeding device having a ratchet-wheel and a detent, and a spring secured at or near the center thereof to said housing and having one extremity in engagement with said lid or cover and the other extremity in engagement with said detent, substantially as and for the purposes set forth.

480,268. WICK-TUBE FOR OIL-STOVES. ROBERT Z. LIDDLE, Albany, N. Y. Filed Apr. 22, 1892. Serial No. 430,196. (No model.)

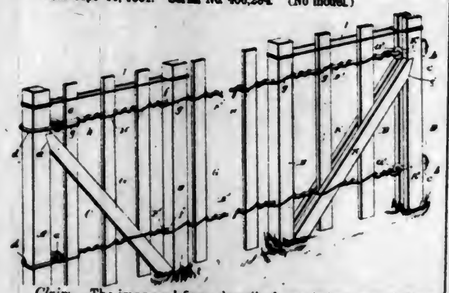
Claim.—1. A wick-tube having one of its principal sides formed by a vertical plane, the opposite side having at its lower part a short vertical plane followed by a depressed portion which forms a contracted passage for containing a wick, the lower part of said depression containing a wick-raiser and the extremities of the last-named side being bent at an obtuse angle to said vertical plane, and ends having an approximated trapezoidal form corresponding to the extremities of said sides, as herein specified.

2. A wick-tube comprising a large open passage below the wick-raiser and a contracted passage above said wick-raiser, one side of both of said passages being formed on the same vertical plane and the other side of both of said passages being parallel to said plane, but at different distances therefrom, the upper passage being adapted to easily inclose the wick and the lower passage forming an open communication from the lower side of the wick-raiser into the oil-reservoir, the ends of said tube having an approximated trapezoidal form and the back of said tube being impressed to form the contracted upper passage for the wick, as and for the purpose specified.

3. A wick-tube having a large open passage of uniform size from the lower side of the wick-raiser to the lower end of said tube and a contracted passage of uniform size from the upper side of the wick-raiser to the upper end of said tube, one side of both of said passages being formed on the same vertical plane, as and for the purpose specified.

4. A wick-tube composed of one or more pieces and having an upper passage of uniform size adapted to inclose the wick and a lower passage of uniform size, but of greater area than said upper passage, one side of both of said passages being formed on the same vertical plane, in combination with a revoluble wick-raiser arranged at the junction of said passages and fitted to discharge the débris from the wick into the oil-reservoir, as and for the purpose herein specified.

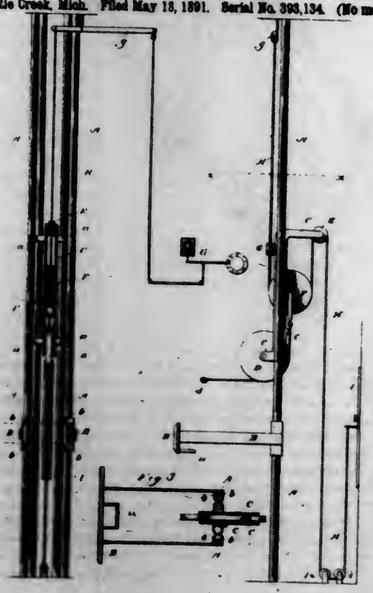
480,269. HAY-LOADER. PIERRE D. MILLER and WILLIAM N. DE VAULT, Peoria, Ill. Filed Jan. 30, 1892. Serial No. 419,755. (No model.)



Claim.—1. In a hay-loader, the bent arms E E, pivoted at or near the middle of their length on the axles C C, the upper extremities of said arms being surmounted by the cross-piece F, and near the lower extremities of which arms is adjustably secured by bolts or the like the rake-head G, substantially as set forth and described.

2. In a hay-loader, the bent arms E E, pivoted at or near the center of their length on the axles C C and carrying between their upper extremities the cross-piece F for the purposes set forth and also carrying the slotted blocks V and carrying between their lower extremities the shaft H, said extremities being provided with the adjustable rake-head G and pivotally supporting the lower end of said elevating-frame in the manner and for the purposes set forth, in combination with the main frame pivoted on the said axles C C and comprising the side beams B B and cross-pieces D D, said frame being provided with the

notched supports S S, substantially in the manner and for the purposes set forth and described.



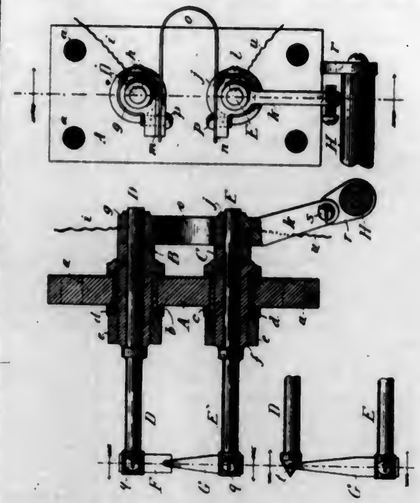
3. In a hay-loader, the bent arms E E, pivoted at or near the center of their length on the axle C C, the upper extremities of said arms being surmounted by the cross-piece F and slotted blocks V, and near the lower extremity of which arms is adjustably secured by bolts or the like the rake-head G, and the rods U, pivoted on the main frame composed of the side beams B B and cross-pieces D D, in combination with an elevating mechanism of the form herein set forth and described.

480,270. PICKET FENCE. NATHAN W. MINTON, Lebanon, Ky. Filed Sept. 19, 1891. Serial No. 406,284. (No model.)

Claim.—The improved fence described, consisting, essentially, of the post at one end, having a notch or under-cut on its inside adjacent to its upper end, intermediate posts arranged at intervals and having horizontal eyes near their upper and lower ends, the double post at the opposite end of the fence, having a notch or under-cut in its inside adjacent to its upper end, the diagonal braces having their upper ends beveled to take into the notches or under-cuts of the end posts and bearing at their opposite ends against the adjacent intermediate posts, the brace-wires I, connecting the upper ends of the end posts and the adjacent intermediate post, the main or line wires passing through the eyes in the intermediate posts and secured at one end to one of the end posts, the threaded eyebolts receiving the opposite ends of said wires and arranged between the members of the double post, the adjusting-nuts on the ends of the said bolts, and the securing and spacing wires embracing the pickets on one side and at opposite edges and wrapping the main wires between the pickets, the said securing and spacing wires being secured at one end to one post and at their opposite ends to the adjusting-bolts, substantially as specified.

480,271. EXERCISING APPARATUS. MILON W. NEWTON, Battle Creek, Mich. Filed May 18, 1891. Serial No. 393,134. (No model.)

Claim.—1. The combination of upright supports or standards, a vertically-adjustable limb or body rest, and a vertically-adjustable pull and frame carrying pull-guide, substantially as described.



2. The combination of a weighing device, a cord connected with a balance-beam of said weighing device, means for taking up and extending the outer extremity of the cord, a pull device, and an adjustable pull-guide, substantially as described.

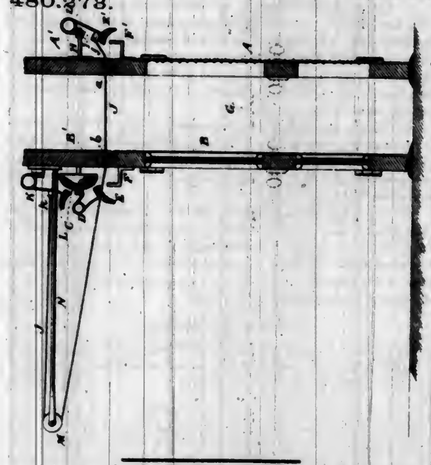
3. The combination of upright supports or standards, a vertically adjustable rest, a vertically-adjustable pull and pull-guide, and means, as an adjustable clutch, for taking up slack and paying out rope, substantially as described.

4. The combination of standards, a body or limb rest adjustable on said standards, a fixed weighing device, a movable clutch-frame, a floating pulley, a pull-strap connected with said pulley, a suspended pulley and guide-pulley, and a rope extending from the weighing device around said pulleys to the movable clutch-frame, substantially as described.

5. The combination, in an exercising-machine, of an adjustable body or limb rest, an adjustable frame carrying guide-pulleys, a fixed weighing device, a rope or cord, a pull-strap operatively connected with said rope, and means for paying out or taking in the rope for adjusting the pull strap to the desired position, substantially as described.

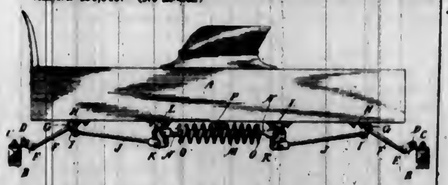
480,272. IGNITOR FOR GAS-ENGINES. EMORY I. NICHOLS, San Francisco, Cal. Filed May 26, 1891. Serial No. 394,190. (No model.)

Claim.—1. In combination, the igniter-stems insulated from their support, the contacts on the stems, the means for operating one of the stems to bring the contacts together, and the spring O in connection with both stems for keeping the contacts normally apart, substantially as described.



2. In combination, the plate A, the plugs B C, extending through the same, the insulating-collars *b c*, the igniter-stems extending through the plugs and carrying the contact-points, the arm *k*, extending from one of the stems and carrying an adjustable stud *s*, and the sliding shaft H, carrying a projection *r* to engage said stud, and the means for returning the stem to normal position, substantially as described.

3. In combination, the igniter-stems with means for operating one of them, one of said stems having a conical end *t*, and the contact G, secured to the other stem and extending transversely of the stems to contact with the conical end *t*, substantially as described.

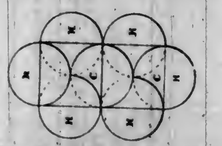


480,273. ALARM. DAVID P. MORGROS, Wilton, N. J. Filed Dec. 19, 1891. Serial No. 415,650. (No model.)

Claim.—The doors A B, opening in opposite directions and carrying near the top of their outside and inside, respectively, the angle-studs F F', in combination with the frame A', carrying on the outside the pin H with the spring D' and hammer E', and the frame B', carrying on the inside the bell C, with spring D and hammer E, the spring K, with hammer L, and the arm N, with end pulley M, the said springs D' K being connected by a wire or cord J, passing through said frames, as shown and described.

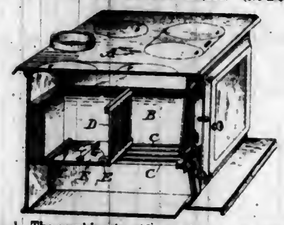
480,273.

480,274. BUGGY SPRING-GEARING. STEPHEN E. O'DELL and CORNELIUS VAN LIEW, Cedar Springs, Mich. Filed Apr. 23, 1892. Serial No. 430,313. (No model.)



Claim.—1. In combination with the body and bolsters of a vehicle, rock-shafts journaled upon said body, levers rigidly attached to said shafts and shackled to said bolsters, arms also attached to said rock-shafts, rocker-arms pivoted to said body, connecting-rods pivoted to the arms on the rock-shaft and adjustably pivoted to said rocker-arms, a coiled spring between said rocker-arms, and rods pivoted to said rocker-arms at their outer ends and having their inner ends overlapping and connected to the opposite ends of said coiled spring, substantially as described.

2. In combination with the body and bolsters of a vehicle, eyes secured to said bolsters and overhanging the same at their adjacent sides, rods parallel to said bolsters and supported by said eyes, shackles pivoted to said rods, transverse rock-shafts journaled on the body, levers rigidly attached to said shafts and pivoted to said shackles, arms attached to said rock-shaft, a coiled spring arranged longitudinally between said arms, disks engaging the ends of said spring, and rods pivotally connected to said arms extending through said spring and attached to said disks, substantially as described.



3. In a spring-gearing for vehicles, in combination with rock-shafts having rigid levers shackled to the bolsters and arms substantially at right angles to said levers, and a coiled spring arranged longitudinally between said arms, rocker-arms near each end of said spring, rods pivoted to said arms on the rock-shafts at one end and adjustably pivoted to said rocker-arm at the other end, and rods also adjustably pivoted to said rocker-arm and passing through said spring and connected to its opposite ends, substantially as described.

480,275. APPLIANCE FOR TEACHING CHEMISTRY. JOSTO OSCANIS, Brooklyn, N. Y. Filed Nov. 5, 1891. Serial No. 411,006. (No model.)

Claim.—An appliance for teaching chemistry, consisting of a number of semicircular parts made of pasteboard or similar material colored, and provided with symbols and printing to indicate various elements, the parts representing each element being hinged together, all being adapted to illustrate molecules of single elements and of combinations, substantially as described.

480,276. FIRE-BOX DIVIDER. SOLOMON L. PAKAS, New York, N. Y. Filed Nov. 9, 1891. Serial No. 411,259. (No model.)

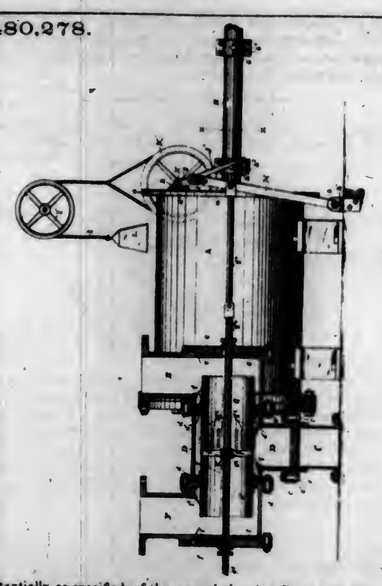
Claim.—1. The combination of a vertical grated partition having horizontal and upwardly-turned fingers and a solid horizontal plate having horizontal and downwardly-turned fingers interlocking with the fingers on the grated partition, substantially as shown and described.

2. The combination of a vertical grated partition, a solid horizontal plate, said grated partition and plate having interlocking fingers, and a second plate connected to the first by a hinge-joint, substantially as shown and described.

480,277. IRONING-MACHINE. WILLIAM PHILLIPS, Northville, Mich. Filed June 1, 1891. Serial No. 394,712. (No model.)

Claim.—1. The combination, with a frame provided with horizontal ways, of an ironing-board mounted in said ways, the latter being provided with depressions between their extremities, a polishing-iron in position over said board, and mechanism for reciprocating said ironing-board, substantially as set forth and described.

2. The combination, with a frame provided with vertical guides, of a movable ironing-board, a polishing-iron in position over said board, squared heads adjustably secured to the ends of said polishing-iron, the said heads being provided with openings and inward-bearing points to receive the extremities of said iron, and securing-screws whereby the iron may be set with any part of its face downward, substantially as set forth and described.

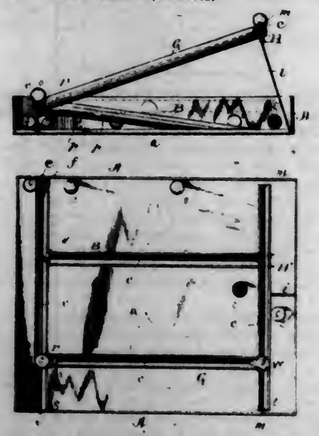


480,278. AUTOMATIC STOP-VALVE FOR ELEVATORS. HENRY J. REEDY, Cincinnati, Ohio. Filed Feb. 6, 1889. Serial No. 299,159. (No model.)

Claim.—1. The combination, as hereinbefore set forth, of the water-cylinder A and plunger B, the connected chambers D E F, located at the side of said cylinder, the pipe connecting the central chamber D and the cylinder, the tubular valve G, open at the ends and having the openings g^4, the seats d' f' for said valve, the valve-rod extending through the head *e* and connected to tripping mechanism, such as shown, and the straps b^1 b^2, having pins *b' b'*, carried by the plunger B to seat said valve and automatically cut off the supply or exhaust when the platform or cage has reached either the upper or lower limit of its travel.

2. A safety-cut-off valve for hydraulic elevators, consisting of the three chambers D E F, the open-ended tubular valve G, having opposite ends in communication with the opposite supply and exhaust chambers E and F and the central portion of its shell perforated to communicate with the chamber D, which chamber has a port to connect with the water-cylinder of the elevator, packings for said valve between the chamber D and the supply and exhaust chambers E F, the seats d' f' for the tubular valve, and the valve-rod extending outside of the valve-chambers for connection to a movable part of the elevator mechanism, whereby the valve may be brought against either seat d' or f' to cut off the supply or exhaust, substantially as hereinbefore set forth.

3. In a valve mechanism for hydraulic elevators, the combination,

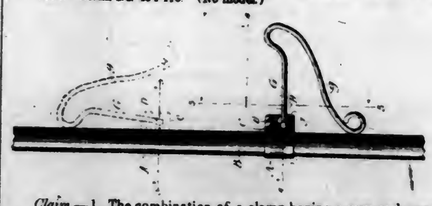


480,278.

substantially as specified, of the central chamber D, having a port for connection to the cylinder of a hydraulic elevator, and interior flanges d' and exterior perforated flanges at each end, the supply and exhaust ports E F, having flanges corresponding to the flanges upon the chamber D, the packings g, held between the said interior flanges, the valve G, open at both ends, centrally perforated and fitted to slide longitudinally in said flanges and packings, the valve-rod g^4, and seats e' f' at onter ends of chambers E F, substantially as and for the purpose set forth.

4. The combination, substantially as specified, with cylinder A, plunger B, and supply and exhaust valves for said cylinder, of an intermediate valve between the supply and exhaust valves, and the cylinder arranged to automatically control the supply to and exhaust from said cylinder independent of the customary valves, with the rock-shaft K, wheel K', chain secured to said wheel, pulley and weight, rod g^6, and arms H and J for returning said automatic valve to its normal position.

480,279. TOY. ALFRED A. ROBINSON, Lowell, Mass. Filed Feb. 11, 1892. Serial No. 421,104. (No model.)



Claim.—1. The toy or puzzle consisting of a box with a flat floor, a grooved inclined bar rising from said floor, a grooved bar extending across the box in close proximity to the upper end of said inclined bar and further grooved bars connected to the latter, and a number of balls for use in said box, substantially as described.

2. The toy puzzle consisting, essentially, of a rectangular box with a flat floor, an inclined grooved bar rising from said floor, a grooved transverse bar at the upper end of said inclined bar, and a second grooved inclined bar projecting from said transverse bar and connected to a second grooved transverse bar at a different elevation, constituting a box to be used as a toy puzzle, with balls to move along the grooves, substantially as described.

3. The toy puzzle consisting, essentially, of a box with a grooved bar pivotally supported therein, a second bar connected to the pivoted bar and having a supporting bar or roost connected thereto, and means for supporting the latter in a plane above the pivoted bar, substantially as described.

4. The box A, having the inclined bar B secured to its floor, the transverse bar D, pivoted to the box in proximity to the upper end of bar B, the bar or trough G, connected at a right angle to bar D and connected to bar H, which is parallel to bar D, all of said bars being grooved, as described, and the leg i for supporting said bar H at an elevation, all substantially as described.

480,280. REST OR BRACKET FOR RABBLS. WILLIAM ROCKLITZ, Chicago, Ill., assignor to Edward Roos, same place. Filed May 26, 1892. Serial No. 434,410. (No model.)

Claim.—1. The combination of a clamp having a cam and a rest pivoted to said clamp and adapted to engage said cam for closing the clamp, substantially as set forth.

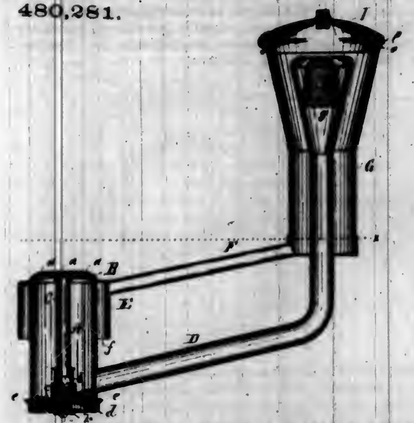
2. The combination of a split collar having a cam and a rest pivoted to said collar and adapted to engage said cam for contracting the collar, substantially as set forth.

3. The combination of a split collar provided with lips or extensions having cams or wedges and a bifurcated rest pivoted thereto and adapted to engage over said cams or wedges, substantially as set forth.

4. The combination of a split spring-collar whose extremities terminate in extensions or lips provided with cams or wedges and a bifurcated rest pivoted to said extensions and adapted to engage over said cams, substantially as set forth.

5. The combination of a split collar having the extensions or lips C, provided with cams, a pintle passing through said extensions, and a rest having spring extremities secured to said pintle, substantially as set forth.

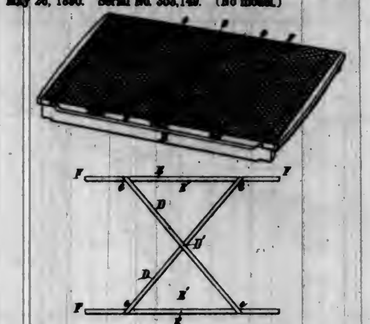
6. The combination of a split collar having the extensions C and a cam D, provided with the seat or notch I, and a bifurcated rest pivoted to said extensions and adapted to engage over said cam, substantially as set forth.



7. The combination of a split collar having the extensions C and a cam or wedge D, provided with a stop J, and a bifurcated rest pivoted to said extensions and adapted to engage over said cam or wedge, substantially as set forth

8. The combination of a split collar having its extremities formed with the lips or extensions C, terminating with the wedges or cams D, having stops J and seats I, a pintle passing through said extensions C, and a rest having the spring extremities F pivoted on said pintle and adapted to engage over said cams or wedges D, substantially as set forth.

480,281. VAPOR-STOVE. HENRY RUPPEL, Cleveland, Ohio, assignor to the Dangler Stove and Manufacturing Company. Filed Sept. 23, 1891. Serial No. 406,592. (No model.)

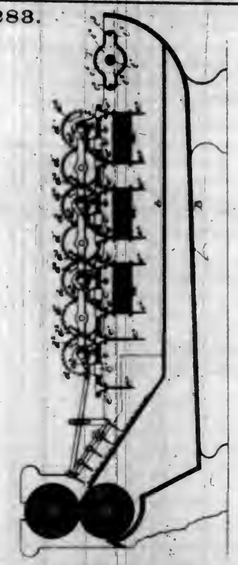


480,281.

Claim.—A vapor-burner composed of a cylinder having a sawed cap thereon, with a hole in the center thereof, and a tube C, in open relation to said hole and passing down through the center of said cylinder, in conjoint operation with a rectangular sawed chamber b and tube c, in combination with the generating tube D, generator g, and the tank, arranged substantially as and for the purpose specified.

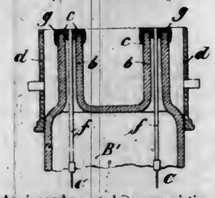
480,282. BED-BOTTOM. JAMES B. RYAN, New York, N. Y. Filed May 26, 1890. Serial No. 353,149. (No model.)

Claim.—1. In a bed-bottom consisting of a main frame with woven-wire or other fabric stretched between its ends and supported by one or more rows of springs, the diagonally-placed bars D, extending across the woven-wire or other fabric and under the same and between the fabric and the terminal coil of the central spiral spring, as herein described and set forth.



2. In a bed-bottom consisting of a main frame with woven-wire or other fabric stretched between its ends and supported by one or more rows of springs, the combination of the diagonally-placed bars D, extending across the woven-wire or other fabric and under the same between the fabric and the top of the terminal coil of the central spiral spring, and the bar E, extending along the selvage of the woven-wire fabric and under the same, connected with the diagonally-placed bars, as herein described and set forth.

480,283. WOOL-WASHING MACHINE. FREDERICK G. SARGENT and ALLAN G. SARGENT, Grantsville, Mass. Filed Jan. 17, 1887. Serial No. 224,647. (No model.)



Claim.—1. The combination, with the bowl B, of the tumbler T, formed with longitudinal flutings t^6 t^6, such flutings being perforated and provided with cavities extending across through the body of the flutings from one flating to another, whereby the fluid may flow through the same from one side to the other, substantially as described.

2. In combination with two rake-heads d, provided with teeth d^3, projecting downward into the liquid, the perforated basket m, connected thereto and passing below the surface of the washing fluid therewith at each movement of the rake-head, substantially as described.

480,283.

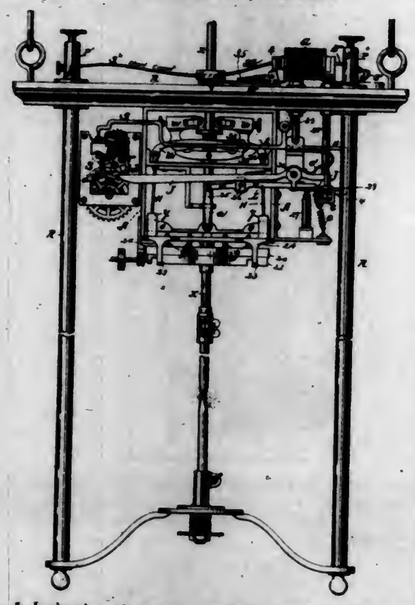
480,284. INCANDESCENT ELECTRIC LAMP. PAUL SCHARF, Vienna, Austria-Hungary, assignor of one-fourth to Rudolf Latako, same place. Filed Aug. 7, 1891. Renewed July 1, 1892. Serial No. 438,707. (No model.)

Claim.—1. An incandescent lamp consisting of a bulb B, provided with a neck B', having two tubular bearings b, metallized, as set forth, an incandescible body, and supporting and conducting wires therefor, soldered to the metallized surfaces of the said bearings, as and for the purpose set forth.

2. An incandescent lamp consisting of a bulb B, provided with a neck B', having two tubular bearings b, metallized, as set forth, an incandescible body, supporting and conducting wires therefor, soldered to the inner metallized surfaces of said bearings, and the metallic cap c, soldered to the outer metallized surface of the bearings, as and for the purpose set forth.

3. An incandescent lamp consisting of a bulb B, provided with a neck B', having two tubular bearings b, metallized, as set forth, an incandescible body, supporting and conducting wires therefor, said wires being made of a base metal, such as copper, iron, &c., and soldered to the inner metallized surfaces of said bearings, and the metallic cap c, soldered to the outer metallized surface of the bearings, as and for the purpose set forth.

480,285. ARC LAMP. CHARLES SCHEID, Chicago, Ill., assignor of two-thirds to Henry Schuettler and Pancratius Friedrich, same place. Filed Dec. 7, 1888. Renewed Apr. 30, 1892. Serial No. 431,364. (No model.)



Claim.—1. In electric-arc lamps, the combination, with the carbon-holder, of the mechanically-suspended retaining-clamp and the trip-feed coacting mechanically at determined intervals to release said clamp, substantially as described

2. In electric-arc lamps, the combination, with the carbon-holder and with its retaining-clamp, of the mechanical suspender for said clamp and the trip-feed coacting mechanically at regular intervals to shift said suspender and release the clamp, substantially as described.

3. In electric-arc lamps, the combination, with the carbon-holder, of the retaining-clamp therefor, the lever suspending said clamp, and the trip-feed device coacting mechanically therewith at predetermined

intervals to impart a quick impulsive shift to said lever, substantially as described.

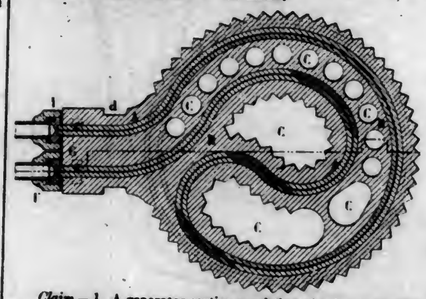
4. In electric-arc lamps, the combination, with the carbon-holder, of the retaining-clamp, the lever-suspender therefor, the trip-hammer to shift said suspender, and the release mechanism to actuate said hammer at definite intervals, substantially as described.

5. In electric-arc lamps, the combination, with the carbon-holder, of the suspended retaining-clamp and the trip-hammer coacting mechanically at definite intervals to shift said suspended clamp, substantially as described.

6. In electric-arc lamps, the combination, with the carbon-holder, of the retaining-clamp therefor, the suspending-lever, the trip-hammer, and the clock mechanism to actuate said hammer at definite intervals, whereby the lever is shifted and the clamp released, substantially as described.

7. In electric-arc lamps, the combination, with the carbon-holder, of the jointed clamp retaining said holder between the sections thereof, the connecting-link secured to the hinged joint of the clamp-sections, the suspending-lever, the pivot-hammer to shift said lever at intervals, mechanism for actuating said hammer intermittently, and stops to determine the drop movement of the jointed clamp, substantially as described.

8. In electric-arc lamps, the combination, with the carbon-holder, of the jointed clamp retaining said holder between the sections thereof, stops to determine the drop movement of said clamp, the connecting-link secured to the hinged joint of the clamp-sections, the suspending-lever, the pivot-hammer to strike said lever at intervals, the reaction-springs to restore the lever and hammer to position, and the intermittent mechanism to operate said hammer, substantially as described.



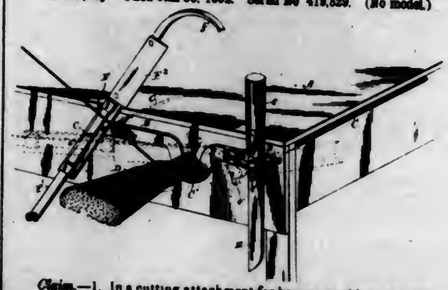
9. In electric-arc lamps, the combination, with the carbon-holder, of the jointed clamp retaining said holder between the sections thereof, the suspending-lever for said clamp, the intermediate lever, the striking hammer, and intermittent mechanism to actuate the same at intervals, substantially as described.

10. In electric-arc lamps, the combination, with the carbon-holder and with the retaining-clamp therefor, of the suspension device to maintain said clamp, the trip mechanism coacting at regular intervals to shift the suspension device, an electro-magnet energized from the lamp-current, and an armature therefor having movable arms to control said suspension device and trip mechanism, respectively, substantially as described.

11. In electric-arc lamps, the combination, with the carbon-holder, of the clamp to retain the same, the lever suspending said clamp, the clock mechanism to intermittently actuate said lever, an electro-magnet energized from the lamp-current, and an armature therefor, having movable arms to control the action of said suspending-lever and clock mechanism, respectively, substantially as described.

480,286. GENERATOR FOR THE VAPORIZATION OF LIQUIDS.

LÉON SERPOLLET, Paris, France, assignor to La Société des Générateurs à Vaporisation Instantanée, (Système Serpollet,) same place. Filed Nov. 20, 1890. Serial No. 372,083. (No model.)



Claim.—1. A generator-section consisting of a sinuous metal tube A and a surrounding casing of metal cast around the same, provided with a series of openings or spaces intermediate of the circuitous lines of sinuous tube A, substantially as described.

2. A generator-section consisting of a flattened tube A, having an elongated flattened interior passage and an inclosing casing of metal cast around the same, substantially as described.

3. A generator-section consisting of a sinuous tube A, a surrounding casing of metal cast around the same, and braces or supports interposed between the parts of the casing, substantially as described.

480,287. BROOM-SHOULDER CUTTER.

WILLIAM F. SETTLE, Russellville, Ky. Filed Jan. 30, 1892. Serial No. 419,829. (No model.)

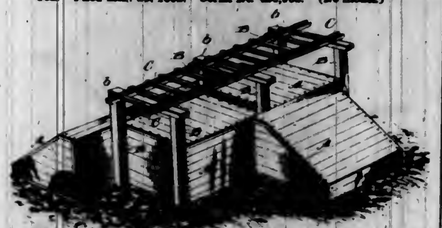
Claim.—1. In a cutting attachment for broom-machines, the combination, with the machine frame or table, of a sliding laterally-adjustable knife rod or shaft mounted in said frame and a separate swinging movable knife removably connected to the outer end of said rod, substantially as set forth.

2. In a cutting attachment for broom-machines, the combination, with the machine frame or table, of laterally adjustable and swinging over and under cutting knives connected with said frame and adapted to be thrown against the broom-stock during rotation, substantially as set forth.

3. In a cutting attachment for broom-machines, the combination, with the machine frame or table, of a plate secured to one side of said table and provided with a central U-shaped portion encircling the revolving broom-handle and an opening adjacent to said U-shaped portion and above the plane of the handle revolving therein, a sliding knife-rod laterally adjustable in said opening and the machine-frame, and a movable cutting-knife removably connected to one end of said rod and adapted to be swung against the broom-stock during rotation, substantially as set forth.

4. In a cutting attachment for broom-machines, the combination, with the machine frame or table, of a plate secured to one side of said table and provided with a central U-shaped portion encircling the revolving broom-handle and an opening adjacent to said U-shaped portion, a sliding knife-rod laterally adjustable through said opening and said frame, a binding-screw working through said plate and said opening, a knife-guide connected with said rod, and a cutting-knife working in said guide, substantially as set forth.

5. In a cutting attachment for broom-machines, the combination, with the frame or table, of a sliding laterally-adjustable knife-rod mounted in said frame, a guide-head pivoted to one end of said rod, and a cutting-knife working through said guide head, substantially as set forth.



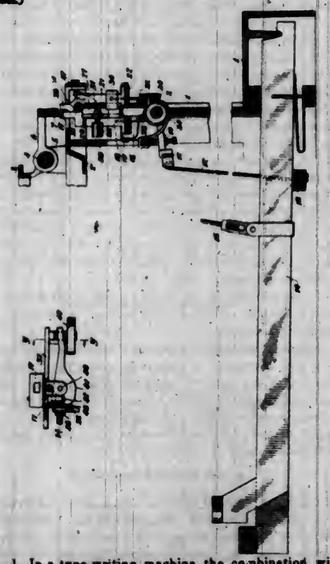
6. In a cutting attachment for broom-machines, the combination of a sliding laterally-adjustable knife-rod, a guide-head adjustably pivoted to one end of said rod, an overcutting saw-knife working through said guide-head, and an undercutting-knife member pivoted to said guide-head, substantially as set forth.

7. In a cutting attachment for broom-machines, the combination of a sliding laterally-adjustable knife-rod terminating in a securing-head, a guide-head having an offstanding securing-arm adjustably pivoted to said securing head and provided with a stop-lug engaging the top of said knife-rod, and an overcutting sliding knife working through said guide-head, substantially as set forth.

8. In a cutting attachment for broom-machines, the combination of a sliding laterally-adjustable knife-rod, a guide-head comprising opposite parallel spaced plates clamped together at each end, an offstanding securing-arm connected with said guide-head and adjustably pivoted to one end of said knife-rod and provided with a stop-lug engaging the top of the same, an overcutting sliding knife working through said guide-head, and an undercutting-knife pivoted to said guide-head, substantially as set forth.

480,288. BREAKWATER, &c.

ALEX. M. SHANNON, Galveston, Tex. Filed Mar. 29, 1892. Serial No. 426,902. (No model.)



Claim.—1. A wall formed of receptacles set with spaces between them and to break joint and filled with sand, gravel, or the like, substantially as specified.

2. The combination, with the receptacles set with spaces between them and to break joints and filled with sand, gravel, or the like, of the piles set to hold said receptacles, the concrete filling in the spaces and binding the piles and receptacles together, and the cross-timbers secured to the upper ends of the piles, as set forth.

480,289. TYPE-WRITING MACHINE.

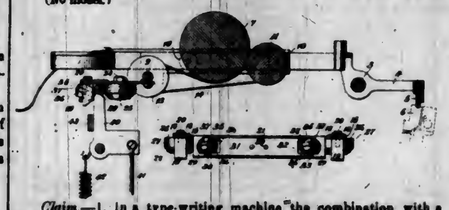
CHARLES H. SHEPARD, Brooklyn, assignor to the Remington Standard Type Writer Manufacturing Company, New York, N. Y. Filed Jan. 28, 1892. Serial No. 419,551. (No model.)

Claim.—1. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and a pair of spacing-dogs, of a stop for one of said dogs and a weight adapted to automatically remove said stop.

2. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and a pair of spacing-dogs, of a stop for one of said dogs, a lever carrying said stop, and a weight for vibrating said lever automatically by inertia.

3. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and a pair of spacing-dogs, of a stop for one of said dogs, a lever carrying said stop, and a pivoted weight.

4. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and a pair of spacing-dogs, of a stop for one of said dogs, a lever carrying said stop, a weight, and a returning spring.



5. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and a pair of spacing-dogs, of a stop for one of said dogs, a lever carrying said stop, and a pivoted weight loosely connected to said lever.

6. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and a pair of spacing-dogs, of a stop for one of said dogs, a lever carrying said stop, and a pivoted slotted weight embracing one arm of said lever.

7. In a type-writing machine, the combination of a power-driven paper-carriage, a feed-rack, a spring-actuated spacing-rocker having a limited forward motion, a dog-holder, a pair of pivoted spring-actuated spacing-dogs, a vibratory stop for one of said dogs, and a weight for automatically moving said stop out of the path of vibration of said dog.

480,290. TYPE-WRITING MACHINE.

CHARLES H. SHEPARD, Brooklyn, assignor to the Remington Standard Type Writer Manufacturing Company, New York, N. Y. Filed Jan. 28, 1892. Serial No. 419,552. (No model.)

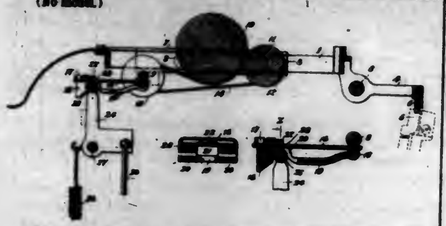
Claim.—1. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of rollers engaging diametrically-opposite sides of said rail and having their working faces arranged in parallel planes.

2. In a type-writing machine, the combination, with a shifting platen-carrier, a shift-rail, and means for moving the same, of a rigidly-mounted roller engaging the back of said rail and an elastically-mounted roller engaging the front of said rail.

3. In a type-writing machine, the combination, with a shifting platen-carrier, a shift-rail, and means for moving the same, of a pair of rigidly-mounted rollers engaging the back of said rail and a pair of spring-mounted rollers engaging the front of said rail.

4. In a type-writing machine, the combination, with a shifting platen-carrier, a shift-rail, and means for shifting the same, of wedge-pieces and a set of rollers engaging opposite sides of said rail, one of said rollers being elastically mounted.

5. In a type-writing machine, the combination, with a shifting platen-carrier, a shift-rail, and means for moving the same, of a pair of wedge-pieces, a pair of rigidly-mounted rollers for engaging the back of said rail, and a pair of spring-mounted rollers for engaging the front of said rail.



6. In a type-writing machine, the combination, with a shifting platen-carrier, a shift-rail, and means for moving the same, of means for engaging the back of said rail and elastically-mounted rollers for engaging the front of said rail.

7. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of a back roller having a cylindrical face to engage said rail and a front elastically-mounted roller having tapering ends.

8. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of the back rollers, their supporting-arms attached to the platen-carrier, a connecting-bar attached to said arms, and an elastically-mounted roller connected to said bar.

9. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of the back rollers, their supporting-arms attached to the platen-carrier and slotted at their forward ends, a bar connected to said arms and provided with slots, attaching-screws, an inclined support depending from said bar, and an elastically-mounted roller attached thereto.

480,291. TYPE-WRITING MACHINE. CHARLES H. SHEPARD, Brooklyn, assignor to the Remington Standard Type Writer Manufacturing Company, New York, N. Y. Filed Jan. 28, 1892. Serial No. 419,553. (No model.)

Claim.—1. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of a pivotally-mounted hook connected to rise and fall with said rail and to adjust itself thereto as wear takes place.

2. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of a hook to engage said rail, provided at its upper side interiorly with a groove or cut-away.

3. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of a gravity hook having a notch or cut-away interiorly at its upper side.

4. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of a pivoted hook provided interiorly with a groove or cut-away and means for limiting its downward movement.

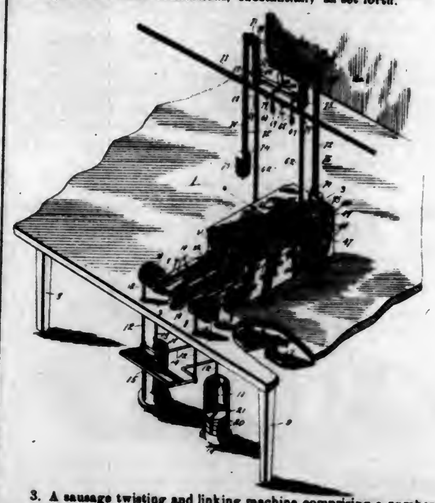
5. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of an arm and a bifurcated pivoted hook having a groove or cut-away interiorly at its upper side.

6. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of an arm and a bifurcated gravity-hook having a loop and provided interiorly at its upper side with a groove or cut-away.

7. In a type-writing machine, the combination, with a shifting platen-carrier and a shift-rail, of an arm carrying a wedge-piece and a gravity-hook having at its top interiorly a groove or cut-away.

480,292. WATER-CLOSET SEAT AND COVER. HENRY H. SIEVERT, Chicago, Ill., assignor to the L. Wolff Manufacturing Company same place. Filed Feb. 15, 1892. Serial No. 421,492. (No model.)

Claim.—1. The combination, with the frame A, of hinge-lids B C, turning on a common center, and a split hinge having one strap secured to said stationary part A, a strap d', fitting on and secured to the upper side of said seat B, and a strap d^3, fitting on and secured to the under side of said cover C, substantially as specified.



2. The combination, with the frame A, of hinge-lids B C, turning on a common center, and a split hinge having one strap secured to said stationary part A, a strap d', fitting on and secured to the upper side of said seat B, and a strap d^3, fitting on and secured to the under side of said cover C, said straps d and d' being secured in place by metal screws inserted from below and entering threaded holes or bosses on the under side of said straps $d\,d'$ and said strap d^3 being secured to said cover C by wood screws, substantially as specified.

3. The split hinge comprising straps d, d', and d^3, and a common pivot b, pivoting said straps together, substantially as specified.

480,293. SAUSAGE TWISTING AND LINKING MACHINE. HENRY A. SMALLFIELD, Kansas City, Mo., and HARRY EDWARDS, Kansas City, Kans. Filed Apr. 4, 1892. Serial No. 427,742. (No model.)

Claim.—1. A sausage twisting and linking machine comprising an oscillating counterweighted power crank-shaft, a number of lower oppositely-reciprocating twisting-slides operatively connected to the crank-shaft, a number of upper oppositely-reciprocating twisting-slides, and a number of gear-wheels interposed between the lower and upper slides and operating to reciprocate each upper slide oppositely from the reciprocation of the companion lower slide, substantially as set forth.

2. A sausage twisting and linking machine comprising an oscillating power crank-shaft, a number of grooved pulleys mounted upon said shaft, a treadle, flexible connections from the treadle wound upon the pulleys, counter-weights, and flexible connections from said counter-weights wound oppositely upon the pulleys from the direction of winding of the treadle connections, substantially as set forth.

3. A sausage twisting and linking machine comprising a number of lower oppositely-reciprocatory twisting-slides, an oscillating power crank-shaft operatively connected to said slides, a number of gear-wheels operated by said lower slides, and a number of vertically-adjustable upper slides operated by the said gear-wheels and carried by the top of the machine, substantially as set forth.

4. A sausage twisting and linking machine comprising a number of oppositely-reciprocatory twisting-slides, and yielding supporting-springs carried by the slides and working in guides in the machine, substantially as set forth.

5. A sausage twisting and linking machine comprising a number of oppositely-reciprocaitng twisting-slides, a hinged top or cover carrying said slides, and a retracting-pin connected at one end to the top or cover and at its opposite end to the slide, substantially as set forth.

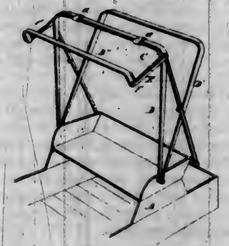
6. A sausage twisting and linking machine comprising a suitable framework, a cover hinged upon said framework, a number of creasing-blades carried by the cover and pendent therefrom, and a number of longitudinally-divided receivers for said blades carried by the framework of the machine, and each located directly beneath one of the creasing-blades, substantially as set forth.

7. A sausage twisting and linking machine comprising a suitable framework, a cover hinged upon said framework, a number of creasing-blades carried by the cover and pendent therefrom, a number of longitudinally-divided receivers for said blades carried by the framework of the machine and each located directly beneath one of the creasing-blades, and openings through the top and frame of the machine for affording access to opposite sides of the creasing-blades, substantially as set forth.

8. A sausage twisting and linking machine comprising a number of vertically-movable scorchers, each having a bifurcated lower end, substantially as set forth.

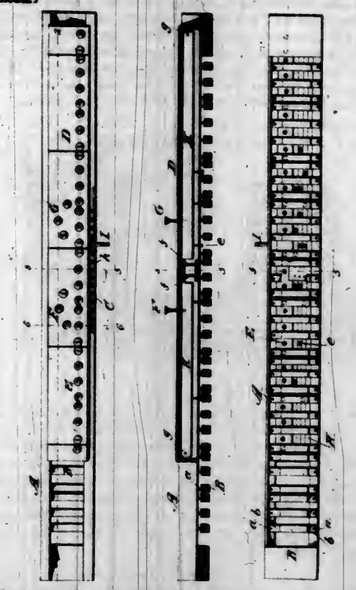
9. A sausage twisting and linking machine comprising a suitable machine-frame, a number of standards extending vertically upward from said frame, a number of slides movable upon said standards, a cross-bar connecting said slides, a number of scorchers carried by said cross-piece, counter-weights, and flexible connections for attaching the weights to the slides, and brackets and pulleys carried by the standards, substantially as set forth.

480,294. FOUNTAIN-PEN. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Feb. 26, 1890. Serial No. 341,822. (No model.)



Claim.—1. In a fountain-pen, the combination, with the ink-reservoir and a condensing-chamber connecting therewith and in communication with the pen, of a valve between said reservoir and chamber constructed to close communication between the latter when seated and to open communication between the latter when unseated, and a strand or irritant within said reservoir, said strand constructed with one of its ends free and in proximity to said valve, whereby it can vibrate relatively thereto, and extending thence upwardly within said reservoir substantially parallel with its axis.

2. In a fountain-pen, the combination, with the holder constructed with an ink-reservoir and a condensing-chamber in connection therewith and with the pen, said chamber constructed with capillary conduits and conductors for effecting a passage of ink and air therein and with a valve-seat in its upper portion, of a valve within said reservoir for controlling communication between the latter and said chamber and constructed with a stem extending longitudinally of said reservoir and projecting through the upper end thereof, a handle secured to the outer end of said stem, a screw connection between said handle and holder, and a strand or irritant H within said reservoir projecting longitudinally of said reservoir and terminating in proximity to said valve and constructed with its end in proximity to said valve free to vibrate.

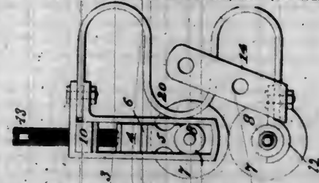


3. In a fountain-pen, the combination, with the holder constructed with an ink-reservoir and a condensing-chamber in connection therewith and with the pen, said chamber constructed with capillary conduits and conductors for effecting a passage of ink and air therein and with a valve-seat in its upper portion, of a valve within said reservoir for controlling communication between the latter and said chamber and constructed with a stem extending longitudinally of said reservoir and projecting through the upper end thereof, a handle secured to the outer end of said stem, a screw connection between said handle and holder, and a strand or irritant within said reservoir and connected at its upper end to said stem and projecting thence longitudinally of said reservoir and terminating in proximity to said valve and so constructed that its end in proximity to said valve is free to vibrate whereby when said valve is moved by rotating its handle said irritant is moved therewith, thereby maintaining its relative position thereto.

480,295. CARRIAGE-TOP. GARLAND R. ST. JOHN, Kalamazoo, Mich. Filed Jan. 31, 1891. Serial No. 379,556. (No model.)

Claim.—In a carriage-top, the combination, with the bows B B' and their connecting-braces, substantially as described, of an interposed spring-bail rigidly secured to the bow B' and hinged to the bow B, substantially as and for the purpose set forth.

480,296. ATTACHMENT FOR PIANOS OR ORGANS. JOHN M. STUKES, San Marcos, Tex. Filed Apr. 25, 1892. Serial No. 430,587. (No model.)

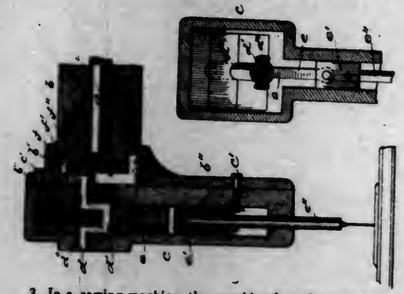


Claim.—1. In an attachment for pianos or organs, the rectangular frame A, having vertically-movable transverse spacing-blocks B and the guide-pins a therefor, in combination with the movable keyboard D, substantially as and for the purpose set forth.

2. In an attachment for pianos or organs, the rectangular frame A, having vertically-movable transverse spacing-blocks B and the indicator-plate C, provided with notches A, in combination with the movable keyboard D, having the hinged locking-lever I to engage with the notches, and the supplemental keys to operate the keys of the instrument, substantially as and for the purpose specified.

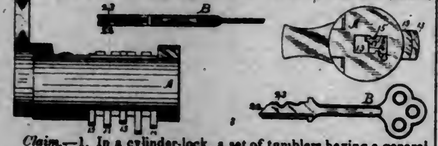
3. In an attachment for pianos or organs, the rectangular frame A, having the movable spacing-blocks B, in combination with the movable keyboard D, carrying the pivoted pressure-arms H, which are provided with the push-keys, as shown, and upon the under side having push-pins e and the springs f, substantially as and for the purpose described.

480,297. CLOTHES-WRINGER. WILLIAM THORNTON, Chattanooga, Tenn. Filed Oct. 3, 1891. Serial No. 407,619. (No model.)



Claim.—The combination, in a clothes-wringer, of two rollers, two housings connected at the top to springs having several beads, the middle bead of each spring resting against the lower end of a housing and having the bearings for the journals of the lower roller bolted to the ends of the springs, substantially as herein shown and described.

480,298. SEWING-MACHINE. JASPER VANHETTE, Tiffin, Ohio, assignor, by direct and mesne assignments, to The Singer Manufacturing Company of New Jersey. Filed Sept. 1, 1891. Serial No. 404,669. (No model.)



Claim.—1. The combination of an arm *a'* a sewing-machine, provided with a cavity, a shaft journaled therein and carrying a cam at its end, said cam working in said cavity, a frame or casing *c*, secured on the end of the arm, removable journal-blocks *d''* *d''*, secured in an opening in the casing *c* adjacent to the cavity, a crank-shaft journaled between said journal-blocks and carrying an arm engaging the cam, and means connecting the needle-bar to the crank shaft, substantially as described.

2. The combination of an arm *b*, a hollow frame or casing *c*, secured on the end of the arm, a crank-shaft removably inclosed in the upper end of the casing and having its ends journaled in opposite sides thereof, means for operating this crank-shaft, a cross-head *d'*, sliding in the hollow casing, a pitman *e*, connecting the cross-head to the crank-arm between its ends, and a removable needle-bar secured to said cross-head in line with the pitman, substantially as described.

3. In a sewing-machine, the combination of the arm thereof, a driving-shaft mounted in said arm, a hollow frame or casing *c* on the arm, a cross-head sliding in said hollow casing, the walls of the cavity entirely surrounding the cross-head and bearing on all its vertical sides, means for connecting the cross-head to the driving-shaft to cause said cross-head to have a reciprocating motion, and a needle-bar connected to the lower end of the cross-head and projecting through the casing and carrying needle-holding devices at its lower end, substantially as described.

480,299. CYLINDER LOCKS AND KEYS. HENRY G VOIGHT, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Sept. 15, 1891. Serial No. 405,786. (Model.)

Claim.—1. In a cylinder-lock, a set of tumblers having a general keyway and a plurality of sub-keyways, substantially as described, and for the purpose specified.

2. A key for cylinder-locks, having two blades arranged side by side, with their bitted edges facing in the same general direction, one of which is bitted to fit one lock and the other of which is bitted to fit a different lock, substantially as described, and for the purpose specified.

3. The improvement in cylinder locks and keys, which consists of a set of locks, a set of keys, each of which is fitted to one lock in said set without fitting the other lock thereof, and a main door-lock common to all of said keys, substantially as described, and for the purpose specified.

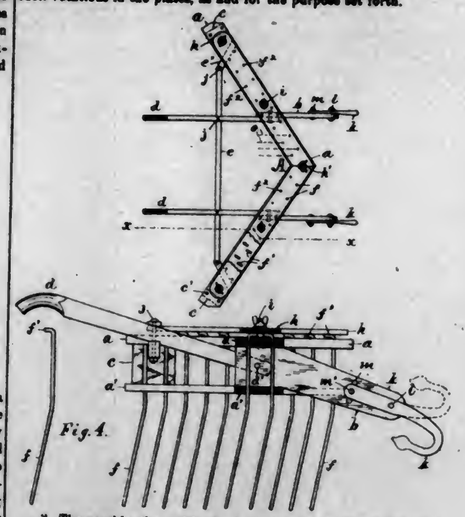
4. The improvement in cylinder locks and keys, which consists of a set of locks and a main door-lock, the tumblers of which are provided with sub-keyways on two different lines, and a set of two-bladed keys, one of which is bitted to act in common on one line of said sub-keyways in said set of locks and in the main door-lock and the other blade of which is bitted to the different locks on the other line of sub-keyways, substantially as described, and for the purpose specified.

5. The improvement in cylinder locks and keys, which consists of a main door-lock and set of room-locks, the tumblers of which have three sub-keyways, a set of two-bladed keys, one blade of which is bitted to fit the main door-lock and the other to fit one room-lock in said set, and a master key common to all of said room-locks and main door-lock, substantially as described, and for the purpose specified.

480,300. WEED-EXTERMINATOR. WARREN VREELAND, Nutley, N. J. Filed Apr. 6, 1892. Serial No. 428,026. (No model.)

Claim.—1. The combination, with the draft-bars *b* and spacing-blocks *c*, of the plates *a* and *a'*, secured, respectively, above and below the draft-bars and blocks, the handles *d*, the brace *e*, and the teeth inserted through the plates *a* and *a'*, substantially as herein set forth.

2. The combination, with the draft-bars *b* and spacing-blocks *c*, of the plates *a* and *a'*, secured, respectively, above and below the draft-bars and blocks, the handles *d*, the brace *e*, and the teeth bent backwardly and provided with the heads *f'* and fitted removably in the plates *a* and *a'*, with a cap held over the heads of the teeth to permit their rotations in the plates, as and for the purpose set forth.



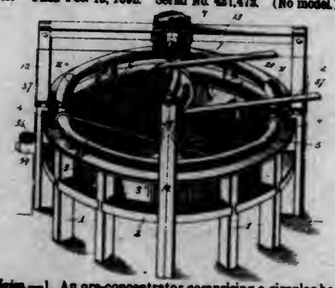


Fig. 4.

3. The combination, with the draft-bars *b* and spacing-blocks *c*, of the plates *a* and *a'*, secured, respectively, above and below the draft-bars and blocks, the handles *d*, the brace *e*, the teeth bent backwardly and provided with the heads *f'* and fitted removably in the plates *a* and *a'*, and the cap secured detachably over the heads of the teeth to permit the removal of the latter.

4. The combination, with the draft-bars *b* and spacing-blocks *c*, of the plates *a* and *a'*, secured, respectively, above and below the draft-bars and blocks, the handles *d*, the brace *e*, the teeth inserted through the plates *a* and *a'*, and the hooks *k*, provided with reversible shanks and secured adjustably to the draft-bars, as and for the purpose set forth.

480,301. ORE-CONCENTRATOR. CHARLES R. WALKER, Trinidad, Colo. Filed Feb. 13, 1892. Serial No. 421,472. (No model.)

Claim.—1. An ore-concentrator comprising a circular bed or base, a circular perforated discharge-pipe located above the bed or base, and a curved feed-pipe communicating with the discharge-pipe, substantially as set forth.

2. An ore-concentrator comprising a circular bed or base, a circular perforated discharge-pipe located above the said bed or base, a semicircular feed-pipe located above the discharge-pipe and communicating at its ends with said pipe, and a hopper mounted upon and communicating with the feed-pipe, substantially as set forth.

3. An ore-concentrator comprising a circular bed or base having a bottom provided with a central outlet-opening, a concave pocket secured beneath said opening, and an outlet-pipe leading from said pocket, substantially as set forth.

480,302. DETACHABLE SLEIGH-RUNNER. CHARLES G. WARNER, Syracuse, N. Y. Filed Sept. 19, 1891. Serial No. 406,209. (No model.)

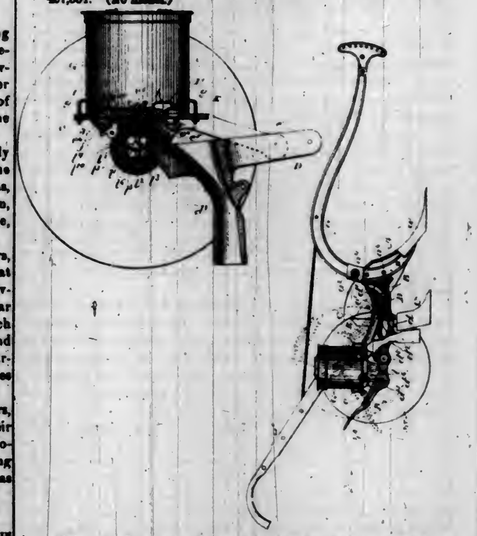
Claim.—1. The herein-described detachable sleigh, comprising runners, beams mounted substantially centrally upon the cross-rod between the axle and runners and adjustable laterally thereon and having their lower ends loosely secured to the runners and their upper ends provided with heads loosely secured thereto for the purpose of receiving the axle, and means for detachably securing said head to the axle, as set forth.

2. The herein-described sleigh, comprising runners, beams loosely secured thereto and secured together substantially centrally upon the cross rod, heads loosely secured thereto at the upper ends of the beams, a rod having recesses in one side loosely secured to the forward beam, and a slidingly-mounted head adapted to be secured to the rear axle, as set forth.

3. The herein-described detachable sleigh, comprising runners, beams loosely secured together at their lower ends and provided at their upper ends with loosely-secured heads for the purpose of receiving the axle, the detachable head C, adapted to be secured to the rear axle and having an opening in its lower side, the inner face of which is provided with a strap-spring 10 and the inwardly-projecting lug, and a rod loosely secured to the forward beam, thence extending rearwardly through the opening in the head C and provided with recesses for the purpose of engaging with the lugs in the opening therein.

4. The herein-described detachable sleigh, comprising runners, beams mounted upon the rod centrally and adjustably and having their lower ends loosely secured to the runners and their upper ends provided with heads loosely secured thereto for the purpose of receiving the axle, and means for detachably securing said heads to the axle, as set forth.

480,303. COMBINED MOP-TUB AND MOP-WRINGER. BENJAMIN F. WARNER, Blair, Nebr. Filed Dec. 12, 1891. Serial No. 414,847. (No model.)



Claim.—1. In a combined mop-tub and mop-wringer, the combination of the tub 1, having the horizontal stationary roller 2, journaled between the upper ends of ears attached to the inside of tub at top and nearer one side, also having the gatherer 7, made of a single piece of wire curved to fit and attached to the inner surface of the tub a distance below the roller 2 with its ends toward the opposite side of tub, a portion near the center of each half bent in a reverse curve arching toward center of tub, the bifurcate bell crank having the U-shaped arm 3', with treadle 5, and the integral end arms 3 and 3, with the roller 2' journaled between their upper ends, the lower ends or angles pivoted to the sides of tub at such points as to swing roller 2' in contact with roller 2 and suspend the tub nearly upright when raised by roller 2', substantially as shown and described.

2. In a combination mop-tub and mop-wringer, the tube 1, having the roller 2, the gatherer 7, consisting of a single piece of wire curved to fit and attached to the inner surface of the tub a distance below the roller 2, the ends toward the opposite side of tub, and a portion near the center of each half bent in a reverse curve arching toward the center of the tub, the pivots 4, and the brackets 8, in combination with the bifurcate bell-crank 3 3 3', seated at its angles on the pivots 4 and having the roller 2' journaled between its ends 3 3 and the treadle 5, and the C-spring 6, one end attached to the tub, the free end bent to form a hook adapted to engage and actuate the bell-crank or to be disengaged from same, the pivots 4 so placed that when the machine is suspended by the roller 2' the stationary roller 2 will bear against roller 2', substantially as described.

3. The gatherer 7, consisting of a single piece of ductile wire bent in a general curve to fit and attached at its ends and center to the inner surface a distance below the rollers of a combined mop-tub and mop-wringer, portions near the center of each of the halves of the wire bent in reverse curves adapted to be adjusted toward or from each other by bending, substantially as shown and described.

480,304. PLANTER. LEWIS R. WATERMAN, Moline, Ill., assignor to the Deere & Company, same place. Filed Apr. 2, 1892. Serial No. 427,551. (No model.)

Claim.—1. In a corn-planter, the combination, substantially as hereinbefore described, of a seed-box, mechanism for measuring and delivering seed from the box, co-operating disks on either side of the box, which disks carry or support the seed-box and the measuring and delivering mechanism and which actuate the latter, and means for adjusting the disks, so as to vary their covering capacity.

2. In a corn-planter, and in combination, substantially as hereinbefore described, a seed-box, mechanism for measuring and delivering seed from the seed-box to the seed-tube, disks on either side of the box, adapted to support said box and the measuring and delivering mechanism, a divided axle to which said disks are fixed to rotate therewith and the two parts of which are coupled to rotate with each other, and a pinion fixed to one of said parts and geared with and to operate the seed measuring and delivering mechanism in the seed-box.

3. In a corn-planter, and in combination, substantially as hereinbefore described, a seed-box, mechanism for measuring and delivering seed from the seed-box to the seed-tube, disks on either side of the box, adapted to support said box and measuring and delivering mechanism, said disks being fixed to a divided axle the two parts of which are coupled to each other and which are adjustable to change the angle of the disks to the line of travel of the planter, and a pinion fixed to one of the parts of the axle and geared with to operate the seed measuring and delivering mechanism in the seed-box.

4. In a corn-planter, and in combination, substantially as hereinbefore described, a seed-box, mechanism for measuring and delivering seed from the seed-box to the seed-tube, disks on either side of and adapted to support said box and measuring and delivering mechanism; said disks being fixed to a divided axle the two parts of which are coupled to each other, a pinion carried on one of said parts of the axle, and means for adjusting the two parts of the axle to adjust the angle of the disks to the line of travel of the planter and in such manner as to adjust the pinion concentrically with the circular series of counterpart cogs with which it gears to actuate said seed-measuring mechanism.

5. In a corn-planter, and in combination, substantially as herein-

before described, a seed-box, mechanism for measuring and delivering seed from the seed-box to the seed-tube, disks on either side of the box, adapted to support said box and measuring and delivering mechanism, an axle in two parts, each part of which has one of said disks fixed thereto, a pinion on one of the parts of the axle, which pinion gears with and actuates the seeding mechanism referred to, and means for adjusting said disks at different angles to the line of travel of the planter.

6. In a corn-planter, in combination with a lister-plow, a drag-bar, as B, fixed to and in rear thereof and provided with a furrow-opener, another drag-bar, as D, fixed thereto and provided with a seed-tube, and a frame or bar, as E, hinged to the bar D at one end and provided with a seed-box having seed measuring and delivering mechanism supported by disks, as M, with an axle fixed thereto and provided with a pinion which gears with said seed measuring and delivering mechanism, substantially as described.

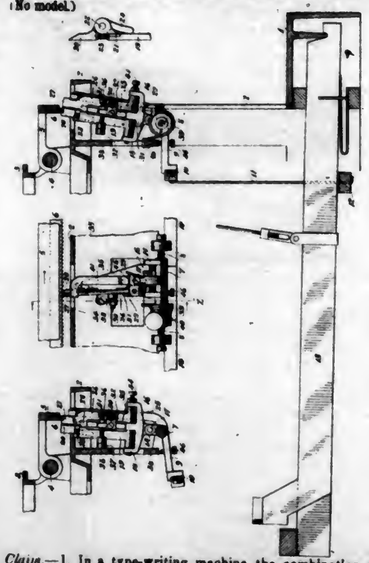
7. In a corn-planter, in combination with a lister-plow, a drag-bar B, removably fixed thereto and provided with a furrow-opener, another drag-bar D, removably fixed to the bar B and provided with a seed-tube, whereby said bar B may be substituted by another not fixed to a lister-plow, a seed-box provided with seed measuring and delivering mechanism and mounted on an arm E, hinged to the bar D, and disks, as M, fixed to a divided axle to support said seed-box, which axle gears with and operates the seed mechanism referred to, substantially as described.

8. In a corn-planter, in combination with a drag-bar, a seed-box having seed measuring and delivering mechanism carried on a bar hinged to said drag-bar, and a lever, as R, pivoted between its ends to the drag-bar and having a link connection therewith, whereby the box may be raised and lowered, substantially as described.

9. In a corn-planter, in combination with a drag-bar, as D, and bar, as E, hinged thereto and having a seed-box mounted thereon and provided with seed measuring and delivering mechanism, a lever R, hinged to the rear end of bar D, link r, and detent-lug r^4, substantially as described.

10. In a corn-planter, in combination with a lister-plow and drag-bars in rear thereof, a frame hinged to said drag-bars and provided with a seed-box at its free end having seed measuring and delivering mechanism, a lever R, hinged to said drag-bars, a link r, pivotally connected with said lever and with a lug on the swinging bar, and a detent for locking said lever when turned to elevate the seed-box, substantially as described.

11. In a corn-planter, in combination with a drag-bar, a frame hinged to said bar and carrying a seed-box at its rear, said box having seed measuring and delivering mechanism, a two-part axle journaled in said frame and carrying supporting, pulverizing, and covering disks, a pinion fixed to said axle and geared with and to operate said seed measuring and delivering mechanism, and means for independently adjusting the parts of the axle, substantially as described.



12. In a corn-planter, in combination with a lister-plow, drag-bars in rear thereof, a frame or bar hinged to said drag-bars, a seed-box mounted on said swinging frame and provided with a seed measuring and delivering mechanism, disks fixed to a divided axle to support said seed-box and its contained mechanism and adjustable to change their angle to the line of travel of the planter, and a pinion fixed to said axle and geared with to operate said seeding mechanism, substantially as described.

13. In a corn-planter, in combination with a lister-plow, drag-bars in rear thereof, a frame or bar hinged to said drag-bars, a seed-box mounted on said swinging frame and provided with a seed measuring and delivering mechanism, disks fixed to a divided axle to support said seed-box and its contained mechanism and adjustable to change their angle to the line of travel of the planter, and a pinion fixed to said axle and geared with to operate said seeding mechanism, and a lever, as R, for raising and lowering said seed-box and disks, substantially as described.

14. In a corn-planter, the combination of a main frame, a supplemental frame pivoted thereto and carrying a seed box or receptacle and seed measuring and delivering mechanism, a two-part axle journaled in the supplemental frame and carrying disks acting to support the box and its contained mechanism on either side of the same and to pulverize the soil and cover the seed, and means for adjusting the parts of the axle so as to set the disks to throw more or less of the soil onto the seed.

15. In a corn-planter, the combination of a drag-bar, as B, a supplemental drag-bar, as D, secured thereto, a furrow-opener carried by the main drag-bar, a spout or tube carried by the supplemental drag-bar, a pivoted frame carrying a seed-box and measuring and delivering mechanism, an axle journaled in the pivoted frame and carrying wheels or disks for supporting the box and its contained mechanism and pulverizing the soil and covering the seed, and mechanism between the axle and the measuring and delivering mechanism for actuating the same.

480,305. TYPE-WRITING MACHINE. GEORGE B. WEBB, New York, N. Y., assignor to the Remington Standard Type Writer Manufacturing Company, same place. Filed Jan. 23, 1892. Serial No. 419,006. (No model.)

Claim.—1. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and letter-spacing dogs, of a detent or stop to prevent any feed of the carriage until after the finger of the operator has been removed from the type-actuating key.

2. In a type-writing machine, the combination, with a power-driven paper-carriage, a feed-rack, and letter-spacing dogs, of a rocking detent or stop arranged to hold one of said dogs and prevent the feed of the carriage as long as the type-actuating key is held depressed by the finger of the operator.

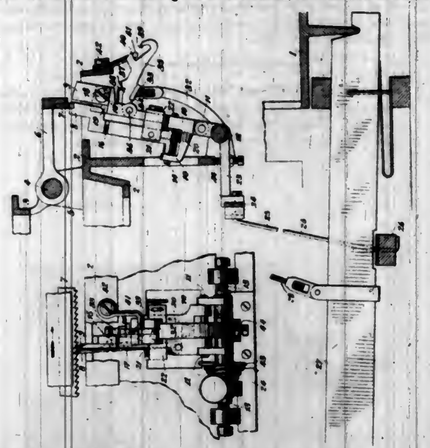
3. In a type-writing machine, the combination, with a power-driven paper-carriage, of a rack, a feeding-dog, a detaining-dog, a vibratory dog-holder, a spring-actuated spacing-rocker, and a detent connected to said spacing-rocker and adapted to co-operate with the feeding-dog, substantially in the manner described.

4. In a type-writing machine, the combination, with a power-driven paper-carriage, of a rack, a spring-actuated spacing rocker, a vibratory dog-holder pivotally connected to said rocker, a spring-actuated detaining-dog, a spring-actuated feeding-dog, and a detent or stop for the latter to prevent any feed of the carriage until the finger has been removed from the type-actuating key.

5. In a type-writing machine, the combination, with a power-driven paper-carriage, of a rack, a spring-actuated spacing-rocker having an arm provided with a detent, a vibratory dog-holder pivotally connected to said rocker and provided with letter-spacing dogs, and a stop or abutment on the dog-holder, whereby the said arm may vibrate the dog-holder in both directions.

6. In a type-writing machine, the combination, with a power-driven paper-carriage, of a rack, a spring-actuated spacing-rocker having an arm provided with a shoulder, and a dog-holder carrying a detaining-dog and a feeding-dog, the latter adapted to be engaged by said shoulder.

480,306. TYPE-WRITING MACHINE. GEORGE B. WEBB, New York, N. Y., assignor to the Remington Standard Type Writer Manufacturing Company, same place. Filed Mar. 1, 1892. Serial No. 423,328. (No model.)



Claim.—1. In a type-writing machine, as an improvement in the carriage-escapement mechanism, the combination, with a spacing rocker or frame, of a spacing member frictionally connected thereto, substantially as and for the purpose set forth.

2. In a type-writing machine, as an improvement in the carriage-escapement mechanism, a dog-holder frictionally connected to the spacing rocker or frame, substantially as and for the purpose set forth.

3. In a type-writing machine, as an improvement in the carriage-escapement mechanism, the combination of a spacing rocker or frame provided with a friction pad or block and a dog-holder provided with a seat or bearing for said pad or block.

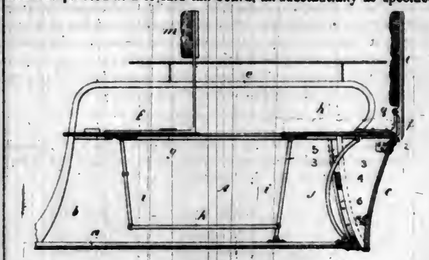
4. In a type-writing machine, as an improvement in the carriage-escapement mechanism, the combination of a spacing rocker or frame provided with a friction-pad or block and a dog holder provided with a pressure arm or lever provided with a seat or bearing for said pad or block.

5. In a type-writing machine, as an improvement in the carriage-escapement mechanism, the combination of a spacing-rocker provided with a pad or block and a dog-holder provided with a pivoted spring-pressed arm or lever having a seat or bearing for said pad or block.

6. In a type-writing machine, as an improvement in the carriage-escapement mechanism, the combination of a spacing rocker or frame having a friction pad or block, a dog-holder provided with a pressure arm or lever having a seat or bearing for said pad or block and having two cams or inclined faces, and an arm or projection to co-operate with said cams or inclined faces.

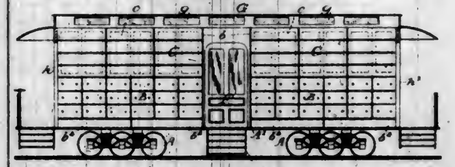
7. In a type-writing machine, as an improvement in the carriage-escapement mechanism, the combination of a spacing rocker or frame having a friction pad or block, a dog-holder pivoted independently of said spacing rocker or frame, a spring-pressed arm or lever pivoted to said pivoted dog-holder and provided with a seat or bearing for the pad or block and with two cams or inclined faces, and an arm or projection to co-operate with said cams or inclined faces.

8. In a type-writing machine, the combination, with a paper-carriage having a feed-rack, type-bars, and key-levers, of a spacing rocker or frame, a feed-dog frictionally connected to the same, means for reducing the force of the frictional contact or connection when the dog is moved the proper distance to escape from the rack, so that the spacing rocker or frame may continue its movement to permit the type to strike, and means for also reducing the force of the frictional contact or connection when the dog is returned to its initial or normal position, so that the spacing rocker or frame and the type may be allowed to continue to move back to their initial or normal positions, substantially as described.



9. In a type-writing machine, the combination, with a paper-carriage having a feed-rack, type-bars, and key-levers, of a spacing rocker or frame carrying a friction pad or block, a dog-holder pivoted to said spacing rocker or frame, a rigid dog and a yielding dog mounted on said dog-holder, and a spring-pressed arm or lever pivoted to said dog holder and provided with a seat or bearing for said pad or block and with two cams or inclined faces to co-operate with an arm or projection fixed on the framework.

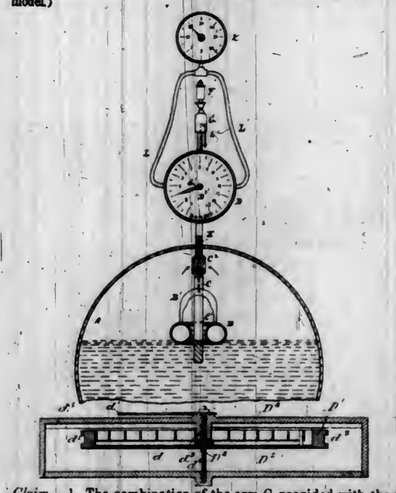
480,307. CARRIAGE. HARLAN P. WELLS, Amesbury, Mass., assignor of one-half to Osgood Morrill, same place. Filed Feb. 29, 1892. Serial No. 423,118. (No model.)



Claim.—1. In a two-seat vehicle, the combination of a rising and falling seat, a hinged tail-board, and a seat-back formed to also serve as a deck-panel and hinged both to the seat and tail-board in manner to be closed down as a deck-panel by the closing of the tail-board and to be raised into position as a seat-back by the opening of the tail-board, substantially as specified.

2. In a two-seat vehicle, the combination of tail-board c, pivoted to the body, back t, pivoted to said tail-board, and the rising and falling seat h, pivoted to back t by the rigid angle-iron p, whereby the opening and closing of the tail-board will automatically raise and lower said seat-back and will raise and lower said seat, substantially as specified.

3. The combination of seat A, supported by irons i j, pivoted to said seat and to the body, tail-board c, pivoted at its lower edge to the body, and back t, connected with said seat by pivot q in seat-iron p and also pivoted at 2 to said tail-board, all substantially as specified.

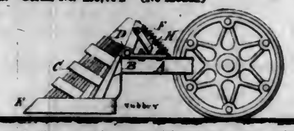


480,308. MERCHANDISING-CAR. RUFUS A. WILDER, Cressona, Pa. Filed Apr 9, 1892. Serial No. 428,455. (No model.)

Claim.—A merchandising-car comprising the body, drawers arranged on both sides of the car, package-spaces under the drawers, living-apartments at the ends of the car, shelves above the drawers, vertical openings in the sides of the car between the drawers and shelves, doors to close the openings, and steps hinged to the bottom of the openings and adapted to fold up and turn within the car, substantially as and for the purpose specified.

480,309. COMBINED WATER AND STEAM GAGE. ISAAC WILLAN, Detroit, Mich. Filed Feb. 12, 1892. Serial No. 421,346. (No model.)

Claim.—1. The combination of the arm C, provided with the slot C', the float provided with the yoke B', passed through said slot, a water-gage provided with a rotatable spring-case carrying an index-finger, and a flexible connection connecting said case and yoke, substantially as described.



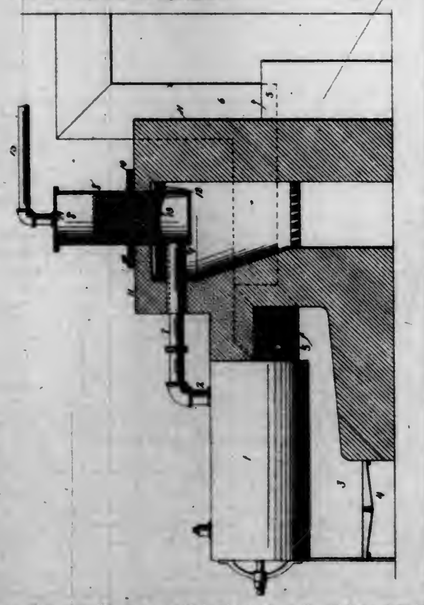
2. The combination of the float, the water-gage, a steam-gage communicating with the water-gage, the arm C, communicating with the interior of the water-gage, whereby steam may pass to said gage, a rotatable spring-case located in the water-gage case, carrying an index-finger, and a flexible connection connected with the spring-case and float, substantially as described.

3. The combination of the float, the arm C, made tubular at its

upper end, the water-gage provided with a rotatable spring-case, connected with the float, alarm mechanism communicating with the interior of said gage, and a controlling-valve operated by the movement of the spring-case, substantially as described.

4. The combination of the float, the arm C, made tubular at its upper end, the water-gage provided with a rotatable spring-case, connected with the float, alarm mechanism communicating with the interior of said gage, and a self-closing controlling-valve arranged to be opened by the movement of said case, said valve provided with a valve-stem projecting to the exterior, substantially as described.

480,310. TRAM-CAR. ADOLF WÖRNER, Buda-Pesth, Austria-Hungary, assignor to Siemens & Halske, Berlin, Germany. Filed Feb. 8, 1892. Serial No. 420,794. (No model.)

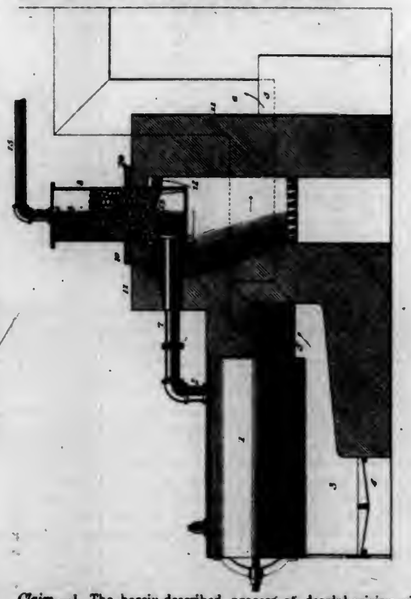


Claim.—1. The combination, with a tram-car or with the trucks thereof, of a safety device pivoted on the ends of said car or trucks, a spring connected at one end with the safety device above its pivotal point and at its other end with the car body or trucks for normally holding the said safety device above the level of the ground, and a stop for limiting the upward motion of the safety device connected thereto above its pivotal point.

2. The combination, with a tram-car or with the trucks thereof, of a safety device pivoted on the ends of said car or trucks, a rubber covering carried over the lower edge of said safety device, and a retractile spring connected to said safety device above its pivotal point, substantially as described.

3. The combination, with a tram-car or with the trucks thereof, of a safety device pivoted on the ends of said car or trucks, a retractile spring connected to said safety device above its pivotal point, a device for limiting the upward motion of the safety device connected thereto above its pivotal point, and an elastic covering for the lower edge of the safety device.

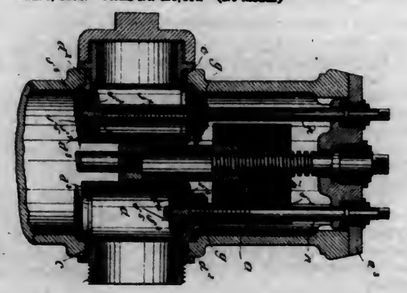
480,311. PROCESS OF DESULPHURIZING OILS. OTTO P. AMEND, New York, and JOSIAH H. MACY, Harrison, N. Y. Filed Feb. 18, 1892. Serial No. 421,919. (No specimens.)



Claim.—1. The process of desulphurizing oil, which consists in vaporizing the oil containing the sulphur and heating the oil-vapor to a degree of heat at or above the boiling-point of sulphur, exposing the oil-vapor so heated to the action of one or more chemical reagents that will combine with sulphur or sulphur compounds, and then condensing the oil-vapor.

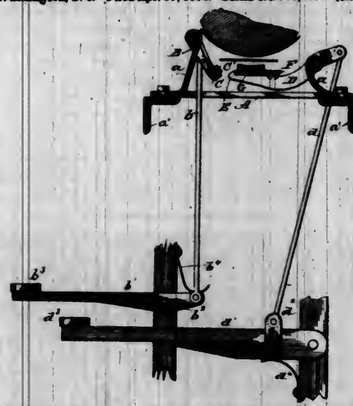
2. The process of desulphurizing oil, which consists in vaporizing the oil containing sulphur and heating the oil-vapor to a degree of heat at or above the boiling-point of sulphur, exposing the oil-vapor so heated to the action of an oxidizing agent capable of combining with sulphur or sulphur compounds, and then condensing the oil-vapor.

3. The process of desulphurizing oil, which consists in vaporizing the oil containing the sulphur and heating the oil-vapor to a degree of heat at or above the boiling-point of sulphur, exposing the oil-vapor so heated to the action of an oxidizing agent and a caustic alkali, and then condensing the oil-vapor.



480,312. PROCESS OF DESULPHURIZING OILS. OTTO P. AMEND, New York, and JOSIAH H. MACY, Harrison, N. Y. Original application filed Feb. 18, 1892, Serial No. 421,919. Divided and this application filed June 10, 1892. Serial No. 436,216. (No specimens.)

Claim.—1. The herein-described process of desulphurizing oil, which consists in vaporizing the oil containing sulphur or sulphur compounds and heating the vaporized oil to a degree of heat at or above the boiling-point of sulphur and then exposing the vaporized oil so heated to the action of one or more alkalies and then condensing the oil.

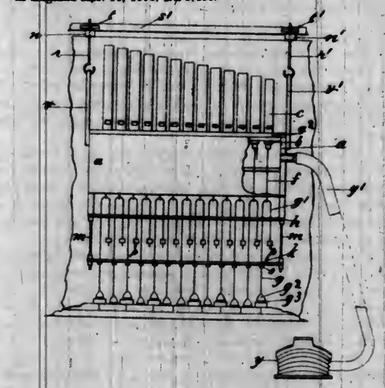


2. The process of desulphurizing oil, which consists in vaporizing the oil containing sulphur or sulphur compounds and heating the vaporized oil to a degree of heat at or above the boiling-point of sulphur and exposing the vaporized oil so heated to the action of a hydrated (caustic) alkali and then condensing the oil-vapor.

480,313. HYDRANT. EDWARD J. BACHELDER, Boston, Mass. Filed Mar. 2, 1892. Serial No. 423,444. (No model.)

Claim.—The combination, with the main body of a fire-plug having a removable cap or bonnet, of internal valve-chambers separable from said body and introduced therein, and hose-connecting nozzles *d*, connected with said internal valve-chambers through the said openings in the body of the plug, said internal valve-chambers having valve-seat openings at one end communicating with the interior of the plug, and lateral openings communicating with the hose-connecting nozzles and being otherwise closed, and a valve working in each of said chambers, and an operating-rod therefor accessible outside of the body of the plug, substantially as described.

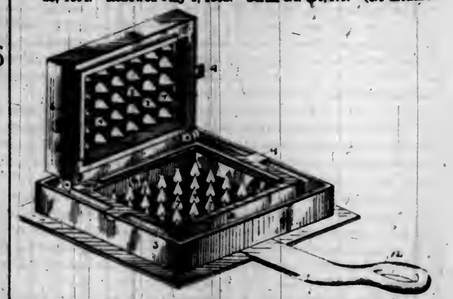
480,314. TYPE-WRITING MACHINE. GEORGE M. BEEBOWER, Washington, D. C. Filed Apr. 13, 1891. Serial No. 388,795. (No model.)



Claim.—1. In a type-writing machine, the combination, with a type lever or bar formed with a flange at its free end, of a plate and a binding-screw, substantially as shown and described.

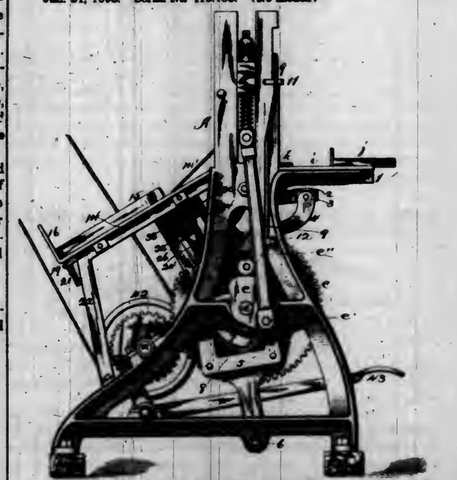
2. In a type-writing machine, the combination, with a supplemental rectangular open frame adapted to be attached to the main frame of the machine, of a type-bar pivoted thereto and type or types arranged at the end of the said bar, substantially as shown and described.

3. In a type-writing machine, the combination, with a supplemental open frame attached to the end of the main frame of the machine, having upwardly and inwardly curved arms integral with the frame, of the type bar or lever pivoted between the arms, the free end of said bar having a mortise, and type or types adapted to be inserted in the mortise, substantially as shown and described.



4. The combination, with the supplemental open frame attached to the end of the main frame of the machine, provided with arms, of the type bar pivoted between the arms and provided with a mortise at its free end, the pitman connected to the type-bar, the key-lever pivoted to the frame and connected with the pitman, and the removable type or types arranged in the mortise, substantially as shown and described.

480,315. MUSICAL INSTRUMENT. CARLO BOSSA, London, England. Filed Nov. 30, 1891. Serial No. 413,499. (No model.) Patented in England Apr. 10, 1890. No. 5,466.



Claim.—In an instrument adapted to be attached to and operated by the keys of a piano or such like instrument, the links *g*, having weights, one end terminating in a rest g^2 and supported upon the key-board of the piano, the other end of said links connected to the pallets controlled by a spring *b'*, which closes the communication to the pipes *c*, supplied with wind from the bellows *y* through pipe *y'* to the wind-chamber *a*.

480,316. BROILER. JAMES W. BRADY, Bartow, Fla. Filed July 23, 1891. Renewed July 9, 1892. Serial No. 439,479. (No model.)

Claim.—A broiler comprising the rectangular dish-shaped sections hinged together and provided with side pivots and having thin walls 3 and 5 and thick walls 4 and 6, the thin walls of one section being arranged opposite the thick walls of the other section, the conical hollow teeth extending inward from the bottom of the sections, the L-shaped flanges 8, arranged in the faces of the thick walls and adapted when the sections are closed to fit against the inner faces of the thin walls, whereby a continuous tight joint is effected, and the rectangular frame provided with bearings to receive the said pivots, substantially as described.

480,317. SOLE-MACHINE. FRED A. BOEBER, Auburn, N. Y. Filed Jan. 21, 1892. Serial No. 418,755. (No model.)

Claim.—1. The combination, with a vertically-operated male die, of the horizontally-reciprocated female-die holder, the female die mounted therein, and the apron hinged to said holder.

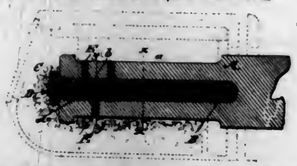
2. The combination, with the main frame, the table mounted thereon, and the reciprocating die-holder mounted upon the table, of the female die mounted in said holder, the apron hinged to said holder, and means to reciprocate them upon said table.

3. The combination, with the main frame and the male die operated vertically therein, of the table in said frame, the die-holder supported thereon, the apron hinged to said holder, the female die mounted in said holder, and means to reciprocate said holder and die to and from the operative position below the male die.

4. The combination, with the female die and means to reciprocate it horizontally, of a stripper and means to operate it vertically simultaneously with the reciprocation of said die.

5. The combination, with the female die and means to reciprocate it horizontally, of a stripper adapted to be raised clear of the die as it travels forward and to be lowered into contact with it when the die travels backward and a cam operatively engaging with the said stripper.

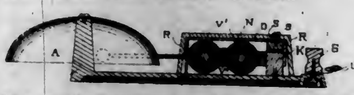
6. The combination, with the main frame, the table thereon, and the male die operative vertically above the table, of the female die and its holder and the apron hinged thereto, the rock-frame and its operating-cam actuating the female die and its holder and the apron across said table, the inclined receiving-table, and the stripper operative vertically simultaneously with the travel of said die and holder.



7. The combination, with the horizontally-reciprocating female die, the apron connected thereto, and the inclined table in extension of said apron, slotted as shown, of piling-fingers adapted to project above said table and to be withdrawn below it through the slots, a cam mechanism operating said fingers, and a stop upon the table.

8. The combination, with the horizontally-reciprocating female die, the apron connected thereto, and the inclined table in extension of said apron, slotted as shown and provided with a stop, of piling-fingers mounted in a rocking frame, a vibratory cam engaging with said frame, and means to operate it.

9. The combination, with the main frame and the table thereon, of a female die adapted to be reciprocated upon said table, arms upon said die, and a stripper adapted to be lowered into contact with said arms and to remain in that plane while said die is moving forward and to be raised above the die and its arms when they are moved backward.



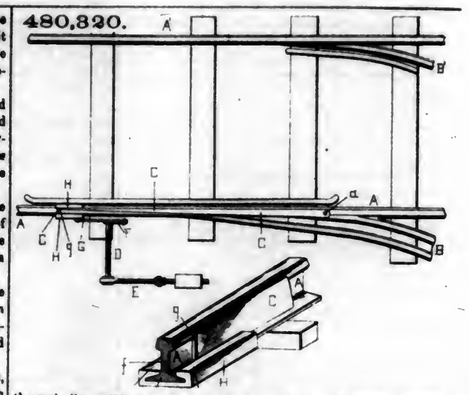
10. In a sole forming machine, the combination, with the reciprocating female die, of the vertically-reciprocating strippers and the fingers supporting them adjacent to the front of the die.

480,318. AXLE-LUBRICATOR. JAMES T. CONNELLY, Milton, Pa. Filed Jan. 23, 1892. Serial No. 419,058. (No model.)

Claim.—The combination, with a journal provided with a central longitudinal bore and with one or more transverse bores extending from said longitudinal bore to the periphery of the journal, of a plug secured in the open end of the longitudinal bore and provided with a central longitudinal bore of less diameter than the main bore of the journal and with one or more transverse bores coinciding with the corresponding bores of the journal, substantially as and for the purpose set forth.

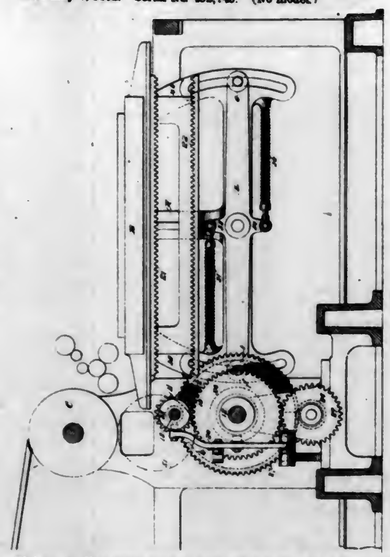
480,319. ELECTRIC BELL. GEORGE W. CONOVER, Chicago, Ill. Filed Oct. 31, 1891. Serial No. 410,550. (No model.)

Claim.—1. The combination of a base with two contact-points thereon, with a cover containing the operative portions of the bell or buzzer and two contact-points thereon, and means for securing the cover to the base.



2. The combination of a base with circuit-terminals and two contact-points, with a cover containing the operative portions of the bell or buzzer and two contact-points thereon, and means for securing the cover on the base so that the contact-points all engage and the operative portions are brought in circuit with the terminals.

3. The combination of a base with contact-points thereon, and a cover containing the operative portions of the bell or buzzer, with opposite contact-points, one set of contact-points consisting of a spring-clamp and a part to be received thereby.



4. The combination of a base with contact-points thereon, and a cover containing the operative portions of the bell or buzzer, with opposite contact-points, one set of contacts consisting of a hook and an engaging part therefor.

480,320. RAILWAY-SWITCH FASTENING. SAMUEL H. CORSON, Cape May, N. J. Filed Dec. 14, 1891. Serial No. 415,051. (No model.)

Claim.—The combination, with a main-line and switch rail, of a reciprocating clamp which is slotted for embracing and sliding over the main-line-rail bottom flange and web, and actuating means whereby said clamp clasps the main-line-rail and switch free end and binds them in intimate contact, for the purpose shown and described.

480,321. BED-MOTION FOR CYLINDER PRINTING-MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed May 7, 1892. Serial No. 432,145. (No model.)

Claim.—1. The combination, with the moving bed, of a swinging lever hung to the bed, a revolving disk having a pocket, and a revolving guard co-operating with said pocket to engage the end of said lever and reverse the movement of the bed by retarding, stopping, starting, and accelerating the same by a crank-like motion, substantially as described.

2. The combination, with the reciprocating bed, of a swinging lever hung to the bed, a revolving disk having a pocket, and two revolving guards co-operating with said pocket to alternately engage opposite ends of said lever and reverse the movement of the bed at each end of its run by retarding, stopping, starting, and accelerating the same by a crank-like motion, substantially as described.

3. The combination, with the moving bed, of a swinging lever hung to the bed, a revolving disk having a pocket, a revolving guard coacting with said pocket to engage the end of said lever, and a curved guide in which said lever end travels, whereby the travel of the bed is reversed by retarding, stopping, starting, and accelerating the same through a compound movement, substantially as described.

4. The combination, with the reciprocating bed, of a swinging lever hung to the bed, a revolving disk having a pocket, two revolving

guards coacting with said pocket to alternately engage opposite ends of said lever, and a curved guide at each end of the bed in which the opposite ends of the lever travel, whereby the motion of the bed is reversed at each end of its run by retarding, stopping, starting, and accelerating the same through compound movements, substantially as described.

5. The combination, with the bed and a rack-and-pinion mechanism for driving it during the major part of its run in either direction, of a swinging lever hung to the bed, a revolving disk having a pocket, and a revolving guard co-operating with said pocket to engage the end of said lever and reverse the movement of the bed by retarding, stopping, starting, and accelerating the same by a crank-like motion, substantially as described.

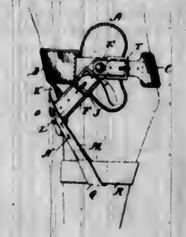
6. The combination, with the bed and a rack-and-pinion mechanism for driving it during the major part of its reciprocation, of a swinging lever hung to the bed, a revolving disk having a pocket, and two revolving guards co-operating with said pocket to alternately engage opposite ends of said lever and reverse the movement of the bed at each end of its run by retarding, stopping, starting, and accelerating the same by a crank-like motion, substantially as described.

7. The combination, with the bed and a rack-and-pinion mechanism for driving it in either direction, of a swinging lever hung to the bed, a revolving disk having a pocket, a revolving guard coacting with said pocket to engage the end of said lever, and a curved guide in which said lever end travels, whereby the travel of the bed is reversed by retarding, stopping, starting, and accelerating the same through a compound movement, substantially as described.

8. The combination, with the bed and a rack-and-pinion mechanism for driving it during the major part of its reciprocation, of a swinging lever hung to the bed, a revolving disk having a pocket, two revolving guards coacting with said pocket to alternately engage opposite ends of said lever, and a curved guide at each end of the bed in which the opposite ends of the lever travel, whereby the travel of the bed is reversed at each end of its run by retarding, stopping, starting, and accelerating the same through compound movements, substantially as described.

9. The combination, with the revolving pocket-disk P and revolving guards 2 4, of the bed B, rocking lever L, and spring-rods 31 32, substantially as described.

10. The combination, with the pinion, racks 21 22, pinion 11, revolving pocket-disk P, and cam 26, of means coupling said cam and pinion and gearing connecting the said pinion and disk, whereby timely relative co-operation is accomplished, substantially as described.



11. The combination, with the pocket-disk, guard-disk, pinion 10, and shaft 12, of gearing connecting the two and proportioned to impart to said disks differential rotative movements, substantially as described.

480,322. BACK OR LINING FOR FIREPLACES. WILLIAM E. FITCH, Louisville, Ky. Filed Feb. 24, 1892. Serial No. 422,670. (No model.)

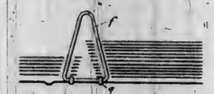
Claim.—A back or lining for fireplaces, composed of rear and side walls and a removable top, which comprises a frame adapted to be bolted to the walls of the back or lining, a cross piece detachably secured to the frame, and dampers also detachably connected with said frame, substantially as described.

480,323. VETERINARY TRUSS. HERMANN HAUSSMANN, Chicago, Ill. Filed Apr. 19, 1892. Serial No. 429,727. (No model.)

Claim.—1. In a truss, the combination, with a band or belt adapted to encircle the animal's leg, of an arm pivoted to the side of said band and provided with a truss-pad arranged at an angle thereto and adapted to impinge the animal's leg, substantially as set forth.

2. In a truss, the combination, with a band or belt adapted to encircle the animal's leg, of an arm pivoted to said band and provided with a truss-pad arranged at an angle thereto and garter connected to said pad and adapted to encircle the leg below said pad, substantially as set forth.

3. In a truss, the combination, with a band or belt adapted to encircle the animal's leg, of a depending arm secured to said band or belt and being provided with an angular portion, a truss-pad secured to said angular portion, and a garter or second belt adapted to encircle the animal's leg, said band and garter being connected together and to said pad, substantially as set forth.

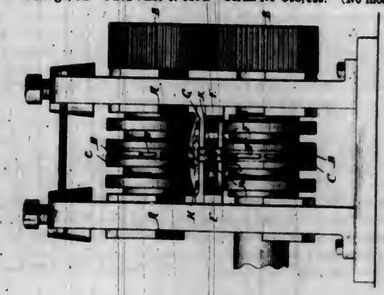


4. In a truss, the combination, with the band or belt adapted to encircle the animal's leg, of a depending arm pivoted to said belt, a truss-pad secured to said arm, a garter adapted to surround the leg below said pad, and crossed straps secured at their ends, respectively, to said garter and belt and being adjustably secured at their intersection to said pad, substantially as set forth.

5. In a truss, the combination, with the band or belt adapted to encircle the animal's leg, of a depending arm adjustably secured to said band, a truss-pad adjustably secured to said arm, a garter adapted to encircle the leg, and straps adjustably secured to said pad and to said garter and band, substantially as set forth.

6. In a truss, the combination, with a band or belt adapted to encircle the animal's leg, of the pads A and B, pins E, by which said pads are secured to said band, a spring-arm secured to one of said pins E and having a perforated foot or supplemental arm, a pad K, the headed pin I, securing said pad K and supplemental arm together, buckles secured to said pins E, crossed straps secured at their upper ends to said buckles, respectively, and having buttonholes through which said pin I passes, and a garter to which the lower ends of said straps are connected, substantially as set forth.

7. In a truss, the combination, with a band adapted to encircle the animal's leg, of thorough-pin truss-pads secured on each side of said band, a flexible arm pivoted to one of said pads, and a bog-spavin truss-pad secured to said arm, substantially as set forth.

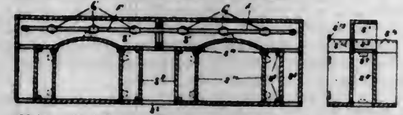


480,324. TEMPORARY BINDER. FRIEDRICH VON HEFNER ALTENECK, Berlin, Germany. Filed May 2, 1892. Serial No. 431,468. (No model.) Patented in Germany Mar. 16, 1890, No. 54,107; in England May 22, 1890, No. 7,979; in France May 29, 1890, No. 205,958; in Belgium June 4, 1890, No. 90,784; in Italy Aug. 21, 1890, XXIV, 27,982, and LV, 60, and in Austria-Hungary Nov. 14, 1890, No. 29,534 and No. 52,270.

Claim.—1. In a temporary binder, the combination, with an outer wrapper or cover, of a series of fasteners pivotally connected to the said wrapper upon one side of its central fold, said fasteners being adapted to have the loose papers strung upon them and to fold over, substantially as set forth.

2. In a temporary binder, the combination, with an outer wrapper or cover, of a series of divided fastening-loops adapted to be sprung open to have loose papers strung upon them, and the eyes pivotally connecting the said loops to the said wrapper upon one side of its central fold, whereby the said loops are free to fold over, substantially as set forth.

480,325. ROLLING-MACHINE FOR CUTLERY. ISAAC HIRSCH, Chicago, Ill. Filed June 8, 1891. Serial No. 395,449. (No model.)

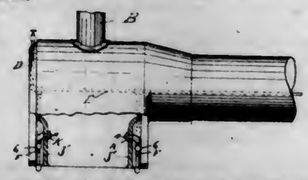


Claim.—In rolls for making cutlery and the like, the combination of two engaging die-carrying rolls, with a guide to deliver the metal thereto, and cleaning tongs or clamps adapted to entirely surround the rod and engage the same at the point of its entry into the guide, so that the rod is scraped and cleaned by the action of the rolls pulling it through the guide.

480,326. DIAZO DYE. MEINHARD HOFFMANN, Frankfort-on-the-Main, Germany, assignor to Leopold Cassella & Co., same place. Filed Dec. 12, 1891. Serial No. 414,636. (Specimens.) Patented in France Sept. 11, 1891, No. 201,770.

Claim.—1. The new process of producing diazo coloring-matters from the amidonaphtholdisulpho-acid H, which consists in the following steps: One molecule of the acid H is introduced into the solution of one molecule of a diazo body in presence of a mineral acid; the solution is made alkaline and a second molecule of a diazo body is added; the separation of the dye-stuff is completed by means of common salt, all substantially as herein described.

2. The new coloring-matter hereinbefore described, composed of two molecules of diazo bodies, such as diazo nitro-benzole, diazo-benzole, and one molecule of amidonaphtholdisulpho-acid H, forming a greenish-black powder, easily soluble in water, with a blue color, more difficultly soluble in spirit, dissolving in concentrated sulphuric acid with a dark green shade; on addition of water the color of this solution is changed into blue and a dark-blue precipitate is formed.

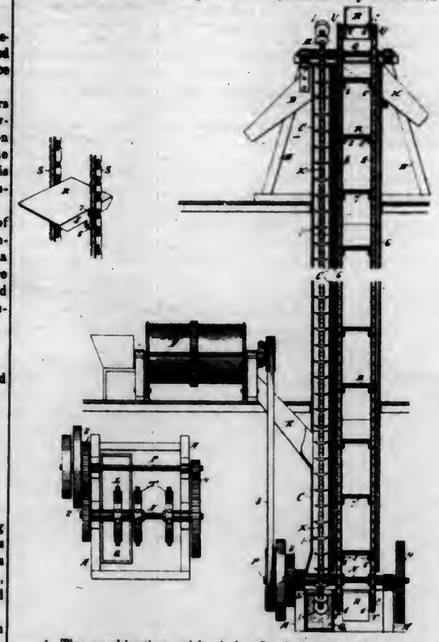


480,327. FURNACE. WILLIAM S. HUTCHINSON, Chicago, Ill. Filed June 5, 1891. Serial No. 396,221. (No model.)

Claim.—1. A furnace-front consisting of upper transverse long boxes with connecting-apertures, vertically-separating plates, and boxes on which such boxes rest and whereby the door-spaces are formed, as also air-spaces from the ash-pit to the boxes and surrounding masonry, whereby a hollow front furnace is formed, substantially as shown and described.

2. A furnace-front consisting of upper transverse long boxes with connecting-apertures, vertically-separating plates, and boxes on which such boxes rest and whereby the door spaces are formed, as also air-spaces from the ash-pit to the boxes and surrounding masonry, whereby a hollow-front furnace is formed, and a transverse steam-pipe through such transverse boxes, with forwardly-projecting steam-nozzles, and a series of air-discharging and injector nozzles about and upon such steam-pipe nozzles and projecting through such boxes into the furnace, substantially as shown and described.

480,328. FURNACE AND ATTACHMENT THEREFOR. WILLIAM S. HUTCHINSON, Chicago, Ill. Filed Sept. 9, 1891. Serial No. 405,173. (No model.)



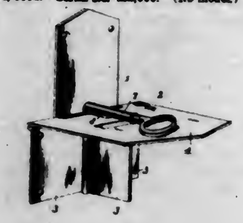
Claim.—In a furnace for locomotive and marine boilers or the like, the combination of interior vertical plates with injectors located in the space between such plate and the furnace-wall, a pipe leading from such injectors, passing through the plates, and opening into the furnace, and a steam-pipe passing down the outside of the boiler and furnace and up between such plate and the inner wall of the furnace to the injector, substantially as shown and described.

480,329. BUILDING-MATERIAL ELEVATOR. JOHN J. KIERST, New York, N. Y. Filed Aug. 3, 1891. Serial No. 401,446. (No model.)

Claim.—1. The combination, with a mortar-mixer, of a casing, a chute through which the mortar is delivered from the mixer to the casing, an endless carrier and series of buckets moving in said casing, and a water-tank through which the buckets pass before receiving the mortar, substantially as described.

2. The combination of a casing, a chute through which mortar is delivered to the casing, an endless carrier and series of buckets moving in said casing, and a water-tank through which the buckets pass before reaching the chute, substantially as described.

3. The combination, with a mortar-elevator having an endless carrier and series of buckets, of a water-tank through which the buckets pass before receiving the mortar, substantially as described.

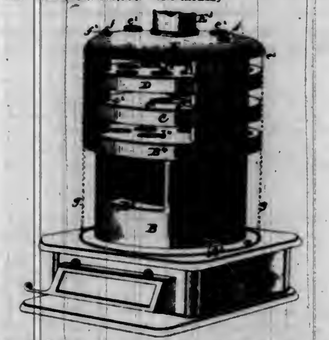


4. The combination, with chains S, of platforms R, pivoted on said chains outside their centers of gravity and having lugs 6, engaging the chains to support the platforms during their upward movement, substantially as described.

5. The combination, with a mortar-elevator consisting of a casing, a chute through which mortar is delivered to the casing, and an endless carrier and series of buckets moving in said casing, of a brick-elevator consisting of a casing having a loading-opening, and an endless carrier and series of platforms moving in said casing, and driving mechanism by which the brick-elevator is driven at a lower speed than the mortar-elevator, substantially as described.

6. The combination, with a mortar-mixer, of a casing, a chute through which the mortar is delivered from the mixer to the casing, an endless carrier and buckets moving in said casing, a brick-elevator consisting of a casing having a loading-opening, and an endless carrier and a series of platforms moving in said casing, and driving mechanism for the brick and mortar elevators, substantially as described.

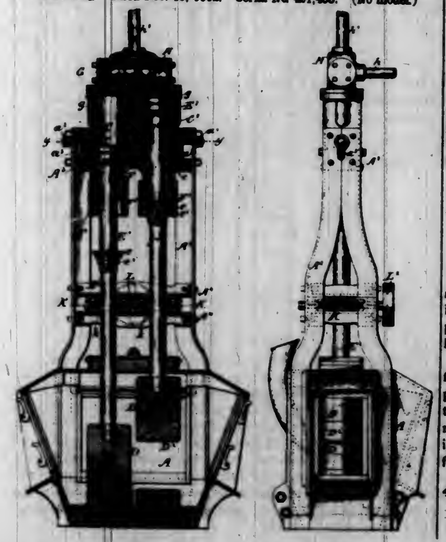
7. The combination, with a mortar-mixer, of a casing, a chute through which the mortar is delivered from the mixer to the casing, an endless carrier and series of buckets moving in said casing, a water-tank through which the buckets pass before receiving the mortar, a brick-elevator consisting of a casing having a loading-opening, and an endless carrier and series of platforms moving in said casing, and driving mechanism for the brick and mortar elevators, substantially as described.



480,330. KEY-FASTENER. ANDREW C. MACK, Portland, Oreg. Filed Feb. 24, 1892. Serial No. 422,660. (No model.)

Claim.—1. A key guard or fastener comprising a folding bracket consisting of a horizontal shelf hinged at its inner end and a hinged brace arranged to support the shelf in a horizontal position, substantially as described.

2. A key guard or fastener consisting of a bracket comprising a back plate provided with a slot to register with a keyhole-slot of a lock, a horizontal shelf hinged at its inner end to the back plate and provided with a slot arranged adjacent to the slot of the back plate, said shelf having a notched flange, and a brace hinged to the back plate and arranged to engage the notched flange to support the shelf in a horizontal position, substantially as described.

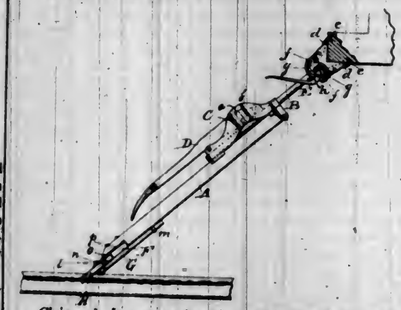


480,331. BOILER. MICHAEL MAHONY, Troy, N. Y. Filed Mar. 24, 1892. Serial No. 426,300. (No model.)

Claim.—1. In a sectional boiler, the combination of a double-wall cylindrical fire-pot having integral therewith an overhanging section provided with a series of vertical flues therethrough and segmental tubes projecting above it, with a series of sections having vertical flues therethrough and segmental tubes projecting above them, and a steam-dome having segmental openings in the bottom thereof, substantially as described.

2. A sectional boiler consisting of a double-wall cylindrical fire-pot having an overhanging section provided with vertical flues therethrough and segmental tubes projecting above it, with a series of substantially similarly-constructed sections resting upon the fire-pot section, and a steam-dome having segmental openings in the bottom thereof, bolts passing through said openings, and a jacket bearing against the overhanging sections, substantially as described.

480,332. STEAM-POWER STAMP. CHARLES A. MARLITT, Portland, Oreg. Filed Feb. 13, 1892. Serial No. 421,405. (No model.)



Claim.—1. The combination of two stamps, their stems, and pistons upon the latter, two cylinders having passages leading thereto and therefrom, as described, with a valve-chamber on top of said cylinders and a recessed steam-actuated cylindrical valve therein controlled by the piston, whereby the same steam used to raise the piston is transferred to the top thereof to force the piston down, substantially as described.

2. The combination of two stamps, their stems, and pistons upon said stems, two cylinders having stuffing-boxes and inverted cylindrical cups upon said boxes, with the piston-rods and collars screwed upon said rods, substantially as described.

3. The combination of two stamps, their grooved stems, and pistons upon said stems, two worm-wheels having keys within their hub, and a worm between the two worm-wheels and in gear with both wheels, substantially as described.

4. The combination of a stamp-box, angle-iron frames attached thereto, grooved and slotted blocks A^4, attached to the upper end of said frames, the frame of the two cylinders having dovetails fitting within the grooved blocks, and stud-bolts passing through the slots of the blocks and secured to the frame of the cylinders, substantially as described.

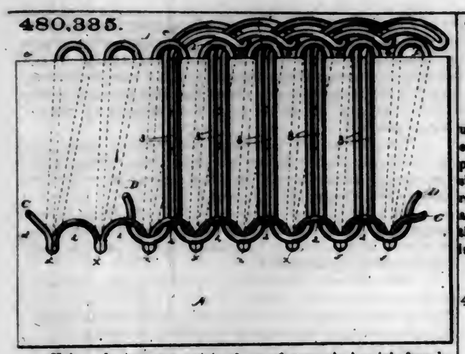
480,333. CAR-MOVER. NATHANIEL B. MARSTON, Lebanon, N. H., and WILLIAM M. KIMBALL, Barre, Vt. Filed Apr. 23, 1892. Serial No. 430,344. (No model.)

Claim.—1. In a car pusher, the combination of the main beam, having the spring-actuated gripping-jaws at one end and the bracket at the opposite end, the operating-lever, the sliding bar working in said bracket, a head on said bar, and dogs pivoted to said head, and the cam-lever for operating the said dogs, substantially as described.

2. In a car-pusher, the combination of the beam, the rail clutch attached to the lower end, the base-piece having beveled shoulders and a slot, a slidable bar provided with a pin engaging said slot, the gripping-jaws, the pins on said jaws, and the spring for bearing on said pins and operating said jaws, substantially as described.

3. In a car-pusher, the main beam, the bracket rigidly mounted on said beam and provided with vertical slots, the operating-lever having pins to engage and slide in said slots by which a sliding fulcrum is provided for the said operating-lever, and the sliding bar attached to the operating-lever, substantially as described.

4. The combination of a slidable bar, a head, a pair of holding-jaws pivoted to said head and provided with pins, the lever for operating the jaws, said lever having eccentric slots therein to engage the pins on the jaws, substantially as described.

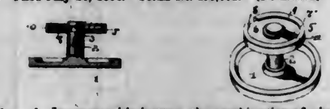


480,334. PROCESS OF PREPARING CELLULOSE FROM WOOD. HERMANN A. A. MAETZ, Arnsberg, assignor to the Vereinäfte Zellstoffindustrie Actiengesellschaft, Dresden, Germany. Filed July 13, 1891. Serial No. 399,405. (No specimens.)

Claim.—1. The process of making sulphite cellulose, which consists in first softening the ligneous material by steam heat, then forcing a sulphite solution into the material under repeated variations of pressure, and finally decomposing the intercellular substance by steam heat, substantially as set forth.

2. The process of making sulphite cellulose, which consists in first softening the ligneous material by steam heat, then reducing the pressure in the vessel below that of the atmosphere to free the material from steam and air, then forcing a sulphite solution into the material under repeated variation of pressure, and finally decomposing the intercellular substances by steam heat, substantially as set forth.

480,335. FINISH OR BORDER FOR THE EDGES OF FABRICS. JOSEPH M. MERROW, Merrow, Conn. Filed May 31, 1892. Serial No. 436,016. (No model.)



480,335.

Claim.—1. As a new article of manufacture, the hereinbefore-described improved border or finish, the same consisting of a base or fabric and two threads applied to opposite faces and united on two lines of connection, the one beyond the edge of the fabric and the other within the edge of the fabric, one of said threads extending back and forth through the fabric at points removed from the edge to form two series of loops, the one series being located on the lower face of the fabric and extending from the points of insertion beyond the edge, while the other series of loops is located on the upper face of the fabric, the other thread extending in bights or loops through the upper series of loops to form the inner line of connection, and thence across the fabric to the edge, where they enter the lower series of loops to form the outer line of connections, the outer ends of said bights being interlooped one with another beyond said outer line of connections, substantially as and for the purpose set forth.

2. The combination, to form an elastic ornamental finish such as described, of the base or fabric A, the thread C, extending back and forth through the fabric at points equidistant apart and lying in a plane parallel with the edge *a* of the fabric to produce two series of loops, one below and the other above the fabric, the loops of the lower series each extending from a point of insertion beyond the edge of the fabric, while the loops of the other series are shorter and extend from one point of insertion to the next, and the thread D, formed into a series of loops or bights 3, each of the latter engaging one of the shorter upper loops of thread C, and extending thence to the edge of the fabric, where it passes through one of the lower loops of the thread C and is held by engagement with the loop of the next succeeding bight 3 of thread D.

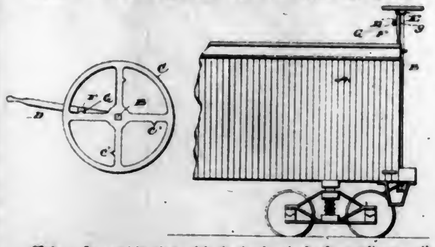
480,336. SEPARABLE BUTTON. ROBERT MONDAY, Lampasas, assignor to Wm. C. Price, same place, and Lewis J. Wertheimer, Dallas, Tex. Filed July 20, 1891. Serial No. 400,092. (No model.)

Claim.—1. In a separable button, the combination of a back composed of two disks permanently connected together and rotatively mounted on each other and provided with radial openings extending from the periphery to the center, a front, and a stem secured to the front and arranged in said openings and engaging one of the disks and holding the same against rotation, the other disk being free to turn, substantially as described.

2. In a separable button, the combination of a front, a stem provided with an annular groove and having a lug arranged in the groove, and a back composed of two disks rotatively mounted on each other and provided with radial openings extending from the periphery to the center to receive the stem, one of the disks being arranged to be engaged by said lug, substantially as described.

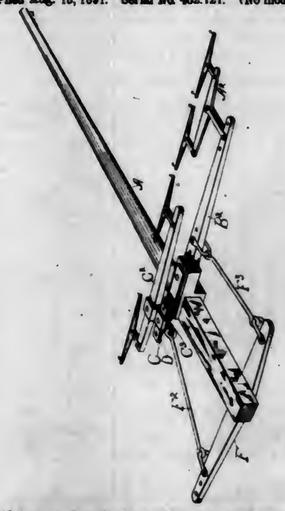
480,337. SASH-HOLDER. ROBERT MONDAY, Lampasas, assignor of one-half to Lewis J. Samuels and Emanuel Domnau, Dallas, Tex. Filed Oct. 14, 1891. Serial No. 408,690. (No model.)

Claim.—1. The combination, with the upper sash, the window-casing, the perforated guide-block having a set-screw secured to the casing, and the L-shaped bracket projecting from the casing below the guide-block, of the post extending from the sash and the cylindrical rod depending from the post, passed through the guide-block, laterally disposed below the block to form a handle, and adapted to be swung over the bracket, substantially as specified.



2. The combination, with the lower sash, the window-casing, the

480,337.

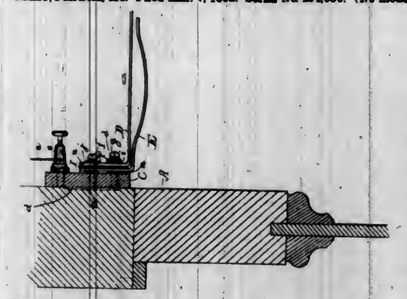


upper and lower brackets, and the vertical guide-rod connected at its ends to the brackets, of the guide-block secured to the window-casing, provided with a vertical perforation for the reception of the rod at one side of the perforation, with a wedge-shaped recess, and in rear of the recess with a slot, a wedge-shaped locking-block mounted in the recess and provided with a shoulder or pin extending from its rear side through the slot, and the set-screw passing through the guide-block and bearing on the locking-block, substantially as specified.

480,338. BRAKE FOR RAILROAD-CARS. GEORGE L. MCCALLUM, Costello, Pa. Filed Dec. 30, 1891. Serial No. 416,575. (No model.)

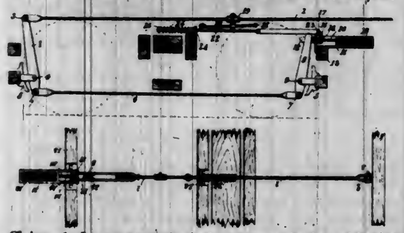
Claim.—In combination with the brake-shaft of an ordinary railroad-car, a wheel C, having triangular projections C' on each of the spokes thereof, collar E, encircling said shaft just below said wheel, and the lever D, pivotally suspended in said collar, slotted longitudinally to provide a variable location for the recessed projection F by the nut *g*, whereby pressure applied upon the said lever during horizontal adjustment of the projection will supplement the pressure applied to the wheel by reason of the said projection F engaging the projection C' on the wheel, for the purpose set forth.

480,339. DRAFT-EQUALIZER. ALEXANDER MCKEE, Stuart, Iowa. Filed Aug. 15, 1891. Serial No. 402,721. (No model.)



Claim.—1. In a draft-equalizer, the combination of a metal frame having its one end bifurcated, a wagon-tongue placed in the said bifurcated end, a pin or bolt extended through the said metal frame and tongue to connect them, an angular hollow formation on the other end of the said metal frame, an arm inserted in the said opening and extended at right angles from the tongue, a whiffletree on the outer end of the said arm, and a whiffletree connected with an extension from the other side of the tongue, to operate substantially in the manner set forth, for the purposes stated.

2. In a draft-equalizer, the combination of a metal clevis formed complete in one piece, the central portion being adapted to admit and retain an angular bar, its forward ends bent outward at right angles thereto and vertically perforated and its rear end provided with a perforated extension, a bar fixed to the wagon-tongue and inserted in the central portion of the clevis, a doubletree pivoted in its forward end, and a rod fixed to the rear end and connected with an evener pivoted to the tongue, a bar connected with the other end of the said evener and extended forward therefrom, and a whiffletree connected with the forward end of the said bar, to operate substantially in the manner set forth, for the purposes stated.



3. A transformable draft-equalizer for two, three, or four draft-animals, comprising a wagon-tongue, a socket fixed to the said tongue, which socket has its one end bifurcated and placed on the tongue and its other end formed into a socket adapted to admit and retain an angular arm, the said arm fixed in the said socket, a whiffletree connected with the outer end of the said arm, a bar pivotally connected with the said socket, a clevis on its outer end, which clevis is formed complete from one piece of metal, its rear end formed into a perforated extension and its forward end bent outward at right angles thereto and adapted to admit a doubletree, a doubletree pivoted in the forward end thereof, an evener pivoted to the tongue in the rear of the said socket, connected by means of bars with said perforated end of the clevis, and the said arm fixed in the socket, constructed and combined substantially in the manner set forth, for the purposes stated.

480,340. BURGLAR-ALARM. FRED H. NEAL and JOHN R. DONNELLY, Fairfield, Me. Filed Mar. 7, 1892. Serial No. 424,090. (No model.)

Claim.—The herein-described electric alarm, consisting of an elliptical spring and an arm held adjacent to each other, each having its end turned up at right angles to form a flange, the arm and spring being secured to the base-board by two screws passing through said flanges, the flange of said arm being superposed on the flange of said spring, each of said screws being in electrical connection with one of said flanges and an insulting-plate held between said flanges, the said screws being connected with the wires of an alarm-circuit, substantially as described.

480,341. SLACK-ADJUSTER FOR CAR-BRAKES. ROBERT A. PARKE, New York, N. Y., assignor of one-half to H. H. Westinghouse, Pittsburg, Pa. Filed Feb. 13, 1892. Serial No. 421,334. (No model.)

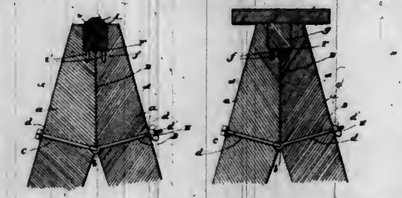
Claim.—1. In an automatic slack-adjuster, a brake-rod having a definite normal movement for setting the brake-shoes, in combination with one of the brake-levers and an axially-movable abutment actuated through intermediate mechanism, substantially as described, by the abnormal movement of the brake-rod caused by the slack produced by the wearing of the brake-shoes, substantially as and for the purposes described.

2. In an automatic slack-adjuster, the brake-rod having a definite normal movement for setting the brake-shoes, in combination with one of the brake-levers, an axially-movable abutment, mechanism arranged between the brake-rod and the abutment and operated in one direction by an abnormal movement of the brake rod and in the opposite direction by a retracting-spring, whereby the abutment is automatically advanced and forces the brake-lever forward to take up the slack of the brake apparatus caused by the wear of the brake-shoes, and a locking device for holding the abutment in its advanced position, substantially as and for the purposes described.

3. The combination of the brake-rod having a definite normal movement for setting the brake-shoes with an abutment having an axially-movable stem, a clutch device capable of a free backward motion on the stem of the abutment, a loose connection between the brake-rod and the clutch device, and a retracting-spring for actuating the clutch device and causing it to move the abutment forward to a new position, substantially as and for the purposes described.

4. The combination of the brake-rod with the loose connection, the abutment 12, having a stem 10, a clutch device capable of moving freely in one direction on the stem, a spring for moving the clutch device and stem in the opposite direction, and a locking device for holding the abutment in its adjusted position, substantially as and for the purposes described.

5. The combination of the brake-rod with the carrier or collar 19, the loose connection 22, the abutment-stem 10, and the clutch device mounted on the rod 10 and moved by the connection 22 in one direction and a spring 26 in the other direction, substantially as and for the purposes described.



6. In an automatic slack-adjuster, an abutment having a stem by which it is supported on the truck-frame, in combination with a casing containing washers, which, when the abutment is adjusted forward to take up the slack of the brake-lever, fall one by one back of the end of the stem for the purpose of holding the abutment in its adjusted position, substantially as and for the purposes described.

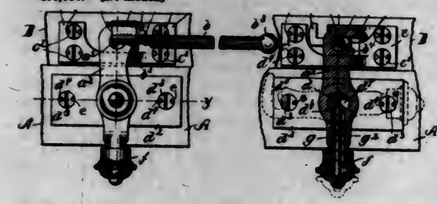
7. The combination of the abutment 12, stem 10, casing 11, and washers 18, substantially as and for the purposes described.

8. The combination of the abutment 12, stem 10, and washers 18 with the casing 11 for containing and holding the washers, provided with a narrow slot 30 for the insertion of an instrument to raise the washers in the casing, substantially as and for the purposes described.

9. The combination of the brake-lever, abutment 12, and stem 10 with the sliding box or sleeve 14 and pawl 15, substantially as and for the purposes described.

480,342. COMBINATION STEP-LADDER. CHARLES A. POLAND, Ann Arbor, Mich. Filed Nov. 4, 1891. Serial No. 410,862. (No model.)

Claim.—1. The combination, with opposing clamping-sections hinged near their upper ends and provided with clamping-jaws, of a support adapted to be clamped between said clamping-jaws and a spreader hinged to said clamping-sections, substantially as set forth.



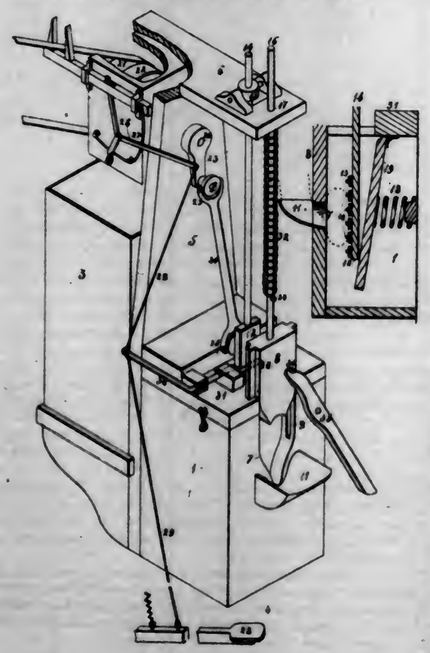
2. In a combination step-ladder, the combination, with the opposing ladder members hinged near their upper ends and provided with clamping-jaws, of supplemental saw-clamping jaws adapted to be operated by and between the ladder-jaws, substantially as set forth.

3. In a combination step-ladder, the combination, with the opposing ladder members hinged at their upper ends and provided with squared notches, of opposing members of a saw-clamp carried in each pair of notches of the opposing ladder members and operated thereby and a locking-spreader hinged to each ladder, substantially as set forth.

4. In a combination step-ladder, the combination, with the opposing ladder members provided at their upper ends with squared notches having circular recesses therein, of eyebolts hinging the ladder members together near their upper ends and transversely adjustable opposing jaws of a saw-clamp, each provided with depending pins engaging the circular recesses of each ladder member and carried thereby, and a locking-spreader having opposite sections hinged together upon their under sides and to the bottom step of each opposing member, substantially as set forth.

5. In a combination step-ladder, the combination, with the opposing ladder members hinged at their upper ends and provided with squared notches adapted to receive either the two jaws of a saw-clamp or the top support of a step-ladder, of a locking-spreader hinged to each ladder, substantially as set forth.

480,343. FASTENER FOR THE MEETING-RAILS OF SASHES. FRANCIS J. RABBITT, Boston, Mass. Filed Oct. 14, 1891. Serial No. 408,667. (No model.)



Claim.—1. A fastener one member of which comprises a bar connected at one end with one of the parts to be fastened and provided with a notch or reduced portion near said end and with a head or enlargement at its other end, combined with the other fastening member comprising a jaw having a recess to receive said bar and a throat or passage into said recess corresponding to the notched or reduced portion of the bar, whereby said bar and jaw can be engaged with and disengaged from one another only at the said reduced portion of the bar, the said members being retained in engagement while the jaw is traversing the length of the bar, substantially as and for the purpose described.

2. The combination of the pivoted bar provided with a notch or reduced portion near its pivoted end and an enlargement or head at its farther end and an engaging hook or shoulder, as A, connected with the said bar, with the co-operating fastening member having a movable jaw adapted to be engaged with said bar or hook, substantially as and for the purpose described.

3. A fastener comprising two members, one connected with each of the members to be fastened together, one of said members comprising a jaw and the other a bar pivotally connected at one end with the member to be fastened and having a pivotal movement from a position substantially at right angles to the line of movement of the parts to be fastened, carrying the jaw member, to the position in engagement with the said jaw member and substantially in line with the path of movement thereof, said pivotal movement of the bar being in a plane at right angles to the path of movement of the jaw member, substantially as described.

480,344. STARCHING-MACHINE. CHAUNCEY T. RAY, Rockford, Ill. Filed Aug. 7, 1891. Serial No. 402,045. (No model.)

Claim.—1. A starching-machine comprising a starch-box having an opening therein, a closure for the opening, a rubber, and means for imparting a vertically-reciprocating motion to said rubber.

2. A starching-machine comprising a box having an opening therein, a vertically-sliding closure for the opening, a vertically-moving rubber, a shaft, a crank thereon, and connection between the crank and the rubber.

3. A starching-machine comprising a starch-box having an opening therein, a sliding spring-actuated closure for the opening, a lever for moving the closure, a rubbing-block, a crank, and a connecting-rod between the crank and the rubbing-block.

4. A starching-machine comprising a starch-box having an opening therein, a sliding spring-actuated closure for the opening, a crank, a yielding rubbing-block, a connecting-rod between the crank and the rubbing-block, and a starch-reservoir holding a supply of starch.

5. A starching-machine comprising a starch-box having an opening therein, a closure for the opening, a lever for moving the closure, a shaft, a tight pulley, a loose pulley, and a crank on the shaft, a belt for the pulleys, a yielding rubbing-block, a connecting-rod between the crank and the rubbing-block, a lever for moving the rubber-block back, and a spring for holding it forward.

6. A starching-machine comprising a starch-box, a frame arising therefrom, a shaft journaled in the frame, a crank, a tight pulley and a loose pulley on the shaft, a belt connecting said pulleys with a prime mover, a belt-shifter, a spring for holding the belt on the tight pulley, a rubber in the box, the rubber capable of a twisting, a rearwardly-yielding, and a vertically-reciprocating movement, a connecting-rod between the crank and the rubber, said connecting-rod being capable of a bodily-reciprocating movement, and also of a greater or less inclination from the perpendicular, a spring for holding the rubber in contact with the garment, an opening in the side of the starch-box, a vertically-sliding closure for said opening, and a spring for forcibly sliding said closure.

7. A starching-machine comprising a starch-box, a reservoir for supplying starch thereto, a frame arising from the box, a shaft journaled in the frame, a crank, a tight pulley and a loose pulley on the shaft, a belt connecting said pulleys with a prime mover, a spring for shifting the belt to the tight pulley, a lever for holding the belt on the loose pulley, a rubber in the box, the rubber having an upwardly-extending shank bearing in a swinging collar in the frame, a spring for pushing the rubber against the garment, a lever for holding the rubber away from the garment, a connecting-rod between the crank and the rubber, an opening in the side of the box, a starch-guide before the opening, a vertically-sliding closure for the opening, ways in which said closure slides, the closure having an upwardly-extending shank-bearing in the frame, and a lever for operating said closure.

480,345. BOLTING-REEL. BENJAMIN F. REINBOLD, Lickdale, Pa. Filed Feb. 20, 1892. Serial No. 422,284. (No model.)

Claim.—1. In a bolting-reel, the combination of the opposite receiving and discharging polygonal reel-heads, a series of inwardly-opening buckets connecting the opposite reel-heads at their angles and slightly below the bolting cloth, and regulating devices in each bucket, substantially as set forth.

2. In a bolting-reel, the combination of the opposite polygonal reel-heads, the bolting-cloth covering the space between said heads, a series of inclined connecting-ribs connecting said heads at their angles to form a peripheral series of receptacles between the ribs and the bolting-cloth, a series of inclined bucket-boards meeting the inner edges of said ribs and extending therefrom at an angle to form a series of inwardly-opening buckets, and feed-regulating devices in each bucket, substantially as set forth.

3. In a bolting-reel, the combination of the opposite polygonal reel-heads, the bolting-cloth covering the space between said heads, a series of inwardly-opening buckets connecting the opposite reel-heads at their angles and projecting inwardly at an angle to form an opposite peripheral series of receptacles between the same and the bolting-cloth, and regulating devices in each bucket, substantially as set forth.

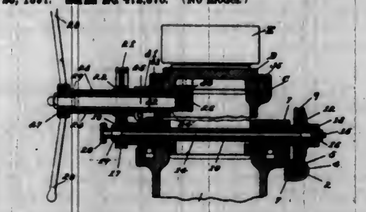
4. In a bolting-reel, the combination of the opposite polygonal reel-heads, a series of inwardly-opening buckets connecting the opposite reel-heads at their angles and opening below the bolting-cloth, a series of regularly-spaced draft or feed regulating wings pivoted in each bucket, and means for adjusting said wings in said buckets, substantially as set forth.

5. In a bolting-reel, the combination of the opposite polygonal reel-heads, a series of inwardly-opening buckets connecting the opposite reel-heads at their angles, a series of regularly-spaced draft or feed regulating wings pivoted in each bucket, longitudinally-movable operating-rods working in the apices of the buckets and connecting the wings in series, operating-levers connected to the ends of said rods, and means for operating said levers, substantially as set forth.

6. In a bolting-reel, the combination of the main horizontal shaft having an interiorly-threaded hollow end and a longitudinally-disposed slot, the opposite reel-heads, inwardly-opening buckets connecting the opposite reel-heads at their angles, a series of draft or feed regulating wings pivoted in said buckets, operating-rods connected to the inner ends of said wings, a radial series of levers pivoted upon one of said heads and connected with said operating-rods, a longitudinally-movable sleeve working over one end of said shaft and receiving the other ends of said levers, a sliding block working in the hollow end of said shaft, a bolt passing through the slot in said shaft and connecting the sleeve with said block, and an adjusting screw-threaded collar loosely connected with said block and engaging the threaded end of said shaft, substantially as set forth.

7. In a bolting-reel, the combination, with the shaft, of a series of opposite polygonal reel-heads, a series of inwardly-opening buckets connecting the opposite reel-heads at their angles and provided at one end with discharge-openings, a radial series of discharge-chutes secured to one of said heads beneath said discharge-openings, a longitudinally-movable sleeve working over said shaft and carrying a conical discharging-flange working through the head and beyond the ends of said chutes, regulating devices in each bucket, connected to said sleeves, and means for adjusting said sleeve, substantially as set forth.

8. In a bolting-reel, a series of inwardly-opening buckets opening below the bolting-cloth, a series of regularly-spaced draft or feed regulating wings pivoted in each bucket, and means for adjusting said wings in said buckets, substantially as set forth.



480,346. FOLDING BASE FOR STANDS. SAMUEL K REUTTER, Titusville, Pa. Filed Apr. 5, 1892. Serial No. 428,376. (No model.)

Claim.—1. A folding base for the support of a stand or camp-stool, consisting of three or more tines or feet, each tine being a flat piece of metal with square projection *c* upon each side, in combination with a socket having slots cut in the lower corner equal in number to the number of tines and equal in width to the body of the tine, the tines being inserted in the slots from within and supported by the projections *c*, resting on the bottom and sides of the slots, said socket being adapted to receive a center support or standard, the tines when extended being held as a support by the upper edge bearing against the upper edge of the slot and the projection *c*, bearing on the bottom, substantially as shown and described.

2. A folding base for the support of a single stem, consisting of the socket B, adapted to receive the lower end of the stem, said socket having the slots *a* cut therein, the tines C, having the shoulders *c c* thereon inserted in the slots *a*, the rubber follower D, adapted to be compressed between the end of the stem A and the tines C, all constructed as shown and working in combination, substantially as shown and described.

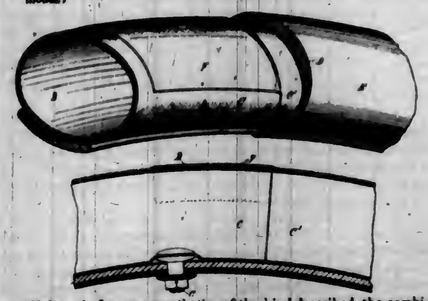
480,347. SLIDE FEED MECHANISM. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Nov. 23, 1891. Serial No. 412,870. (No model.)

Claim.—1. In a feed mechanism of the class specified, the combination, with the slide having the rack thereon, of the eccentric sleeve, the shaft journaled in said sleeve and having a pinion engaging the slide-rack, means for revolving the shaft by hand, and means for holding the sleeve in place by the eccentric portion thereof, substantially as described, and for the purpose specified.

2. In a feed mechanism of the class specified, the combination, with the slide having the rack thereon, of the sleeve 24, formed eccentric at one end thereof and supported by its eccentric portion adjacent to the slide, the shaft journaled in said sleeve and having a pinion engaging the slide-rack, means for revolving said shaft by hand, and the sleeve 23, revolably supported on the concentric portion of the sleeve 24 and connecting with said pinion-shaft, and means for revolving said sleeve 23 by power, substantially as described, and for the purpose specified.

3. In a feed mechanism of the class specified, the combination, with the bed of the machine, of the slide-block on said bed, the slide on said block and having a rack, the shaft 2, parallel with the line of movement of the slide-block, the intermediate shaft carried by the slide-block, feed-gearing intermediate to the shaft 2 and said intermediate shaft and provided with a clutch and means for engaging and disengaging the same, the sleeve carried in the block and carrying a shaft journaled therein and provided with a pinion engaging the slide-rack, and gearing actuating said pinion-shaft from the intermediate shaft, substantially as set forth.

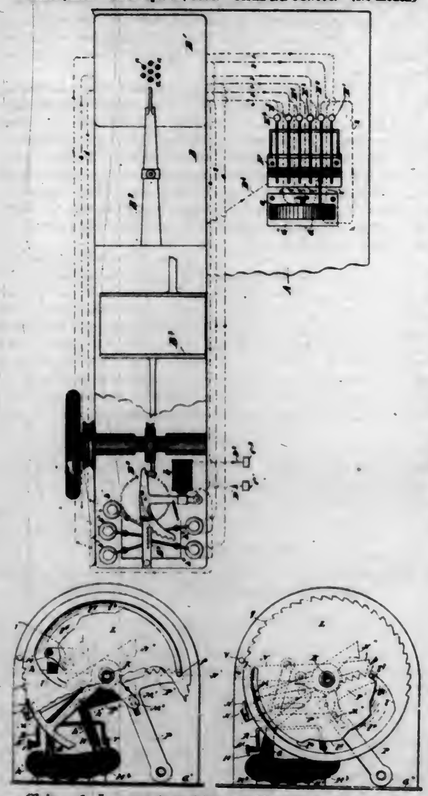
4. In a feed mechanism of the class specified, the combination, with the slide-block having the clamp-bearing 31, of the slide supported on said block and having a rack thereon, the sleeve 24, having one end formed eccentrically to its bore and supported by said eccentric portion in said clamp-bearing, the shaft 25, journaled in said sleeve and having a pinion engaging the slide rack, the gear 21, supported on the concentric projecting portion of the sleeve 24 and connected with the shaft within said sleeve, and the pinion 17, meshing with said gear 21 and set in the normal plane of the axes of said eccentric and said shaft 25, substantially as described, and for the purpose specified.



480,348. LEGGIN. MAX SCHEUER, New York, N. Y. Filed Feb. 11, 1892. Serial No. 421,106. (No model.)

Claim.—1. The combination of a leggin with divided foot-strap *d*, clip d^2 for attaching the foot-strap to the leggin at one end buckle d^3 for attaching the foot-strap to the leggin at the other end, and with an inner concealed elastic section d^3, substantially as specified.

2. The combination of a leggin with a protecting-tip consisting of boot plate *f*, having prongs f^1 and perforations f^2 and lapped over the lower edge of the leggin to cover the front and rear sutures at the bottom, substantially as specified



480,349. PNEUMATIC TIRE. FINLAY SINCLAIR, Coventry, England, assignor to the Pneumatic Tyre and Booth's Cycle Agency, Limited, Dublin, Ireland. Filed Feb. 15, 1892. Serial No. 421,491. (No model.)

Claim.—1. In a pneumatic tire of the kind described, the combination, with an inner expansible or inflatable tube, of a tubular non-expansible confining jacket of canvas, the ends of which are secured together by a flap or tongue from one overlapping and secured to the other, as set forth.

2. The combination, with a felly A, of a rubber inflatable tube B, and a tubular canvas jacket the contiguous ends of which are united by a flap or tongue F, extending from the outer or tread portion of one and overlying and connected to the other, as described.

480,350. JUSTIFYING ATTACHMENT FOR MATRIX-MAKING MACHINES. WILLOUGHBY W. STREET and CHARLES L. TRAVIS, Minneapolis, Minn., assignors to the Minneapolis Electro-Matrix Company, same place. Filed Apr. 12, 1890. Serial No. 347,696. (No model.)

Claim.—1. In a matrix-making machine of the class described, the combination, with the differential electric feed devices and the space-key, of an electric switch adjustable to close a circuit through any one of said feed devices at will and operated from the space-key to distribute the spaces as may be required to justify the line.

2. In a matrix-making machine of the class described, the combination, with the differential electric feed devices and the normal space-key, of an electric switch capable of closing a circuit through one or another of said feed devices and a cam-plate for operating said switch to shift the connection from said normal space-key to some other than the normal space-feed device.

3. In a matrix-making machine of the class described, the combination, with the differential electric feed devices, of an electric switch adapted to close a circuit through one or another of the feed devices, a normal space-key in circuit with the switch, and an adjustable cam-plate for controlling the switch to vary the space-feed movement as required to justify the line.

4. In a matrix-making machine of the class described, the combination, with the differential electric feed devices, of an electric switch shiftable into circuit with one or another of said devices, an adjustable cam-plate having different cam-surfaces, adapted to be moved from normal to set the switch and returnable to normal by a step-by-step motion, and a normal space-key in circuit with the switch and having a connection with the cam-plate for operating the same to return it to normal position.

5. An electric switch comprising a pivoted contact, a series of relatively fixed contacts, a movable cam-plate having different cam-surfaces and ratchet-teeth, adjustable from normal position to shift the pivoted contact, and a pivoted pawl-carrying lever engageable with said teeth for returning said plate and pivoted contact to normal position.

6. The combination, with the pivoted contact, of the fixed contacts, the adjustable movable cam-plate with different cam-surfaces and ratchet-teeth, the pivoted pawl-carrying lever engageable with said teeth, and a shield or cut-off also operated from said cam-plate to vary the effective throw of the pawl-lever.

7. The combination, with the pivoted contact, of the fixed contacts, the cam-plate with different cam-surfaces and ratchet-teeth, the pivoted pawl-carrying lever, the tooth-shield or cut-off, the operating-key, and the connecting-rod to said pawl-lever, substantially as described.

8. The combination, with the pivoted contact under tension to hold it in its normal position, of the fixed contacts, the adjustable cam-plate with different cam-surfaces, as described, the pawl-lever, the pivoted shield or cut-off provided with angularly-extended arms, the pivoted lever provided with cam-stud co-operating with said cam-surfaces and slotted to receive a stud from said extended arm, and a pivoted bar attached at one end to said cam-stud lever and provided with a slot to receive stud of the pivoted contact, substantially as described.

9. The combination, with the pivoted contact under tension, of the fixed contacts, the adjustable cam-plate with different cam-surfaces, the pawl-lever, and a tension device controlled by the pawl-lever to hold the pivoted contact at the end of the pawl-lever stroke.

10. In a matrix-making machine of the class described, the combination, with the differential feed devices and the normal space-key, of an automatic switch adjustable to shift the connection from the said space-key to some other than the normal feed device for a certain number of throws and then return to normal for distributing the extra spaces, a dial-plate, and a pointer with a connection to the switch for setting the same at the beginning of the line, substantially as described.

11. The combination, with the pivoted contact, of the fixed contacts, the adjustable cam-plate with cam-surfaces and ratchet-teeth, the pawl-lever, the dial, and the pointer attached to the cam-plate, substantially as described.

480,351. LINE-HOLDER. DANIEL SWEINEY, Newark, N. J. Filed Feb. 18, 1891. Renewed Jan. 20, 1892. Serial No. 418,629. (No model.)

Claim.—1. A holding device provided with means for securing one end of a line or cable thereto, a hole a^3 in the body portion of said device, through which the other end of the line is passed, and a longitudinally-extending arm provided with a groove, said groove being spirally formed and winding around the body of said arm, as and for the purposes set forth.

2. A holding device provided with means for securing one end of a line or cable thereto, a hole a^3 in the body portion of said device, through which the other end of the line is passed, and a longitudinally-extending arm provided with a groove, said groove being spirally formed and winding around the body of said arm, and a hook on the free end of said arm, substantially as and for the purposes set forth.

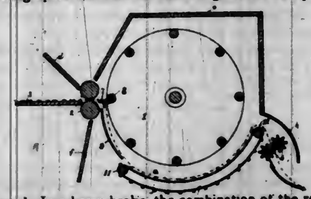
3. A holding device consisting of the main or body portion a, provided with arms a' and a^2, said arm a^2 having a hole for securing the end of a line therein, and said arm a' having a hole a^3, in which is loosely arranged the other end of the line, and said arm a' being provided with a spirally-formed groove winding from said hole a^3 around the body of the arm to its free end, as and for the purposes set forth.

4. A holding device consisting of a main or body portion a, provided with arms a' and a^2, said arm a^2 having a hole for securing the end of a line therein, and said arm a' having a hole a^3, in which is loosely arranged the other end of the line, and said arm a' being provided with a spirally-formed groove winding from said hole a^3 around the body of the arm to its free end and a hook on said end, as and for the purposes set forth.

480,352. SEPARABLE BUTTON. WILLIAM A. TURNER, Worcester, Mass. Filed Dec. 17, 1891. Serial No. 415,381. (No model.)

Claim.—1. In a separable button, the combination of the shoe A, post B, extending from said shoe, said post being provided with a shoulder B^2, by which the entrance of the post into the crown of the button is limited and having its end reduced in diameter, forming a shank B', pins B^3 B^3, extending radially from said shank the width of said shoulder, so the distance between the ends of said pins will equal the diameter of the post B, plate D, forming a portion of the crown of the button and provided with a central hole D^2, and openings D^4 D^4, extending radially from said central hole and said plate having upon its outer face an annular countersunk recess D', concentric with said central hole and having its diameter equal to the diameter of said post to receive the end of the shank B' and radial pins B^3 B^3 and hold the post concentrically with the central hole D^2 while the post and crown are being rotated upon each other in order to bring the pins B^3 B^3 into alignment with the notches D^4 D^4, and a spring held in the crown of the button and acting against the end of said post to resist its entrance into the hole D^2, substantially as described.

2. In a separable button, the combination, with a crown comprising an annular band C, provided with an internal shoulder C^3, and a plate D, held in said band and provided with a central hole D^2 to receive the post, of a shoe A, having a post B extending from said shoe with its free end entering said hole D^2, and a blade-spring C^3 with its ends resting upon the shoulder C^3 and extending diametrically across the hole D^2, so as to act against the end of the post B as it is pushed into the crown, whereby the strain exerted by said spring will be received upon the shoulder C^3, substantially as described.



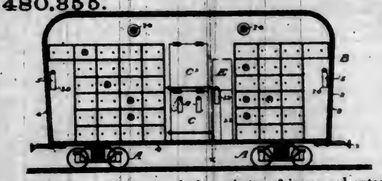
480,353. UMBRELLA-RIB. WILLIAM L. UHLENHART, Astoria, Oreg. Filed Nov. 28, 1891. Serial No. 413,455. (No model.)

Claim.—In an umbrella or parasol, the combination of the top notch with a rib composed of a socket-piece connected to said notch and a rib-iron inserted loosely in the socket of said piece, the parts of the ribs so formed being held in place by the connections therewith of the notch and cover, all substantially as set forth.

480,354. HEMP-BRAKE. JOSIAH O. WARD, Orange, N. J. Filed Jan. 12, 1892. Serial No. 417,822. (No model.)

Brief.—The machine includes a rotary riddle-beater, feed-rolls, break-bar, fenders for supporting the material while being treated, and a traveling apron and rolls for delivering the finished product.

Claim.—1. In a hemp-brake, the combination of the rotary riddle-breaker having separate revolving arms 8, feed-rolls, and stationary breaker-bar 7, arranged between the feed-rolls and riddle-breaker, an open endless carrier arranged below the riddle-breaker, and the delivery device at the rear end of said endless carrier, substantially as specified.



2. In a hemp-brake, the combination of a rotary riddle-breaker having separated arms 8, a pair of feed-rolls 2, a stationary break-bar 7, arranged between the feed-rolls and the rotary riddle-breaker, an endless traveling carrier 10, arranged below the rotary riddle-breaker, a pair of delivery-rolls 5, arranged at one end of the endless carrier, and a series of fenders interposed between the other end of the endless carrier and the stationary break-bar, substantially as described.

480,355. RAILWAY-CAR. ROYAL A. WILDER, Cresaptown, Pa. Filed Apr. 25, 1892. Serial No. 430,589. (No model.)

Claim.—1. A safety-car composed of outer and inner metal shells, loop-holes through the shells of the car, upper and lower doors at the sides of the car, loop-holes in the doors, and movable covers over all the loop-holes, substantially as described.

2. A safety-car composed of inner and outer metal shells, metal side doors in the car, safety boxes or turrets secured within the car, and doors and loop-holes in the turrets, substantially as described.

480,355.

3. A safety-car composed throughout of inner and outer metal shells arranged with a space between them, loop-holes having movable covers through the shells, compartments in the sides of the car, side doors with loop-holes in them, and safety boxes or tunnels in the car, having doors and loop-holes, as set forth.

480,356. WHIP-HOLDER. JAMES E. WOODWARD, Yardville, N. J. Filed Apr. 6, 1892. Serial No. 428,008. (No model.)

Claim.—1. In a holder for whips or other articles, the combination of jaws, a plate to which said jaws are pivoted, a cam adapted to slide on said plate and between said jaws, and means to retain said jaws normally closed.

2. In a holder for whips or other articles, the combination of jaws, a plate to which said jaws are pivoted, a groove in said plate, a cam adapted to work in said groove and rest between said jaws, and means to retain said jaws normally closed.

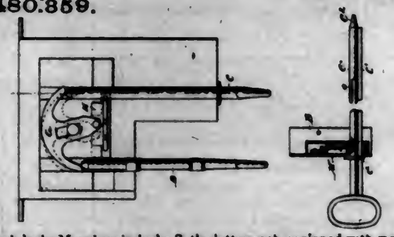
3. In a holder for whips or other articles, the combination of jaws, a plate to which said jaws are pivoted, a cam adapted to slide in said plate between said jaws, said cam being provided with projections to limit its movement, and means to retain said jaws normally closed.

480,357. DENTAL JAW-BRACE. ARTHUR E. WORTHEN, Melrose, Mass., assignor of one-half to Charles L. Sprague, same place. Filed Apr. 12, 1892. Serial No. 428,840. (No model.)

Claim.—1. A mouth-prop for dental operations, comprising a pair of pivotally-connected jaws, as A B, an adjusting-screw C, and troughs, as D H, permanently pivotally secured to said jaws, substantially as set forth.

2. The hereinbefore-described mouth-prop for dental operations, consisting, essentially, of the pivotally-connected jaws A B, adjusting-screws C C' C'', spring E, and troughs H D, permanently pivoted, respectively, to said spring and jaw B, substantially as set forth.

480,358. JAIL-BAR. LEVI D. YORK, Portsmouth, Ohio. Filed Mar. 17, 1892. Serial No. 425,361. (No model.)



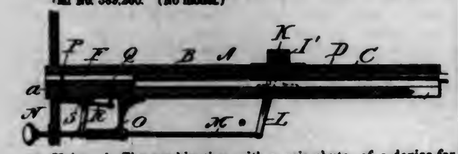
Claim.—A bar composed of a center stratum of soft metal, two embracing or overlapping strata of hard steel provided with longitudinal ribs, one at the center and another between the center rib and each edge, and outer strata or layers of soft metal in which the longitudinal ribs are embedded, substantially as specified.

480,359. LOCK. PETER EISENMANN, Jr., New York, N. Y. Filed Dec. 17, 1891. Serial No. 415,344. (No model.)

Claim.—1. The locking means described, comprising a series of thin locks or sub-locks M and main locks S, the latter each equipped with means P for retaining a sub-lock in a main lock, and with means I J, carried in the sub-lock, for retaining it at another period upon a pin C, the whole adapted to serve in securing water, gas, windows, &c., in an apartment or building, as herein specified.

2. The locking means described, comprising a series of thin locks

480,359.



or sub-locks M and main locks S, the latter each equipped with means P for retaining a sub-lock in a main lock, and with means I J, carried in the sub-lock, for retaining it at another period upon a pin C, in combination with the means K L in the main lock for effecting the liberation of the sub-lock from such pin when desired, arranged for joint operation as herein specified.

3. In a locking system, the holder E, having two holes adapted to receive the pin C and key D, and means, as the lever G and locking-slide H, for engaging and liberating each, one at a time, as herein specified.

4. In a locking system, the pin C, having the wing C' extending along one side and holes *c* and *c'*, and having a taper end C^3, adapted to serve with the levers G and slide H of a series of sub-locks M, and with a holder E and key D, substantially as herein specified.

480,360. COIN-CHUTE. RUSSELL F. AVERY, Spokane Falls, Wash., assignor to Jacob Goetz, trustee, same place. Filed Apr. 16, 1891. Serial No. 389,200. (No model.)

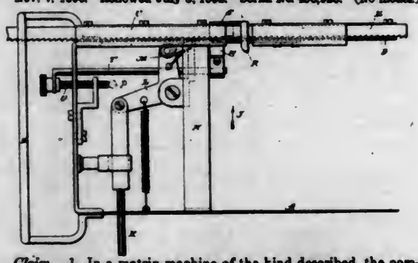
Claim.—1. The combination, with a coin-chute, of a device for automatically allowing the passage of a coin of determined thickness, a device for automatically allowing the passage of a coin of determined diameter, and mechanism actuated from the exterior of the coin-chute for releasing a coin of undue thickness arrested in the thickness-determining device, substantially as described.

2. The combination, with a coin-chute, of devices for automatically determining the passage of a coin therein in respect to its two dimensions, mechanism actuated from the exterior of the coin-chute to release and automatically reset said measuring devices, and gates for inserting and retaining the coin introduced into the slot of the coin-chute during the releasing of the dimension-measuring devices and automatically delivering the coin from the slot and closing the same when the measuring mechanism is reset, substantially as described.

3. The combination of the case having a slot therein and a movable lid to said case having secured thereto a longitudinal rib adapted to divide the case into two parallel channels, with a longitudinal passage between said channels and beneath said rib when said lid is closed, substantially as described.

4. The combination of the case having a slot therein, a lid to said case having secured thereto a longitudinal rib adapted to divide said case into two channels, with a longitudinal passage between said channels and beneath said rib when said lid is closed, and suitable connections between the case and the lid, whereby the lid can be opened and closed, substantially as described.

5. The combination of the case, a slot therein, an upper and lower gate located in said slot, a lid to said case, a longitudinal rib dividing said case into two channels, and suitable connection between the case, the lid, and the two gates, whereby when the upper gate is opened the lid is also opened and the lower gate closed, and vice versa, substantially as described.



6. The combination of the case having the apertures *d* and *e*, a slot in said case, an upper and a lower gate located in said slot, a lid to said case, a longitudinal rib in said case, and suitable connections between the case, the lid, and the two gates, substantially as described.

7. The combination of the case having the slot therein, a lid to said case, a longitudinal rib forming when closed two channels in said case, a slide connected with one of said channels, and a balance in said slide, substantially as set forth.

8. The combination of the case having the apertures *d* and *e*, a slot in said case, an upper and a lower gate located in said slot, a lid to said case, a longitudinal rib forming two channels, as described, a slide connected with one of said channels, a balance in said slide, and suitable connections between the case, the lid, and the two gates, substantially as described.

9. The combination of the case A, having the apertures *d e* at the open end of the case, the slot F at the other end of the case, the gates P and Q, located in the slot, the bar R, hinged to the gates, the shaft S, pivoted to the bar R, the lever-arm T, connected to the shaft S, the lid B, closing the case and having the rib C, the keeper I', secured to the lid, the eccentric shaft K, loosely retained by the keeper and mounted in bearings in the case, the lever-arm L, connected to the shaft K, the actuating-rod M, connected to the levers T and L, the spring O, connected to the actuating-rod M, the slide G at the open end of the case, the guide I, connecting said slide and case, and the balance H, located in the slide, substantially as described, and for the purpose set forth.

480,361. MATRIX-MAKING MACHINE. SHERWIN C. BECKWITH, New York, N. Y., and WILLOUGHBY W. STREET, Springfield, Mass., assignors to the Matrix Manufacturing Company, New York, N. Y. Filed Nov. 7, 1890. Renewed July 5, 1892. Serial No. 438,925. (No model.)

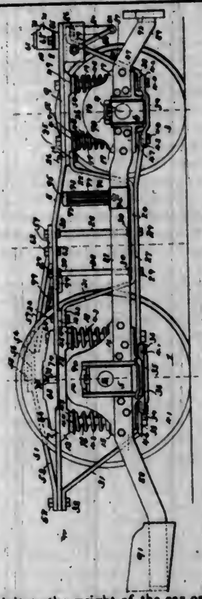
Claim.—1. In a matrix-machine of the kind described, the combination, with a traveling carriage and feed mechanism, of a matrix-material support or carrier adjustable with respect to said carriage in a direction transverse to the lines or rows of impressions, and line-spacing rack-bars having teeth of different widths, as herein set forth.

2. The combination, with the main carriage, of a support or carrier for a matrix board, a screw set therein, and a stop or fixed point on the main or feed carriage, the said screw being in position to encounter the stop for adjusting the position of the matrix-board with respect to the impression-point and in a direction at right angles to the lines of impression.

3. The combination, with the detachable matrix-support of a machine of the kind described, of a device of the kind described (the screw O) for adjusting the said support with respect to the main carriage in a direction transverse to the lines of impressions, and a pointer or gage movable over the matrix material and connected with the adjusting device, as set forth.

4. The combination, with the frame A, of the adjusting-screw O, the rack bar or bars E, and the pointer or gage R, connected and movable with the screw, as set forth.

480,362. MOTOR-TRUCK. JOHN A. BRILL, Philadelphia, Pa. Filed Mar. 1, 1892. Serial No. 423,342. (No model.)



Claim.—1. A truck having wheels and running-gear, a frame for the same, springs for supporting the frame on the running-gear, side bearings secured to the truck-frame, and a truck center bearing located approximately over an axle at one end of the truck, the side bearings and center bearing being arranged to precipitate the weight of the car directly upon the springs above said axle, substantially as described.

2. A truck having wheels and running-gear, a frame for the same, side bearings secured to the truck-frame, and a truck center bearing located approximately over the axle at one end of the truck, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, substantially as described.

3. A truck having wheels and running-gear, a frame for the same, side bearings secured to the truck-frame, a truck center bearing located approximately over the axle at one end of the truck, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, and a rub-plate on the end of the truck-frame farthest removed from the center bearing, substantially as described.

4. The combination of a car-body and a truck, the truck having wheels and running-gear, a frame for the same, side bearings secured to the truck-frame, coacting bearings on the car-body, a truck center bearing located approximately over the axle at one end of the truck, and a coacting center bearing on the car-body, the car and truck side bearings and center bearing being so disposed in relation to the

480,362.

said axle as to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, substantially as described.

5. The combination, with a car and truck, the truck having wheels and running-gear, a frame for the same, side bearings secured to the truck-frame, a truck center bearing located approximately over the axle at one end of the truck, a rub-plate on the end of the truck-frame farthest removed from the center bearing, coacting side bearings, and a center bearing and rub-plate on the car-body, the truck and car side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, the end rub-plates being adapted to prevent that end of the truck-frame being lifted by such preponderance, substantially as described.

6. A truck having wheels and running-gear, a frame for the same, a truck center bearing located approximately over the axle at one end of the truck, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, and springs of different capacity for supporting the truck-frame on the running-gear, the springs of greater capacity supporting that part of the truck-frame upon which the side bearings are secured, substantially as described.

7. A truck having wheels and running-gear, a frame for the same, springs of different capacity for supporting the frame on the running-gear, side bearings secured to the truck-frame, the springs of greater capacity supporting that part of the truck-frame to which the side bearings are secured, a truck-bolster secured to the truck-frame, one member of which is disposed approximately over the wheel-base center of the truck, and a center bearing supported upon the truck-bolster approximately over the axle at one end of the truck, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, substantially as described.

8. A truck having wheels and running-gear, a frame for the same, side bearings secured to the truck-frame, a truck center bearing located approximately over the axle at one end of the truck, a rub-plate on the end of the frame opposite the center bearing, and a brace secured to the truck-frame beneath the rub-plate for supporting the same, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, substantially as described.

9. A truck having wheels and running-gear, a frame for the same, springs of varying capacity for supporting the truck-frame on the running-gear, side bearings secured to the truck-frame, a truck center bearing located approximately over the axle at one end of the truck, a rub-plate secured to the truck-frame at the opposite end, a brace for supporting the truck-frame on which the end rub-plate is located, springs of greater capacity for supporting the truck-frame over which the side bearings are located, and springs of lesser capacity for supporting the end of the frame upon which the rub-plate is located, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of the axle over which the center bearing is located, substantially as described.

10. A truck having wheels and running-gear, a frame for the same, springs of varying capacity for supporting the truck-frame on the running-gear, side bearings on the truck-frame, a truck-bolster having a member thereof secured to the truck-frame approximately over the wheel-base center of the truck, a truck center bearing thereon set approximately over the axle at one end of the truck, a rub-plate on the end of the truck-frame opposite the center bearing, a brace under the rub-plate for supporting that end of the truck, springs of greater carrying capacity between the side bearings and running-gear, and springs of lesser capacity for supporting the end of the truck upon which the end rub-plate is located, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of the axle over which the center bearing is located, substantially as described.

11. A truck having a frame, running-gear, wheels of varying diameter with accompanying axles supported in the running-gear, side bearings secured to the truck-frame over the axle of the larger wheels, and a truck center bearing located approximately over that axle, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck about the perpendicular axis of the axle of the large wheels, substantially as described.

12. A truck having a frame, running-gear, wheels of varying diameter with accompanying axles supported in the running-gear, side bearings secured to the truck-frame over the axle of the larger wheels, a truck center bearing located approximately over that axle, and a rub-plate on the end of the truck-frame in which the smaller wheels are located, the side bearings and center bearing being arranged to precipitate the weight of the car on the truck-frame about the perpendicular axis of said axle, the end rub-plate being adapted to prevent the small wheels leaving the track, substantially as described.

13. A truck having a frame, running-gear, wheels of varying diameter with accompanying axles supported in the running-gear, springs of varying capacity for supporting the truck-frame on the running-gear, side bearings secured to the truck-frame over the axles of the larger wheels, springs of greater carrying capacity between the side bearings and the running-gear, and springs of lesser capacity for supporting the truck-frame about the smaller wheels, the side bearings and center bearing being arranged to precipitate the weight of the car-body on the truck-frame about the perpendicular axis of said axle, substantially as described.

14. A truck having a frame, wheels, and running-gear, pedestals and springs about the axle-boxes, side rub-plates for supporting the car-body on the truck, located over the axle box pedestals at one end of the truck, and a center bearing supported on the truck approximately over the axle at that end, substantially as described.

15. A truck-frame having axle box pedestals, a center bearing located approximately over the axle at one end, and side bearings secured to the truck-frame over the pedestals at that end, the center of said side bearings being in line with the perpendicular axis over which said bearing is located, substantially as described.

16. The combination, with a truck, of a car-body, the truck having a frame, wheels, and running-gear, pedestals and springs surrounding the axle-boxes, side rub-plates located over the axle-box pedestals at one end of the truck, a center bearing supported on the truck approximately over the axle at that end, coacting rub-plates secured to the car-body, and a center bearing on the car-body adapted to coact with the truck center bearing, the position of the car and truck center bearings and side bearings being such as to preponderate the weight of the car on the axle over which the side bearings are located, substantially as described.

17. A truck having a frame, wheels, axles, and running-gear for the same, and springs of varying capacity for supporting the truck-frame on the running-gear, the springs of greater carrying capacity supporting the truck-frame at one end thereof and springs of lesser carrying capacity supporting the springs at the opposite ends thereof, substantially as described.

18. A truck having wheels, axles, and running-gear, a frame for supporting the same, a truck center bearing located approximately over one of the axles, springs for supporting the truck-frame on the running-gear, side bearings secured to the truck-frame over the said axle, a rub-plate secured to the end of the truck-frame opposite to the center bearing, and a brace for reinforcing the said frame under the rub-plate, substantially as described.

19. A truck having wheels, axles, and running-gear, a truck-frame for carrying the running-gear, springs for supporting the truck-frame on the running-gear, a truck-bolster having a transverse member secured to the truck-frame approximately over the wheel-base center of the truck, another member spanning one of the axles and secured to the truck-frame, and a center bearing on the bolster located approximately over said axle, substantially as described.

20. A truck having wheels, axles, and running-gear, a truck-frame, springs for supporting the truck-frame on the running-gear, a truck-bolster secured to the truck-frame, having a longitudinal member spanning one of the axles, a transverse member secured upon the truck-frame approximately over the wheel-base center thereof, a center bearing on the bolster located approximately over said axle, and side bearings secured to the truck-frame over the truck-springs encompassed by the said bolster, substantially as described.

21. A truck having wheels, axles, and running-gear, a truck-frame, springs for supporting the truck-frame on the running-gear, and a truck-bolster secured to said frame and spanning one of the axles of the truck, the said bolster having a transverse member extending from its point of attachment to the truck-frame toward the said axle, and a center bearing on the bolster located approximately over said axle, substantially as described.

22. A truck having wheels, axles, and running-gear, a truck-frame, springs for supporting the truck-frame on the running-gear, a bolster secured to the truck-frame and spanning the axle at one end thereof, said bolster having a transverse member secured to the truck-frame approximately over the wheel-base center of the truck and arched therefrom toward said axle, and a center bearing on the bolster approximately over said axle, substantially as described.

23. A truck having an upper chord and an added member secured thereto and made integral therewith, substantially as described.

24. A truck having an upper chord and an added member made integral therewith, said added member following the outline of a portion of said upper chord and adapted to strengthen said upper chord at its place of attachment thereto, substantially as described.

25. An upper chord having longitudinal and transverse sections, the longitudinal sections being adapted to carry the running-gear of the truck, and an added member secured to the transverse sections for the purpose of strengthening the same, substantially as described.

26. A truck having an upper chord, an added member for strengthening the upper chord at its place of attachment thereto, and a brace secured to the added member and adapted to co-operate with said member to strengthen the upper chord at the point of attachment thereof, substantially as described.

27. In a side bearing, the combination of a friction-plate secured thereto, a reservoir for a lubricant, and means for conducting said lubricant to the surface of the friction-plate, substantially as described.

28. In a side bearing, the combination, with the body of the bearing, with an added friction-plate secured thereto, of an oil-reservoir within the body thereof, a duct leading from the reservoir to the surface of the friction-plate, and a conducting medium leading from said reservoir to the surface of said friction-plate, substantially as described.

29. In a truck, the combination, with a truck-frame, of large wheels 1, axle 2, and axle-boxes 5 at one end thereof, smaller wheels 3, axle 4, and axle-boxes 6 at the other end thereof, axle-box saddle 14 with ears 15, supported on the axle-boxes 5; axle-box 16 with ears 17, supported on the axle-boxes 6, spring-plates 12, secured to the upper chord of the frame over the axle of the large wheels, spring-plates 10, secured to said upper chord over the axle of the smaller wheels, spring-posts 18, secured to the truck-frame and passing through the ears 15 of the saddle 14, spring posts 19, secured to the truck-frame and passing through the ears 17 of the saddle 16, and springs of varying carrying capacity for supporting the truck-frame on the saddles, the springs 43 between the saddle on the axle of the large wheels and the truck-frame being of greater carrying capacity than the springs 48 between the saddle of the axle of the smaller wheels and the truck-frame, substantially as described.

30. The combination, with the truck-frame, of wheels and axles, axle-boxes on the axles, saddles supported on the axle-boxes, spring-posts about one of the axles, passing through the saddles and secured to the truck-frame, springs surrounding the spring-posts between the saddles and the frame, and side bearings secured to the truck-frame over one of the said axles, substantially as described.

31. The wheels 1, axle 2, axle-boxes 5 on the axle 2, saddles 14 with ears 15, supported on the axle boxes, the upper chord of the truck-frame, side bearings 63 on the upper chord of the truck-frame, the center of which is directly over the axle 2, spring-posts 18, secured to the side bearings 63, passing through the upper chord and ears 15 of the axle-box saddles 14, spring plates 12, secured to the upper chord, and springs 43, surrounding the spring-posts 18 between the spring-plate 12 and ears 15 of the saddles, substantially as described.

32. The combination, with a truck having running-gear, a frame, springs for supporting the frame on the running-gear, pillars 28 between the upper and lower members of the truck-frame, a truck-bolster having a transverse member 59 secured to the upper chord of the frame between the pillars 28, and the longitudinal member 51, secured to the upper chord and to the transverse member 59, and a center bearing 55, secured to the member 51, substantially as described.

33. The combination, with the wheels and running-gear, a truck-frame, springs for supporting the truck-frame on the running gear, and a truck-bolster secured to the upper member of said frame and spanning one of the axles thereof, said bolster comprising the transverse member 59, arched inwardly and upwardly toward the said axle, substantially as described.

34. A truck-bolster comprising a longitudinal member 51, secured to the upper chord of the frame at one end, extending upwardly and spanning the axle and secured upon the transverse member 59 at the other end, both members of the bolster forming an arch over one of the axles, and a center bearing on said bolster approximately over said axle, substantially as described.

35. The upper chord 9, having the added member 78 secured thereto, and a supplemental brace secured to the added member, said brace comprising the strut 83 and truss 80, substantially as described.

36. The upper chord 9, the angle-iron 78, secured to the upper chord and having the end sections 79 disposed at an angle thereto, the strut 83, having arms 84 secured to the angle-iron 78, an eye 82 on the strut, and a truss 80, passing through said eye and secured to the end sections 79 on the angle-iron 78, substantially as described.

37. In a side bearing, the well 65 therein, the slots 66 and central web 67 over the well, the friction-plate 69, having the opening 70 over said slots and central web and an oil-conductor 71, of felt or like material, extending from the well through the slots 66 and over the central web 67, substantially as described.

38. The side bearings 63, having the oil-well 65 in the body thereof, an outwardly-extending lug 72, and a duct 73, leading from the top of said lug downwardly into said well, substantially as described.

39. The side bearings 63, having an enlarged central section 64, the oil-well 65 in said central section, slots 66 over the well, a central web 67 between the slots, a boss 68 on the said enlarged section, and a friction-plate 69, having the opening 70 above the slots 66 and web 67, seated within said boss, substantially as described.

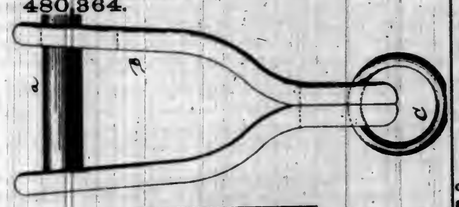
40. The side bearings having the central enlarged sections 64, the end sections 75 of reduced thickness, countersinks 77 therein, and bolt-holes 76 within the countersinks, substantially as described.

41. The combination, with the upper-chord section 7, of the side bearing 63, bolt-holes 76 therein, an outwardly-extending lug 74 on the side bearings, adapted to bear against the upper chord, and bolts for securing the side bearings to the upper chord, substantially as described.

42. The truck-frame comprising the upper chord, the spring-posts 18 19, the lower chord 27, secured to the inner spring-posts, the angle-braces 31 37, uniting the outer spring posts with the upper chord, the reversed arch-brace 20, attached to the upper and lower chords between the inner spring-posts, and the pillars 28, extending between the brace 20 and lower chord 27 and the upper chord, and the cross-bars 35 39, extending between the spring-posts, substantially as described.

43. The bolster member 59, having the downwardly-extending link 99 secured thereto, and a brake-rod 101, supported by said link, in combination with a braking system to which both ends of the rod 101 are secured, substantially as described.

480,363. BOOT. GEORGE A. BROWN, Bristol, Tenn. Filed Mar. 31, 1892. Serial No. 427,248. (No model.)



Claim.—The herein-described boot, consisting of a leg portion and a counter and vamp portion having an angular end, said leg portion having a slit or cut in the lower part of one side extending into the adjacent upper rear portion of the counter and terminating at said angular end of the counter above the sole, the angular end of the counter extending forwardly of said slit or cut and then downwardly to said sole, and a shield or flap secured against the inner side of the leg or boot on all sides thereof around said slit or cut and of loose form to permit the expansion of the boot at the point where it is applied and a lace adapted to draw the walls of said slit or cut together or loosen the same, substantially as described.

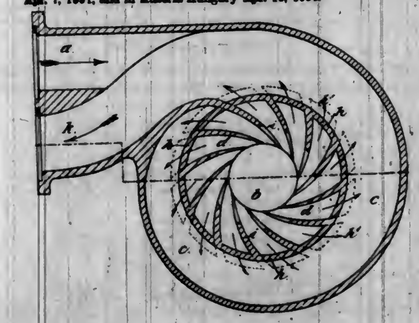
480,364. CLEVIS. OLE GABUTSON, Leland, Ill. Filed Aug. 25, 1891. Serial No. 403,731. (No model.)

Claim.—A clevis consisting of two side pieces having at their draft ends elongated beveled slots and a ring passing through the slots and at the opposite end of one of the side pieces a stud or bolt *a*, having the head *a'*, and in the corresponding end of the other side piece the elongated socket *b*, in the manner and for the purposes described.

480,364.

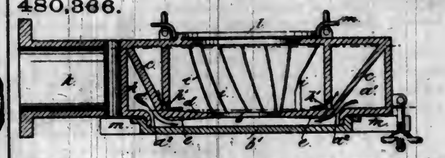
480,365. STEAM-GENERATOR. HENRY G. FISK, Worcester, Mass. Filed Nov. 22, 1883. Serial No. 291,534. (No model.)

Claim.—1. In a steam-generator, the combination, with a fire-pot, of a boiler placed over and above the fire-pot, said boiler being provided with lugs extending radially from its sides and beyond the walls of the fire-pot, and boiler-supports beneath said lugs and disconnected with said fire-pot, whereby said boiler is supported independently of said fire-pot, substantially as described.



2. In a steam-generator, the combination, with an ash-box and a fire-pot resting upon said ash-box, of a water receptacle or boiler, a series of lugs attached to said boiler and extending radially outside of said boiler, and legs extending downward from said lugs to said ash-box and supporting said boiler, substantially as described.

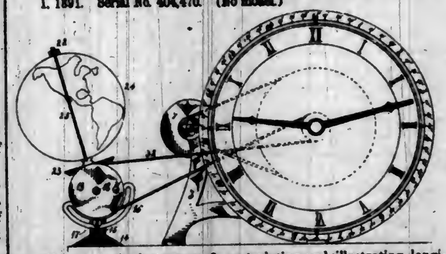
3. In a steam-generator, the combination, with an ash-box and a fire-pot resting upon said ash-box, of a boiler provided with a crown-sheet placed in a horizontal plane over said fire-pot and having a radius greater than the radius of said fire-pot, said boiler being supported at the outer edges of said crown-sheet and independently of said fire-pot, so as to leave a continuous space around the entire upper edge of said fire-pot, through which the products of combustion may pass, substantially as described.



4. In a steam-generator, the combination of an ash-box, a fire-pot resting upon said ash-box, a hemispherical water receptacle or boiler having a horizontal crown-sheet next the fire-pot, radial lugs projecting outwardly from the edge of said boiler, legs supporting said boiler and resting upon the ash-box, and adjusting-nuts upon said legs by which the vertical height of the boiler is adjusted, substantially as described.

5. The combination of ash-box A, fire-pot B, hemispherical boiler E, provided with a flange F, crown sheet G, lugs H, legs J, having a screw-threaded section, and adjusting-nuts K, all arranged substantially as described.

480,366. AMALGAMATING APPARATUS FOR CRUSHED ORES AND LIKE REDUCED BODIES. WILLIAM W. FYFE, London, England. Filed Sept. 17, 1891. Serial No. 405,867. (No model.) Patented in England June 3, 1890, No. 8,609; in France Mar. 26, 1891, No. 212,419; in Belgium Apr. 1, 1891, No. 94,369; in Germany Mar. 31, 1891, No. 59,901; in Italy Mar. 31, 1891, XXV, 29,706, and LIX, 41; in Spain Apr. 7, 1891, and in Austria-Hungary Apr. 10, 1891.



480,366.

Claim.—1. In amalgamator apparatus, the pulp-supply chamber or casing *a a'*, having the ports a^3, leading the pulp down into, under, and through the mercury stratum, together with the well *b'*, and plate *d e*, and central opening *b* thereof, as and for the purpose herein set forth.

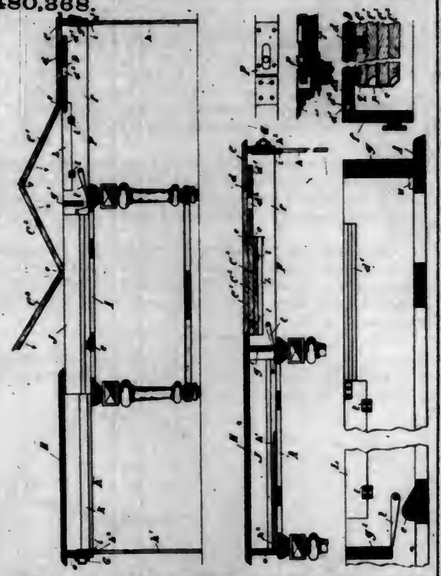
2. In amalgamator apparatus, the combination of the passage *a a'*, with ports a^3, plate C, mercury-well, and central space *b' b*, the mid-feathers and under plate *d e i*, dividing-plate A, and ports *k'*, distributing the tailings to the outflow-way *k*, as and for the purpose herein set forth.

480,367. MACHINE FOR CALCULATING AND ILLUSTRATING LONGITUDE AND TIME. WILLIAM W. HALLETT, Lee, Ill. Filed Sept. 1, 1891. Serial No. 404,470. (No model.)

Claim.—1. An instrument for calculating and illustrating longitude and time, comprising a dial marked with divisions of time and divisions of longitude, a globe capable of rotation, hands for the dial, and means for rotating the globe and moving the hands at fixed relative speeds.

2. An instrument for calculating and illustrating longitude and time, comprising a dial marked with divisions of time and divisions of longitude, a globe capable of rotation, two hands for the dial, and a crank for turning the hands and rotating the globe at fixed relative speeds.

3. An instrument for calculating and illustrating longitude and time, comprising a dial marked with divisions of time and divisions of longitude, a globe capable of rotation and of an adjustment of the inclination of its axis, hands for the dial, and means for rotating the globe and moving the hands at fixed relative speeds.

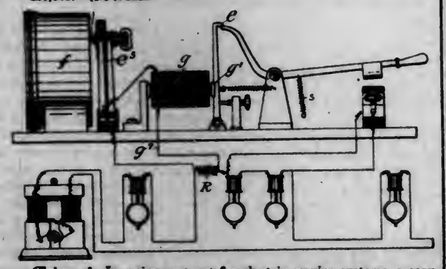


4. An instrument for calculating and illustrating longitude and time, comprising a frame, two shafts journaled therein, a crank and a pulley loosely affixed to and a pulley mounted on one shaft, two pulleys on the other shaft, belts for the pulleys, a dial marked with divisions of time and divisions of longitude, a hand for the dial, affixed to the crank-bearing shaft, and a hand affixed to the loose pulley.

5. An instrument for calculating and illustrating longitude and time, comprising a frame, two shafts journaled therein, a crank and a pulley affixed to one of the shafts and two pulleys secured together loosely mounted thereon, two pulleys rigidly secured to the other shaft, belts for the pulleys, a dial marked with divisions of time and divisions of longitude, a hand secured to the crank-bearing shaft, a hand affixed to the loose pulleys, a globe capable of rotation, a pulley for rotating the globe, and a belt from one loose pulley to the pulley of the globe.

6. An instrument for calculating and illustrating longitude and time, comprising a frame, two shafts journaled therein, a crank and a pulley affixed to one of the shafts and two loose pulleys secured together mounted thereon, two pulleys rigidly secured to the other shaft, belts for the pulleys, a dial marked with hours and minutes of time and degrees and minutes of longitude, a hand secured to the crank-bearing shaft, a hand affixed to the loose pulleys, a globe capable of rotation and an adjustment of the inclination of its axis, a stationary ring about the globe, a miter-gear affixed to the globe, a gear meshing therewith, a pulley affixed to the gear, and a belt from the loose pulley for driving the gear.

480,368. TELESCOPE TABLE. CARL JONAS and ISIDOR RAGUS, Vienna, Austria-Hungary. Filed Aug. 17, 1891. Serial No. 402,961. (No model.)



480,368.

Claim.—An extension-table composed of folding plates $C C' C^2 C^3$, turning on a pivot d of a cross-beam D, the latter being arranged to swing around pivots d^2 d^3, and the plates being held together by leather straps p p of an inner frame F, provided with guides d' d' for the slide-blocks d^2 d^3 of the cross-beam D, of the hinged flaps L L in the frame F for the reception of the non-folded out plates C^2 C^3, and of the hinged supplementary supports h h and h' h', arranged to be set fast by keys G, substantially as described, and for the purpose set forth.

480,369. TIME CUT-OUT FOR ELECTRIC-SERVICE SYSTEMS.

SAMUEL R. LINVILLE, Philadelphia, Pa. Filed Mar. 29, 1892. Serial No. 426,873. (No model.)

Claim.—1. In a time cut-out for electric-service systems, a service-circuit, a supply-circuit for energizing the service-circuit, terminals interposed in the supply and service circuits, a lever provided with an insulated conducting extremity adapted to engage said terminals and constitute a bridge for conveying the current between said terminals, a trigger normally restraining the lever from cutting out the service-circuit, and clock-work mechanism for tripping the trigger, substantially as and for the purposes set forth.

2. In a time cut-out for electric-service systems, a trigger, clock-work for tripping the same, a switch for cutting out the service-circuit, and a bell-crank lever connected with said switch and controlled by said trigger, substantially as and for the purposes set forth.

3. In a time cut-out for electric-service systems, a trigger, clock mechanism for tripping the same, a rocker-arm for operating a switch, and a bell-crank lever controlled by said trigger and operating said rocker-arm, substantially as and for the purposes set forth.

4. In a time cut-out for electric-service systems, a service-circuit, terminals, a lever provided with an insulated conducting bridge-piece tending to cut out the service-circuit, a trigger for engaging and restraining said lever, a clock-spindle and its complemental mechanism, and means interposed between said spindle and trigger for releasing the trigger, substantially as and for the purposes set forth.

5. In a time cut out for electric-service systems, a circuit provided with terminals, a switch, as shown, for bridging the current across said terminals, a trigger for engaging said switch, and time mechanism for controlling said trigger and releasing said switch, substantially as and for the purposes set forth.

6. In a time cut-out for electric-service systems, a switch tending to cut out a circuit, a trigger for restraining said switch, a threaded clock-spindle and its complemental mechanism, a nut on said clock-spindle, and a feather engaging said nut, substantially as and for the purposes set forth.

7. In a time cut-out for electric-service systems, a clock provided with escapement mechanism, gears actuated by the clock and adapted to release the escapement mechanism, a service-circuit, and a switch controlled by the escapement mechanism and adapted to cut out the service-circuit, substantially as and for the purposes set forth.

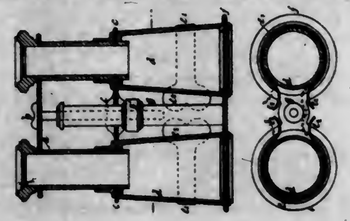
8. In a time cut-out for electric-service systems, a switch provided with a bridge-piece, as shown, a service-circuit, terminals, a source of electric energy, a trigger for engaging said switch, and time-registering mechanism for controlling said trigger and releasing the switch, substantially as and for the purposes set forth.

9. In a time cut-out for electric-service systems, a circuit and a generator, a switch tending to cut out the circuit, a trigger for restraining said switch, a time mechanism provided with a spindle and nut, and a feather for engaging said nut for releasing said trigger, substantially as and for the purposes set forth.

10. In a time cut-out for electric-service systems, a generator and service-circuit, a clock mechanism provided with an escapement, devices actuated by the clock mechanism and adapted to release said escapement, and a switch controlled by said escapement and adapted to close a shunt-circuit and interrupt said service-circuit, substantially as and for the purposes set forth.

11. In a time cut-out for electric-service systems, a time-controlled lever provided with an insulated conducting bridge-piece for breaking the circuit through a lamp, motor, or other translating device, a trigger engaging the lever, and clock mechanism for releasing the trigger, substantially as and for the purposes set forth.

12. A time cut-out for electric-service systems, comprising a time-registering apparatus, a cut-out-releasing device controlled by suitable power and adapted to be released at a determinate period by said time-registering apparatus, a trigger released by said releasing device, and a lever released by said trigger and provided with an insulated conducting bridge-piece, adapted to be included in and withdrawn from a circuit to make and break the same, substantially as and for the purposes set forth.



13. A time cut-out for electric service systems, comprising electric generators, main and service circuits, a time-registering mechanism, a shunt-circuit around a resistance in the main circuit, magnetic devices, circuit-closing devices in said shunt-circuit released at a determinate period by the time mechanism, and a lever controlled by said magnetic devices and provided with a short-circuiting bridge-piece, substantially as and for the purposes set forth.

14. In a time cut-out for electric-service systems, a source of electric energy, a main circuit with translating devices included therein, a time-registering apparatus, a releasing mechanism controlled by suitable power and adapted to be set and to be released at a specific time by said time mechanism, in combination with a spring-actuated short-circuiting switch, a trigger normally restraining said switch, and devices actuated by said releasing mechanism adapted to release said trigger, substantially as and for the purposes set forth.

15. In a time cut-out for electric-service systems, a time-registering apparatus, a main dynamo-circuit, service-circuits, translating devices, a shunt-circuit around a resistance in the main circuit, a magnet included in said shunt, an armature and detent for said magnet, in combination with a spring-actuated switch restrained by said detent and a power-impelled mechanism operating to close said shunt-circuit upon being released by said time-registering apparatus, substantially as and for the purposes set forth.

480,370. OPERA OR FIELD GLASS.

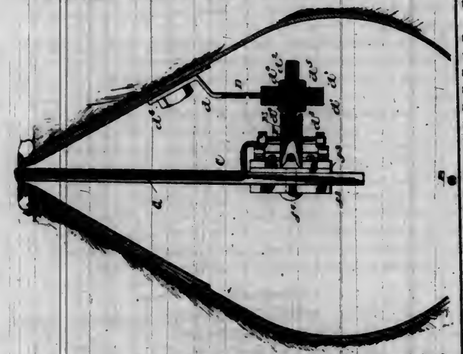
ERNST LÖDDIGKEIMS, Liegnitz, Germany. Filed Oct. 20, 1891. Serial No. 409,203. (No model.)

Claim.—1. The combination of an opera or field glass with rings d surrounding its tubes and having outwardly-turned ends d^2, substantially as specified.

2. The combination of an opera or field glass with nose-rest b and with rings d, having outwardly-turned ends d^2, substantially as specified.

480,371. SIGN HAVING ORNAMENTAL LETTERS OR DESIGNS IN RELIEF, FORMED OF A COMPOSITE MATERIAL, AND METHOD OF MAKING THE SAME.

HENRY H. M. MANDOSE, Newton, N. H. Filed Mar. 26, 1892. Serial No. 426,417. (No specimens.)



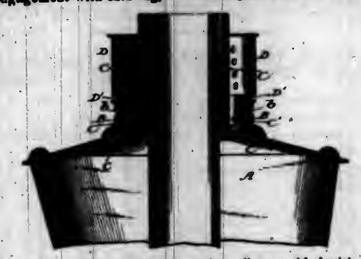
Claim.—1. As a new article of manufacture, raised letters, ornaments, and the like formed on a base of a composite material consisting of whiting, varnish, glue, and spirits of turpentine, substantially as herein described.

2. The method herein described of making raised composite letters and ornaments on signs, cards, or other base, consisting in providing a flowing composite material which will harden under exposure to the atmosphere and admit of beading without liability of cracking, placing this material in a compressible bulb having a conducting and discharging tube, preparing a design of the letters and ornaments upon the base, following the outline with the tube, compressing the bulb, and thereby continuously forcing out the fluid material through the tube upon the design and allowing the finished letters and ornaments to harden and become set, substantially as described.

480,372. SYSTEM OF ELECTRIC LIGHTING.

GEORGE F. MYERS, Pittsburg, Pa. Filed Dec. 15, 1891. Serial No. 415,192. (No model.)

Claim.—1. The combination, with a cable-railway conduit, its cable, and a moving vehicle having a grip-arm extending within the conduit, of an electric conductor extending through the conduit, a contact device for making connections with the electric conductor, and circuit connections therefrom, with translating devices located within the vehicle and a yielding support whereby the contact device is secured to the grip-arm and insulating-plates, a support for the conductor held in position by said insulating-plates, and a rigid support carrying said insulated plates, substantially as described.



2. The combination of a trolley or contact wheel for electric conductors, two flexible supporting-arms carrying the contact-wheel, a support to which the other ends of the flexible supporting-arms are attached, and latches carried by said support for engaging said flexible supporting-arms and holding said contact-wheel in an inoperative position.

480,373. ARGAND LAMP.

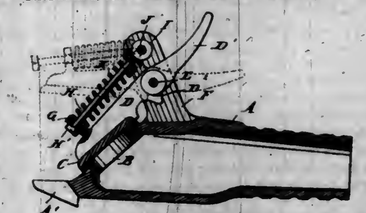
FRANK REHM, Meriden, Conn. Filed Oct. 21, 1891. Serial No. 408,891. (No model.)

Claim.—1. In a lamp, the combination of a collar provided with a lug or projection, a removable burner-slip adapted to vertical movement within said collar and restrained by said lug from rotary movement, and a removable burner-skirt adapted to rotary movement within said first-named removable burner-slip and to engage with said lug, substantially as described.

2. In a lamp, the combination of a collar, a lug or projection on said collar, a removable burner-slip, a vertical slot in said removable slip, a removable burner-skirt, and a catch in said second removable burner portion, said slot and said catch being adapted to simultaneous engagement with said lug, substantially as described.

3. In a lamp, the combination of a collar provided with a lug or projection, a removable burner-slip adapted to fit said collar and provided with a vertical slot adapted to embrace said projection, and a removable burner-skirt adapted to fit said first-named removable burner-slip and provided with means for engaging said projection, so as to secure both said removable burner portions to said collar, substantially as described.

4. In a lamp, the combination of a collar provided with a lug or projection, a removable burner-slip adapted to fit said collar and provided at its lower edge with a vertical slot, and a removable burner-skirt provided with a bayonet-catch, said projection being adapted to pass through said slot and to engage said catch, so as to lock said removable burner portions to said collar, substantially as described.



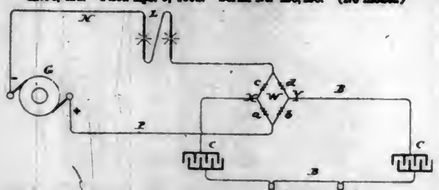
5. In a lamp, the combination of a collar provided with an internal projection, a removable burner portion consisting of an outer wick-tube and a flange adapted to fit within said collar, a second removable burner portion consisting of a foraminous skirt of greater diameter and a flange of less diameter than said first-named flange, and a catch on said inner flange adapted to engage with said internal projection, substantially as described.

6. In a lamp, the combination of a collar provided with an internal projection, a removable burner portion consisting of an outer wick-tube, a depressed annular perforated portion, and a flange adapted to fit within said collar, a vertical slot in said flange, a second removable burner portion consisting of a foraminous skirt and a flange adapted to fit within said first-named flange, and a catch on said inner flange adapted to engage with said internal projection, substantially as described.

7. In a lamp, the combination of a collar, an internal projection in said collar, an outer wick-tube, a flange connected with said wick-tube and adapted to seat within said collar, a vertical slot in said flange, an outturned rim on said flange, a foraminous skirt, a flange at the lower edge of and of less diameter than said skirt, said last-named flange being adapted to seat within said first-named flange, and a catch in said inner flange adapted to detachable engagement with said internal projection in said collar, substantially as described.

480,374. PIPE-COUPLING.

GEORGE W. SERRACK, New York, N. Y. Filed June 1, 1892. Serial No. 435,186. (No model.)



Claim.—1. A device of the class described, comprising a valve held on a pivoted arm, a spring pressing on the free end of the said pivoted arm, and a rod mounted to swing and loosely connected with the said arm to swing with the latter, the said spring being coiled on the said rod, substantially as shown and described.

2. In a device of the class described, the combination, with a pivoted arm carrying a lug adapted to engage a lug on the other coupling member, of a pivoted rod loosely engaging with its free end the

free end of the said pivoted arm to swing with the latter and a spring coiled on the said rod, substantially as shown and described.

3. In a device of the class described, the combination, with a pivoted arm carrying a disk valve and provided with a lug adapted to engage a lug on the other coupling member, a collar mounted to turn above the pivot of the said arm, a rod fastened to the said collar and loosely engaging the outer end of the said arm, and a spring coiled on the said rod and pressing with one end on the said arm and resting with its other end on the said collar, substantially as shown and described.

480,875. ELECTRIC-LIGHTING SYSTEM. CHARLES SELDEN, Baltimore, Md. Filed Apr. 9, 1892. Serial No. 428,490. (No model.)

Claim.—1. In a system of electrical distribution, the combination, with the main-line wire, of a Wheatstone bridge interposed in said main-line wire arranged to supply a definite current to the translating devices connected in the bridge-wire thereof, substantially as described.

2. In a system of electrical distribution, the combination, with the main-line wire, of a Wheatstone bridge interposed therein and translating devices connected in the bridge-wire, the resistances of the various arms of the bridge being so proportioned as to furnish the desired current to the translating devices in the bridge-wire, substantially as described.

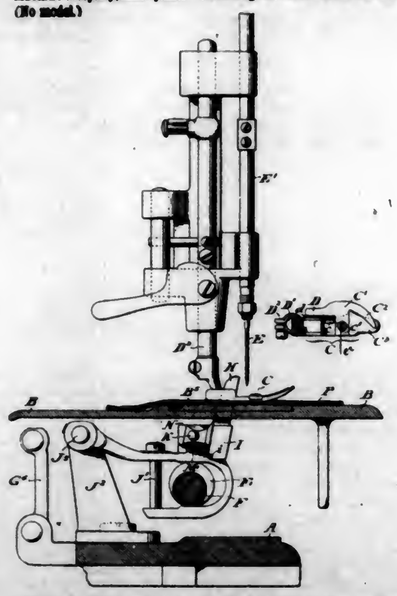
3. In a system of electrical distribution, the combination, with the main-line wire, of a Wheatstone bridge connected thereto arranged to supply a definite current to the bridge-wire, translating devices arranged in said bridge-wire, and inductive devices interposed between the translating devices and the terminals of the bridge-wire, substantially as described.

4. In a system of electrical distribution, the combination, with the main-line wire carrying currents of high potential and translating devices connected to said main-line wire, of a Wheatstone bridge connected to said main wire and arranged to supply the bridge-wire thereof with an inductive current of lower potential and translating devices arranged in said bridge-wire, substantially as described.

5. In a system of electrical distribution, the combination, with the main-line wire, of a Wheatstone bridge interposed in said main-line wire arranged to supply current to the bridge-wire thereof, and a second bridge connected in said first bridge-wire, and translating devices connected to the second bridge-wire, substantially as described.

6. In a system of electrical distribution, the combination, with the main-line wire, of a Wheatstone bridge interposed therein and arranged to supply current to the translating devices in the bridge-wire, and automatic means controlled by the current arranged to vary the relative resistances of the bridge to compensate for changes of potential in the main-line circuit, substantially as described.

7. In a system of electrical distribution, the combination, with the main-line wire, of a Wheatstone bridge interposed in said main-line wire and arranged to supply current in the bridge-wire containing the translating devices, of an electro-magnet connected in the circuit and arranged to automatically compensate for variations of changes of potential in said circuit, substantially as described.



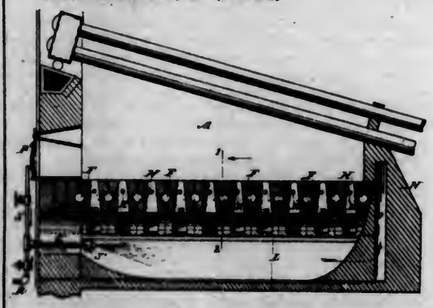
8. In a system of electrical distribution, the combination, with the main-line wire, of a Wheatstone bridge interposed therein, a second bridge interposed in the bridge-wire of the first bridge, and electro-magnetic devices arranged to automatically vary the resistances of the branches of said second bridge to compensate for variations in the potential of the current, substantially as described.

9. In a system of electrical distribution, the combination, with the main-line wire divided into branches, of a Wheatstone bridge interposed in one of said branches and arranged to supply current to the bridge-wire containing the translating devices, substantially as described.

480,876. PROCESS OF MAKING TANNING-EXTRACTS. WALTON G. TIFFANY, New York, N. Y., assignor of one-half to Brewster Cisneros, Tucson, Ariz. Filed Sept. 2, 1891. Serial No. 404,556. (No specimens.)

Claim.—The process of obtaining a dry tanning-extract from cascigra-root, which consists in comminuting or macerating the root, subjecting it to a bath of water at about 140° Fahrenheit or less, and reducing the liquid extract so obtained to a commercially-dry state by vacuo or otherwise, substantially as set forth.

480,877. SEWING-MACHINE TRIMMER. RUSSEL G. WOODWARD and CHARLES TIBBS, Chicago, Ill., assignors to The Union Special Sewing Machine Company, same place. Filed Aug. 19, 1890. Serial No. 362,363. (No model.)



Claim.—1. The combination, with the stitch-forming mechanism, of the slotted work-plate, the oscillating trimmer-frame located below the work-plate, the laterally-adjustable arm carried by said frame, the socket-piece mounted upon said arm, and the trimmer-blade rigidly but removably secured beneath the work-plate in said socket-piece and projecting at its upper end above the work-plate, substantially as set forth.

2. The combination, with the oscillating trimmer-frame and its laterally-projecting arm, of the slotted socket-piece having a beveled recess on its rear side, the trimmer-blade fitting freely in said socket-piece, and the screw and beveled nut adapted to enter said recess and to bear against the back of the blade, substantially as set forth.

3. The combination, with the stitch-forming mechanism, the oscillating trimmer-frame mounted beneath the work-plate, and the trimmer-blade rigidly mounted in said frame but laterally adjustable with relation to the needle, of a strip mounted in the work-plate and laterally adjustable with relation to the needle, said strip being provided with a trimmer-slot and a feed-slot immediately alongside thereof, each of said slots being entirely inclosed by the metal of the strip, and a feed-dog having a laterally-adjustable supplemental feed-surface fitting in said feed-slot, substantially as set forth.

480,878. FURNACE. ROBERT R. ZELL, Baltimore, Md. Filed Feb. 15, 1892. Serial No. 421,541. (No model.)

Claim.—1. In a furnace, a fire-arch having flues for the products of combustion, transverse and longitudinal air-passages, and connections between both sets of said air-passages and the said flues, substantially as set forth.

2. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body for the products of combustion, and transverse and longitudinal air-passages, said air-passages being in communication with one another and with the said flues, substantially as set forth.

3. In a furnace, a fire-arch consisting of a number of abutting blocks, each having a flue through its body for the products of combustion, air-passages surrounding each block and formed by recesses in the sides of the abutting blocks, and air-openings from the said passages to the flue of each block, the said blocks having two opposite converging sides and two opposite parallel sides, substantially as set forth.

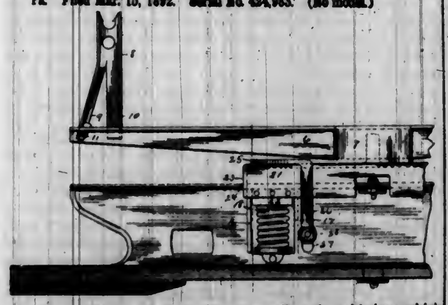
4. In a furnace, a fire-arch consisting of a number of abutting blocks, each having a flue, the sides of which upwardly converge, through its body for the products of combustion, air-passages surrounding each block, and air-openings from said passages to the flue of each block, substantially as set forth.

5. In a furnace, a fire-arch consisting of a number of abutting blocks, each having a flue, the sides of which upwardly converge, through its body for the products of combustion, air-passages surrounding each block, and air-openings from the said passages to the flue of each block, each of the said blocks having two opposite converging sides and two opposite parallel sides, substantially as set forth.

6. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body for the products of combustion, transverse and longitudinal air-passages, said air-passages being in communication with one another, and means for admitting air to said flues, so as to cause complete combustion, substantially as set forth.

7. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body, air-passages surrounding each block, and air-openings from the said passages to the flue of each block, substantially as set forth.

8. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body, air-passages surrounding each block, and air-openings from the said passages to the flue of each block, said air-passages being formed by recesses in the sides of the abutting blocks, substantially as set forth.



9. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body, air-passages surrounding each block, and air-openings from the said passages to the flue of each block, said air-passages being formed of recesses in the sides of the abutting blocks and one series of said air-passages extending transversely of and another series extending longitudinally with the furnace, substantially as set forth.

10. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body, air-passages surrounding each block, and air-openings from the said passages to the flue of each block and being in open communication with each other, substantially as set forth.

11. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body, air-passages surrounding each block, and air-openings from said passages to the flue of each block, the said air passages being in open communication with each other and being formed by recesses in the sides of the abutting blocks, one series of the said air-passages extending transversely of and another series extending longitudinally with the furnace, substantially as set forth.

12. In a furnace, a fire-arch consisting of a number of blocks, each having a flue through its body, air-passages surrounding each block, and oblique air-openings from the said passages to the flue of each block, substantially as set forth.

480,879. WAGON RUNNING-GEAR. JAMES H. BAKER, Allegheny, Pa. Filed Mar. 15, 1892. Serial No. 424,963. (No model.)

Claim.—1. A method of making a metallic axle and bolster, which consists in making the bolster portion in one piece and the axle portion in another and welding the two together, substantially as set forth.

2. A metallic axle and bolster in one piece for wagons, with a heavier cross-section at the point where the arms leave and lose the support of the metal connecting the axle and bolster, substantially as set forth.

3. A metallic axle and bolster in one piece for wagons, the axle having a cross-section substantially of a half-circle, substantially as set forth.

4. A metallic axle and bolster in one piece for wagons, the axle having a cross section substantially of a half-circle and the axle-arms being formed by welding thereto pieces of metal substantially, also, of a half-circle in cross-section, substantially as set forth.

5. A metallic axle and bolster in one piece for wagons, in which the lower half of the arms is of hard steel welded to a softer upper part, substantially as set forth.

6. A metallic rock-bolster for wagons, with cross-section in the T form and with a center bottom bearing of a channel-section having its sides fastened to the upper part of the bolster, substantially as set forth.

7. A metallic stake for wagons, made of I-shaped sections divided at the lower end and locked in place by wedges, substantially as set forth.

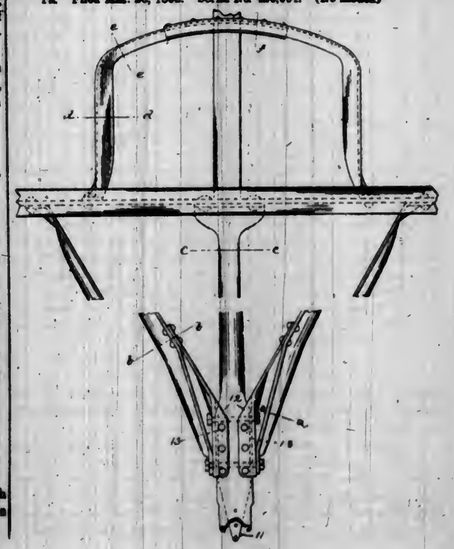
8. A metallic stake for wagons, divided at its lower end and having self-contained tension when put in position, substantially as set forth.

9. A metallic brace for wagons, having a head adapted to be locked in an opening of another metallic piece, substantially as set forth.

10. A metallic axle and bolster for wagons, having springs between the axle and the top of the bolster, with a cap or spring-bar to vertically slide, substantially as set forth.

11. A metallic axle and bolster for wagons, having guides for a spring-cap made integral with the axle and bolster, substantially as set forth.

12. A metallic axle and sand-board for wagons, having springs fastened between the axle and the top of the sand-board, substantially as set forth.



13. A metallic axle and sand-board for wagons, with a rock-bolster bearing hung over them, substantially as set forth.

14. A metallic axle and sand-board for wagons, having a rock-bolster bearing resting on springs having slide-arms fastened thereto, substantially as set forth.

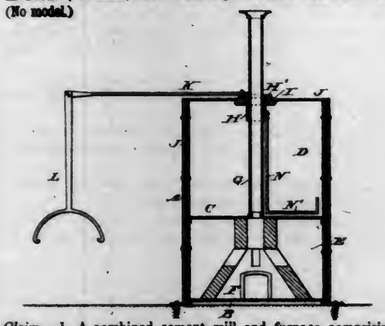
15. A metallic rock-bolster bearing having slide-arms fastened thereto, with slide-arm braces extending downward to and arranged to slide vertically on the sides of the lower part of the structure, substantially as set forth.

16. A metallic axle and sand-board in one piece in gear, having a reach forked at the front end, with one part fastened to the axle and the other part fastened to the sand-board at or near the top of the sand-board, substantially as set forth.

480,880. WAGON RUNNING-GEAR. JAMES H. BAKER, Allegheny, Pa. Filed Mar. 28, 1892. Serial No. 426,651. (No model.)

Claim.—1. In a wagon, a metallic axle and bolster in one piece having the arms made heavier than the balance of the axle and provided with reinforcements extending to the web, substantially as set forth.

2. In a wagon, a metallic axle and bolster in one piece having the web connecting them thicker next the axle than in the balance of the web, substantially as set forth.



3. Pressed metallic bounds for a wagon, having increased strength imparted to them in a vertical direction at the point where they join the axle and bolster by increasing there the vertical depth of the section of said bounds.

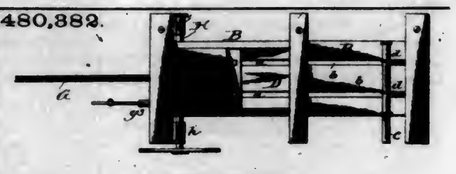
4. Pressed metallic bounds for a wagon, having increased strength imparted to them in a horizontal plane at the point where they join each other by increasing their horizontal section there.

5. In a wagon, pressed metallic combined bounds and slider having increased thickness at the place where the reach works upon the slider, substantially as set forth.

6. A pressed metallic tongue for a wagon, the cross-section of which at the rear end is shallow vertically and wide horizontally, said section gradually changing into a circle at the front end, said tongue also having a longitudinal tapering corrugation extending from the rear end nearly to the front end.

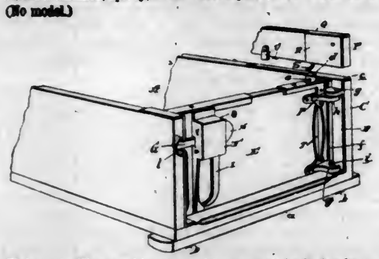
480,381. COMBINED CEMENT MILL AND FURNACE. HENRY H. BOURNE, Trinidad, Colo. Filed Sept. 15, 1891. Serial No. 405,764. (No model.)

Claim.—1. A combined cement mill and furnace comprising a casing, a transverse partition forming a mill-compartment and a furnace-compartment in the said casing, a furnace located in the said furnace-compartment to heat the latter and also the mill-compartment, a smoke-stack extending centrally from the said partition to connect with the outlet of the said furnace, and an agitator held in the said mill-compartment and mounted to turn on the said smoke-stack, substantially as shown and described.



2. In a combined cement mill and furnace, the combination, with a casing formed with a transverse partition dividing the casing into an upper and lower compartment, of a furnace located in the said lower compartment, a bearing held in the upper end of the uppermost compartment, rods for supporting the said bearing and attached to the said casing, a sleeve held in the said bearing and mounted to turn, an agitator secured to the said sleeve and extending in the uppermost compartment, and a smoke-stack extending from the said furnace through the uppermost compartment and through the said sleeve, substantially as shown and described.

3. In a combined cement mill and furnace, the combination, with a casing formed with a transverse partition dividing the casing into an upper and lower compartment, of a furnace located in the said lower compartment, a bearing held in the upper end of the uppermost compartment, rods for supporting the said bearing and attached to the said casing, a sleeve held in the said bearing and mounted to turn, an agitator secured to the said sleeve and extending in the uppermost compartment, a smoke-stack extending from the said furnace through the uppermost compartment and through the said sleeve, and means, substantially as described, for revolving the said sleeve on the said smoke-stack and the said bearing, as set forth.



480,382. HAND HAY-PRESS. WILLIAM H. CARR, WILLIAM T. BLACKBURN, and ROBERT P. OWEN, Rogers, Ark. Filed Mar. 17, 1892. Serial No. 425,243. (No model.)

Claim.—The combination of the frames A A, clamp C, box B, having the top opening D, bottom slots *a a*, top slots *b b*, and side slots *e e*, rod *d'*, passing across said bottom slots near their rear ends, crank-axle *c*, having secured to it catches *d d*, working in the upper slots *b b*, follow-blocks E, having the pins *f f f' f'* and grooves *g g*, and plunger F, operated by mechanism substantially as shown and described.

480,382.

480,383. WAGON END-GATE. BENJAMIN F. CLARK, Harper, and JAMES C. CARRICK, Spivey, Kans. Filed Sept. 10, 1890. Serial No. 364,579. (No model.)

Claim.—1. The combination, with a wagon-body having a plate on the inner side of one of its side walls provided with a notch, of a removably-hinged end-gate carrying a latch-casing, as described, a pivoted latch arranged in said casing and having a hook to engage the notched plate in the side wall, and the operating-lever having the double cams at one end to bear in the walls of said latch-casing and pivotally connected with the latch, substantially as specified.

2. A wagon end-gate having a latch-casing secured thereto, in combination with the lever having the double cam at one end, arranged to bear in the walls of the casing, and the hooked latch pivotally connected with said lever and adapted to receive a vertical and lateral oscillating motion, substantially as specified.

3. The combination, with a wagon-body, of the plate B, having the vertically-disposed flange on its inner side, the flanges at its upper and lower ends and also the studs or pintles at opposite ends, the plate D, having the vertical flange on its inner side, the beveled lug and the flanges at opposite ends and also provided with the notch, the end-gate having the lug-eye and hook near one end and the latch-casing near its opposite end, and the pivoted oscillating latch having the hook at one end and the lever pivoted to said latch and having the double cam at said pivoted end, substantially as specified.

480,384. GALVANIC BATTERY. HERBERT H. DOW, Midland, Mich., assignor of two-thirds to Albert H. Smith and John C. Hale, Cleveland, Ohio. Filed Apr. 4, 1892. Serial No. 427,589. (No model.)

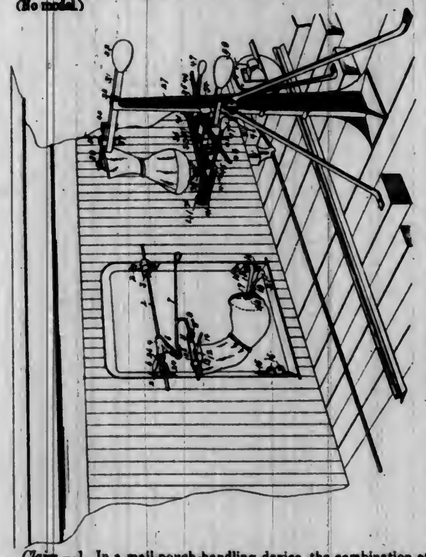
Claim.—1. In an electro-galvanic battery, the combination, with couples of zinc and bibulous carbon elements having a non-liquid electrolyte between them, of a layer of a granular conductor arranged between the zinc of one couple and the carbon of another couple, substantially as set forth.

2. In an electro-galvanic battery, the combination of a zinc element, a bibulous sheet moistened with the electrolyte, and a layer of finely-pulverized carbon, substantially as set forth.

3. In an electro-galvanic battery, the combination, with a positive and a negative element and an interposed sheet of bibulous substance moistened with a deliquescent salt, of a porous and non-conducting box inclosing said elements and sheet, substantially as set forth.

4. In an electro-galvanic battery, the combination of couples of zinc and carbon elements having a deliquescent electrolyte between them, layers of granular coke between said couples, and a porous and non-conducting box inclosing said couples, substantially as set forth.

5. In an electro-galvanic battery, the combination of couples of zinc and carbon elements having a deliquescent electrolyte between them, layers of granular coke between said couples, and a non-conducting box inclosing said couples and layers and having air-holes registering with said layers, substantially as set forth.



6. In an electro-galvanic battery, a central positive element, pairs of bibulous sheets containing the electrolyte, and pairs of negative elements arranged in opposite order at opposite sides of the central element, substantially as set forth.

7. In an electro-galvanic battery, couples having their elements facing in opposite directions and arranged in opposite order from a central positive element, and layers of a granular conducting material between said couples, substantially as set forth.

8. In an electro-galvanic battery, an inclosing-box of non-conducting material having openings for the admission of atmospheric air into its interior, a positive element arranged in the middle of the box and having a binding-post connection upon the exterior of the box, sheets of bibulous non-conducting material placed against the faces of said element and moistened with a solution of a deliquescent salt, negative elements of porous and bibulous material placed against said sheets, layers of granular conducting material placed against said negative elements, positive elements placed against said layers, sheets of bibulous non-conducting material placed against said positive elements and moistened with a solution of deliquescent salt, negative elements of porous and bibulous material placed against said sheets, layers of granular conducting material placed against said negative elements, and metallic conducting-sheets placed against said layers and having united binding-post connection upon the outside of the box, substantially as set forth.

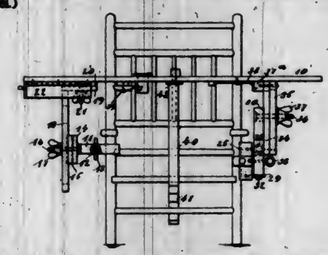
9. In an electro-galvanic battery, the combination, with couples of zinc and bibulous carbon elements having between them a solid non-conducting substance moistened with a solution of a deliquescent salt, of a layer composed of a granular conductor which is arranged between the zinc of one couple and the carbon of another, substantially as set forth.

480,385. MAIL-BAG CATCHER AND DELIVERER. AUGUSTUS P. HAINS, New Albany, Ind. Filed Nov. 3, 1891. Serial No. 410,735. (No model.)

Claim.—1. In a mail-pouch-handling device, the combination of the horizontal bar, the casting mounted thereon and having the operating-handle, the catcher-arm 7, mounted in said casting, the curved delivery-arm 9, and the spring-clamp consisting of the tubular body 10, fitting the end of the delivery-arm, means for retaining the said body in position on the arm end, and the pivoted spring-actuated clamping-finger 13, mounted on the tubular body, substantially as set forth.

2. The combination, with an end clasp arranged at the lower part of the car-door and the reversible horizontal bar 1, of the casting mounted on said bar and having the operating-handle and the catching and delivering arms 7 and 9, and the spring-clamp mounted on the end of the delivering-arm, consisting of the tubular body 10 and the pivoted spring-actuated clamping-finger 13, substantially as set forth.

3. The combination, with the crane-arms, of the pivots 36, formed at their outer ends with the recessed heads 38, the finger 39, pivoted in said recessed heads, and the hooks 40, adapted to engage the inner ends of the fingers when the latter are "set," substantially as set forth



4. The combination, with a crane-post, of a block secured thereto and a mail-bag receiver secured to said block, said receiver consisting of a flat metallic band, the ends of which are bolted to the flat sides of the block and which band is doubled upon itself to form the broad semicircular receiving ends, substantially as set forth.

5. The combination, with a pivoted crane-arm, of the double collector and receiver consisting of a band of metal curved upon itself to form the long outer arms 41, having the broad semicircular ends $41^{\times}$ curved at the points 41^{a}, and the short inner arms 42, substantially as set forth.

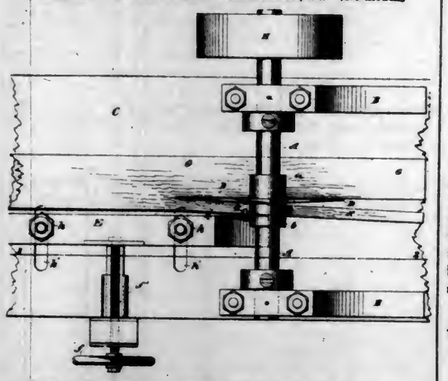
6. The combination, with the pivoted lower crane-arm, of the automatic double receiver consisting of the body-piece bent to form the long outer arms 41, curved at the points 41^{a}, and the short inner arms 42, recessed at their ends to form the lugs 43, and the automatic guards pivoted in the said recessed ends and formed with the inner arms, the middle arms 46, and the weighted outer arms 47, substantially as and for the purpose set forth.

7. A mail-bag receiver consisting of a single piece of material, the intermediate portion of which upon each side of the center is doubled upon itself to form a receiving-arm, the doubled portion being formed into substantially a semicircle at the outer end of the arm and extended nearly to the center of the main portion of the material and then bent at an angle thereto and extended parallel with the similarly-bent portion of the other arm to form a point of attachment to the crane-post, and each end being then bent outwardly in the same plane with the arm upon that side to form a receptacle for the mail-bag, substantially as set forth.

480,386. DESK ATTACHMENT FOR CHAIRS. MILTON C. HUTTON, Georgetown, Tex. Filed Oct. 28, 1891. Serial No. 410,082. (No model.)

Claim.—1. In a desk attachment for chairs, &c., the combination, with a board, of a slotted bar having its upper end pivotally and adjustably secured to the board, a clamp toothed disk between the clamp and slotted bar and engaging each other, a bolt passing through the clamp, the toothed disks, and the slotted bar, and a nut on said bolt, substantially as described.

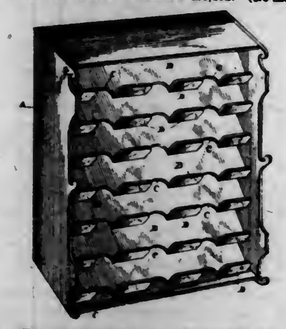
2. In a device of the character described, the combination, with a clamp, disks carried by the clamp, having their opposed surfaces toothed, and a board or table located above the clamp and disks, of a bar adjustably connected with the disks, a tension device controlling the bar and the disks, a platform connected with the bar and provided with a slot, and an adjusting-screw connected with the table and passed downward through the slot in the platform, as and for the purpose specified.



3. In a desk attachment for chairs, &c., the combination, with a board, a slotted bar having its upper end pivotally and adjustably secured to the board, and a clamp to which the said bar is adjustably secured, of a second clamp, a bar detachably connected to the clamp, and links pivotally connected to the board and adjustably secured to the said bar, substantially as described.

4. In a device of the character described, the combination, with a board or table, a bar having a pivotal and adjustable connection with the table, a clamp, disks carried by the clamp, having their engaging surfaces toothed, and an adjusting-screw carried by the clamp, controlling the disks and the bar, of a second clamp provided with a socket and a guide device, a bar slotted to receive the guide device and fitted into the socket of the clamp, and links adjustably secured to the upper end of the bar, the said links being pivotally connected with the board or table, as and for the purpose specified.

5. In a device of the character described, the combination, with a board or table, a bar having a pivotal and adjustable connection with the table, a clamp, disks carried by the clamp, having their engaging surfaces toothed, and an adjusting-screw carried by the clamp, controlling the disks and the bar, of a second clamp provided with a socket and a guide device, a bar slotted to receive the guide device and fitted into the socket of the clamp, links adjustably secured to the upper end of the bar, the said links having an adjustable hinged connection with the board or table, and means, substantially as described, for locking the links, as and for the purpose specified.



6. In a device of the character described, the combination, with a board or table, a bar having a pivotal and adjustable connection with the table, a clamp, disks carried by the clamp, having their engaging surfaces toothed, and an adjusting-screw carried by the clamp, controlling the disks and the bar, of a second clamp provided with a socket and a guide device, a bar slotted to receive the guide device and fitted into the socket of the clamp, links adjustably secured to the upper end of the bar, the said links having an adjustable hinged connection with the board or table, means, substantially as described, for locking the links, a stop-bar attached to the under face of the table, a rest-bar pivotally connected with the top of the table, and a supporting-bar provided with a toothed or notched lower end and adapted for engagement with the stop-bar, as and for the purpose specified.

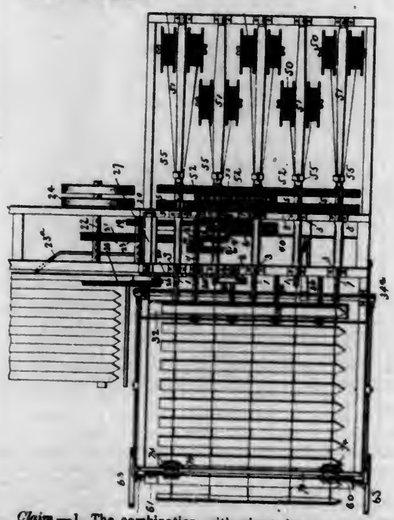
480,887. ROTARY-BLADE CUTTING-MACHINE. FREDERICK KIRCHER, New York, N. Y., assignor of one-half to Ludwig Gloeckner, same place. Filed Oct 5, 1891. Serial No. 407,762. (No model.)

Claim.—The combination of the rotary cutter D, mounted upon a shaft A and having one or more beveled knife-blades *d*, with the gage E facing the bevel of the blade and having that portion which is nearest the blade parallel with the bevel thereof, substantially as and for the purpose described.

480,888. BOOK OR BLANK CASE. ROY MILLER, Alma Centre, Wis. Filed Feb. 3, 1892. Serial No. 420,192. (No model.)

Claim.—The combination, with an inclosing case, of a series of forwardly-inclined shelves fixedly secured at an angle within said case parallel with and in close proximity to each other, the same inclining downwardly from their rear edges at the back of the case to the front thereof and provided at their front lower edges with upwardly-extending right-angularly-disposed retaining-flanges and a series of finger-notches interrupting said flanges at regular intervals, substantially as set forth.

480,889. DUST-BEATER. JEREMIAH J. SLATTERY, Lansingburg, N. Y. Filed Oct. 8, 1891. Serial No. 408,300. (No model.)



Claim.—In a dust-beater, the combination, with a handle made with the holder B, having forked arms G G, of the loop of helically-coiled wire D at its ends, each arranged to encircle and to be secured to one of the forked arms of the said holder, substantially in the manner as and for the purposes set forth.

480,890. SPARK-ARRESTER. EDGAR W. SMITH and CONSTANTINE SAX, Morris, Minn. Filed Feb. 3, 1892. Serial No. 420,206. (No model.)

Claim.—A spark-arrester comprising an outer foraminous casing forming the upper portion of a smoke-stack and consisting of a lower conical portion and an upper conical portion having a truncated top forming an opening, and an inverted foraminous cone supported within the casing and arranged concentric with the lower portion of the same and having its upper end or base of greater diameter than the opening of the top of the casing, substantially as and for the purpose described.

480,891. SLAT-AND-WIRE-FENCING MACHINE. JACOB B. SOLT and JAMES B. SOLT, Northbrook, Pa. Filed Aug. 26, 1891. Serial No. 403,826. (No model.)

Claim.—1. The combination, with wire-twisters, one of which is provided with different-sized gear-wheels, of a shaft in proximity to said twister having different-sized gear-wheels thereon, said wheels adapted to be shifted, whereby to change the speed and number of rotations of the twisters, substantially as set forth.

2. The combination, with twisters, one of which is provided with gear-wheels of different sizes, of a shaft having different-sized gear-wheels adapted to be shifted to change the speed of the twisters, and means for locking the twisters temporarily when they have made the requisite number of revolutions, substantially as set forth.

3. The combination, with twisters and means for regulating the number of their revolutions, of a pawl for automatically locking the twisters when they have made the required number of revolutions, and means for automatically unlocking the twisters, substantially as set forth.

4. The combination, with a series of twisters, of a constantly-rotating gear-wheel having a portion of its teeth widened, and a gear-wheel arranged to communicate motion to the twisters, said wheel located in position to be operated periodically by the widened teeth of the large gear-wheel, substantially as set forth.

5. The combination, with the main frame and a sliding table, of a rocking shaft having crank arm thereon, a toggle-joint extending from the main frame to the sliding table, and a link extending from the crank-arm to the toggle-joint, substantially as set forth.

6. The combination, with a frame and table constructed to slide thereon, of a rocking shaft having arms thereon, means for rocking the shaft, toggle-joints connecting the sliding table and the frame, and links extending from the toggle joints to the arms on the rocking shaft, substantially as set forth.

7. The combination, with a sliding table and gearing, of a rocking shaft connected with the table and adapted to slide the latter, a lever connected with the shaft, and means on the gearing for swinging the lever whereby the shaft is rocked, substantially as set forth.

8. The combination, with a sliding table and means for sliding it outward and locking it, of independent lever mechanism for swinging the shaft in the opposite direction at a predetermined interval, whereby the table is returned to its normal position, substantially as set forth.

9. The combination, with a sliding table, means for sliding same outward, of a rocking shaft, a bell-crank lever connected therewith, and independent lever mechanism for swinging the latter, whereby the shaft is rocked to its normal position, substantially as set forth.

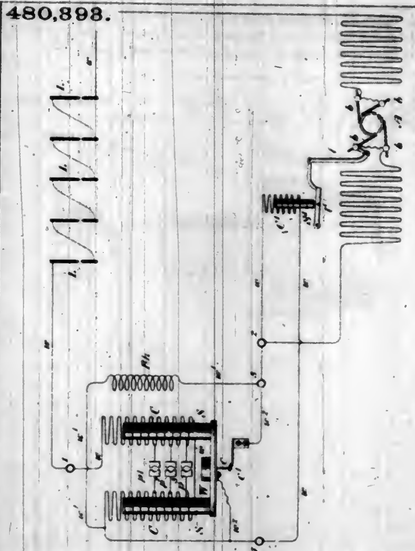
10. A fence-making machine, a tension device consisting of a support, a plate secured thereto and provided with outwardly-projecting ends, said ends having upturned flanges at their edges, a spring-plate having ends adapted to lie between the upturned flanges of the ends, and a screw swiveled in the support and passing through a threaded hole in the spring-plate, substantially as set forth.

11. The combination, with a reel, levers, pitmen having sliding connection with the levers, and a shaft for automatically sliding the pitmen with the increased size of the roll, said shaft having rollers thereon, of rocking levers with which the pitmen are adjustably connected, a rocking shaft, and pitmen connecting the latter with the rocking levers, substantially as set forth.

480,892. METHOD OF ELECTRIC SOLDERING. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson Electric Welding Company, of Maine. Filed Aug. 22, 1887. Serial No. 247,507. (No specimens.)

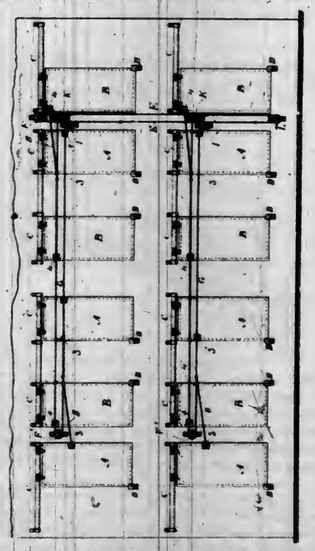
Claim.—1. The herein-described improvement in soldering or brazing, which consists in generating heat in the body of the piece or pieces of metal to be united through the resistance of the material to the passage of an electric current through it, such current being of volume sufficient to develop the determinate or required soldering or brazing temperature.

2. The herein-described improvement in soldering or brazing, which consists in generating heat in the body of the pieces to be joined through the resistance to the passage of an electric current through the pieces and from one to the other across the point of junction, as and for the purpose described.



480,893. METHOD OF ELECTRICAL REGULATION. HENRY E. VINNING, Roseville, N. J., assignor to the Electric Secret Service Company, New York, N. Y. Filed Feb. 23, 1892. Serial No. 422,535. (No model.)

Claim.—1. A series of arc lights adapted to operate effectually between specified current-limits, a dynamo electric machine in circuit therewith, a primary electro-magnetic regulator therefor, and a supplemental electro-magnetic regulator provided with adjustable means in the nature of sectional coils for varying the current-supply which actuates the primary regulator, substantially as described.

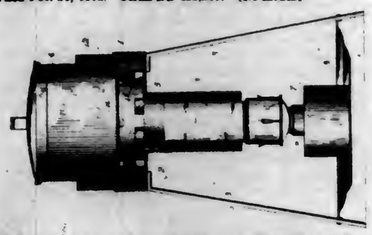


2. One or more electric translating devices adapted to operate effectually between specified current-limits, a dynamo-electric machine in circuit therewith, and a primary electro-magnetic regulator, in combination with a supplemental electro-magnetic regulator having sectional coils and means for throwing more or less of the coils into and out of circuit, whereby the current-supply may be maintained at a fixed quantity within the limits specified, substantially as described.

3. Two or more electric lamps located in series with a dynamo-electric machine and adapted to work effectually between specified current-limits, a current-regulator for regulating the supply of current to the lamps, and a supplemental regulator provided with sectional coils, and means for varying the number of such coils in circuit, substantially as described.

480,898.

480,894. FIRE PROTECTING-SHUTTER. WILLIAM H. BRODER, Plainfield, N. J. Filed Oct. 19, 1891. Serial No. 409,090. (No model.)

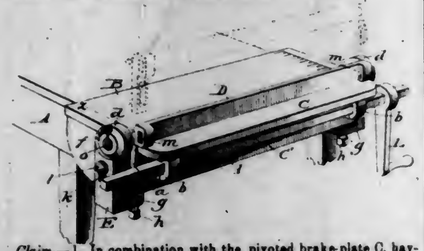


Claim.—1. The combination, with two or more horizontally-moving shutters for a building, of a rope or chain around a pulley, with the two portions of such rope or chain passing horizontally and adjacent to the shutters, and a connection from one part of such rope or chain to one shutter and from the other part to the other shutter for giving the shutter a positive motion in opposite directions in opening and closing the same, and a winch or other suitable connection for giving motion to such rope or chain, substantially as set forth.

2. The combination, with the fire-shutters and the tracks or supports for the same, of halyards passing up the building and over a sheave, a winch or other suitable mechanism for moving the same, one or more lateral ropes or chains with the ends connected to the hal-

yards, pulleys for such lateral rope or chain, and connections from one portion or the other to the shutters, whereby such shutters can be opened or closed in opposite directions, substantially as set forth.

480,395. LAMP-STOVE. BENJAMIN F. BROWN, Blackstone, Kans. Filed Feb. 20, 1892. Serial No. 422,283. (No model.)

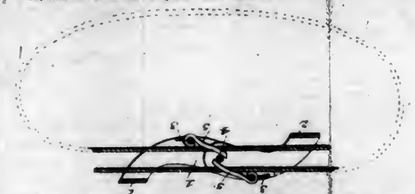


Claim.—1. A lamp-stove comprising a cylindrical body having a flat bottom with a hole therein, legs supporting the body, a cylindrical support arranged within the body and having a cylindrical extension arranged within the hole of the body and depending therefrom, and a lamp supported beneath the body and having its chimney arranged within the extension, substantially as described.

2. A lamp-stove comprising a cylindrical body having a flat bottom with a hole therein, legs supporting the body, a cylindrical support arranged within the body and provided with a depending extension arranged within the hole and consisting of concentric tubes, and a lamp supported beneath the body and having its chimney arranged within the extension, substantially as described.

3. A lamp-stove comprising a cylindrical body provided with a removable upper section and having a flat bottom with a hole therein, legs supporting the body, a cylindrical support arranged within the body and having a depending cylindrical extension arranged in said hole, a supplemental support arranged within the cylindrical support and consisting of a strip of metal successively doubled on itself, and a lamp supported beneath the body and having its chimney arranged within the extension, substantially as described.

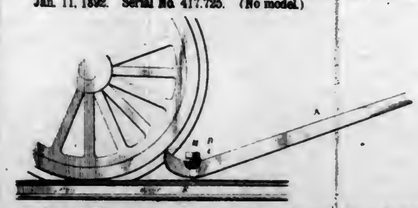
480,396. SHEET-METAL-BENDING MACHINE. JASPER CLARK, Elmira, N. Y., assignor to T. C. Northcott and Cynthia J. Clark, same place. Filed Apr. 2, 1892. Serial No. 427,497. (Model.)



Claim.—1. In combination with the pivoted brake-plate C, having the shaft I mounted in bearings secured to or formed thereon, the detachable brake-bar D, mounted on said plate and provided with pendants or arms *a*, arranged to engage with projections on the shaft I when the latter is turned to swing the brake-plate, whereby the brake-bar is caused to automatically clamp the sheet of metal fast on the brake-plate before the latter begins its movement, substantially as set forth.

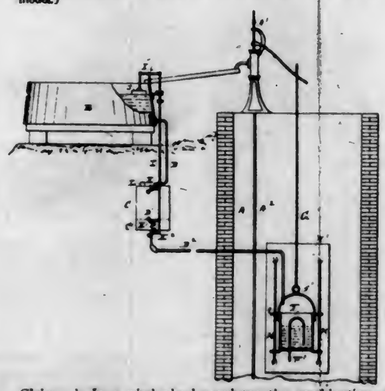
2. In combination with the stationary bed-plate B, the swinging or pivoted brake-plate C, with the brake-bar D held normally rigid when in use, but detachably connected to said brake-plate, substantially as described, whereby when the sheet has been bent into the form of a tube the brake-bar can be lifted from its seat and withdrawn from the tube, as set forth.

3. In combination with the movable brake-bar provided with the depending arms *a*, the levers *r*, provided with eccentrics arranged to bear against said arms and thereby raise the bar, the arrangement being substantially as shown and described.



4. In a machine for bending sheet metal, comprising a stationary bed and a pivoted brake-plate, and a pointer or index *o*, secured to the journal of the brake-plate and arranged to move therewith, in combination with the circular head or bearing *d*, provided with marks to indicate the various points at which the brake-plate is to be stopped in order to bend the sheet at a predetermined angle or angles, as set forth.

480,397. BUCKLE. THOMAS J. CLARK, Gila, N. Mex. Filed Apr. 29, 1892. Serial No. 431,140. (No model.)



Claim.—In a buckle, the combination of the side bars connected at their ends by cross bars 2, the intermediate cross bars having pivoted thereto the inwardly-extending tongues, and the central cross-bar intermediate of the free ends of the tongues, the said side bars being formed in sections and hinged to the central cross-bar, substantially as described.

480,398. PINCH-BAR. AUSTIN M. COLLETT, Omaha, Nebr. Filed Jan. 11, 1892. Serial No. 417,725. (No model.)

Claim.—The combination, with a pinch-bar having a threaded perforation in rear of the pinch end thereof, of an adjustable fulcrum-screw passed vertically through the perforation and provided at its upper end with a squared head and terminating below the bar in a conical heel or fulcrum-point, substantially as set forth.

480,399. AUTOMATIC WINDMILL-REGULATOR. EUGENE T. CROWE, Delray, Mich. Filed Jan. 25, 1892. Serial No. 419,113. (No model.)

Claim.—1. In a wind-wheel regulator, the combination of the movable counterbalance-bucket, reservoirs communicating one with another and with said bucket, means to control said communications, and a wheel-operating connection G, by which said bucket is suspended, substantially as described.

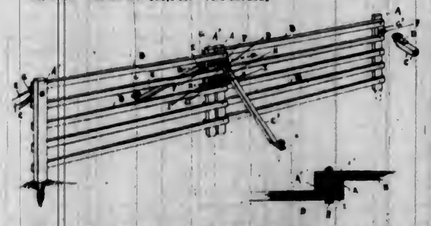
2. In a wind-wheel regulator, the combination of the counterbalance-bucket, a wheel connection suspending said bucket, an auxiliary reservoir communicating with said bucket, a main reservoir communicating with the auxiliary reservoir, a water-inlet pipe leading into the main reservoir, valves controlling said communications, and the valve controlling the communication between the reservoirs, arranged to close when the other valves are open, and vice versa, substantially as described.

3. In a wind-wheel regulator, the combination of the siphon-bucket, a wheel connection suspending the bucket, an auxiliary reservoir, a pipe D^4, leading from said reservoir to said bucket, a main reservoir communicating with the auxiliary reservoir, a water-inlet pipe leading into the main reservoir, valves to control the communication through the water-inlet pipe and between said reservoirs, the pipe D^3, provided with a pipe-arm D^5, projecting upward toward the top of the auxiliary reservoir, and a pipe-arm D^6, provided with a controlling-valve, and means for operating said valves, substantially as described.

4. In a wind-wheel regulator, the combination of the suspended bucket, an auxiliary reservoir communicating with the bucket, a main reservoir communicating with the auxiliary reservoir, and simultaneously-operated valves to control said communication, substantially as and in the manner described.

5. In a wind-wheel regulator, the combination of the suspended bucket, the auxiliary reservoir communicating therewith, the main reservoir communicating with the auxiliary reservoir, a stock-tank communicating with the main reservoir, and valves controlling said communications, said valves automatically operated by the quantity of water in the stock-tank, substantially as and in the manner described.

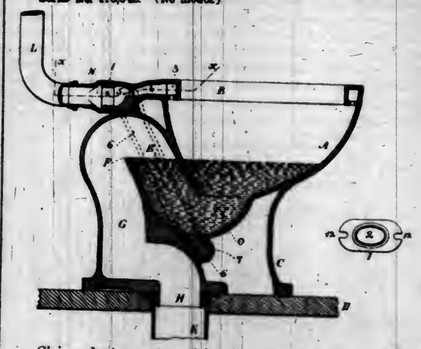
480,400. VALVE FOR PNEUMATIC TIRES. EDWARD R. DE WOLFE, New York, N. Y. Filed Apr. 18, 1892. Serial No. 429,523. (No model.)



Claim.—1. The herein-described air-valve, consisting, essentially, of a tubular cylindrical case with a flat seat at the upper end, a perforated cylindrical head screwing upon the said case with a flat inner portion forming a seat, and an air-retaining device for permitting the entrance of air but closing automatically to prevent its escape and having a ring or flange held between the seats of the respective parts where an air-tight joint is formed, substantially as set forth.

2. The herein-described air-valve, consisting, essentially, of a tubular cylindrical case *b*, a disk *b'*, connected to one end thereof and the other end threaded and having a seat at the upper end, a perforated cylindrical head *c*, having a tubular portion adapted to screw upon the case *b* and having an internal seat, an imperforate cap or cover *d* for closing the opening in the head *c*, and an elastic air-retaining device for permitting the entrance of air but closing automatically to prevent its escape, having a ring or flange held by the clamping action between the seats, where an air-tight joint is formed, substantially as set forth.

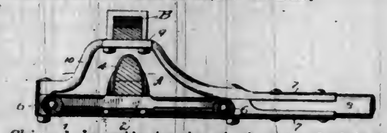
3. The combination, with the inflatable or hollow expansible tube *a*, of the tubular cylindrical case *b*, its disk *b'* molded into the tube *a*, its square shoulder b^3 and having its upper end reduced and threaded, the perforated and tubular cylindrical head *c*, having a knurled surface and screwing upon the case *b* and having a reduced and threaded portion, the imperforate cap or cover *d*, also having a knurled surface and closing the opening in the head *c*, the perforated plug *f* and head *f'* of hard rubber, and the soft-rubber sleeve *h* with a thickened end *h'*, substantially as set forth.



4. The herein-described air-valve, consisting, essentially, of a tubular cylindrical case *b*, a perforated cylindrical head *c*, screwing upon said case, and the longitudinally perforated hard-rubber plug *f*, having a head *f'* and rounded end, the soft-rubber sleeve *h* with a thickened end *h'*, and a closed end covering the opening in the plug and perforated at 20, substantially as specified.

480,401. FENCE. WILLIAM H. GASKILL, Canton, Ill. Filed July 24, 1891. Serial No. 400,546. (No model.)

Claim.—The herein-described fence, consisting of the following elements: the overlapping sections B B, provided with eyebolts F in the perpendicular end pieces, the blocks I I' and bolt H for connecting the panels, the side braces C C', having the hooks D E and perforated foot-plates, and the pins *c* for securing the braces to the ground, all substantially as described and shown.



480,402. WATER-CLOSET. EDWARD HANMANN, Brooklyn, assignor to The J. L. Mott Iron Works, New York, N. Y. Filed Dec. 30, 1891. Serial No. 416,542. (No model.)

Claim.—1. As a new article of manufacture, a water-closet, of porcelain or similar vitrified material in one piece, having a bowl A, a trap with an uptake E, downtake G, escape-pipe H and dam F, and a connection for the flushing-pipe, having a water-way 2, a branch connection 4 to the hollow flushing-rim, with an opening 5 in the deflecting-wall of the water-way 2, and a descending pipe or water-way 6 to the upward jet-pipe 7 at the bottom of the trap, the water-way 2 being in a vertical plane passing through the center of the bowl and the trap, substantially as set forth.

2. As a new article of manufacture, a water-closet, of porcelain or similar vitrified material in one piece, having a bowl A, a base or support C, a trap with an uptake E, downtake G, escape-pipe H and dam F, and a connection for the flushing-pipe, having a water-way 2, a branch connection 4 to the hollow flushing-rim, with an opening 5 in the deflecting-wall of the water-way 2, and a descending pipe or water-way 6 to the upward jet-pipe 7 at the bottom of the trap, the water-way 2 being elliptical, substantially as set forth.

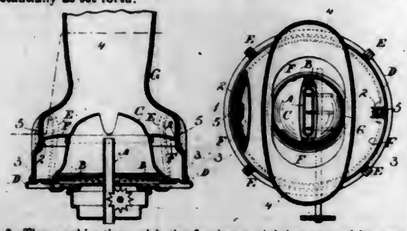
480,403. FIFTH-WHEEL. ADOLPH E. HERMAN, Terre Haute, Ind. Filed Oct. 21, 1891. Serial No. 409,427. (No model.)

Claim.—1. In combination, the axle, the section I of the fifth-wheel secured thereto, a second section 6, supported by the first, and the arched brace extending over the sections and connected to the second section 6, and the spring carried by said arch, substantially as described.

2. In combination, the axle, the fifth-wheel comprising the two sections beneath the axle, one section being secured thereto, the arched brace extending from side to side of the second section 6, said arch extending over the axle and being free therefrom, and a spring supported thereon, substantially as described.

3. In combination, the two sections arranged in the same horizontal plane with their vertical faces adjacent to each other, means for holding the sections together, means for supporting the inner section to the axle and beneath the same, the arched brace extending over the axle and connected to the outer section, and the spring supported upon said arched brace, substantially as described.

4. In combination, the fifth-wheel comprising the first section secured to the axle, the second section supported by the first, the reach connected to the second section and converging into a plate 9 above the axle, and an extension 10, curving downwardly and connected with the second section 6 at the front side thereof, substantially as described.



5. In combination, the two sections, one secured to the axle and the other to the frame, the said sections having their meeting faces inclined and grooved at the connecting means between the sections in the grooves.

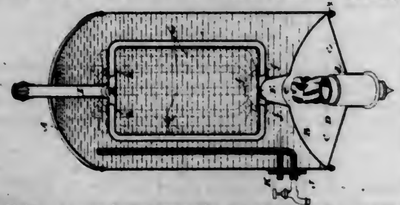
480,404. LAMP-BURNER. THOMAS HIPWELL, Long Island City, assignor to the Manhattan Brass Company, New York, N. Y. Filed Feb. 25, 1892. Serial No. 422,755. (No model.)

Claim.—1. The combination, with the lamp-burner having a flat wick-tube and a cone or deflector, of an annular flange around such

cone or deflector, having notches at opposite edges thereof, and the flattened-bulb glass chimney having a nearly-cylindrical base and inwardly-pressed guides at opposite sides thereof to pass into the notches of the annular deflector, substantially as set forth.

2. The combination, with the flat wick-burner having a perforated air-distributer, chimney-rest, and springs, of a cone or deflector, an annular flange around such cone or deflector and attached thereto and having notches in the opposite edges, and a flattened-bulb glass chimney having inwardly-pressed guides at opposite sides to the base thereof, adapted to be received into the notches of the annular flange substantially as set forth.

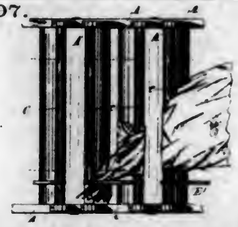
3. The combination, with the flat lamp-wick burner and its cone or deflector, of an annular flange fastened to such cone and having a notch in the edge thereof and a chimney having a flattened bulb and an inwardly-pressed guide adapted to be received into the notch of the annular flange, substantially as set forth.



480,405. PROCESS OF TREATING ORES CONTAINING HYDRATED SESQUIOXIDE OF IRON. CLEMENS JOHNS, Easton, Pa. Filed May 23, 1892. Serial No. 434,055. (No specimens.)

Claim.—1. The process of treating iron ore containing hydrated sesquioxide of iron, which consists in converting the hydrated sesquioxide of iron into an anhydrous and magnetic sesquioxide of iron by roasting the ore without fusion and then subjecting the roasted ore to the action of magnets to separate the magnetized oxide of iron from the non-magnetic portion of the ore, substantially as described.

2. The process of extracting iron from low-grade ore containing hydrated sesquioxide of iron, which consists in converting the hydrated sesquioxide of iron into an anhydrous and magnetic sesquioxide of iron by roasting the ore without fusion, subjecting the roasted ore to the action of magnets to separate the magnetized oxide of iron from the non-magnetic portion of the ore, and reducing the metal from the magnetic concentrates, substantially as described.

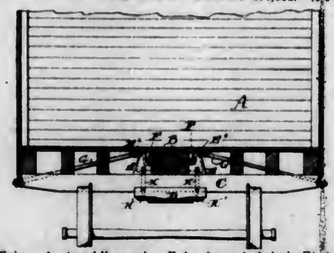


3. The process of treating the run of the mine of brown ore, which consists in screening to separate the lumps of ore from the fine material, roasting the fine material without fusion to convert the hydrated sesquioxide of iron contained therein into an anhydrous and magnetic sesquioxide of iron, and separating the magnetized oxide of iron from the non-magnetic material by the action of magnets, substantially as described.

480,406. HOT-WATER HEATER. WILLIAM KENNEDY, Newmarket, Canada. Filed Apr. 11, 1891. Serial No. 388,446. (No model.)

Claim.—A water-heater comprising an outer casing, a concave piece extending entirely across the casing and constituting the bottom of the same, and a supplemental bottom, also extending entirely across the casing, both secured to the said casing at its lower end and forming a fire-box permanently carried thereby and constituting the bottom closure for the casing, the collar F, forming a supplemental fire-box within the casing and above the main fire-box, a pipe E, connecting the main and supplemental fire-box, and the circulating pipes leading from the supplemental fire-box F, the said supplemental bottom having an opening adapted to fit over a burner, substantially as described.

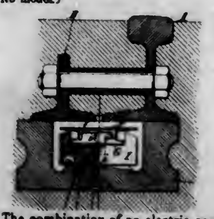
480,407. DRIER FOR PAPER-MACHINES. THOMAS LINDSAY, Brookville, Ind. Filed Feb. 14, 1891. Serial No. 381,416. (No model.)



Claim.—1. In a drier for paper-machines, the combination of the drying-rolls, the felt-carrying rolls and paper-carrying rolls, an endless carrier for conveying the leading end of the paper web when started through the drier, said carrier being arranged around the faces of the drying-rolls and web-carrying rolls to follow the travel of said web outside of and parallel to its edge, substantially as hereinbefore set forth.

2. In a drier for paper-making machines, substantially as described, the combination of a pair of tapes arranged one above the other and passing around the drying-rolls and paper-carrying rolls alongside of and parallel to the paper web to grasp the leading end of the paper web upon starting it through the drier and to assist in revolving the paper-carrying rolls and releasing the web from strain.

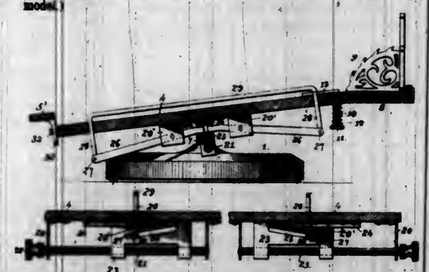
3. In a drier for paper-machines, the combination, substantially as hereinbefore set forth, of the drying rolls, the felt carrying rolls and paper-carrying rolls, and the web-carrying felt, with the tape E, carried with the felt around the bottom and side of the rolls and over the paper carrying rolls, and the endless tape E', passing over the pulleys F and F', thence under and around the drying-rolls with the felt and over the paper-rolls with the tape E, said tapes being arranged to travel outside of and parallel to the edge of the paper web for the purpose of carrying the leading end of said web through the driers, substantially as shown as described.



480,408. CENTER-PLATE FASTENING. CHARLES LINDSTROM, Altoona, Pa. Filed May 5, 1892. Serial No. 431,852. (No model.)

Claim.—1. A saddle-casting E, having a bolt-hole E^4 through its bottom and a key-seat E^5 at the top of said hole, substantially as shown and described.

2. In combination, the body-bolster C, a saddle casting or castings secured above the body-bolster and having bolt-holes E^4 and key-seats E^5, as described, a center plate D, bolts H, arranged to hold the center plate and having slotted ends H^3, extending through the holes E^4 of the saddle-castings, and keys I, adapted to enter the slotted bolt ends and rest in seats E^5.



480,409. CLOSED CONDUIT FOR ELECTRIC RAILWAYS. ALEXANDER L. LINEFF, London, England. Filed June 30, 1891. Serial No. 397,969. (No model.)

Claim.—1. The combination of an electric conductor and a series of separate supports therefor, provided with downwardly-projecting annular lips, and a continuous series of tiles serving as a base for said supports and provided with oil-troughs into which said annular lips enter, substantially as herein set forth.

2. The combination of the copper conductor G, of trough-like section, and the flexible iron conductor F, having junction-pieces *f* entering between the trough-like sides of the said conductor G for the purpose of preventing the said conductor F from moving otherwise than in a vertical direction, all substantially as herein set forth.

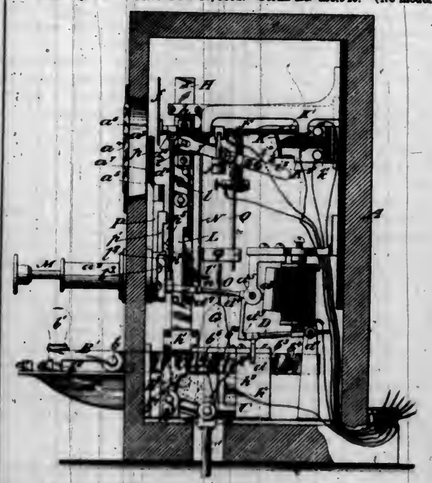
480,410. BOOK-HOLDER. CHARLES D. MERRIMAN and FRANK W. TILDEN, Hinsdale, N. H. Filed Nov. 14, 1891. Serial No. 411,899. (No model.)

Claim.—1. In a book-holder, the combination, with a stand and spring actuated leaf-clamping devices, substantially as described, near the upper corners thereof, of book-raising devices located near the side edges of the stand and each comprising a bar having downturned ends passing loosely through the stand and means for positively adjusting such ends through the stand, as and for the purpose set forth.

2. In a book-holder, the combination, with a stand, spring-actuated leaf-clamping devices near the upper corners thereof, and an adjustable bead, substantially as described, across each half of the lower edge of the stand, of book-raising devices located near the side edges of the stand and each comprising a bar having downturned ends passing loosely through the stand and means for positively adjusting such ends through the stand, as and for the purpose set forth.

3. In a book-holder, the combination, with a stand, spring-actuated leaf-clamping devices near the upper corners thereof, and positively-actuated book-raising devices near the side edges of the stand, of an adjustable bead in two sections across the lower edge of the stand, each section comprising a body having depending and longitudinally-slotted brackets, and set-screws passing through said brackets into the lower edges of the stand, as and for the purpose set forth.

4. In a book-holder, the combination, with a stand, positively-actuated book-raising devices near the side edges thereof, and an adjustable bead, substantially as described, across the lower edge of the stand, of leaf-clamping devices located near the upper corners of said stand, each of said devices consisting of a rod passing loosely through the hole in the stand, with its upper end bent at a right angle, a head at the lower end of the rod, and an expansive spring coiled on the rod between its head and the lower face of the stand, as and for the purpose set forth.



5. In a book-holder, the combination, with a stand and positively-actuated book-raising devices near the side edges thereof, of an adjustable bead in two sections across the lower edge of the stand, each section comprising a body having depending and longitudinally-slotted brackets, and set-screws passing through said brackets into the lower edge of the stand, as and for the purpose set forth.

6. In a book-holder, the combination, with the stand and a bead in two sections across the lower edge of the stand, each section being vertically adjustable, of book-raising devices located near the side edges of the stand, and each comprising a bar having downturned ends passing loosely through the stand, and means for positively adjusting such ends through the stand, as and for the purpose set forth.

7. In a book-holder, the combination, with a stand and a bead in two sections across the lower edge of the stand, each section being adjustable at right angles to the face of the stand, of book-raising devices, substantially as described, located near the side edges of the stand, and positive means for adjusting them independently, as and for the purpose set forth.

8. In a book-holder, the combination, with a stand having holes through its body near its side edges and a support for said stand, of book-raising devices located near the side edges of the stand and each comprising a bar standing over the face of the stand and having downturned ends passing loosely through said holes, levers pivoted to said ends, brackets carried by the stand and pivotally supporting the levers between their ends, a nut having an oblique slot loosely embracing the inner ends of said levers, and a threaded shaft journaled in bearings passing through said nut and having a milled knob on one end, as and for the purpose hereinafter set forth.

480,411. BLOCK-SIGNAL APPARATUS. THOMAS H. PATTERSON, Rahway, N. J. Filed Feb. 10, 1892. Serial No. 420,949. (No model.)

Claim.—1. The combination, with signal-operating mechanism and means for locking and releasing it independent of the signal operating mechanism, of means for controlling the unlocking of said mechanism from a remote point along the line, and means for controlling the locking of said mechanism from another remote point along the line, the said signal-operating mechanism when once unlocked being free to be repeatedly manipulated to denote "safety" or "danger" at pleasure until again locked, substantially as set forth.

2. The combination, with a plurality of signal operating mechanisms, of instruments for controlling the locking and unlocking of said operating mechanisms, one of the instruments being under the control of a succeeding instrument to unlock it, and hence the signal-operating mechanism connected therewith, and under the control of the passing train to permit the locking of the said signal-operating mechanism, and a movable stop under the control of the locking mechanism for preventing the unlocking of a preceding instrument while the signal-operating mechanism at the succeeding instrument remains unlocked, substantially as set forth.

3. The combination, with a sliding bar under the control of the operator, a movable part under the control of the sliding bar, and means for locking and releasing the signal-operating mechanism, also under the control of the sliding bar, of a latch for locking and releasing the sliding bar, means for operating the latch, a plunger, an electric circuit adapted to be closed by the plunger to unlock a remote instrument, and a plunger-locking device under the control of the aforesaid movable part to prevent the second operation of the plunger until the said sliding bar is returned to its normal position, substantially as set forth.

4. The combination, with the signal locking and releasing mechanism, of the normally twice-broken electric circuit for plunging to a preceding station and means for positively closing said circuit at the station to be plunged to for securing a release of the signal-locking mechanism, substantially as set forth.

5. The combination, with the signal locking and releasing mechanism, of the normally twice-broken electric-plunging and track-treadle circuits, a circuit-closer, and means for moving the circuit-closer successively into position to close the plunging-circuit and then in position to break the plunging-circuit and close the track-treadle circuit, substantially as set forth.

6. The combination, with the bar for mechanically unlocking and locking the signal-operating mechanism, of a gravity-latch for locking the said bar in position to lock the signal-operating mechanism and

in position to release the signal-operating mechanism and an electro-magnet for releasing the latch, the said latch being under the control of the said bar to allow it to fall into engagement with the bar, substantially as set forth.

7. The combination, with the bar for unlocking and locking the signal-operating mechanism, of a gravity-latch for locking said bar in its positions to lock and unlock the signal-operating mechanism, an electro-magnet for withdrawing the latch, and an indicator under the control of the latch to indicate "locked" or "unlocked," the said latch being under the control of the said bar to allow it to fall into engagement with the bar, substantially as set forth.

8. The combination, with the plunger and the plunger electric circuit, of the drop-plate through which the plunger passes to plunge and the movable section on the drop-plate, the latter having a sliding movement independently of the drop-plate in a direction transverse to the plunger, substantially as set forth.

9. The combination, with the plunger, the electric plunger-circuit, and the swinging contact-piece provided with a nose, of a drop-plate through which the plunger passes to plunge and a movable section carried by the drop-plate and provided with a nose adapted to interlock with the nose on the contact-piece, the said movable section having an extended dropping movement while the plunger is thrust in to carry its nose past the nose on the contact-piece, substantially as set forth.

10. The combination, with separate instruments at a station for controlling the movements of trains in opposite directions, of electric plunging-circuits, one in connection with each instrument, each circuit comprising a portion of the plunger-actuated circuit-closing mechanism of the other instrument to complete the plunging-circuit through its own electro-magnet, substantially as set forth.

11. The combination, with the means for connecting the sliding bar with the device for unlocking and locking the signal operating levers, of the sliding bar having a predetermined movement relatively to said connecting means without effecting the unlocking or locking, the latch for locking the bar and at the same time permitting said predetermined movement, the circuit-closer under the control of the said bar, and the normally twice-broken electric circuit adapted to be closed as to one of the breaks by said circuit-closer, substantially as set forth.

480,412. LAMP. JOHN C. PATTERSON and JOHN KIRBY, Jr., Dayton, Ohio, assignors, by mesne assignments, to Oliver Kinsey, trustee. Filed July 6, 1891. Serial No. 398,468. (No model.)

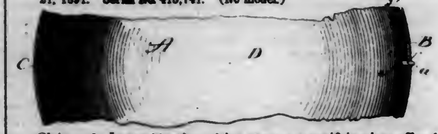
Claim.—1. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame being provided with outwardly-extending arms rigidly secured thereto and carrying shade-holders at their outer ends, which sustain shades over the burners, in combination with a dependent rotatable reservoir-support centrally pivoted to said hanger or frame and adapted to carry a plurality of reservoirs detachably connected therewith, and a fastening device for preventing undue rotation of said reservoir-support.

2. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame being provided with outwardly-extending arms rigidly secured thereto and carrying shade-holders at their outer ends, which sustain shades over the burners, in combination with a dependent rotatable reservoir-support centrally pivoted to said hanger or frame and adapted to carry a plurality of reservoirs detachably connected therewith, a fastening device for preventing undue rotation of said reservoir-support, and a stop for controlling the latter.

3. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame being provided with outwardly-extending arms rigidly secured thereto and carrying shade-holders at their outer ends, which sustain shades over the burners, in combination with a dependent rotatable reservoir-support centrally pivoted to said hanger or frame and adapted to carry a plurality of reservoirs detachably connected therewith, a fastening device for preventing undue rotation of said reservoir-support, a stop for controlling the latter, and means intermediate said hanger or frame and the reservoir-support, whereby a steady movement is imparted to the latter.

4. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame carrying shade-holder arms, to the ends of which are attached shade-holders sustaining shades over the burners, in combination with a dependent rotatable reservoir-support, a plurality of reservoirs detachably connected therewith, and a fastening device for locking said rotatable reservoir-support to said shade-holder arms.

5. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame carrying shade-holder arms, to the ends of which are attached shade-holders sustaining shades over the burners, in combination with a dependent rotatable reservoir-support, a plurality of reservoirs detachably connected therewith, a fastening device for locking said rotatable reservoir-support to said shade-holder arms, and a stop for controlling the movement of said reservoir-support.



6. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger carrying shade-holder arms, to the ends of which are attached shade-holders sustaining shades over the burners, in combination with a dependent rotatable reservoir-support, a plurality of reservoirs detachably connected therewith, a fastening device for locking said rotatable reservoir-support to said shade-holder arms, a stop for controlling the movement of the latter, and means intermediate said hanger or frame and said reservoir-support, whereby a steady movement is imparted to the latter.

7. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame carrying shade-holder arms, to the ends of which are attached shade-holders sustaining shades over the burners, in combination with a dependent rotatable reservoir-support, a plurality of reservoirs detachably connected therewith, and means for preventing undue rotation of said reservoir-support and for steadying said reservoirs in place, substantially as described.

8. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame carrying shade-holder arms, to the ends of which are attached shade-holders sustaining shades over the burners, in combination with a dependent rotatable reservoir-support, a plurality of reservoirs detachably connected therewith, means for steadying said reservoirs in place, and a stop for controlling the movement of said reservoir-support, substantially as described.

9. In a lamp, a main hanger or frame adapted to be rigidly suspended from a car-ceiling or other overhead support, said hanger or frame carrying shade-holder arms, to the ends of which are attached shade-holders sustaining shades over the burners, in combination with a dependent rotatable reservoir support, a plurality of reservoirs detachably connected therewith, means for steadying said reservoirs in place, a stop for controlling the movement of said reservoir-support, and means intermediate said hanger or frame and said reservoir-support, whereby a steady movement is imparted to the latter, substantially as described.

480,413. CHART. JONATHAN D. PRICE, Chicago, Ill. Filed Dec. 21, 1891. Serial No. 415,741. (No model.)

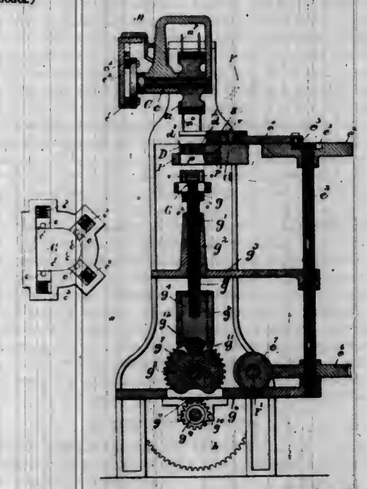
Claim.—1. In combination with a chart, a magnifying-lens affixed thereto at a desired point and a representation visible through said lens and in some way associated with the locality represented at the point of application of the lens, substantially as described.

2. In combination with a chart, a magnifying-lens affixed thereto at a desired point and a view upon the lens in some way associated with the locality represented at the point of application of the lens to the chart, substantially as described.

3. In combination with a globe A, a lens B, secured in an opening therein at a desired point, a suitable view observable through the lens in its position on the globe, and means for illuminating the interior of the globe, substantially as described.

4. In combination with a globe A, a lens B, secured in an opening therein at a desired point, a suitable view observable through the lens in its position on the globe, and an artificial light inside the globe, substantially as described.

5. In combination with a globe A, a lens B, secured in an opening therein at a desired point and provided with a view in some way associated with the locality represented at the point of application of the lens, and an artificial light inside the globe, substantially as described.



480,414. STOPPER-EXTRACTOR. RODOLO PUCCINI, Chicago, Ill. Filed Mar. 29, 1892. Serial No. 426,967. (No model.)

Claim.—1. In a stopper-extractor, the combination of a shank, a hook upon the end of the shank, a guard for the hook, and a cushion upon the shank adjacent to the hook, substantially as and for the purpose set forth.

2. A stopper-extractor comprising, in combination, a shank B, having a threaded extension *f* at one end and provided at its opposite end with a hook A, a guard C for the said hook, and a cushion D upon the shank adjacent to the hook, substantially as and for the purpose set forth.

480,415. HEEL-LOADING MACHINE. FREEMAN P. RAYMOND, 2d, Newton, Mass. Filed Feb. 11, 1889. Serial No. 299,517. (No model.)

Claim.—1. In a heel-loading machine, the combination of a cross-head, a rotary head supported thereby and carrying two gangs or groups of awls and two gangs or groups of drivers in the order named, each of the two groups of awls and two groups of drivers being of the same arrangement and adapted for use with the same templet, with the said single templet having holes d' and a heel-support having independent vertically and united horizontally operating adjusting devices in connection therewith, substantially as described.

2. In a heel-loading machine, the combination of a cross-head, a rotary head supported thereby and carrying two gangs or groups of awls and two gangs or groups of drivers in the order named, each of the two groups of awls and two groups of drivers being of the same arrangement and adapted for use with the same templet, with the said single templet having holes d' and a heel-support or former having independent vertically and united horizontally operating adjusting devices in connection therewith, and a single nail-carrier E to feed nails in successive order for each group of drivers, substantially as described.

3. In a heel-loading machine, the combination of a cross-head, a rotary head supported thereby and carrying two gangs or groups of awls and two gangs or groups of drivers in the order named, each of the two groups of awls and two groups of drivers being of the same arrangement and adapted for use with the same templet, with the said single templet having holes d' and a heel support or former having independent vertically and united horizontally operating adjusting devices in connection therewith, and a heel-blank carrier for moving heel-blanks in successive order between the templet and support, substantially as described.

4. In a heel-loading machine, the combination of a cross-head, a rotary head supported thereby and carrying two gangs or groups of awls and two gangs or groups of drivers in the order specified, each of the two groups of awls and two groups of drivers being of the same arrangement and adapted for use with the same templet, with the said single templet having holes d' and a heel-support having independent vertically and united horizontally operating adjusting devices in connection therewith, and the heel-side compressing or forming die, substantially as described.

5. The combination of a reciprocating cross-head, a rotary head supporting two gangs or groups of awls and two gangs or groups of drivers of the same arrangement and adapted for use with the same templet and alternated upon the head, as specified, and adapted to be automatically turned or rotated, the single templet D, having holes d', the single nail-carrier E, the cam e^4, having the cam-groove ℓ to operate the nail-carrier, as specified, and the heel-support G, having independent vertically and united horizontally operating adjusting devices in connection therewith, the cam g^7, constructed as specified, and intermediate connecting mechanism, substantially as described.

6. The combination, in a heel-loading machine, of the heel-support G with the heel-centering pins or arms o and coacting mechanism, substantially as described.

7. The combination, in a heel-loading machine, of the heel-support G with the pins or arms o, extending above the same and independently horizontally and vertically movable in relation to the support, and coacting mechanism, substantially as described.

8. The combination, in a heel-loading machine, of the die, the heel-support G, movable in relation thereto, and the vertical yielding arms or pins o and coacting mechanism, substantially as described.

9. The combination, in a heel-loading machine, of the templet D, the heel-support G, the spindle g', the post g^3, the slide-head g^4, and its adjustable head g^{12} and cam g^7, and coacting mechanism, substantially as described.

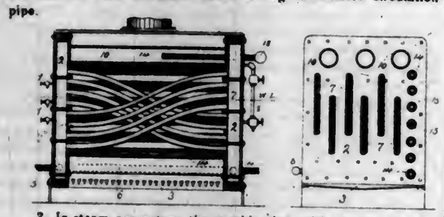
10. The combination, in a heel-loading machine, of the templet having a hole d' with a projecting spring-actuated pin M, carried by the rotary head a, and coacting mechanism, substantially as described.

11. The combination, in an organized heel-loading machine, of a reciprocating cross-head adapted to be continuously reciprocated, a head carried thereby supporting heel-pricking and nail-driving devices adapted to have continuous movement imparted to them to bring them automatically and successively into operative position, a single continuously-operated nail-carrier E, the single templet D, and the continuously-operated heel-support and pressure-block G, having independent vertically and united horizontally operating adjusting devices in connection therewith, the heel-blank carrier for feeding heels between the templet and heel-support and pressure-block, and an automatic nail-supplying machine for automatically supplying nails to the single nail carrier, substantially as described.

12. The combination of the reciprocating cross-head A, the cranks B, connecting-rods b', the gears b, shaft g^9, pinions f, and pulley-shaft F', the rotary head a, carried by the cross-head, the gangs or groups a^1 a^7 of awls and the gangs or groups a^4 a^{10} of drivers, the head-turning mechanism, templet D, having holes d', the nail-carrier E, having the holes e, the vertical shaft e^3, connected with the pulley-shaft by the worm-wheel e^5 and worm e^7, the cam e^4, having the cam-groove ℓ to engage the cam-pin of the nail-carrier, the pressure-head and heel-support G, spindle g', slide-head g^4, operating-cam g^7 on the shaft g^8, the gears g^{11} on said shaft, and the pinion g^{10} on the shaft g^9, which mesh with the gear g^{11}, substantially as described.

13. In a heel-loading machine, the combination of the templet D, the die, the heel support or former mounted upon a slide, the said slide, and a rotary cam g^7, constructed to operate the slide, as specified, substantially as described.

480,416. ART OF DESILVERIZING ARGENTIFEROUS LEAD. HEINRICH ROESSLER, Frankfort-on-the-Main, Germany, assignor of one-half to Bernhard Edelmann, same place. Filed June 13, 1891. Serial No. 396,186. (No specimens.) Patented in Germany June 20, 1890, No. 56,271.



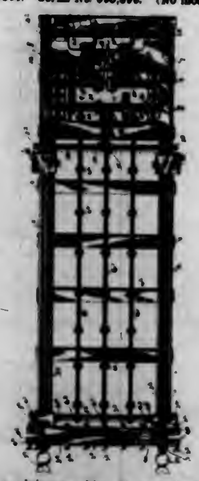
Claim.—The within-described improvement in the process of desilverization of argentiferous lead, consisting in fusing the lead with an alloy of zinc and aluminium in the proportions of not more than one-half of one per cent. of aluminium to the zinc.

480,417. STEAM-GENERATOR. THOMAS L. STURTEVANT and THOMAS J. STURTEVANT, Framingham, Mass. Filed Jan. 16, 1892. Serial No. 418,324. (No model.)

Claim.—1. In a steam-generator, the combination, with opposite headers constructed to form water-tight receptacles, of groups of in-

clined tubes arranged in series and communicating at their lower ends with the lower part of one header and at their upper ends with the upper part of the opposite header, and horizontal cross-tubes arranged in vertical series at the rear of the said inclined tubes, substantially as set forth.

2. In a steam-generator, the combination, with opposite headers, of oppositely-inclined groups of cross-tubes communicating at their lower ends with the lower part of one header and at their upper ends with the upper part of the opposite header, and a series of horizontal cross tubes forming transverse communications between said headers, each of said horizontal tubes having an interior circulation-pipe.

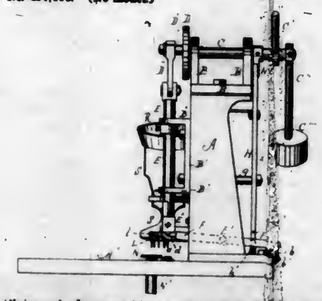


3. In steam-generators, the combination, with opposite headers and the oppositely inclined alternate groups of crossed tubes, of a series of horizontal cross-tubes uniting the headers and an interior circulating-pipe formed with an opening midway of its length and located within each horizontal tube, substantially as explained.

4. In a steam-generator, the water-tight headers, the oppositely-inclined alternate groups of curved steam-generating tubes, and one or more steam-collecting tubes which interconnect said headers, combined with a series of horizontal cross-tubes likewise uniting opposite headers and interior circulating-pipes apertured midway of their length and contained one within each cross-tube, substantially as set forth.

5 In a steam-generator, the opposite water-tight headers formed with their corresponding ends bent toward each other, combined with one or more groups of straight crossed tubes alternately oppositely inclined, which unite said headers, the exterior circulating-pipe 6, one or more steam-collecting pipes, and a series of cross-tubes, each adapted to contain a circulating-pipe formed with a lateral aperture, about midway of its length, all operating substantially as explained.

480,418. MINING-MACHINE. FRANK W. SYLER, Columbus, Ohio. Filed June 6, 1891. Serial No. 395,998. (No model.)

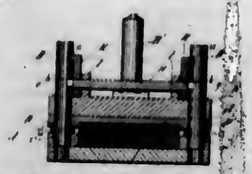


Claim.—1. In a mining-machine, the combination, with a moving frame and rotating shafts carried thereby, of sprocket-wheels on the forward portions of said shafts and a series of projecting cutters on the front faces of said sprocket-wheels, substantially as specified.

2. In a mining-machine, the combination, with a movable frame and rotating shafts carried thereby, of sprocket-wheels on said shafts, cutters 44, supported from the forward faces of said sprocket-wheels, cutting-chain 46, connecting said sprocket-wheels, as described, and cutters 44, supported and projecting from the forward faces of the links of said chain, substantially as specified.

3. In a mining-machine, the combination, with a movable frame and rotating shafts carried thereby, of sprocket-wheels on said shafts, cutting-tools 44, projecting from the forward faces of said wheels, drilling-tools supported in the forward ends of said shafts in front of said sprocket-wheels, and an endless chain connecting said wheels, as described, and having cutting-tools projecting forwardly from the forward face thereof, substantially as specified.

480,419. MACHINE FOR PUNCHING LEATHER LOOM-PICKERS. WILLIAM WADSWORTH, Fall River, Mass. Filed Apr. 29, 1892. Serial No. 431,188. (No model.)



Claim.—1. In a punching-machine, in combination, the punching-head E', provided with the awl *e*, said punching-head being rigidly secured to the plunger E, to which vertical reciprocating motion is imparted by a crank actuated by the driving-shaft, the lever F, provided with the clearing-fingers *d* and held normally up by the spring *b*, the notched lever H H', held normally in engagement with the lever F by the spring *h*, and the cam H", fast on the shaft C, substantially as set forth.

2. In a punching-machine, the mechanism for inserting the rivets in the picker, comprising the polygonal disk K and disk L, the latter having openings, as L', for holding rivets, said openings corresponding or coinciding with the sides of the disk K and both said disks being adapted to be rotated simultaneously, mechanism for feeding rivets into said openings, and mechanism, as the bed-plate N and vertically-reciprocating rod N', for pressing said rivets into previously-prepared perforations in the picker, substantially as described.

3. In a punching-machine, the mechanism for inserting the rivets in the picker, comprising the polygonal disk K and disk L, the latter having openings, as L', for holding rivets, said openings corresponding or coinciding with the sides of the disk K and both said disks being adapted to be rotated simultaneously, a spring secured to the frame and bearing against one of the flat surfaces of the disk K, mechanism for feeding rivets into said openings, and mechanism, as the bed-plate N and vertically-reciprocating rod N', for pressing said rivets into previously-prepared perforations in the picker, substantially as set forth.

480,420. APPARATUS FOR MAKING RUBBER STAMPS. JOSIAH C. BARTON, Brooklyn, N. Y. Filed June 22, 1891. Serial No. 397,010. (No model.)

Claim.—1. The combination of a base A, standards B, having shoulders *a*, removable chase C, removable cope D, removable follower E, connected levers F, and cams K, substantially as and for the purpose herein set forth.

2. The combination of a base A, standards B, having shoulders *a*, reversible cope D, removable chase C, removable follower E, and levers F, provided with cams K, the whole constructed and arranged for joint use and operation, substantially as and for the purpose herein set forth.

3. The combination of a base A, the standards constructed with shoulders *a b* at different distances from the base A, the removable chase C, removable and reversible cope D, follower E, connected levers F, and cams K, all substantially as and for the purpose herein set forth.

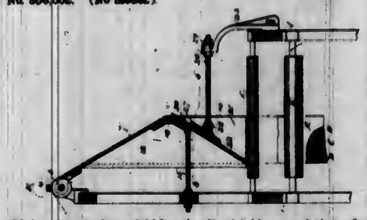
4. The combination of a base A, standards B, having shoulders *a*, springs G, removable chase C, removable cope D, removable follower E, connected levers F, and cams K, substantially as and for the purpose herein set forth.

5. The combination of a base A, standards B, having shoulders *a*, springs G, reversible cope D, removable chase C, and removable follower interchangeable with said cope upon said base and standards and having levers F, provided with cams K, the whole constructed and arranged for joint use and operation, substantially as and for the purpose herein set forth.

6. The combination of the base A, springs G, the standards constructed with shoulders *a b* at different distances from the base A, the removable chase C, removable and reversible cope D, follower E, connected levers F, and cams K, all substantially as and for the purpose herein set forth.

7. The combination of a base A, standards B, having shoulders *a*, reversible cope D, having opening *f*, removable chase C, having stud-stop I', and removable follower E, having levers F, provided with cams K, the whole constructed and arranged for joint use and operation, substantially as and for the purpose herein set forth.

480,421. VEHICLE. CHARLES COMSTOCK, Indianapolis, Ind. Filed May 11, 1891. Serial No. 392,266. (No model.)



Claim.—1. The combination of the body, the fixed front seat, the inclined strips secured to the inside of the body sides and extending under the fixed front seat to furnish supports for a rear seat under the front seat, the rear seat resting upon said strips, and means for locking it in either its upper or lower position.

2. The combination, substantially as specified, of the body A, the fixed front seat, the angle iron bars B, secured in an inclined position to its inner side walls and extending under the front seat, the sliding seat C, supported upon said bars and adapted to slide to either its elevated position at the rear of the body or to its lower position under the seat, and means to retain the seat in its elevated position, whereby the vehicle is changed from a single-seat to a double-seat wagon, and vice versa.

3. The combination of the body having a front seat, inclined ways for a sliding rear seat, the rear seat adapted to slide upon said ways, and the reversible back for the rear seat, substantially as shown and described.

4. The combination of the body, the front seat, the inclined angle-iron ways for the rear seat, extending under the front seat and having its horizontal web notched, the sliding rear seat, and the catch D, pivoted to rear seat, having its end hooked to engage under the angle-ways and its edge adapted to enter the notch in said way to retain the seat in its upper position, substantially as shown and described.

480,422. FOLDING-MACHINE. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed June 10, 1890. Serial No. 354,902. (No model.)

Claim.—1. A three-fold longitudinal folder consisting of a pair of internal side guides converging from points on each side of the central-fold line of the unfolded web to the front edge of the folded web, and a pair of external guides converging from the same points to the rear edge of the folded web, substantially as described.

2. A three fold longitudinal folder consisting of a pair of internal guides converging toward the central-fold line of the web, but terminating at points on each side of the central-fold line, a pair of internal side guides placed at an angle to the first pair and converging from said points to the front edge of the folded web, and a pair of external guides converging from the same points to the rear edge of the folded web, substantially as described.

3. The combination, with a fold-laying device, of a three fold longitudinal folder consisting of a pair of internal side guides converging from points on each side of the central-fold line of the unfolded web to the fold-laying device at the front edge of the folded web and a pair of external guides converging from the same points to the fold-laying device at the rear edge of the folded web, substantially as described.

4. The combination, with a fold-laying device and feeding mechanism, of a three-fold longitudinal folder consisting of a pair of internal side guides converging from points on each side of the central-fold line of the unfolded web to the fold-laying device at the front edge of the folded web and a pair of external guides converging from the same points to the fold-laying device at the rear edge of the folded web, substantially as described.

5. In a longitudinal folder, the combination, with internal side guides 13 14, of external guides 23 24, extending between said guides, said internal and external guides converging from a point on each side between the central-fold line and side lines of the unfolded web, the internal lines converging to the front edge and the external guides to the rear edge of the folded web, substantially as described.

6. In a longitudinal folder, the combination, with internal side guides 13 14, of external guides 23 24 between said guides, said internal and external guides converging from a point on each side between the central-fold line and side lines of the unfolded web, the internal guides converging to the front edge and the external guides to the rear edge of the folded web, and internal converging guides 8 9, over which the web is led to the side and external guides, substantially as described.

7. In a longitudinal folder, the combination of the internal converging guides 8 9, transverse guide 10, the internal converging side guides 13 14, and the external converging guides 23 24, inclined rearward between the side guides, substantially as described.

8. In a longitudinal folder, the combination of internal converging side guides 13 14 and the external converging guides 23 24, inclined rearward between the side guides, and means for adjustably supporting said external guides, substantially as described.

9. In a longitudinal folder, the combination, with the fixed body 7 and fixed side guides 13 14, of interchangeable nose-pieces 17 22, whereby the folder may be capacitated to impart either one or a plurality of folds to the material, substantially as described.

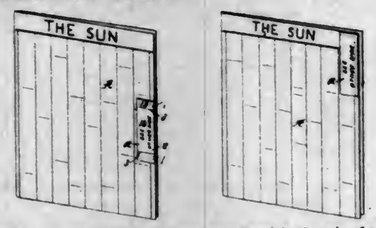
10. The combination, with the fixed body 7 and side guides 13 14, of the removable nose-piece 22, carrying external guides 23 24, substantially as described.

11. The combination, with longitudinally-adjustable supporting-rod 26, of the nose-piece 22, having an adjustable swinging connection with rod 26, and the side guides 13 14, substantially as described.

480,423. METHOD OF PREVENTING FRAUD IN THE SALE OF NEWSPAPERS AND OTHER PUBLICATIONS. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Feb. 5, 1891. Serial No. 380,894. (No model.)

Claim.—1. The method of preventing fraud in the sale of newspapers and other publications, which consists of applying to a page of the publication a seal partly attached to the page, so as to cover and conceal a part of the matter on the page until the seal is broken or removed, substantially as described.

2. The method of preventing fraud in the sale of newspapers and other publications, which consists of applying to a page of the publications a seal having matter on its under side and partly attached to the page, so as to cover and conceal a part of the matter on the page until it is broken or detached, substantially as described.



3. A paper or other publication having upon one of its pages a partly-attached seal, covering and concealing a part of the matter on the page until it is broken or detached, substantially as described.

4. A paper or other publication having on one of its pages a partly-attached seal having matter on its under side and covering and concealing a part of the matter on the page until it is broken or detached, substantially as described.

5. A paper or other publication having upon one of its pages and concealing a part of the matter upon the page a seal consisting of the

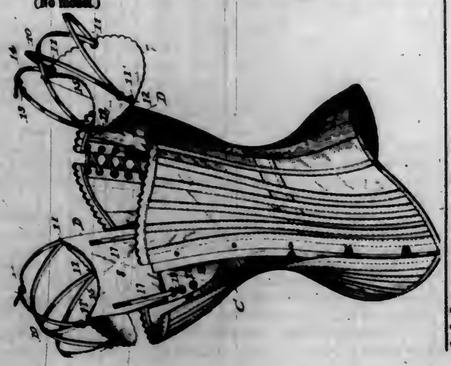
middle detachable portion 2 and the end portions 1, secured to the page, substantially as described.

480,424. METHOD OF PREVENTING FRAUD IN THE SALE OF NEWSPAPERS AND OTHER PUBLICATIONS. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Dec. 22, 1891. Serial No. 415,872. (No model.)

Claim.—1. The method of preventing fraud in the sale of newspapers and other publications, which consists of applying to a page of the publication a seal having matter on its under side and partly attached to the paper, so as to be broken or detached for access to said matter, substantially as described.

2. A paper or other publication having upon one of its pages a partly-attached seal having matter on its under side, substantially as described.

480,425. SHADE-HOLDER. EMIL F. GENNERT and JAMES F. CUNNINGHAM, New York, N. Y. Filed Jan. 14, 1892. Serial No. 418,015. (No model.)



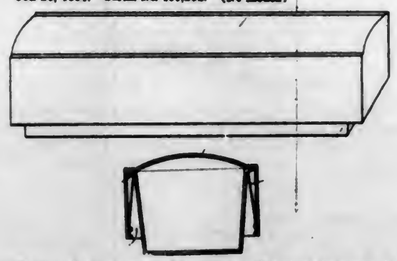
Claim.—1. In a shade-holder, an attaching-collar formed of two pieces which are counterparts of each other, substantially as specified.

2. In a shade-holder, a shade-holding ring, in combination with an adjustable collar composed of two parts that are counterparts of each other, each part being connected with the ring at one end and connected by means of screws at the other end, substantially as specified.

3. A shade-holder composed of a shade-holding ring and collar, the collar consisting of two pieces that are counterparts of each other, united by means of two screws for adjusting the size of the ring, substantially as specified.

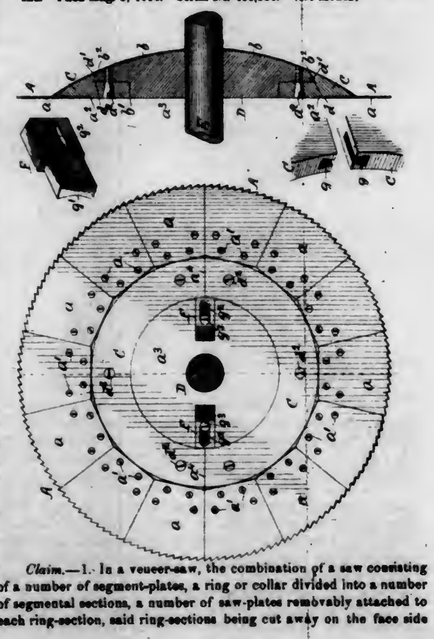
4. In a shade-holder, an attaching-collar capable of being adjusted to several sizes of lamps or fixtures, consisting of two pieces that are counterparts of each other, whereby the shade-holding ring is maintained concentric with the fixture, substantially as specified.

480,426. COMBINED CORSET AND DRESS-SHIELD. JOHN S. GOLDSMITH, New York, N. Y. Filed May 25, 1892. Serial No. 434,269. (No model.)



Claim.—1. A combined corset and dress-shield in which the body-flaps of a pair of armpit-shields are provided with the flexible downwardly-extending connection portions secured at bottom to the corset, and the dress-shields are further provided with means for attaching the armpit-shields to the arms of the wearer, and means for adjusting said connecting portions for the required height of each armpit-shield above the waist of the corset, substantially as hereinbefore specified.

2. A combined corset and dress-shield in which a pair of armpit-shields are provided with eyelets 11 11′ at their back and front edges respectively, and with elastic straps 10, looped to said eyelets 11 at back, and having hooks 12 for attaching and detaching the strap at said eyelets 11′ in front, substantially as hereinbefore specified.



3. A combined corset and dress-shield in which the body-flaps of a pair of armpit-shields have flexible downwardly-extending connecting portions, and the corset is further provided with body-shields secured thereto, said connecting portions and said body-shields being provided, respectively, with elastic tapes 17, having hooks 18 at their free ends, and with vertical series of eyelets 19 to coact with said hooks, substantially as hereinbefore specified.

480,427. BURIAL-CASE. JOHN G. GRAY, Connersville, Ind. Filed Oct. 20, 1891. Serial No. 409,292. (No model.)

Claim.—In a waterproof burial-case, the air-tight cover A, the case B, made impervious to water, arranged to leave an air-space C between their vertical sides, the flange D, and the spring locking-lever E, constructed and operating substantially in the manner and for the purpose as set forth and described.

480,428. VENEER-SAW. ANDREW E. HOFFMAN, Fort Wayne, Ind. Filed Aug. 3, 1891. Serial No. 401,536. (No model.)

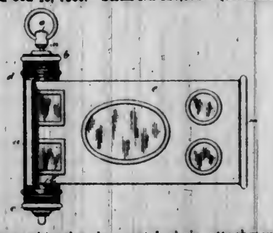
Claim.—1. In a veneer-saw, the combination of a saw consisting of a number of segment-plates, a ring or collar divided into a number of segmental sections, a number of saw-plates removably attached to each ring-section, said ring-sections being cut away on the face side to a depth corresponding to the thickness of the saw-plates, and the fastening-screws securing said plates to said ring, whereby the saw may be separated into as many parts as there are ring-sections without detaching the segmental plates, substantially as set forth.

2. In a veneer-saw, the combination of a saw consisting of a number of segment-plates, a supporting-ring provided with a groove or recess and divided into a number of segmental sections, a number of the saw-plates being removably attached to each ring-section, and a solid disk-collar having a beveled edge adapted to engage with said groove or recess in the supporting-ring, and the driving-shaft upon which said disk-collar is rigidly mounted, substantially as set forth.

3. In a veneer-saw, the combination of a saw-ring constructed in two or more sections and cut away on its rear side to form a V-groove and a disk-wheel correspondingly cut away on its meeting surface to provide a shoulder-bearing for said ring-sections and having its edge beveled to form a V-point to fit into said groove, substantially as set forth.

4. In a veneer-saw, the combination of the saw-ring constructed in sections and provided in its meeting ends with dovetailed recesses, the disk-wheel, the double dovetail pins or keys set into said disk and adapted to engage with said recesses, and the fastening-screws inserted through said ring-sections into said disk, substantially as set forth.

480,429. CAPOTASTO. VOLKMAR T. JOHNSEN, Chicago, Ill. Filed Sept. 7, 1891. Serial No. 405,085. (No model.)



Claim.—1. In a capotasto, the bar A, having a slot *a*, and countersunk hole *b*, as and for the purpose specified.

2. In a capotasto, the bow B, being screw-headed and having a thumb-nut *c*, with conical base, as and for the purpose specified.

3. In a capotasto, the bow B, having a globular head *d*, as and for the purpose specified.

4. The combination, in a capotasto, of the bar A, the bow B, and the tubes *f*, all substantially as set forth.

480,430. WATCH-CHAIN ATTACHMENT. JOHN C. KOCH, Berlin, Germany. Filed Oct. 15, 1889. Serial No. 327,092. (No model.)

Claim.—1. The combination, in a watch-chain attachment, of a slotted cylinder, a suspending device at one end thereof, a web passing through the slot of the cylinder, a roller to which the inner end of the web is connected, a spring for rotating the roller, a ratchet device for holding the roller, and a connection therefrom to the suspending device for liberating the ratchet by a movement of the suspending device, substantially as specified.

2. The slotted case *a* and the web *c*, in combination with the roller *g*, to one end of which the web is attached, the heads *b* and *c* to the case *a*, there being ratchet-teeth on the inner end of the head *b*, the disk *d*, having corresponding ratchet-teeth and the extension *h*, passing into the roller *g*, and a pin *k*, passing through the slot in the roller *g* for connecting the parts together to insure their rotation at the same time that an end movement is allowed to the disk *d* for separating the ratchet-teeth, substantially as set forth.

3. The slotted case *a*, in combination with the web *c*, a roller *g*, to which one end of the web is attached, a spring *f* for rotating the roller, a head *b*, having ratchet-teeth upon its inner face, the disk *d*, having corresponding ratchet-teeth, the extension *h*, passing from the disk *d* into the roller *g*, and a slot and pin for connecting the parts, the stem *n* and head *o* for moving the disk *d* and separating the ratchet-teeth, substantially as set forth.

4. The slotted case *a*, and web *c*, in combination with the tubular roller *g*, to which one end of the web is attached, the helical spring *f* within the tubular roller, the head *b*, to which one end of the spring is connected, and the extension *h*, passing into the roller *g*, the end *b*, having ratchet-teeth, the stem *n* and head *o* for acting upon the disk *d* to separate the ratchet-teeth and permit the spring *f* to rotate the roller and wind the web upon it, substantially as set forth.

5. The slotted case *a* and web *c*, in combination with the tubular roller *g*, to which one end of the web is attached, the helical spring *f*, the head to which one end of the spring is connected, the end *b*, and the suspending-stem *n*, substantially as set forth.

6. The combination, with a slotted case, of a web passing through the slot, a roller to which one end of the web is connected, a spring within the roller for actuating the same, a ratchet device for holding the roller, and a disconnecting device projecting axially from one end of the case, substantially as specified.

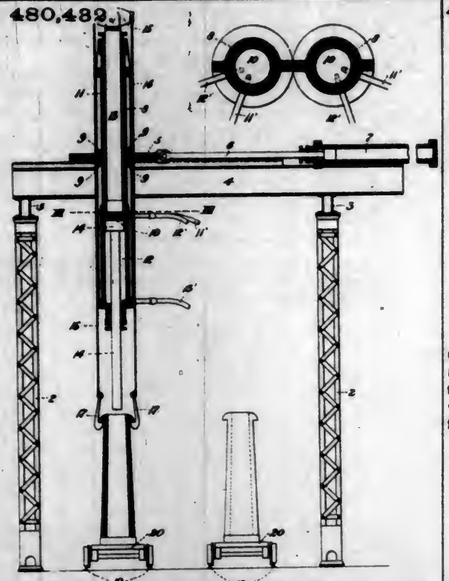
480,431. COIN-OPERATED MACHINE. AUGUST LARSEN, Syracuse, assignor of one-half to Henry C. Nye, Whitehall, N. Y. Filed Nov. 2, 1891. Serial No. 410,593. (No model.)

Claim.—1. The combination, with the inclosing case provided with a coin-slot, of a partition extending from the top of the case part way toward the bottom, an oscillatory hanger on the back of the said partition, a shelf attached to said hanger and passing under the partition, a spring holding the said shelf in front of the partition, a lever adapted to carry the shelf out of said partition, a coin-carrier communicating normally with the slot of the case, a drag adapted to engage the coin on the carrier and connected with the aforesaid lever, and a handle on the coin-carrier, as set forth.

2. The combination of the case C, provided with the slot *g*, the box *b*, having a transverse slot in range with slot *a*, the coin-holder *b″ b″*, the drag *c*, carrying the catch *c′* in proximity to the path of said coin-holders, the coin-thrower *d* at the side of the coin-carrier, a coin-receptacle under the opposite side of said carrier, and a movable shelf in the case actuated by the drag, as set forth.

3. The combination of the case C, provided with the slot *a*, the vertical partition P, extending from the top part way the depth of the case, the stationary shelf *o* beneath the partition, the horizontal shaft *f* at the back of the partition, the hanger *g*, fixed to said shaft, the shelf *e*, carried on the hanger beneath the partition, the lever *l*, fastened to the shaft, the spring D, holding the hanger in its normal position, the box *b*, provided with a slot in range with slot *a*, the coin-carrier *b′*, provided with coin-holders *b″ b″* and with the handle *h*, the spring *i*, retracting the said carrier, the coin-thrower *d* at one side of the carrier, the coin-receptacle R under the opposite side of the coin-carrier, the drag *c*, provided with the catch *c′* in proximity to the path of the coin-holders, and the lever *l′* and rod *l″*, connecting the drag to the lever *l*, all combined to operate substantially as described, for the purpose set forth.

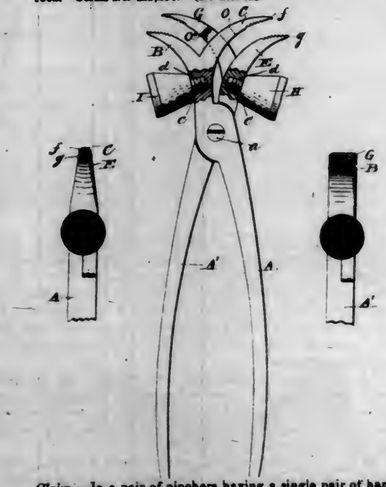
480,432. INGOT-EXTRACTOR. JOHN F. LEWIS, Turtle Creek, Pa. Filed Nov. 5, 1891. Serial No. 410,926. (No model.)



Claim.—1. An ingot-extractor comprising two independent vertically-movable plungers in vertical alignment with each other, the upper plunger being provided with means for engagement with the mold, and means for reciprocating the plungers, substantially as and for the purposes described.

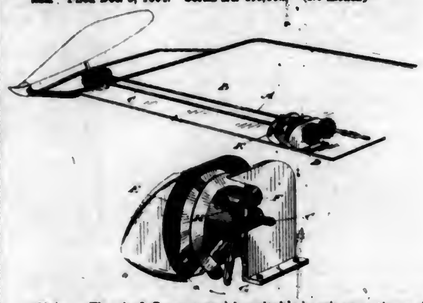
2. An ingot-extractor comprising two independently-movable plungers in vertical alignment with each other, a cross-head swiveled to the upper plunger, hooked rods depending from said cross-head and arranged to engage the mold, and means for reciprocating the plungers, substantially as and for the purposes described.

3. An ingot-extractor comprising a movable slide carrying a cylinder divided into two chambers by a diaphragm, plungers movable in said chambers, the upper plunger being provided with depending rods arranged to engage the mold, and fluid-supply pipes for the cylinder substantially as and for the purposes described.



4. An ingot-extractor comprising a framework carrying an elevated slide, two vertical plunger-cylinders, one above the other, supported thereby, the lower plunger arranged to bear on the ingot, hooked rods depending from the upper plunger, fluid-supply pipes for the cylinder, and a car movable beneath the slide and arranged to support the molds, substantially as and for the purposes described.

480,482.

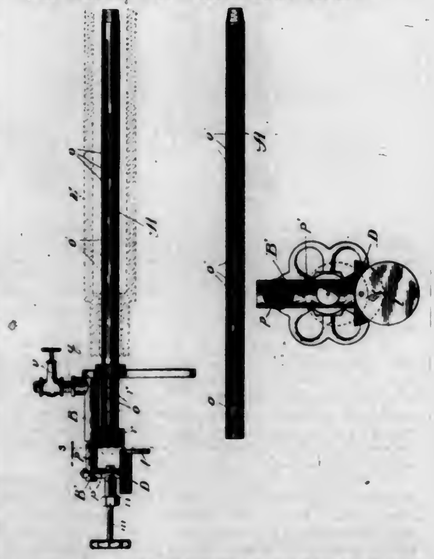


5. An ingot-extractor comprising a framework, an elevated slide carried thereon, two plunger-cylinders, one above the other, supported upon the slide, hooked rods depending from the upper plunger, the lower plunger arranged to bear on the ingot, fluid-supply pipes for the cylinders, two tracks passing beneath the slide, and cars movable thereon, substantially as and for the purposes described.

480,483. LASTING-PINCHERS. GEORGE W. MORRILL, Alton, N. H., assignor of one-half to Ellsworth H. Rollins, same place, and Sylvester A. Edgerly and Charles F. Piper, Wolfborough, N. H. Filed Apr. 15, 1892. Serial No. 429,250. (No model.)

Claim.—In a pair of pinchers having a single pair of handles, the combination of the handle A, provided with two integral outwardly-curving oppositely-inclined jaws B C, the jaw C being narrow at its end *f* and having a shoulder O and the jaw B wide, and a detachable hammer-head I, provided with a screw-threaded shank *c*, adapted to engage the screw-threaded hole *d*, with the handle A', provided with two integral oppositely-inclined jaws E G, the jaw E being narrow at its end *g* and the jaw G wide and provided with a shoulder O', and a detachable hammer-head H, provided with a shank *c*, engaging with screw-threaded hole *d*, substantially as described.

480,484. FLAX-HARVESTER. WESLEY MORROW, Millbrook, Canada. Filed Dec. 3, 1891. Serial No. 413,892. (No model.)



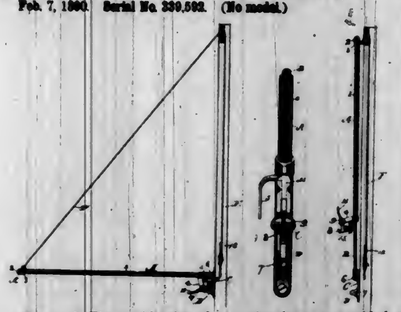
Claim.—The shaft C, supported in suitable bearings on the grain-table B and geared to the driving mechanism of the harvester so as to derive a rotary movement, the fingers G, pivoted in pairs around the shaft C, each finger being actuated by a spring H, in combination with the brackets D, noses *b*, and spring-plates E, substantially as and for the purpose specified.

480,485. LATHE-MANDREL. JOHN H. MCGRAW, Oswego, N. Y. Filed Aug. 31, 1891. Serial No. 404,176. (No model.)

Claim.—The combination, with the tapering spindle P, shaped angular in cross-section, of the sectors *a a a*, provided with longitudinal grooves *c* and riding thereby on the angles of the spindle and formed with steps *d* and circumferential groove *e*, and the elastic band *b*, seated in said groove and holding the sectors yieldingly upon the spindle, substantially as described and shown.

480,486. COMBINED GAS GENERATOR AND HEATER. PETER H. NELSON, Chicago, Ill., assignor to the S. H. Sinclair Company, same place. Filed Mar. 1, 1892. Serial No. 423,358. (No model.)

Claim.—1. In a combined hydrocarbon-gas generating and heating apparatus, the combination of a tube forming toward one end the heating-burner and toward its opposite end the generating-burner, a generator surmounting the tube at the end thereof, forming the generating-burner and having its discharge-opening in line with the open end



of the said tube, and a valve for controlling the discharge from the said opening, substantially as described.

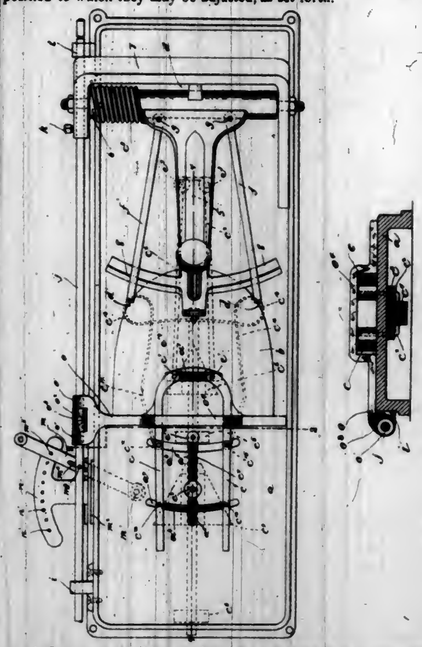
2. In a combined hydrocarbon-gas generating and heating apparatus, the combination of a tube forming toward one end the heating-burner and toward its opposite end the generating-burner, a generator surmounting the tube at the end thereof, forming the generating-burner and having its discharge-opening in line with the open end of said tube, a valve for controlling the discharge from the said opening, and a kindling-cup supported underneath the valve, substantially as and for the purpose set forth.

3. In a combined hydrocarbon-gas generating and heating apparatus, the combination of a tube A, closed at one end and open at its opposite end, a series of burner-openings *o* in the tube toward its open end and a series of burner-openings *o'* therein toward its closed end a generator B, supported on the tube A over the openings *o* and having an elbow-extension B', provided with the generator discharge-opening in line with the open end of the tube A, a needle-valve *m* for the said discharge-opening, and a kindling-cup D on the lower end of the said extension below the point of the valve, substantially as and for the purpose set forth.

4. A combined hydrocarbon-gas generating and heating apparatus comprising, in combination, a tube A, closed at one end and open at its opposite end, a series of burner-openings *o* in the tube toward its open end and a series of burner-openings *o'* therein toward its closed end, a generator B, into which leads the supply-pipe *q* and supported in bearings *r* and *r'* on the tube A over the series of openings *o* and having an elbow extension B', formed with the branch *p* and depending branch *p'*, having the generator discharge-opening in line with the open end of the tube A, and a nipple *n*, containing a needle-valve *m*, controlling the said discharge-opening, and a kindling-cup D, supported on the lower end of the branch *p'* and provided with an adjustable deflecting-plate *l*, the whole being constructed and arranged to operate substantially as and for the purpose set forth.

480,487. AWNING-FRAME. JAMES PETTIT, Albany, N. Y. Filed Feb. 7, 1890. Serial No. 339,592. (No model.)

Claim.—1. The combination of an awning-frame A, provided with tubular end pieces 4, side bars B, fitted to slide telescopically in said end pieces and provided with pivots 6, which allow said awning-frame to swing in a vertical plane, stationary hinge-brackets C, to which said side bars are jointed to form fixed hinge-joints, and a locking mechanism, substantially as described, attached to the inner end of said tubular end pieces and fitted to engage with said hinge-brackets, whereby the awning fabric may be automatically strained, as and for the purpose specified.



2. In an awning-frame and in combination therewith, a locking mechanism for retaining said awning-frame in its extended position, said locking mechanism consisting of a stationary bracket, which forms part of the hinge-joint of said awning-frame and is provided with a catch 7, an arm 4, attached to the awning-frame adjacently to said hinge-joint, and a weighted latch 9, pivoted to said arm and fitted to engage with said catch, as and for the purpose herein specified.

480,488. VAMP-MARKING MACHINE. JOHN F. ROGERS, Belfast, Me. Filed Dec. 8, 1891. Serial No. 414,382. (No model.)

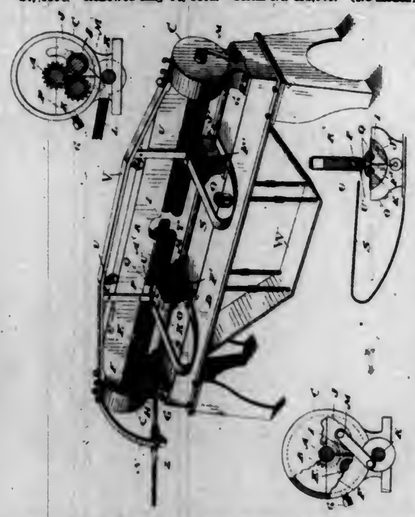
Claim.—1. In a vamp-marking machine, the combination, with a work-supporting bed, of vamp-gages on said bed having their forward ends connected to pivots which are movable crosswise of the bed and a rod movable lengthwise of the bed and provided with wedges against which projections engaged with said gages are yieldingly held, as set forth.

2. In a vamp-marking machine, the combination, with a work-supporting bed, of vamp-gages on said bed having their forward ends connected to pivots which are movable crosswise of the bed, springs arranged to exert an inward pressure on said gages, a rod movable lengthwise of the bed and provided with a wedge interposed between the pivots of the gages, and an independently-adjustable wedge mounted on said rod and interposed between studs projecting from the gages, as set forth.

3. In a vamp-marking machine, the combination of a work-supporting bed, vamp-gages mounted at their forward ends on pivots movable crosswise of the bed, springs arranged to exert an inward pressure on said gages, a rod movable lengthwise of the bed and provided with a wedge interposed between the pivots of the gages and with another wedge interposed between studs projecting from the rear portions of the gages, and a locking device, such as the set-screw e^{15}, whereby the rod and its wedges may be positively secured in any position to which they may be adjusted, as set forth.

4. In a vamp-marking machine, the combination of a work-supporting bed, a marker-carrier movable lengthwise of said bed and provided with marking devices, a rod or slide engaged with said carrier and fitted to move in guides on the supporting-bed, a vamp-gage secured to said slide and movable therewith, and a lever pivoted to the bed and engaged with the slide, said slide, marker-carrier, and gage being movable simultaneously by said lever, as set forth.

5. In a vamp-marking machine, the combination of a work-supporting bed, a marker-carrier movable lengthwise of said bed and provided with marking devices, a rod or slide engaged with said carrier and fitted to move in guides on the supporting-bed, a vamp-gage loosely mounted at one end on said slide and adapted to oscillate or swing thereon, and an adjustable collar or stop on said rod, whereby the gage may be secured at any desired point on the slide without interference with its swinging movements, as set forth.



480,489. YIELDABLE GEAR-WHEEL. BENJAMIN C. BRATON, Nashville, Tenn. Filed Nov. 17, 1891. Serial No. 412,128. (No model.)

Claim.—A yieldable gear-wheel comprising two disks of unequal sizes, the larger provided with an overhanging rim toothed on its pe-

riphery and with two oppositely-projecting flaring lugs extending toward the center of the disk and offset to form seats for springs, the smaller disk being inclosed within the rim of the larger and having an overhanging flange extending toward the larger disk and lugs corresponding with and adapted to fit between the lugs of the first-mentioned disk, and a series of springs, one of each being seated between and bearing against the sides of the opposing lugs of the two disks.

480,440. SHEET-METAL-ROLLING MACHINE. WALTER S. SHIPE, Toronto, Canada, assignor to James Morrison, same place. Filed Feb. 27, 1891. Renewed May 14, 1892. Serial No. 432,975. (No model.)

Claim.—1. A sheet-metal rolling machine having three rolls geared together, one roll having fixed bearings in a bracket C, having a recess *c*, and a second one set in a quadrant arranged to slide in said recess *c* and constructed to be adjusted away from or nearer to the third roll in a curve concentric with the roller having the fixed bearings, substantially as described.

2. A sheet-metal-rolling machine having three rolls geared together, the main driving-roller having a fixed bearing, another of the said rollers having movable bearings at each end and intermediate thereof, a rod running parallel with said rollers and connected to said movable bearings, and means for moving the same, substantially as described.

3. A sheet-metal-rolling machine having three rolls geared together, the main driving-roller having a fixed bearing, another of the rollers having movable bearings at each end and intermediate thereof, a rod running parallel with said rollers, connected to said movable bearings, a lever attached to said rod for moving the same, and a locking device for securing said rod in position, substantially as described.

4. In a sheet-metal-rolling machine, a feed-roll having a series of lifting-pins sliding through it, substantially as described.

5. In a sheet-metal-rolling machine, the main roll A, journaled in the stationary bearing-boxes B, which are supported in the end brackets C, the roll E, geared to the roll A and supported in the adjustable bearing-boxes F, the roll I, journaled in the bearing-boxes J and geared to the roll A, in combination with the links M, connected to boxes J, rod K, connected to the links M, and lever L, attached to rod K and provided with suitable locking mechanism, substantially as and for the purpose specified.

6. In a sheet-metal-rolling machine, the combination, with the rolls thereof, of the springs S, arranged to support the sheets about to be rolled, and a stop-plate U, having its acting or foot end slightly below the normal surface of the supporting-springs, substantially as and for the purpose specified.

480,441. BICYCLE-SUPPORT. WILLIAM SIAR and CHARLES H. DUNN, Seneca, Pa. Filed Mar. 17, 1892. Serial No. 425,246. (No model.)

Claim.—1. In a bicycle-support to be carried on the frame of the bicycle, a bar or rod having a combined rectilinear and rotary movement, whereby it may be extended and moved crosswise of the bicycle-frame, and a step or support pivotally secured to the lower portion of the bar or rod and automatically adjusting itself to the ground, substantially as herein described.

2. A bicycle support to be carried on the frame of the bicycle and comprising a pivotally-secured support or step forming a broad bearing, and a means by which said support may be turned from a position parallel with the frame to one at right angles thereto.

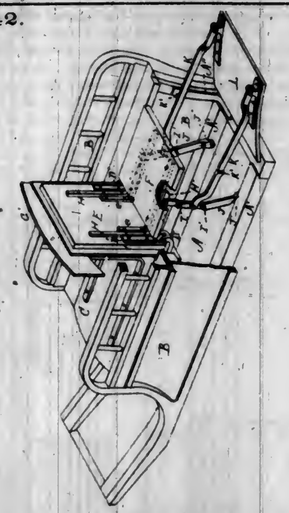
3. A bicycle-support to be carried on the frame of the bicycle, comprising a detachable tube or socket to be secured to said frame, an extensible bar within said tube or socket, a support or step pivotally secured to said bar, whereby it automatically adjusts itself to the condition of the ground, and means for converting the rectilinear movement of the bar into a rotary movement, whereby the support or step may lie parallel with the frame of the bicycle or at right angles thereto.

4. A bicycle-support comprising an extensible bar which has a combined rectilinear and rotary movement, a holder for the bar, and a pivotally-secured support or step carried by the bar and automatically adjusting itself to the condition of the ground.

5. A bicycle-support comprising a tube or socket to be fitted to the frame of the bicycle and having a square opening in one end, a spirally twisted or turned bar within said tube and projecting through said opening, a support or rest pivotally secured to the projected end of the bar and having a movement about its pivot to conform to the condition of the ground, a means for locking the support or step after its adjustment, a spring-actuated pawl for holding the bar extended, and a spring for returning the bar when the pawl is released, substantially as herein described.

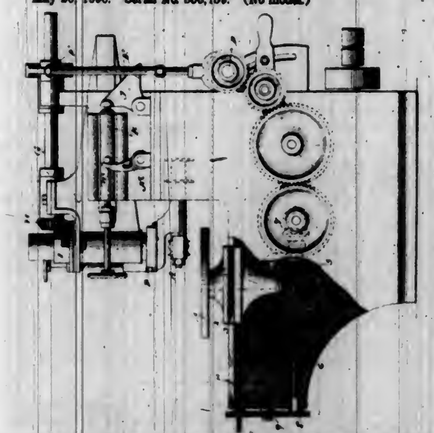
6. A bicycle-support comprising a tube or socket to be fitted to the frame of the bicycle and having end caps, one of which has a square opening, a rod or bar mounted within the tube with its lower end projecting through said opening, said rod having a square form in cross-section and having a spiral twist imparted to it, a ratchet on the bar, and a spring-actuated pawl on the tube passing through a hole therein and engaging and holding the bar when the latter is extended, an enlarged head on the lower end of the bar having a series of holes, a support or step pivotally secured to said head, whereby it may adjust itself to the condition of the ground, a pivoted spring-actuated lever on the support, having a pin passing through a hole in the support and entering one of the holes in the head of the bar to lock the support in its adjusted position, said lever having a foot portion by which it is operated to project the bar and disengage the pin from the head, and a spring for returning the bar and support to their normal positions.

7. A bicycle-support comprising a bar having a combined rectilinear and rotary movement, a holder therefor, a support or step pivotally secured to said bar, and a means for locking the support or step to the head, consisting of a pivoted lever having one end engaging the head and its opposite end forming a foot-piece, whereby the bar is extended and support unlocked from the head simultaneously, and a means for returning the bar within the holder, substantially as herein described.



480,442. VEHICLE. JASON SPOFFORD, Jr., Amesbury, Mass., assignor of one-half to Perrin W. Nichols, same place. Filed Apr. 8, 1891. Serial No. 388,077. (No model.)

Claim.—1. In a two-seated carriage, the combination of a front seat, a rearward-facing rear seat, and an adjustable back for said rearward-facing seat arranged to constitute a deck-panel when lowered over the rear seat, substantially as set forth.

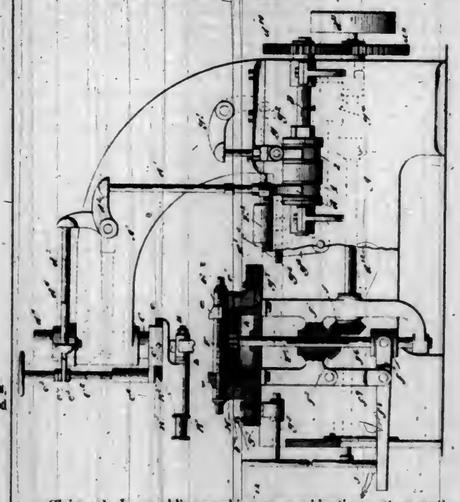


2. The combination of a seat constructed to be raised and lowered, a deck-panel arranged to be raised to serve as the back of said seat when in position for use, and a hinged tail-board connected with said seat and panel, whereby the opening and closing of the tail-board will actuate the seat and will raise and lower said panel, substantially has described.

3. In a vehicle of the character described, the combination of the carriage-body and cross-piece D, the latter provided with the hinges D', the lazy-back E, hinged to said cross-piece, the rear seat F, hinged to the lazy-back, the bars H H', secured to the under or rear side of the lazy-back and bent at right angles, as shown, to form supports for the seat, the jointed levers I J, connecting said bars with the carriage-body, as shown, and the tail-gate L, hinged to the carriage-body and connected with said levers by means of the rods or bars K, whereby the rear seat and lazy-back are automatically raised and lowered by lowering and raising the tail-gate, substantially as set forth.

480,442.

480,443. WOOD-MOLDING MACHINE. FRANK H. VAN HOUTEN, Matteawan, N. Y., assignor to Charles L. Goehring, Allegheny, Pa. Filed May 26, 1890. Serial No. 353,159. (No model.)



Claim.—1. In a machine such as described, the combination, with an oscillatory reciprocating cutter-head whose arbor or axis of rotation is transverse to its axis of oscillation and in a plane substantially parallel with the plane of reciprocation, of a work-support or table pivotally supported to turn about an axis substantially parallel with the axis of oscillation of the cutter-head, said table being mounted upon a base or support guided to travel in a plane substantially parallel with the plane of reciprocation of the cutter-head, substantially as described.

2. In a machine such as described, the combination, with an oscillatory reciprocating cutter-head, of a work support or table pivotally supported to turn about an axis parallel with the axis of oscillation of the cutter-head but to one side thereof, a support for said table, guided to move in a plane substantially parallel with the plane of reciprocation of the cutter-head and actuating devices or driving mechanism common to the cutter-head, and a table for controlling the oscillatory and reciprocating motions of each and preserving the proper relations the one to the other, substantially as described.

3. In a machine such as described, the combination, with an oscillatory reciprocating cutter, of a table or work support extending beneath the cutter and pivotally supported upon a laterally-movable carriage, with devices for automatically rotating the table and moving the carriage, substantially as described.

4. In a machine such as described, the combination, with the oscillatory reciprocating cutter, of the traveling carriage, the table pivotally supported upon said carriage, the screw engaging said carriage, the driving-shaft and gearing intermediate the driving-shaft and table, and the driving-shaft and adjusting-screw for simultaneously rotating the table and shifting the carriage, substantially as described.

480,444. MOLDING-MACHINE. FRANK H. VAN HOUTEN, Matteawan, N. Y., assignor to Charles L. Goehring, Allegheny, Pa. Filed Dec. 23, 1890. Serial No. 375,611. (No model.)

Claim.—1. In a molding-machine, the combination, with an oscillating cutter-head, of a feeding mechanism for advancing the material beneath the cutter-head and a work-support reciprocated laterally of the line of feed motion, substantially as described.

2. In a molding-machine, the combination, with the oscillating cutter-head, of a longitudinally-movable and laterally-reciprocating work-support, substantially as described.

3. In a molding-machine, wherein the material is fed at predetermined speed past a rotating cutter-head oscillating about an axis perpendicular to the direction of the feed motion of the material, and in combination with the feeding devices and oscillating cutter-head thereof, a support for the material, and actuating devices engaging said support and operating to reciprocate the material on a line transverse to the direction of feed motion and in direction and degree proportional to the oscillations of the cutter-head, substantially as described.

4. In a molding-machine, the combination, with the rotating cutter-head mounted to oscillate about an axis perpendicular to the axis of rotation, of a longitudinally movable and laterally-reciprocating work-support or carriage, substantially as described.

5. In a molding-machine, the combination, with an oscillating cutter-head and a carriage movable in a plane substantially perpendicular to the axis about which the cutter-head oscillates, said carriage being connected to a movable frame or support reciprocating in a direction transverse to the feed motion, substantially as described.

6. In a molding-machine, and in combination with the oscillating cutter-head thereof, a movable carriage supported in reversible guides, substantially as described.

7. In a molding-machine, and in combination with the rotating cutter-head thereof, a traveling carriage or work-support movable in guides on a reversible plate or turret, substantially as described.

8. In a molding-machine, and in combination with the cutter-head thereof, a reciprocating support or frame carrying a reversible plate or turret and a work-support or carriage mounted in guides on said reversible plate or turret, substantially as described.

9. In a molding-machine, and in combination with the oscillating cutter-head thereof, a reciprocating frame or support, a plate or turret pivotally mounted upon said reciprocating support, a work-support or carriage mounted upon said turret, and actuating devices for reciprocating said support and feeding devices for advancing the carriage, substantially as described.

10. In a machine, the combination, with a feeding mechanism, a work-support reciprocating laterally of the direction of feed, and a rotating cutter-head mounted to oscillate about an axis intersecting the cutters and the material, substantially as described.

11. In a machine, the combination, with a frame or support mov-

able in guides on the main frame, a plate or turret pivotally attached to said support and provided with means for locking it in position, and a work-support or carriage movable in guides on said rotary turret, substantially as described.

12. In a machine, the combination, with the supporting-frame and the plate or turret pivotally mounted thereon, the work-support or carriage movable on the turret and provided with two racks, and the driving-gear mounted upon a shaft set eccentrically to the axis of the turret, substantially as described.

13. In a machine, and in combination with the work-support or carriage movable in guides on the reversible turret or plate and provided with two racks, the support or frame to which said turret is attached and the movable driving-gear set eccentrically to the axis of the turret, substantially as described.

14. In a machine, and in combination with the oscillating cutter-head, a work-support or carriage movable in guides and supported upon a plate or turret, the latter pivotally supported to move about an axis parallel with but to one side of the axis about which the cutter-head oscillates, substantially as described.

15. In a machine, and in combination with the oscillating cutter-head, a plate or turret movable about an axis parallel with the axis about which the cutter-head oscillates, a support for said turret movable in guides, and a work-support or carriage mounted on the turret and movable in a plane transverse to the direction of motion of the supporting frame on which the turret is mounted, substantially as described.

16. In a machine, the combination, with a reversible work-support or carriage provided with two racks, of a driving-gear rotating in one direction and adapted to alternately engage the racks for reversing the motion of the carriage, substantially as described.

17. In a machine, and in combination with the carriage, its pivoted supporting plate or turret, and the movable frame or support therefor, the feed-operating devices mounted upon said movable frame and actuating the carriage, the same comprising the longitudinally-movable shaft carrying the gear for engaging the carriage, the gears for transmitting motion from the driving-shaft to the said movable shaft, and the devices for reciprocating said last-named shaft to start or stop the carriage, substantially as described.

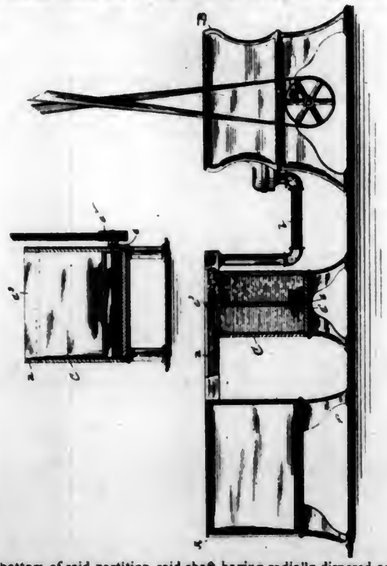
18. In a machine, and in combination with the oscillating cutter-head, laterally-reciprocating work-support, and feeding devices for advancing the material, a gear-train and actuating devices controlling the oscillation of the cutter-head, the feed motion, and the lateral reciprocations of the material, substantially as described.

19. In a machine, and in combination with the oscillating cutter-head and longitudinally-movable carriage or work-support, the frame or support reciprocating laterally of the feed motion, and a reversible plate or turret interposed between the said carriage and reciprocating frame, actuating devices for reciprocating said frame, and actuating devices for feeding the carriage, provided with means for interrupting the feed, substantially as described.

20. In a machine, and in combination with the longitudinally-movable work-support or carriage, the laterally-reciprocating support or frame on which said carriage is mounted, actuating devices for reciprocating said frame, and an extensible connection interposed in the line of said actuating devices and operating to adjust the position of the carriage and its line of motion with respect to the axis about which the cutter-head oscillates, substantially as described.

480,445. ALUMINIUM ALLOY. CHRISTOPHER P. WHITNEY, Newton, Mass. Filed Apr. 21, 1892. Serial No. 430,121. (No specimens.)

Claim.—A metal alloy consisting of aluminium, a malleable metal, and a metal of high fusing-point in proportions as follows: aluminium, eighty per cent. or more; a malleable metal, such as copper, twelve per cent. or less; a metal of high fusing-point, such as nickel, eight per cent. or less, for the purpose described.



480,446. MEANS FOR PREVENTING SPOTS IN PAPER. ROBERT W. ALLAN, Fairfield, assignor of one-half to Roswell M. Fairfield, Holyoke, Mass. Filed Nov. 12, 1889. Renewed Dec. 31, 1891. Serial No. 416,730. (No model.)

Claim.—1. The combination, with a paper-machine and a screen for screening the stuff prior to its delivery to said machine, of an agitator located between said screen and said machine and means, substantially as described, for compelling the stuff to pass through said agitator in its passage from the former to the latter, substantially as and for the purpose set forth.

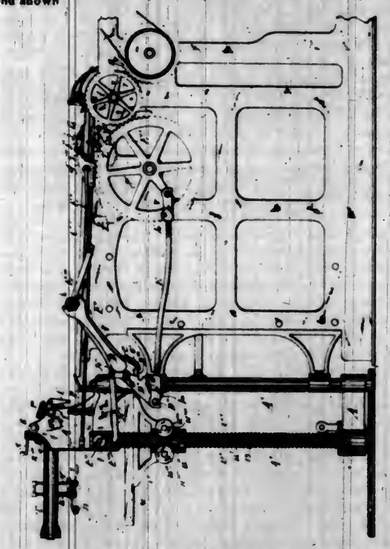
2. The combination, with a stuff-screen and a paper-machine, of a conduit leading from the former to the latter and an agitator located in said conduit, substantially as and for the purpose described.

3. The combination, with a stuff-screen and a paper-machine, of a conduit leading from the former to the latter and an agitator located in said conduit, said agitator being composed of a box having a passage-way leading therethrough, which passage-way is in open communication at each end with said conduit, and having located within said passage-way a revoluble shaft provided with radially-disposed arms or paddles, substantially as and for the purpose described.

4. The combination, with a stuff-screen and a paper-machine, of a conduit leading from the former to the latter, a box located beneath said conduit and having its top in open communication with the latter, said box having a centrally-disposed partition extending from a point above the bottom thereof to and within said conduit, and a revoluble shaft located within said box between the bottom of the latter and

the bottom of said partition, said shaft having radially-disposed arms or paddles, arranged and operating substantially as described.

5. The combination, with a paper-machine and a stuff-screen, of a conduit, as *a*, leading to said machine, a pipe, as *b*, leading from said screen into said conduit, box C, located beneath said conduit and having open communication at its upper end with the interior of the latter, said box having partition c^2 centrally located therein and extending upwardly from a point near the bottom thereof to the top of said conduit, and shaft *c*, provided with paddles *c'* and carrying band-pulley c^3, located within said box between the lower end of said partition and the bottom of the box and having its bearings in the ends of said box, arranged and operating substantially as and for the purpose described.



480,447. PAPER-FEEDING MACHINE. THOMAS A. BRIGGS, Arlington, Mass. Filed Nov. 24, 1891. Serial No. 413,989. (No model.)

Claim.—1. In combination with the feed-table of a printing-machine, longitudinal guides on opposite sides of the machine, slides mounted on said guides, a transverse shaft connected to said slides, grippers on said shaft, rock-arms on opposite sides of the machine, stationary segmental gears fixed to the frame concentric to the axis of the rock-arms, shafts journaled on the rock-arms lengthwise thereof, pinions on both ends of said shafts and receiving motion from the stationary gear, shafts journaled transversely to the free ends of the rock-arms, pinions on said transverse shafts meshing with the outer pinions on the rock-arms, pitmen attached to the aforesaid slides, and arms fixed to the transverse shafts on the rock-arms and connected to the pitmen, substantially as described and shown.

2. In combination with the feed-table of a printing-machine, longitudinally-reciprocating slides on opposite sides of said table, a transverse shaft journaled on said slides, a stationary bar at the side of and parallel with the shaft, gripper-hooks mounted on the shaft and sustained in their position by the stationary bar, gripper-tongues fixed to the shaft, and a crank fixed to the end of the shaft for turning the same and opening the grippers, as set forth.

3. In combination with the feed-table of a printing-machine, longitudinally reciprocating slides on opposite sides of said table, a transverse shaft journaled on said slides, a stationary bar by the side of and parallel with the said shaft, gripper-hooks hung loosely on the shaft and sustained in this position by the stationary bar, gripper-tongues fixed to the shaft, a crank on one end of the shaft, a finger pivoted to the slide and connected with the crank, and a stationary stop actuating said finger to open the grippers, as set forth.

4. In combination with the shaft *f*, the stationary bar H, the gripper-hook G, formed with perforated ears G' G' and mounted thereby on said shaft and having shoulders G'' G'', abutting against the stationary bar, and the tongue H, formed with the eye H' and clamped on the aforesaid shaft between the ears G' G', substantially as described and shown.

5. In combination with the feed table of a printing-machine, longitudinal slides on opposite sides of the machine, a gripper-shaft journaled on said slides, a crank on one end of said shaft, a finger pivoted to one of the slides and connected with the crank, and a tripper hung on the frame back of the feed-table in the path of the finger and movable forward and restrained from rearward movement, substantially as described and shown.

6. In a paper-feeding machine, the combination of a transverse shaft provided with a longitudinal groove and the paper-pusher formed with a hook and hung thereby on said shaft and provided with a longitudinal channel in its pendent portion, a spiral spring in the bottom of said channel, and a bolt seated on said spring and forced thereby into engagement with the groove of the shaft, substantially as described and shown.

7. In combination with the rock-shaft *m*, provided with a longitudinal groove, the paper-pushing arm J, formed with a hook J'' and provided with a channel *n*, recess 14, and a slot in its side, a sliding bolt *n'*, and a spring *n''* in said channel, and a set-screw *n'''*, passing through the bolt, substantially as described and shown.

8. In combination with the paper-supporting table and rock-shaft, a transverse shaft over said table, a lever fixed to the rock-shaft, a bell-crank fixed to the transverse shaft and connected at its lower end to the aforesaid lever, arms secured to the transverse shaft, fingers hinged to said arms and inclined forward therefrom, rods attached to the fingers and extending upward therefrom, disks on the said rods, a plate pivoted to the upper end of the bell crank and having its front edge under the disks, a cam pivoted to the frame, an arm attached to the end of said plate, a roller pivoted to the front end of said arm and traveling on said cam, a lug on the end of said arm, and an inclined cam on the frame for engaging the lug and thereby lifting the arm and carrying the roller to the top of the cam, as set forth.

9. The combination of the frame-posts formed with vertical racks, brackets sliding vertically on said posts, the paper-supporting table mounted on the brackets, horizontal shafts extending across the machine and journaled on the brackets, pinions on said shafts, engaging the racks, worm-gears on the shafts, a vertical shaft journaled to the frame, a worm-gear movable vertically on the latter shaft and locked from rotation thereon, a miter-pinion fixed to the end of the vertical shaft, an actuating miter-pinion pivoted to the frame, and a crank turning the latter pinion, as set forth.

10. In combination with the vertically-movable table, vertical racks, pinions engaging the racks and carrying the table, a vertical shaft, gears transmitting motion from said shaft to the pinion, a miter-pinion fastened to the vertical shaft, a similar pinion meshing therewith, a ratchet-wheel fixed to the latter pinion, a pawl engaging said ratchet-wheel, and a rock arm actuating the pawl, as set forth.

11. In combination with the vertically-movable table, vertical racks, pinions engaging said racks and carrying the table, a vertical shaft, gears transmitting motion from said shaft to the pinions, a miter-pinion fixed to the vertical shaft, a stud-pin projecting horizontally from the frame, a miter-pinion mounted loosely on said stud-pin and engaging the miter-pinion of the vertical shaft, a ratchet-wheel fixed to the miter-pinion on the stud-pin, a hanger mounted loosely on the hub of said pinion, a pawl pivoted to said hanger and engaging the ratchet-wheel, a rod connected to the hanger, and a rock-arm connected to said rod, as set forth and shown.

12. In combination with the loosely-mounted pinion, a ratchet-wheel fixed to said pinion, a hanger mounted loosely on the hub of the pinion, a pawl pivoted to the hanger and projecting over the side of the ratchet-wheel, a rod connected to the hanger, a rock-arm connected to said rod, pins projecting from the side of the ratchet-wheel, and a hand-crank provided with a head of greater diameter than the ratchet-wheel and provided in said head with holes for the reception of the aforesaid pins, substantially as and for the purpose described.

13. In combination with the loosely-mounted pinion and ratchet-wheel fixed thereto, a hanger loosely mounted on the hub of said pinion, a pawl pivoted to said hanger, a rock-arm, a crank hung loosely on the shaft of said rock-arm, projections on the adjacent sides of the rock-arm and crank transmitting intermittent motion to the crank, and a rod connecting the crank with the aforesaid hanger, and a lever actuated by the paper-feeding mechanism and returning the pawl to its normal position for re-engaging the ratchet-wheel, as set forth.

14. In combination with the paper-feeding fingers, the vertically-movable table and mechanism for raising and lowering said table, a vertical shaft transmitting motion to said mechanism, a miter-pinion fixed to said shaft, a stud-pin projecting horizontally from the frame, a miter-pinion mounted loosely on said stud-pin, a ratchet-wheel fixed to the latter pinion, a hanger loosely mounted on the hub of said pinion, a pawl pivoted to said hanger, a rock-arm, a crank hung loosely on the shaft of the rock-arm, projections on the adjacent sides of the rock-arm and crank with a partial play between said projections, a rod connecting the crank with the aforesaid hanger, and thereby cause the pawl to actuate the aforesaid ratchet-wheel, a crank-shaft engaging the said rod to return it to its position of rest, a lever adapted to actuate said crank-shaft, an oscillatory lever connected with said lever and lifted by the paper-feeding fingers, and a cam traversed by said oscillating lever, and thereby raising said oscillatory lever, as set forth.

15. In combination with the table-raising mechanism, a loosely-mounted pinion for actuating said mechanism, a ratchet-wheel fixed to said pinion, a pawl connected to an oscillatory support, a rock-arm transmitting motion to said support, a crank-shaft engaging said support, oscillatory paper-feeding fingers, an oscillatory plate lifting said fingers, a cam pivoted to the frame, an oscillatory lever traveling on said cam and actuating the lifting-plate, an oscillatory lever controlled by the oscillating feed-fingers, and a lever connected with said oscillatory lever and adapted to actuate the aforesaid crank-shaft, as set forth.

16. In combination with the rock-shaft *a*, the lever M', shaft *m*, bell-cranks L, L, pitman L', the plate *o* and arm *o'*, both attached to one and the same shaft pivoted to the upper end of the bell cranks, the roller *o''* on the free end of said arm, the pivoted cam *p'*, provided with the weighted arm *p''*, the lug *o'''* and cam *o''''*, attached, respectively, to the arm *o'* and frame, the plate *p* and lever *g*, pivoted to rock simultaneously, the lever *r'*, pivoted to the bell-crank and connected to the lever *g*, the arms J, attached to the shaft *m*, the paper-pushing fingers J', hinged to said arms, rods K, attached to said fingers and having their free ends under the plate *p*, disks K', connected to the rods and lifted by the plate *o*, the crank-shaft *s'*, having the arm *s* in the path of the lever *r'*, the loosely-mounted pinion *t'*, ratchet-wheel *t''*, fixed to said pinion, hanger *t'''*, mounted loosely on the hub of the pinion, the pawl *t''''*, connected to said hanger, the rock-arm D', crank N, actuated by said rock-arm in one direction, and the rod N', connecting said crank with the aforesaid hanger and moving the same in said direction and engaged with the crank *s''* of the aforesaid crank-shaft and moved thereby in the opposite direction, substantially as described and shown.

17. In combination with the frame and paper-supporting table, the vertical flange P' on the base of the frame, the stays P, resting against said flange, the cross bar P'', attached to the frame-heads and formed with a longitudinal T-shaped groove, and the plates Q, secured to the stays and provided with T-heads inserted in the groove of the cross-bar, as set forth.

18. In combination with the stay P and the cross-bar P'', provided with a longitudinal T-shaped groove, the plate Q, formed with a T head, the attaching-bolt passing through said plate and head, and the spring Q', interposed between the head of the bolt and head of the plate, substantially as described and shown.

19. The combination, with the frame and paper-supporting table,

of cross-bars secured to the top and bottom of the frame and paper-sustaining bars supported in vertical positions on said cross-bars and adjustably lengthwise of the latter to allow said vertical bars to be set closely against opposite sides of the pile of paper on the supporting-table, as set forth.

20. The combination, with the frame and paper-supporting table, of horizontal rack-bars extending across the frame, sleeves mounted loosely on said bars, paper-sustaining bars secured to said sleeves, vertical shafts journaled on said bars, and pinions on said shafts engaging the rack-bars, as set forth.

21. In combination with the horizontal rack-bars extending across the machine, sleeves mounted loosely on said bars, vertical journal-boxes on the sleeves split longitudinally, clamping-screws connected to said journal-boxes, vertical shafts in said boxes, pinions on said shafts engaging the rack-bars, and paper-sustaining bars attached vertically to said sleeves, as set forth and shown.

22. In combination with the frame and paper supporting table, laterally-adjustable paper-sustaining bars for engaging the side edges of the paper piled on the table, and paper-separating mechanism carried by said bars to a corresponding position in relation to the pile of paper, as set forth.

23. In combination with the frame and paper-supporting table, cross-bars secured to the frame, vertical bars connected to the cross-bars adjustably lengthwise of the latter, arms extending from the vertical bars, and paper-separating mechanism connected to said arms, as set forth.

24. In combination with the frame and paper-supporting table, cross-bars attached to said frame, sleeves mounted movable laterally on said bars, clamping-screws confining the sleeves on said bars, paper-sustaining bars attached vertically to the said sleeves, arms extending rigidly rearward from said vertical bars, and paper-separating mechanism connected to said arms, all combined to simultaneously adjust said paper-sustaining bars and paper-separating mechanism laterally in their positions in relation to the width of the pile of paper, substantially as set forth.

25. In combination with the frame and paper-supporting table, rack-bars extending across the frame, sleeves mounted loosely on said bars, vertical paper-sustaining bars attached to said sleeves, vertical journal-boxes on said bars split longitudinally, clamping-screws on said boxes, vertical shafts passing through the boxes, pinions on said shafts engaging the rack-bars, cranks on the shafts, arms extending from the vertical bars, and paper-separating mechanism connected to said arms, as set forth.

26. In combination with the frame and paper-supporting table, brackets supported adjustably in their positions in relation to the width of the paper piled on the table, and paper-separating mechanism sliding vertically on said brackets and comprising a finger bearing upon the paper, a finger buckling the paper, and a rotary foot separating the paper, substantially as set forth.

27. In combination with the frame and paper-supporting table, cross-bars attached to said frame, vertical paper-sustaining bars connected to the cross-bars, adjustable lengthwise of the latter, arms extending from said vertical bars, brackets carried on said arms, adjustable lengthwise thereof, and paper-separating mechanism connected to said brackets, as set forth.

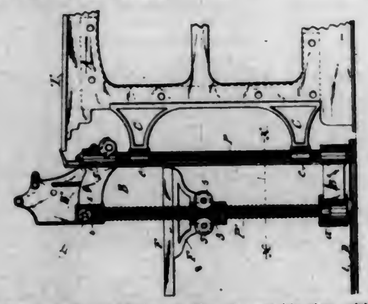
28. In combination with the frame and paper-supporting table, laterally-adjustable vertical bars, arms extending horizontally rearward from said bars, oscillatory shafts extending lengthwise of said arms, brackets hung on said shafts, and paper-separating mechanisms connected movable vertically to said brackets and actuated by the aforesaid shaft, as specified.

29. In combination with the frame and paper-supporting table, a rock-shaft, a gear on said shaft, a horizontal shaft parallel with the line of feed, a gear on the latter shaft meshing with that of the rock-shaft, a bracket hung on said horizontal shaft, and paper-separating mechanism connected to said bracket and actuated by the said horizontal shaft, and a paper-buckling finger moving in the direction of the feed of the paper, as set forth.

30. In combination with the frame and paper supporting table, laterally adjustable paper-sustaining bars, arms extending horizontally from said bars, a rock-shaft pivoted to the frame, gears on said shaft, shafts extending lengthwise of said arms, gears on the latter shaft meshing with those of the rock-shaft, brackets hung on the shafts of the arms, and paper-separating mechanisms connected movable vertically to said brackets and actuated by the latter shafts, as set forth.

31. In combination with the frame and paper-supporting table, a rock-shaft extending across the frame, paper-feeding devices connected to said rock-shaft, a horizontal shaft at right angles to the rock-shaft, gears transmitting motion from the said rock-shaft to the said horizontal shaft, a bracket hung on the latter shaft, and paper-separating mechanisms connected to the brackets and actuated by the aforesaid horizontal shaft and movable in the direction of the feed of the paper, as set forth.

32. In combination with the frame and paper-supporting table, laterally-adjustable paper-sustaining bars, arms extending rearward from said bars, shafts extending lengthwise of said arms and pivoted thereto, brackets hung on said shafts, a rock-shaft and gears actuating the aforesaid shafts, paper-feeding devices connected to said rock-shaft, and paper-separating mechanisms connected movable vertically to the brackets and actuated by the shafts of the aforesaid arms, substantially as set forth.



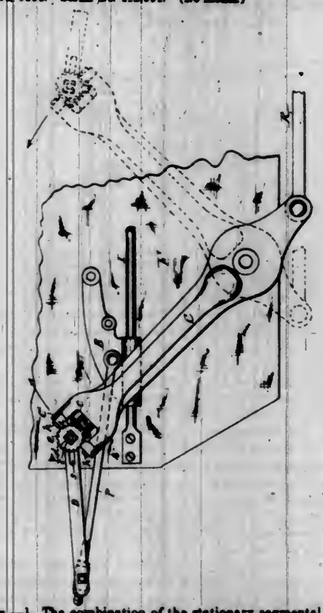
33. In a paper-separating mechanism, the combination of a paper-buckling finger, an arm bearing on the top of the paper in front of said finger, a revoluble foot entering between the buckled top sheet of the said paper between said finger and arm, and frictional rubber bearings secured to the top of said foot, as set forth.

34. In a paper-separating mechanism, the combination, with a paper-buckling finger held in contact with the top of the paper, a friction-block on the bearing end of said finger, a spring-finger bearing on the paper in front of the paper-buckling finger, a vertical revoluble shaft provided with a foot entering beneath the paper buckled between the aforesaid fingers, a lever connected to the paper-buckling finger, and a cam attached to the aforesaid shaft and engaging the said lever and thereby actuating the paper-buckling finger, as set forth.

35. In combination with the paper-supporting table, a horizontal rock-shaft parallel with the line of feed, a bracket connected to said shaft, a vertical shaft sustained movable vertically in the bracket, gears transmitting motion from the horizontal shaft to the vertical shaft, a foot extending from the vertical shaft, a cam affixed to the latter shaft, an oscillatory paper-buckling finger held in contact with the paper back of said foot, a lever extending from the buckling-finger and actuated by the aforesaid cam, and a finger bearing on the paper in front of the aforesaid foot, substantially as set forth and shown.

36. In combination with the paper-supporting table, the rock-shaft *x*, the bracket *y*, provided with ears receiving through them the rock-shaft and provided at the opposite side with vertically-perforated ears *y'* *y''* and vertical guide *y'*, the gear *y'''*, mounted loosely on the shaft between the ears of the bracket, the clutch-collar *x'''*, connected to the shaft, movable longitudinally, and locked to rotate with the shaft, spurs *x*, projecting from the side of said gear and beveled on one side, the spring-bolt *x'* in the adjacent end of the clutch-collar, the rod U, sliding in the vertical guide *y'*, the gear U', journaled in the ears *y''*, the shaft V, passing freely vertically through said gear and locked to rotate with the same, a collar connected in a like manner to said shaft and provided with the finger V'', the cam-ring V', attached to the top of the upper ear *y''*, the cross-bars W W, fixed to the ends of the rods U and provided with journal-bearings for the vertical shaft V, the duplex cam 4 and foot W'', fastened to the said shaft, rubber faces W''', secured to the top of the foot, the lever X, swiveled on the rod, the spring X', holding the said lever in contact with the cam, the sleeve 5, extending from the hub of said lever, the arm 6, secured revolubly in said sleeve, a spring pressing said arm upon the paper, a rubber block fixed to the free end of said arm, the spring-finger 7, pivoted to the cross-bar W, and the lever 7*, extending from said lever and under the cam 4, all combined to operate substantially as described and shown.

480,448. **FEED-MACHINE ATTACHMENT FOR PRINTING-PRESSES.** THOMAS A. BRIGGS, Arlington, Mass. Filed Nov. 24, 1891. Serial No. 412,990. (No model.)

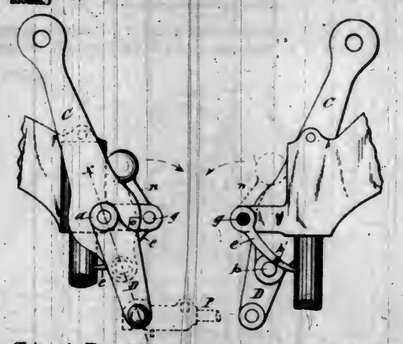


Claim.—1. On a printing-machine, the combination, with the main frame, of a supplemental frame hinged to one side of the feeding end of said main frame, a paper-supporting table carried on said supplemental frame, a segmental track under the latter frame and concentric to the hinge thereof, and a roller connected to the supplemental frame and traversing on the aforesaid track, as set forth and shown.

2. On a printing-machine, the combination, with the main frame A, of the supplemental frame B, hinged to one side of the feeding end of the main frame and formed with a cross-bar B' and with the socket *a* in the under side of said cross-bar and having vertical grooves *a' a'* in opposite sides of said socket, the yoke *b*, seated movable vertically in said grooves, the roller *c*, pivoted to said yoke, and the set-screw *d*, passing through the top of the cross-bar and bearing on top of the yoke, substantially as described and shown.

3. The combination, with the main frame A, of the brackets C C, attached to one side of the feeding end of said frame and provided with the vertical sleeves *e e*, the supplemental frame B, provided with sleeves *e' e'*, the post P, passing through the aforesaid sleeves and hinging the supplemental frame to the main frame, the base-plate D, provided with the socket *f*, having stepped therein the post P and formed with the track *f'* concentric to said socket, the roller *c*, mounted on said track and supporting the central portion of the supplemental frame, and the table F, connected to the post P' adjustably in its elevation, substantially as described and shown.

480,449. **DEVICE FOR CONVERTING OSCILLATORY INTO RECIPROCATING MOTION.** THOMAS A. BRIGGS, Arlington, Mass. Filed Nov. 24, 1891. Serial No. 412,991. (No model.)



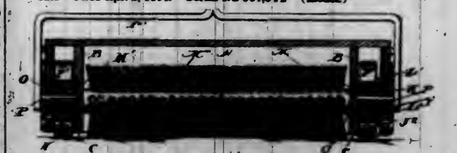
Claim.—1. The combination of the stationary segmental gear A, the rock-arm C, pivoted to the center of said gear, the shaft *a*, extending lengthwise of said arm and journaled thereon, the pinion *b*, fixed to one end of said shaft and engaging the gear A, the miter-pinion *c* on the opposite end of said shaft, the shaft *d*, journaled to the free end of the rock-arm at right angles to the shaft *a*, the pinion *e*, fixed to the shaft *d* and meshing with the pinion *c*, and the arm D, also fixed to the latter shaft to move therewith, as set forth.

2. In combination with the stationary gear A, the rock-arm C, pivoted to the center of said gear, the shaft *a*, extending lengthwise of said rock-arm and journaled thereon, the pinion *b*, fixed to one end of said shaft and engaging the gear A, the miter-pinion *c*, fixed to the opposite end of said shaft, the cap C', attached to the free end of the rock-arm and provided with the journal-bearing *d'* at right angles to the shaft *a*, the shaft *d*, extending through said journal-bearing, the pinion *e*, fixed to one end of the latter shaft and meshing with the pinion *c*, and the arm D, fixed to the opposite end of the shaft *d*, substantially as described and shown.

3. In combination with the guide I and slide B, mounted thereon, the stationary gear A, the rock-arm C, pivoted to the center of said gear, the shaft *a*, journaled on said arm lengthwise thereof, the pinion *b*, fixed to said shaft and engaging the gear A, the pinion *c*, fixed to the opposite end of said shaft, the shaft *d*, journaled to the free end of the rock-arm at right angles to the shaft *a*, the pinion *e*, fixed to one end of shaft *d* and meshing with the pinion *c*, the arm D, fixed to the opposite end of the shaft *d*, and the pitman P, pivotally connected to the free end of the arm D and to the slide B, substantially as described and shown.

4. In combination with the rock-arm C, longitudinal shaft *a*, transverse shaft *d*, and pinions transmitting motion from the longitudinal shaft to the transverse shaft, the arm D, connected longitudinally adjustable to the transverse shaft to regulate the throw of said arm, as set forth.

480,450. **COMPOUND LEVER.** THOMAS A. BRIGGS, Arlington, Mass. Original application filed Nov. 24, 1891, Serial No. 412,989. Divided and this application filed Mar. 5, 1892. Serial No. 423,815. (No model.)



Claim.—1. The combination, with a pivoted lever, of an arm pivoted to said lever, a bolt movably connected to one of said parts and adapted to engage and release the other of said parts, and a gravity-lever actuating the bolt, as set forth.

2. The combination of the pivoted lever C, provided with the eye *c*, the arm D, pivoted to said lever and provided with the socket *d*, the bolt *b*, sliding in the aforesaid eye and adapted to enter the socket, the lug *b'*, projecting laterally from the bolt, and the cam *e*, adapted to be thrown in the path of the lug to automatically unlock the bolt during the movement of the lever, as set forth.

3. In combination with the pivoted lever C, provided with the eye *c*, and the arm D, pivoted to said lever and provided with the socket *d*, the bolt *b*, sliding in the aforesaid eye, a spring forcing said bolt toward the socket *d*, a lug *b'*, projecting laterally from the bolt, a revoluble shaft parallel with the axis of the lever, the cam *e* on said shaft, adapted to fall into the path of the aforesaid lug, and a gravity lever attached to the aforesaid shaft to hold the cam in its requisite position in relation to the lug *b'*, substantially as described and shown.

4. In combination with the lever C, provided with the eye *c*, and the arm D, pivoted to said lever and provided with the socket *d*, the bolt *b*, sliding in said eye and adapted to enter the socket, and the abutment *o*, projecting from the lever and in position to arrest the movement of the arm in one direction and at a point to bring the socket *d* in line with the bolt, substantially as and for the purpose set forth.

480,451. **CARPET-SWEEPER.** HOWARD CADWALADER, Richmond, Ind. Filed Apr. 2, 1891. Serial No. 387,344. (Model.)

Claim.—1. In a carpet-sweeper, the combination of the casing, the adjustable plates secured to the end of the casing, the elastic bearings carried by said plates, the brush arranged in the casing, and the handle bearing in the said elastic bearings and the ends of the brush.

2. In a carpet-sweeper, the combination of a casing having a partition in each end, supporting-rollers mounted in the ends of the casing and having flanged metal hubs and elastic bodies, a brush-shaft mounted in the casing and having elastic rollers engaging the supporting-rollers, plates adjustably secured to the casing and having flanged cups, elastic bearings in said cups, plates having hubs in said bearings, and a bail having studs passing through the bearings into the ends of the brush-shaft.

3. In a carpet-sweeper, the combination of the casing, the adjustable plates secured to the ends of the casing, the elastic bearings carried by said plates, the brush arranged in the casing and carrying elastic rollers, the elastic supporting-rollers engaging said rollers, and the handle bearing in the ends of the brush and the elastic bearings of the plates, substantially as described.

of cross-bars secured to the top and bottom of the frame and paper-sustaining bars supported in vertical positions on said cross-bars and adjustably lengthwise of the latter to allow said vertical bars to be set closely against opposite sides of the pile of paper on the supporting-table, as set forth.

20. The combination, with the frame and paper-supporting table, of horizontal rack-bars extending across the frame, sleeves mounted loosely on said bars, paper-sustaining bars secured to said sleeves, vertical shafts journaled on said bars, and pinions on said shafts engaging the rack-bars, as set forth.

21. In combination with the horizontal rack-bars extending across the machine, sleeves mounted loosely on said bars, vertical journal-boxes on the sleeves split longitudinally, clamping-screws connected to said journal-boxes, vertical shafts in said boxes, pinions on said shafts engaging the rack-bars, and paper-sustaining bars attached vertically to said sleeves, as set forth and shown.

22. In combination with the frame and paper supporting table, laterally-adjustable paper-sustaining bars for engaging the side edges of the paper piled on the table, and paper-separating mechanism carried by said bars to a corresponding position in relation to the pile of paper, as set forth.

23. In combination with the frame and paper-supporting table, cross-bars secured to the frame, vertical bars connected to the cross-bars adjustably lengthwise of the latter, arms extending from the vertical bars, and paper-separating mechanism connected to said arms, as set forth.

24. In combination with the frame and paper-supporting table, cross-bars attached to said frame, sleeves mounted movable laterally on said bars, clamping-screws confining the sleeves on said bars, paper-sustaining bars attached vertically to the said sleeves, arms extending rigidly rearward from said vertical bars, and paper-separating mechanism connected to said arms, all combined to simultaneously adjust said paper-sustaining bars and paper-separating mechanism laterally in their positions in relation to the width of the pile of paper, substantially as set forth.

25. In combination with the frame and paper-supporting table, rack-bars extending across the frame, sleeves mounted loosely on said bars, vertical paper-sustaining bars attached to said sleeves, vertical journal-boxes on said bars split longitudinally, clamping-screws on said boxes, vertical shafts passing through the boxes, pinions on said shafts engaging the rack-bars, cranks on the shafts, arms extending from the vertical bars, and paper-separating mechanism connected to said arms, as set forth.

26. In combination with the frame and paper-supporting table, brackets supported adjustably in their positions in relation to the width of the paper piled on the table, and paper-separating mechanism sliding vertically on said brackets and comprising a finger bearing upon the paper, a finger buckling the paper, and a rotary foot separating the paper, substantially as set forth.

27. In combination with the frame and paper-supporting table, cross-bars attached to said frame, vertical paper-sustaining bars connected to the cross-bars, adjustable lengthwise of the latter, arms extending from said vertical bars, brackets carried on said arms, adjustable lengthwise thereof, and paper-separating mechanism connected to said brackets, as set forth.

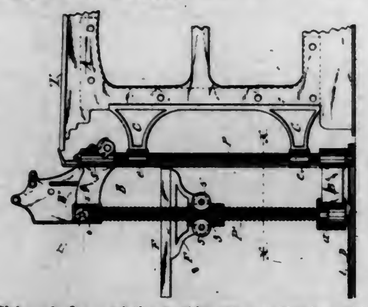
28. In combination with the frame and paper-supporting table, laterally-adjustable vertical bars, arms extending horizontally rearward from said bars, oscillatory shafts extending lengthwise of said arms, brackets hung on said shafts, and paper-separating mechanisms connected movable vertically to said brackets and actuated by the aforesaid shaft, as specified.

29. In combination with the frame and paper-supporting table, a rock-shaft, a gear on said shaft, a horizontal shaft parallel with the line of feed, a gear on the latter shaft meshing with that of the rock-shaft, a bracket hung on said horizontal shaft, and paper-separating mechanism connected to said bracket and actuated by the said horizontal shaft, and a paper-buckling finger moving in the direction of the feed of the paper, as set forth.

30. In combination with the frame and paper supporting table, laterally adjustable paper-sustaining bars, arms extending horizontally from said bars, a rock shaft pivoted to the frame, gears on said shaft, shafts extending lengthwise of said arms, gears on the latter shaft meshing with those of the rock-shaft, brackets hung on the shafts of the arms, and paper-separating mechanisms connected movable vertically to said brackets and actuated by the latter shafts, as set forth.

31. In combination with the frame and paper-supporting table, a rock-shaft extending across the frame, paper-feeding devices connected to said rock-shaft, a horizontal shaft at right angles to the rock-shaft, gears transmitting motion from the said rock-shaft to the said horizontal shaft, a bracket hung on the latter shaft, and paper-separating mechanisms connected to the brackets and actuated by the aforesaid horizontal shaft and movable in the direction of the feed of the paper, as set forth.

32. In combination with the frame and paper-supporting table, laterally-adjustable paper-sustaining bars, arms extending rearward from said bars, shafts extending lengthwise of said arms and pivoted thereto, brackets hung on said shafts, a rock-shaft and gears actuating the aforesaid shafts, paper-feeding devices connected to said rock-shaft, and paper-separating mechanisms connected movable vertically to the brackets and actuated by the shafts of the aforesaid arms, substantially as set forth.



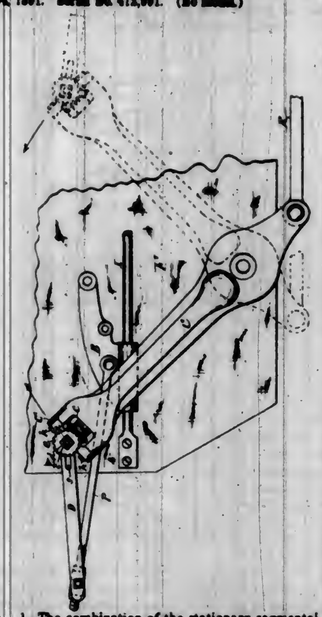
33. In a paper-separating mechanism, the combination of a paper-buckling finger, an arm bearing on the top of the paper in front of said finger, a revoluble foot entering between the buckled top sheet of the said paper between said finger and arm, and frictional rubber bearings secured to the top of said foot, as set forth.

34. In a paper-separating mechanism, the combination, with a paper-buckling finger held in contact with the top of the paper, a friction-block on the bearing end of said finger, a spring-finger bearing on the paper in front of the paper-buckling finger, a vertical revoluble shaft provided with a foot entering beneath the paper buckled between the aforesaid fingers, a lever connected to the paper-buckling finger, and a cam attached to the aforesaid shaft and engaging the said lever and thereby actuating the paper-buckling finger, as set forth.

35. In combination with the paper-supporting table, a horizontal rock-shaft parallel with the line of feed, a bracket connected to said shaft, a vertical shaft sustained movable vertically in the bracket, gears transmitting motion from the horizontal shaft to the vertical shaft, a foot extending from the vertical shaft, a cam affixed to the latter shaft, an oscillatory paper-buckling finger held in contact with the paper back of said foot, a lever extending from the buckling-finger and actuated by the aforesaid cam, and a finger bearing on the paper in front of the aforesaid foot, substantially as set forth and shown.

36. In combination with the paper-supporting table, the rock-shaft x, the bracket y, provided with ears receiving through them the rock-shaft and provided at the opposite side with vertically-perforated ears y'' y'' and vertical guide y', the gear y''', mounted loosely on the shaft between the ears of the bracket, the clutch-collar y''', connected to the shaft, movable longitudinally, and locked to rotate with the shaft, spurs z, projecting from the side of said gear and beveled on one side, the spring-bolt x' in the adjacent end of the clutch-collar, the rod U, sliding in the vertical guide y', the gear U', journaled in the ears y'', the shaft V, passing freely vertically through said gear and locked to rotate with the same, a collar connected in a like manner to said shaft and provided with the finger V'', the cam-ring V', attached to the top of the upper ear y'', the cross-bars W W, fixed to the ends of the rods U and provided with journal-bearings for the vertical shaft V, the duplex cam 4 and foot W'', fastened to the said shaft, rubber faces W''', secured to the top of the foot, the lever X, swiveled on the rod, the spring X', holding the said lever in contact with the cam, the sleeve 5, extending from the hub of said lever, the arm 6, secured revolubly in said sleeve, a spring pressing said arm upon the paper, a rubber block fixed to the free end of said arm, the spring-finger 7, pivoted to the cross-bar W, and the lever 7*, extending from said lever and under the cam 4, all combined to operate substantially as described and shown.

480,448. **FEED-MACHINE ATTACHMENT FOR PRINTING-PRESSES.** THOMAS A. BRIGGS, Arlington, Mass. Filed Nov. 24, 1891. Serial No. 412,990. (No model.)

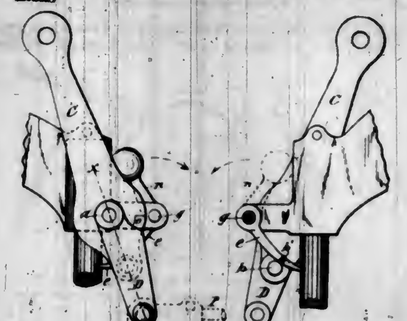


Claim.—1. On a printing-machine, the combination, with the main frame, of a supplemental frame hinged to one side of the feeding end of said main frame, a paper-supporting table carried on said supplemental frame, a segmental track under the latter frame and concentric to the hinge thereof, and a roller connected to the supplemental frame and traversing on the aforesaid track, as set forth and shown.

2. On a printing-machine, the combination, with the main frame A, of the supplemental frame B, hinged to one side of the feeding end of the main frame and formed with a cross-bar B' and with the socket a in the under side of said cross-bar and having vertical grooves a' a' in opposite sides of said socket, the yoke b, seated movable vertically in said grooves, the roller c, pivoted to said yoke, and the set-screw d, passing through the top of the cross-bar and bearing on top of the yoke, substantially as described and shown.

3. The combination, with the main frame A, of the brackets C C, attached to one side of the feeding end of said frame and provided with the vertical sleeves e e, the supplemental frame B, provided with sleeves e d, the post F, passing through the aforesaid sleeves and hinging the supplemental frame to the main frame, the base-plate D, provided with the socket f, having stepped therein the post F' and formed with the track t concentric to said socket, the roller c, mounted on said track and supporting the central portion of the supplemental frame, and the table F, connected to the post F' adjustably in its elevation, substantially as described and shown.

480,449. **DEVICE FOR CONVERTING OSCILLATORY INTO RECIPROCATING MOTION.** THOMAS A. BRIGGS, Arlington, Mass. Filed Nov. 24, 1891. Serial No. 412,991. (No model.)



Claim.—1. The combination of the stationary segmental gear A, the rock-arm C, pivoted to the center of said gear, the shaft a, extending lengthwise of said arm and journaled thereon, the pinion b, fixed to one end of said shaft and engaging the gear A, the miter-pinion c on the opposite end of said shaft, the shaft d, journaled to the free end of the rock-arm at right angles to the shaft a, the pinion e, fixed to the shaft d and meshing with the pinion c, and the arm D, also fixed to the latter shaft to move therewith, as set forth.

2. In combination with the stationary gear A, the rock-arm C, pivoted to the center of said gear, the shaft a, extending lengthwise of said rock-arm and journaled thereon, the pinion b, fixed to one end of said shaft and engaging the gear A, the miter-pinion c, fixed to the opposite end of said shaft, the cap C', attached to the free end of the rock-arm and provided with the journal-bearing d' at right angles to the shaft a, the shaft d, extending through said journal-bearing, the pinion e, fixed to one end of the latter shaft and meshing with the pinion c, and the arm D, fixed to the opposite end of the shaft d, substantially as described and shown.

3. In combination with the guide I and slide B, mounted thereon, the stationary gear A, the rock-arm C, pivoted to the center of said gear, the shaft a, journaled on said arm lengthwise thereof, the pinion b, fixed to said shaft and engaging the gear A, the pinion c, fixed to the opposite end of said shaft, the shaft d, journaled to the free end of the rock-arm at right angles to the shaft a, the pinion e, fixed to one end of shaft d and meshing with the pinion c, the arm D, fixed to the opposite end of the shaft d, and the pitman P, pivotally connected to the free end of the arm D and to the slide B, substantially as described and shown.

4. In combination with the rock-arm C, longitudinal shaft a, transverse shaft d, and pinions transmitting motion from the longitudinal shaft to the transverse shaft, the arm D, connected longitudinally adjustable to the transverse shaft to regulate the thrust of said arm, as set forth.

480,450. **COMPOUND LEVER.** THOMAS A. BRIGGS, Arlington, Mass. Original application filed Nov. 24, 1891, Serial No. 412,989. Divided and this application filed Mar. 5, 1892. Serial No. 423,616. (No model.)

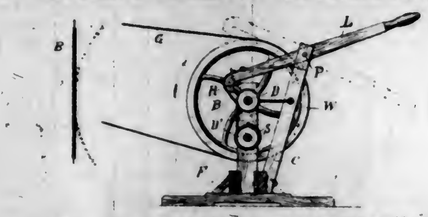
Claim.—1. The combination, with a pivoted lever, of an arm pivoted to said lever, a bolt movably connected to one of said parts and adapted to engage and release the other of said parts, and a gravity-lever actuating the bolt, as set forth.

2. The combination of the pivoted lever C, provided with the eye c, the arm D, pivoted to said lever and provided with the socket d, the bolt b, sliding in the aforesaid eye and adapted to enter the socket, the lug b', projecting laterally from the bolt, and the cam e, adapted to be thrown in the path of the lug to automatically unlock the bolt during the movement of the lever, as set forth.

3. In combination with the pivoted lever C, provided with the eye c, and the arm D, pivoted to said lever and provided with the socket d, the bolt b, sliding in the aforesaid eye, a spring forcing said bolt toward the socket d, a lug b', projecting laterally from the bolt, a revoluble shaft parallel with the axis of the lever, the cam e on said shaft, adapted to fall into the path of the aforesaid lug, and a gravity lever attached to the aforesaid shaft to hold the cam in its requisite position in relation to the lug b', substantially as described and shown.

4. In combination with the lever C, provided with the eye c, and the arm D, pivoted to said lever and provided with the socket d, the bolt b, sliding in said eye and adapted to enter the socket, and the abutment o, projecting from the lever and in position to arrest the movement of the arm in one direction and at a point to bring the socket d in line with the bolt, substantially as and for the purpose set forth.

480,451. **CARPET-SWEEPER.** HOWARD CADWALADER, Richmond, Ind. Filed Apr. 2, 1891. Serial No. 387,344. (Model.)

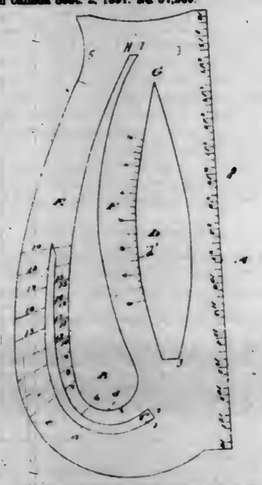


Claim.—1. In a carpet-sweeper, the combination of the casing, the adjustable plates secured to the end of the casing, the elastic bearings carried by said plates, the brush arranged in the casing, and the handle bearing in the said elastic bearings and the ends of the brush.

2. In a carpet-sweeper, the combination of a casing having a partition in each end, supporting-rollers mounted in the ends of the casing and having flanged metal hubs and elastic bodies, a brush-shaft mounted in the casing and having elastic rollers engaging the supporting-rollers, plates adjustably secured to the casing and having flanged caps, elastic bearings in said caps, plates having hubs in said bearings, and a bail having studs passing through the bearings into the ends of the brush-shaft.

3. In a carpet-sweeper, the combination of the casing, the adjustable plates secured to the ends of the casing, the elastic bearings carried by said plates, the brush arranged in the casing and carrying elastic rollers, the elastic supporting-rollers engaging said rollers, and the handle bearing in the ends of the brush and the elastic bearings of the plates, substantially as described.

4. In a carpet-sweeper, the combination of a casing, yielding or elastic supporting-rollers having flanged metal hubs mounted in the casing, a brush having elastic or yielding rollers engaging the supporting-rollers, adjustable plates connected to the ends of the casing and having flanges forming bearing-boxes, elastic or yielding bearings arranged in said boxes, plates having hubs fitting into said yielding bearings, a bail having studs bearing in the brush and the adjustable bearings, and a handle.

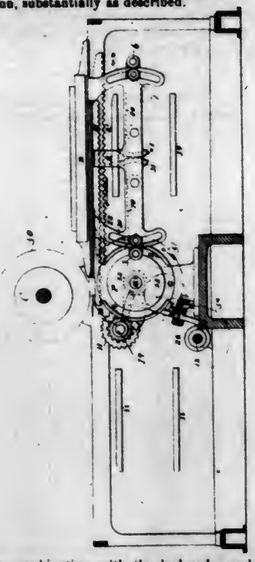


480,452. MANUAL-POWER MACHINE. WARREN K. CROFFORD, New York, N. Y. Filed Aug. 31, 1891. Serial No. 404,362. (No model.)

Claim.—1. The combination, in a manual-power machine, of a lever, a continuous driving-belt fastened to said lever and wound spirally one or more times around a drum on the driving-shaft and one or more times around a take-up drum and fastened to the latter, and said drums, substantially as set forth.

2. The combination, in a manual-power machine, of a lever, the driving flexible connection, the drum and balance-wheel rigid with each other and with the shaft, and an automatic take-up for said flexible connection, said flexible connection being spirally wound around said drum and being thence directly connected at one end with said lever and at the other end to said automatic take-up, substantially as set forth.

480,453. CHART FOR DRAFTING GARMENTS. SAMUEL G. CROW, Toronto, Canada. Filed Dec. 3, 1891. Serial No. 413,894. (No model.) Patented in Canada Sept. 2, 1891. No. 37,289.



Claim.—The chart herein described, having a straight-edge A with a scale thereon and its opposite edge curved and having three openings B, C, and D, forming the curved edges *a b c d* E F, the edges *a b d* being adapted for grading the arm-scye for the different sizes of garments, the edge *d* for marking the shoulder and darts, the edge E for marking the under arm-seam, and the edge F for marking the side form, all substantially as shown and described.

480,454. BED-MOTION FOR CYLINDER PRINTING-MACHINES. LUTHER C. CROWELL, Brooklyn, assignor to Robert Hoe, Stephen D. Tucker, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed May 9, 1892. Serial No. 432,362. (No model.)

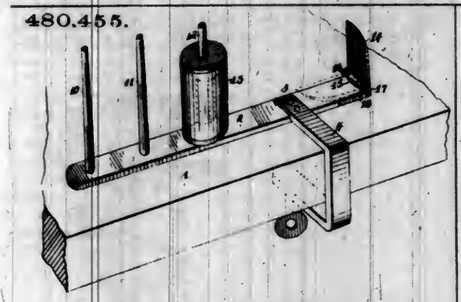
Claim.—1. The combination, with the reciprocating bed, of two levers pivoted to the bed and geared together so as to swing concertedly, a revolving disk having a pocket, and two revolving guards co-operating with said pocket to alternately engage the outer ends of said levers and reverse the movement of the bed at each end of its run by retarding, stopping, starting, and accelerating the same, substantially as described.

2. The combination, with the reciprocating bed, of two levers pivoted to the bed and geared together so as to swing concertedly, a revolving disk having a pocket, two revolving guards co-operating with said pocket to alternately engage the outer ends of said levers, and a curved guide at each end of the bed, in which the outer ends of said levers travel, whereby the motion of the bed is reversed at each end of its run, substantially as described.

3. The combination, with the bed and a rack-and-pinion mechanism for driving it during the major part of its reciprocation, of two levers pivoted to the bed and geared together so as to swing concertedly, a revolving disk having a pocket, and two revolving guards co-operating with said pocket to alternately engage the outer ends of said levers and reverse the movement of the bed at each end of its run by retarding, stopping, starting, and accelerating the same, substantially as described.

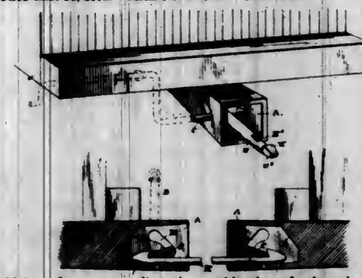
4. The combination, with the bed and a rack-and-pinion mechanism for driving it during the major part of its reciprocation, of two levers pivoted to the bed and geared together so as to swing concertedly, a revolving disk having a pocket, two revolving guards co-operating with said pocket to alternately engage the outer ends of said levers, and a curved guide at each end of the bed, in which the outer ends of said levers travel, whereby the motion of the bed is reversed at each end of its run, substantially as described.

5. The combination, with the moving bed, the two levers pivoted thereto and connected so as to conjointly swing in opposite directions, a revolving pocket, and a revolving guard co-operating therewith, of guide-rails, as 31 32 or 33 34, for supporting said levers in the upper or lower positions to which they are moved by the pocket and guard substantially as described.



6. The combination, with the reciprocating bed, two levers pivoted thereto and connected so as to conjointly swing in opposite directions, a revolving pocket, and two revolving guards co-operating therewith, of guide-rails 31, 32, 33, and 34 for supporting said levers in the upper and lower positions to which they are moved by the pocket and guards, substantially as described.

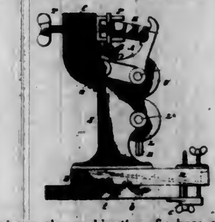
7. The combination of the pocket-disk, shaft 12, pinions 10 11, shaft 13, pinion 28, and movable guard-disks, substantially as described.



480,455. COMBINED SPOOL-HOLDER AND THREAD-CUTTER. ANDREAS BICHSORN, St. Louis, Mo., assignor of one-half to Andrew Frank, same place. Filed May 30, 1892. Serial No. 433,715. (No model.)

Claim.—As an improvement in combined spool-holders and thread-cutters, the combination, with a horizontal base-plate provided with spindles secured thereto and with a clamp, of a folding cutting-blade hinged to one end of said base-plate and adapted when opened to occupy a vertical position, substantially as and for the purpose set forth.

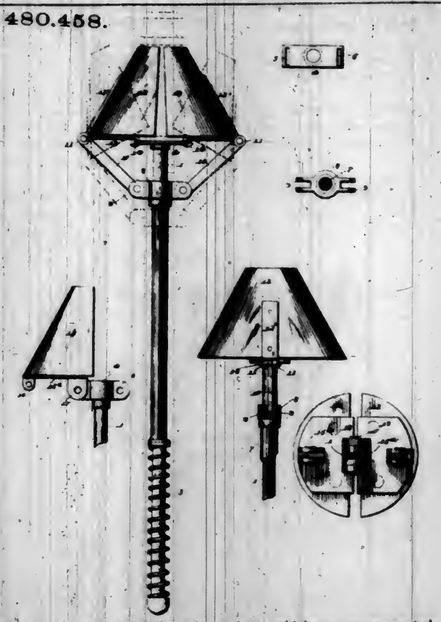
480,455.



480,456. CAR-COUPLING. THOMAS W. FELTON, San Gabriel, Tex. Filed Mar. 31, 1892. Serial No. 427,308. (No model.)

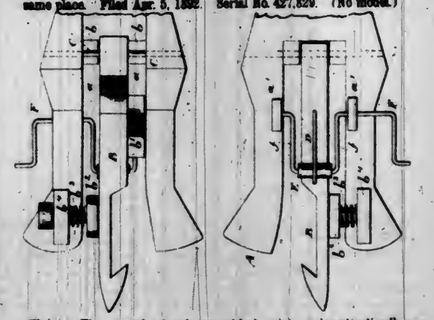
Claim.—In a car-coupling, the combination of a draw-head having slots in the sides thereof arranged at an angle of inclination, a dog of wedge shape mounted in said draw-head and having arms loosely bearing in said slots and normally seated in the lowermost or front portion of said slots to thereby hold the dog in locking position, and a coupling-link having shouldered heads at opposite ends thereof adapted to be engaged by said dog, substantially as described.

480,457. WRINGING-MACHINE. JOHN W. FINDLAY, Lowell, Mass. Filed Aug. 7, 1891. Serial No. 401,996. (No model.)



Claim.—In a wringer, the combination of a base, standards rising therefrom, a roller journaled in said standards, a crank-handle on the shaft of said roller, L-shaped arms pivoted at one end to said standards and their other ends connected by a bar extending transversely across the machine, an upper roller journaled in the elbows of said arms, a cross-bar connecting the top of the standards, a set-screw extending horizontally through said cross-bar, a leaf-spring having its ends freely engaging the said bar, extending transversely across the machine, and arranged in a substantially horizontal position to thereby normally force the roller carried by the said L-shaped arms downward against the roller journaled in the standards, a plate bearing against the central portion of said spring and having the tip of the screw bearing against its face, and means for causing the upper roller to rotate simultaneously with and opposite to the direction of rotation of the lower roller, substantially as described.

480,458. BOTTLE-SNAP. JONATHAN FITHIAN, Bridgeton, N. J. Filed Jan. 23, 1892. Serial No. 419,554. (No model.)

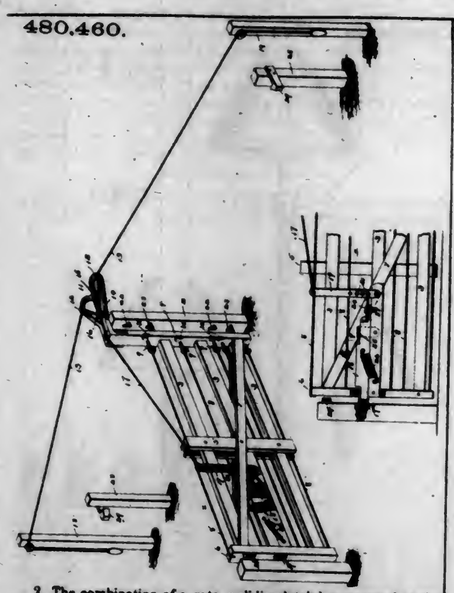


Claim.—1. A bottle snap or holder comprising suitably-shaped jaws hinged at or near their inner lower adjacent edges to a suitable rigid cap or ears on the handle, a sliding sleeve or tube on the handle, held by a spring normally in elevated position, and suitable ears upon the upper end of said sliding tube or sleeve, which ears are connected directly to the outer lower edges of the jaws by single bars or links pivoted at each end, substantially as set forth.

2. In a bottle-snap, suitably-shaped holding jaws having their inner lower adjacent edges hinged directly to the end of the handle by a single common pivot-bolt or rivet and their outer lower edges directly connected to a sliding tube or sleeve on said handle by single bars or links pivoted at each end, substantially as set forth.

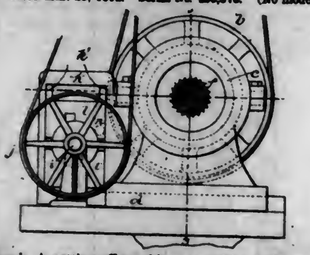
480,458.

480,459. CAR-COUPLING. WASHINGTON H. FOSTER, Concord, N. C., assignor of one-half to Hampton C. Howell and William H. Bradford, same place. Filed Apr. 5, 1892. Serial No. 427,829. (No model.)



Claim.—The coupler-hook provided with a longitudinally-arranged keeper on its bottom, in combination with a hand-crank shaft arranged in bearings on and under the draw-head, whereby the uncoupling may be done in the manner set forth.

480,460. GATE. JASPER M. FROST, Sheeth, Ind. Filed Apr. 5, 1892. Serial No. 427,862. (No model.)



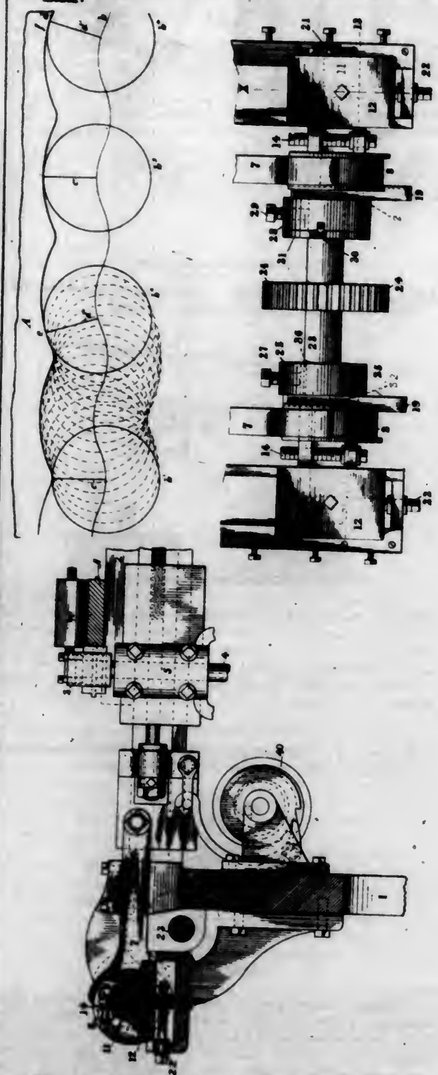
Claim.—1. The combination, with a gate provided with a latch, of an approximately triangular frame constructed of metal and secured to the gate and having an inwardly-extending angular base 11, pulleys mounted on the frame at the ends of the base, a latch-wire connected with the latch and provided at its rear end with a block arranged within the frame, and the operating-ropes having their inner adjacent ends secured to the frame at the angle of the base and passing through the block and around the pulleys and extending from the gate in opposite directions, substantially as described.

480,460.

2. The combination of a gate, a sliding latch-bar mounted on the gate, a vertically-disposed lever provided with a series of perforations and fulcrumed on the gate, a wire connecting the latch-bar with the lever and composed of two sections having their outer ends connected to the latch-bar and to the lever and having their adjacent ends provided with enlarged eyes linked into each other and having a limited movement on each other to permit the latch-bar to move independently of the lever, a spring holding the latch-bar normally extended, and operating-ropes connected with the lever, substantially as described.

480,461. CUTTING-OFF MACHINE. JOHN A. GILMORE, Boston, Mass. Filed Mar. 25, 1892. Serial No. 426,373. (No model.)

Claim.—1. A cutting-off machine comprising in its construction a cutter consisting of a disk having a central aperture or opening and provided on the edge of this opening with cutting-teeth, as set forth.



2. A cutting-off machine comprising in its construction a cutter consisting of a disk provided centrally with an opening and having cutting-teeth on the edge of this opening and a movable support for the cutter, as set forth.

3. A cutting-off machine comprising in its construction a pulley and a cutter consisting of a disk supported at its periphery in said pulley and provided centrally with an opening and having cutting-teeth on the edge of this opening, as set forth.

4. A cutting-off machine comprising in its construction a cutter consisting of a disk provided centrally with an opening and having cutting-teeth on the edge of this opening, a movable support for the cutter, adapted to be reciprocated, and means, substantially as described, for reciprocating the said support, as set forth.

5. In a cutting-off machine, a cutter consisting of a disk having a central opening and provided with cutting-teeth on the edge of this opening, said cutter mounted on a support adapted to reciprocate, and means, substantially as herein shown and described, whereby the cutter may enter the material at a speed which slackens as the cutter proceeds.

480,462. MEANS FOR ORNAMENTING WOOD. CHARLES L. GOEHRING, Allegheny, Pa. Filed Sept. 6, 1890. Serial No. 364,163. (No model.)

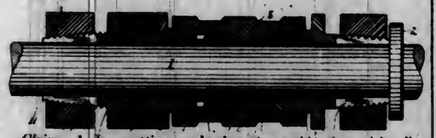
Claim.—1. In a wood-working machine, the combination, with feeding mechanism for advancing the material, of a rotary cutter-head, a rotary eccentric or crank for operating the cutter toward and from or over the material at an angle to the line of feed, and mechanism for varying the speed of the eccentric during its rotation, substantially as described.

2. In a wood-working machine, the combination, with feeding mechanism for advancing the material, of a rotary cutter-head, a rotary eccentric or crank of determined throw for operating the cutter toward and from the center line of the material at an angle to the line of feed, and mechanism for varying the speed of the eccentric during its rotation, substantially as described.

3. The combination, with a movable frame, a cutter-head mounted thereon, and an eccentric cam reciprocating said frame, of a shaft, a crank-pin thereon engaging with and rotating the eccentric, and means for adjusting the crank and cam relative to the rotary center of the latter, substantially as described.

4. The combination, with a movable frame, a cutter-head mounted thereon, and an eccentric cam for reciprocating said frame, of a shaft, a crank-pin thereon engaging with and operating the eccentric, said eccentric and shaft being adjustable relative to each other in a plane parallel with the movement of the movable frame, whereby the position of the pin relative to the center of rotation of the cam may be changed, substantially as described.

5. The combination, with a movable frame, a cutter-head mounted thereon, a movable block, and a rotary eccentric cam mounted upon the block and connected to the frame for reciprocating it, of a rotary shaft mounted in stationary bearings and having a crank-pin for rotating the cam, substantially as described.

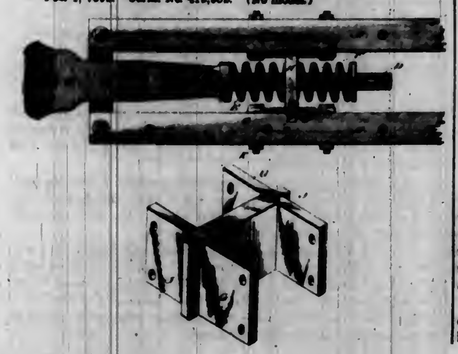


6. The combination, with a movable frame, a cutter-head mounted thereon, a movable block, and a rotary eccentric cam mounted on it having the groove in its face and connected to the frame for reciprocating it, of a rotary shaft and a crank-pin thereon operating in the groove in the cam, substantially as described.

7. The combination, with the movable frame, a cutter-head thereon, an adjustable eccentric cam, of a rotary shaft having a crank-pin co-operating with the cam and rotating it, said cam and shaft being adjustable relative to each other, whereby the position of the pin relative to the center of rotation of the cam can be adjusted, substantially as described.

8. The combination, with the rotary shaft having the two crank-pins thereon adjustable relative to each other, of two movable frames, each carrying a cutter-head, two eccentric cams, one connected to each head and each cam operated upon by one of the crank-pins and adjustable relative to the shaft, whereby the position of the pins relative to the center of rotation of the cams can be adjusted, substantially as described.

9. The combination, with the rotary shaft having the crank-pin and sliding block thereon, of the cam having the slot or way for said block, the movable block in which the cam is mounted, the movable frame and the cutter-head thereon, and connections between said frame and the cam for causing the reciprocation of the former by the rotation of the latter, substantially as described.



480,463. CUTTER-HEAD. CHARLES L. GOEHRING, Allegheny, Pa. Filed Jan. 5, 1891. Renewed July 6, 1892. Serial No. 439,153. (No model.)

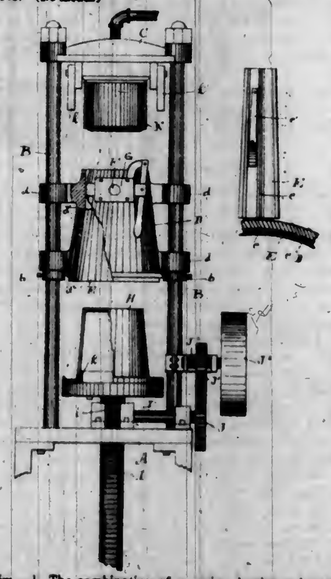
Claim.—1. In a cutting mechanism, the combination, with a live spindle or shaft, of a cutter-head comprising bit-holding devices and a supporting-sleeve or tubular portion encircling the shaft, said sleeve being slotted at points on opposite sides of the cutters or bits and provided with compressing or wedging devices, such as nuts 12, operating to compress the slotted sections of said sleeve and cause it to firmly bind upon the spindle, substantially as described.

2. The combination of the live spindle, the sleeve with split externally-tapered ends, the conical nuts engaging the tapered sections, the bit-clamping sections formed upon the sleeve, and the co-operating bit-clamping section adjustably mounted upon the sleeve, substantially as described.

480,464. DRAW-BAR GUIDE FOR CARS. JOHN L. GUINN, Somerset, Ky., assignor of one-half to John R. Thornton, same place. Filed Feb. 1, 1892. Serial No. 419,962. (No model.)

Claim.—1. The combination, with the longitudinal bars, of the guide consisting of the long side plates, central web and ribs secured to the bars, the draw-bar bearing in the central web and having the shoulders on each side of the web and the round coiled springs around the bar bearing against the shoulders.

2. The combination of the bars having the recesses, the plates unconnected at their ends and secured to the bars and engaging the recesses, the central web having an opening, and the draw-bar bearing in the opening and having the springs around the same.

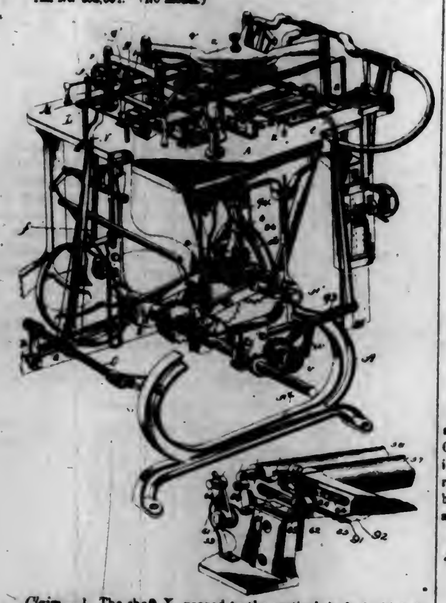


3. The guide or bearing consisting of the longitudinal plates, the thick central web, and the central exterior ribs of less thickness than the central rib or web, and the plates being unconnected at their ends, whereby the casting is easily and cheaply made and may be quickly applied and removed.

480,465. WHIFFLETREE-HOOK. HENRY E. HARRIS, Triumph, Minn. Filed Mar. 30, 1892. Serial No. 427,063. (No model.)

Claim.—The herein-described improvement in whiffletree-hooks, the same comprising a casting adapted to be fitted over the end of the whiffletree and having upon its rear edge an inwardly-extended arm C and upon its opposite side a hook, the semi-annular flange E, extending beyond the end of the whiffletree, and the gravity-latch pivoted to the end of the whiffletree within the flange E and adapted to normally close the space between the end of the hook and the whiffletree, substantially as shown and described, and for the purpose specified.

480,466. PRESS FOR FORMING HOLLOW ARTICLES FROM PULP. EBER HUBBARD, Chicago, Ill. Filed July 15, 1891. Serial No. 399,575. (No model.)



Claim.—1. The combination of a casing having a lower flaring portion and an upper cylindrical portion, overlapping staves or sections lining the inside of said flaring portion and having a longitudinal motion whereby they are expanded and contracted, a former adapted to enter the flaring end of said casing and to move said sections longitudinally as it enters said casing, and a plunger working in the cylindrical portion of said casing, substantially as described.

2. A casing having an upper cylindrical portion, a plunger moving therein, and a lower flaring portion, overlapping staves or sections lining said flaring portion in such a manner as to have a longitudinal

movement, the upper ends of said staves or sections forming when in their highest position a continuation of said cylindrical portion, combined with a former adapted to be inserted into the flaring end of said casing, and a shoulder on said former, adapted to impinge against the lower ends of said staves and to force them upward and contract them about said former, substantially as described.

3. The combination of a casing having a cylindrical upper and a conical lower portion, vertical guides in which said casing is adapted to slide, a plunger fixed above said casing and adapted to enter its upper portion, a sectional lining for the lower portion of said casing, said lining having a longitudinal motion within the casing, whereby it is expanded and contracted, a former below said casing and adapted to enter its lower end, and means for raising and lowering said former, substantially as described.

480,467. **PRINTING APPARATUS.** JAMES W. HUTT and ARTHUR J. PHILLIPS, Toronto, Canada. Original application filed Jan. 2, 1891, Serial No. 376,608. Divided and this application filed Aug. 7, 1891. Serial No. 402,061. (No model.)

Claim.—1. The shaft X, geared to the vertical shaft *f*, which derives its motion from the main shaft A, and a shaft A, geared to the shaft X and to the shaft *i*, in combination with the fount-roller 57, the inking-rollers J, geared to and deriving motion from the shaft *i*, and a cam-disk 60, fixed to the shaft *i* and operating the roller 58, substantially as and for the purpose specified.

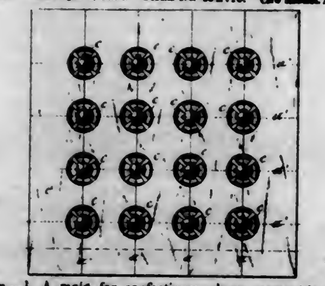
2. The roller 58, journaled at each end on a crank-arm 78, and the crank-arm 79, fixed to the shaft of the crank-arm 78 and having a projecting friction-roller 80, in combination with the revolving cam 60 and spring 61, substantially as and for the purpose specified.

3. A ratchet-wheel 64, fixed to the spindle 81 of the roller 57, and a pawl 63, pivoted on the slide 62 and engaging with the ratchet-wheel 64, in combination with the cam-disk 60 and spring 65, arranged substantially as and for the purpose specified.

4. The combination, with the roller 57, ratchet-wheel 64 on the shaft of said roller 57, the slide 62, carrying a pawl, the spring 65, and means for giving said slide motion in opposition to the spring, of an adjustable stop 66, arranged and operating substantially as described.

5. The combination, with the platen Z and means for feeding the blanks under the same, of an upwardly-curved guard 89, arranged substantially as and for the purpose specified.

480,468. **SHEAF-CARRIER FOR HARVESTER-BINDERS.** LYMAN M. JONES and JAMES K. WEDLAKE, Toronto, Canada, assignors to the Massey-Harris Company, Limited, same place. Filed Dec. 10, 1891. Serial No. 414,622. (No model.)

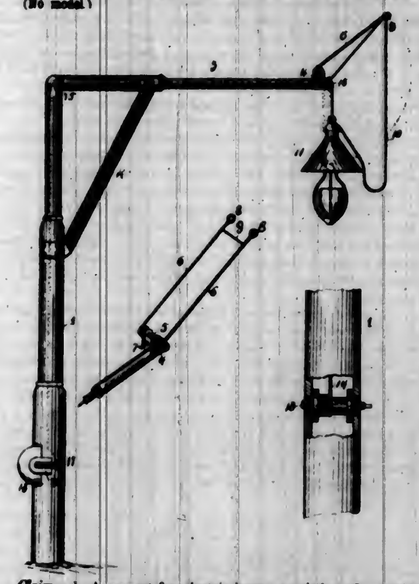


Claim.—1. In a sheaf-carrier, a series of fingers located at the discharge side of the binder-table, each finger independently carried on a horizontal journal-box provided with a vertical stud fitted into a suitable bearing-box on a rocking bar H, in combination with the arm O, reciprocating slotted bar P, and mechanism for giving the desired motion to said rocking bar H and the arm O, substantially as and for the purpose specified.

2. A rolling rod E, suitably journaled to the frame of the machine and having a double crank F formed at its lower end, and a bracket G, fixed to a journaled rock-shaft H and connected to the crank F, in combination with a series of fingers J, independently journaled in journal-boxes M, each journal-box having a vertical stud N, which is journaled in a bracket fixed to the rock-shaft H, and intermediate connection between said boxes M and the double crank, substantially as and for the purpose specified.

3. In a sheaf-carrier, a series of fingers J, each finger carried in a pivoted journal-box M, mounted on a rock-shaft H, having a bracket G, and each journal-box connected to a bar P, having a slot R made in it, in combination with the rod Q, working in said slot, crank F, rock-shaft E, carrying said crank, and connections between said bracket G and crank F, all arranged and operating substantially as and for the purpose specified.

480,469. **CANDY-MOLD.** MARCUS M. JUNE, Syracuse, N. Y., assignor of two-thirds to Orson Coville and Truman H. Whitcomb, same place. Filed Sept. 4, 1891. Serial No. 404,713. (No model.)



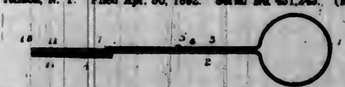
Claim.—1. A mold for confectionery-drops, comprising a bed formed with matrices in its surface and slitted to render it flexible across the said matrices and ties yieldingly holding the bed in its normal position, as set forth.

2. A confection-drop mold composed of a bed of hard material formed with matrices in its surface and divided into separable sections on lines passing through the matrices and ties yieldingly holding the bed in its normal position, as set forth.

3. A confection-drop mold composed of a bed formed with matrices in its surface and divided into separable sections on lines passing through the matrices and having channels extending through it parallel with the plane of the said bed and at right angles to the lines of its separations and spring-ties in said channels holding the bed in its normal position, as described and shown.

4. A confection-drop mold composed of a bed of hard material formed with matrices in its surface and divided into separable sections on lines passing through the matrices, elastic ties holding the bed in its normal position, and facings of rubber in the matrices, substantially as described and shown.

480,470. **SUPPORTING DEVICE FOR ELECTRIC-ARC LAMPS.** JOHN MAIER, St. Louis, Mo. Filed Dec. 11, 1891. Serial No. 414,698. (No model.)



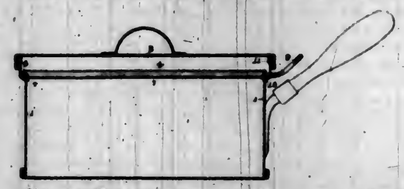
Claim.—1. A support for electric lamps, consisting of a vertical post, supports, such as 2, and horizontal supports, such as 3, an operating-rope attached to the lamp and passed through said horizontal support and post and connected to a suitable reel, and a suitable device secured to the free end of said support for elevating or raising the line-wires leading to the said lamp, substantially as set forth.

2. A support for lamps of the class described, consisting of a hollow support or post 1, support 3, and brace 2, line-wires passing through the said posts, brace, and support and connected to a lamp, and a reel mounted in the lower end of the said post, around which a rope is adapted to be wound, said rope passing over a suitable pulley and through said support 3 to the lamp for raising and lowering the same, substantially as set forth.

3. A support for electric lamps, consisting of a hollow post 1, brace 2, and support 3, a clip secured to the free end of the said support, spring arms, such as 6, secured to the said clip for suspending the line-wires leading to the lamp, and a rope attached to the said lamp and passing through said support and post and attached to a suitable reel mounted near the base of the said post, substantially as set forth.

4. A support for electric-arc lamps, consisting of a hollow post 1, brace 2, and a support 3, a reel mounted in the lower end of the said post, a rope connected to the said reel and adapted to be wound thereon and the opposite end of said rope passing up the post 1 and through the support 3 and attached to the lamp, a clip, such as 7, secured to one end of the said support 3, and a shaft, such as 5, passing through the said clip, arms, such as 6, having coiled ends and in suitable connection with the said clip, and eyes, such as 8, formed in the upper ends of the said arms, through which eyes the line-wires are adapted to pass for supporting the same, substantially as set forth.

480,471. **DENTAL MOISTENING-PAD.** GEORGE W. MELOTTE, Ithaca, N. Y. Filed Apr. 30, 1892. Serial No. 431,243. (No model.)

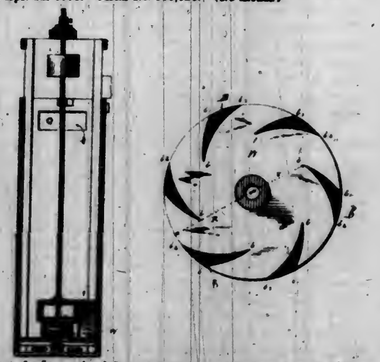


Claim.—1. A dental device consisting of a flat moistening and particle-receiving pad made of parallel layers of porous material secured together, combined with a detachable holder having a widened end fitting between the layers to keep the pad expanded, said pad being adapted to be entirely exposed to the mouth, substantially as set forth.

2. A dental device consisting of a holder having two members and a porous pad consisting of layers and open at one edge to receive one of said members, the opposite one being provided with a holding-tooth, substantially as set forth.

3. In combination with a porous pad adapted to act as a sponge and receive filings, a holder consisting of two members 2 and 3, connected by a spring-bow, one member being slotted and the other provided with a hook, the construction being such that a member can be moved lengthwise by compress in the spring to engage the hook with or disengage it from the slot and thereby hold or release the pad, substantially as set forth.

480,472. **STEAM RUBBER-HEATER.** GEORGE W. MELOTTE, Ithaca, N. Y. Filed May 7, 1892. Serial No. 432,186. (No model.)



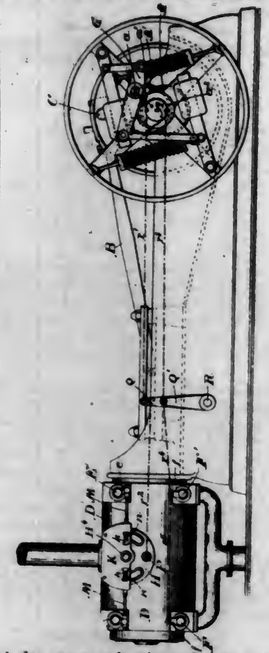
Claim.—1. For use in heating rubber over a water-vessel, a frame provided with a horizontal diaphragm in combination with said vessel and a cover, the frame fitting the vessel and the cover fitting the frame, the diaphragm being situated at the top of the water-vessel immediately below the cover, and the vessel provided with means for supporting the frame and diaphragm in such situation, substantially as set forth.

2. In combination with a water-vessel, the frame covered with a strained textile fabric, said frame consisting of exterior and interior rings adapted to embrace the fabric between them and situated at the top of the vessel, the rings and fabric filling the same horizontally immediately below the cover, substantially as set forth.

3. For use in heating rubber over or in a water-vessel, a frame consisting of two rings fitting one within the other, one of said rings being made of elastic material and having an open joint and a perforated or porous diaphragm held by said rings, substantially as set forth.

4. In combination, the vessel having a flared edge about its open top and a ring fitting said flared edge and provided with a handle and with a reticulated diaphragm, the edge being cut away to receive the handle, substantially as set forth.

480,478. **ROTARY PUMP.** JOSEPH MENGE, New Orleans, La. Filed Apr. 22, 1891. Serial No. 390,028. (No model.)



Claim.—1. In a wheel for a rotary pump, the combination, with a disk, of a plurality of flat blades open axially and radially mounted near the periphery and on each side of said disk, the sides of said blades forming curved channels of practically uniform cross-section, substantially as described.

2. In a wheel for a rotary pump, the combination, with a disk W^2, of a plurality of flat blades B, open axially and bounded by three curved surfaces and mounted on the said disk, said blades having the distance between the cutting-edges *b* equal to the distance between the discharge-edges b' and b^2, the sides of said blades forming curved chan-

nels for the water practically uniform in cross-section, substantially as described.

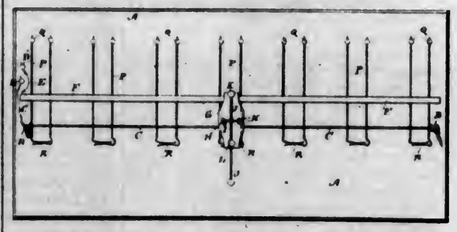
3. In a wheel for a rotary pump, the combination, with a disk W^3, of a plurality of flat blades B, open axially and bounded by three curved surfaces and mounted on each side of the said disk, said blades having the distance between the cutting-edges b' equal to the distance between the discharge-edges b' and b^2, the sides of said blades forming curved channels for the water practically uniform in cross-section, substantially as described.

480,474. VALVE-GEAR. WILLIAM H. VON MEGERINGHAUSEN, Chester, Pa. Filed Apr. 11, 1892. Serial No. 428,736. (No model.)

Claim.—1. In a steam-engine, the combination, with the cylinder and induction-valves, with crank-arms on said valves, of rods connected to said crank-arms and having a roller on the inner end thereof, an oscillating wrist-plate having two symmetrical irregular grooves adapted to engage said rollers, the exterior portions of each of said grooves being of longer and shorter radius and concentric with the axis of oscillation, the said concentric portions being connected by an intermediate eccentric portion, and means for moving said wrist-plate synchronously with the motion of the piston, substantially as described.

2. In a steam-engine, the combination, with the cylinder and induction-valves, with crank-arms on said valves, of rods connected to said crank-arms and having a roller on the inner end thereof, an oscillating wrist-plate having two symmetrical irregular grooves adapted to engage said rollers, the exterior portions of each of said grooves being of longer and shorter radius and concentric with the axis of oscillation, the said concentric portions being connected by an intermediate eccentric portion, a shifting eccentric mounted on the engine-shaft, with a suitable governor regulating said eccentric, and rods connecting said shifting eccentric to said wrist-plate, substantially as and for the purposes described.

3. In a steam-engine, the combination, with the cylinder D and induction-valves E and E', having the crank-arms *e*, of the rods M, having the stub end M^3 connected to said crank-arms, and the fork ends M', carrying a pin N and roller O, of an oscillating wrist-plate attached to said cylinder and having two symmetrical irregular grooves adapted to engage said rollers, the two exterior portions of each of said grooves being of longer and shorter radius and concentric with the axis of oscillation, the said concentric portions being connected by an intermediate eccentric portion, a shifting eccentric mounted on the engine-shaft, with a suitable governor regulating said eccentric, and rods connecting said shifting eccentric to said wrist-plate, substantially as described.



5. In a steam-engine, the combination, with the cylinder and the induction-valves, with crank-arms attached to the said valves, of rods connected at one end to said crank-arms and having a roller at the other end, an oscillating wrist-plate having grooves adapted to engage each of said rollers, a spring bearing against a portion of said rod and adapted to keep said rollers normally pressed against one side of said groove, and means for vibrating said wrist-plate synchronously with the piston, substantially as and for the purposes described.

6. In a steam engine, the combination, with the cylinder and the induction-valves, with crank-arms attached to the said valves, of rods connected at one end to said crank-arms and having a roller at the other end, an oscillating wrist-plate having grooves adapted to engage each of said rollers, a spring bearing against a portion of said rod and adapted to keep said rollers normally pressed against one side of said groove, and a shifting eccentric mounted on the engine-shaft, with a suitable governor regulating said eccentric, and rods connecting said shifting eccentric to said wrist-plate, substantially as and for the purposes described.

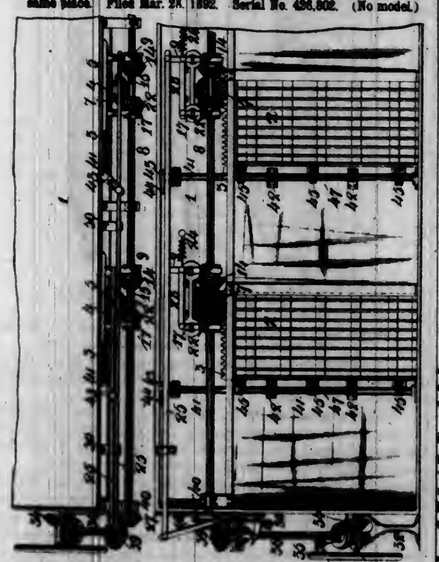
7. In a steam-engine, the combination, with the cylinder and the induction-valves, with crank-arms attached to the said valves, of rods connected at one end to said crank-arms and having a roller at the other end, an oscillating wrist-plate having grooves adapted to engage each of said rollers, said grooves being of three portions, the upper and lower portions being arcs of circles of longer and shorter radius concentric with the axis of vibration, and the central portion being a curve connecting the said circular portions, a spring bearing against a portion of said rod and adapted to keep said rollers normally pressed against one side of said groove, and means for vibrating said wrist-plate synchronously with the piston, substantially as and for the purposes described.

8. In a steam-engine, the combination, with the cylinder and the induction-valves, with crank-arms attached to the said valves, of rods connected at one end to said crank-arms and having a roller at the other end, an oscillating wrist-plate having grooves adapted to engage each of said rollers, said grooves being of three portions, the upper and lower portions being arcs of circles of longer and shorter radius concentric with the axis of vibration, and the central portion being a curve connecting said circular portions, a spring bearing against a portion of said rod and adapted to keep said rollers normally pressed against one side of said groove, and a shifting eccentric mounted on the engine-shaft, with a suitable governor regulating said eccentric, and rods connecting said shifting eccentric to said wrist-plate, substantially as and for the purposes described.

480,475. TELEGRAPH-KEY. ALFRED E. MCCLAREN, Joplin, Mo. Filed Apr. 9, 1892. Serial No. 428,510. (No model.)

Claim.—1. In a telegraph-key, a key base or board, the series of line-wires terminating upon said base or board and arranged in a line thereon, and a shifting key mounted to slide over said base or board from end to end thereof and adapted to be pressed directly in circuit independently with any of the line-wires terminating thereon, substantially as set forth.

2. In a telegraph-key, a key base or board receiving the line-wires, a supporting-rod mounted horizontally upon and over said board, and a telegraph-key mounted to slide and rock upon said rod, said key being in circuit with and carrying the termini of the relay to be thrown in circuit with any of the line wires upon said base or board, substantially as set forth.



3. In a telegraph-key, a key base or board receiving the line-wires, a metallic supporting-rod mounted horizontally upon and over said board, a horizontal contact plate or strip mounted upon said board parallel with said rod, wires connecting said contact-plate and said rod with the relay, and a shifting key loosely mounted upon said rod and carrying the termini of the wires connected with said plate and rod, which termini are adapted to be thrown in connection with any of the line-wires upon the base, substantially as set forth.

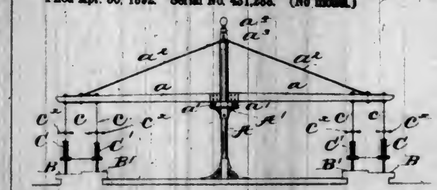
4. In a telegraph-key, the combination, with the separate line-wires, of a metallic supporting-rod connected with one wire of the relay, an adjacent parallel contact-plate connected with the other relay-wire, a metallic key-plate mounted to slide upon said rod, the key or lever mounted upon said plate and insulated therefrom, said key being normally in electrical connection with said contact-plate and the wire terminals or legs depending from said key-plate and in circuit with the key-plate and key, respectively, substantially as set forth.

5. In a telegraph-key, the base or board, the line-wires connected with said board and having contact ends, a horizontal supporting-rod mounted upon said board, an adjacent parallel contact-plate, wires connecting said contact-plate and rod with the relay, a sliding and rocking key-plate mounted upon said rod, the key supports insulated from said key-plate, a contact-spring connected with said supports and normally contacting with said contact-plate, the key or lever mounted in said supports and having the contact-screw, and the depending connecting terminals or legs connected with said key-plate, one of said legs or terminals being insulated from said plate and having a projecting contact-point directly under said contact-screw, said legs or terminals being designed to be pressed in connection with the contact ends of the line-wires, substantially as set forth.

6. In a telegraph-key, the base or board, the line-wires connected with said base or board and provided with bared contact ends normally sprung together and arranged in a line upon said base, and a shifting-key mounted to slide over said base or board and provided with the relay termini or connecting-legs adapted to be forced between said bared contact ends, substantially as set forth.

480,476. MECHANISM FOR OPENING, CLOSING, AND LOCKING JAIL-DOORS. PETER J. PAULY, Sr., and PETER J. PAULY, Jr., St. Louis, Mo., assignors to the Pauly Jail Building and Manufacturing Company, same place. Filed Mar. 28, 1892. Serial No. 426,802. (No model.)

Claim.—1. The herein-described mechanism for operating cell-doors, comprising a longitudinal operating-shaft, beveled gear-wheels loosely mounted upon the same, a rack-bar fixed to the said door and adapted to be moved by the said mechanism, and a bar, such as 25, for simultaneously operating said beveled gear-wheels, substantially as described.



2. The herein-described mechanism for operating cell-doors, comprising a horizontal operating-shaft 8, bevel-gears, such as 14 and 22, adapted to be simultaneously operated, a gear-wheel 4, fixed to a beveled gear-wheel 7, a rack-bar fixed to the upper edge of said door and in engagement with the said gear-wheel 4, levers in movable connection with the said gear-wheels 22 and 14, and a bar, such as 25, movably attached to one of the said levers, substantially as described.

3. The herein-described mechanism for operating cell-doors, comprising an operating-shaft 8 and means for operating same, beveled gear-wheels loosely mounted upon same, one of which is fixed against rotation and the other adapted to be rotated by said shaft, suitable mechanism of gearing located between said wheels and the cell-door for sliding same in either direction, levers in movable connection with said gear-wheels, causing the same to be simultaneously operated, an operating-bar, such as 25, in connection with the said levers, means for operating said bar, an operating-shaft, such as 41, fixed to the cell and located to one side of the door, cams 45, located upon said shaft, a slotted arm 43, also fixed to said shaft, and a bolt or other like device passed through the slot and into said bar 25 for movably attaching the same, whereby the said levers and the said shaft 41 are operated simultaneously, substantially as described.

4. The herein-described mechanism for operating cell-doors, comprising an operating-shaft 8 and means for operating same, beveled gear-wheels loosely mounted upon same, one of which is fixed against rotation and the other adapted to be rotated by said shaft, suitable mechanism of gearing located between said wheels and the cell-door for sliding same in either direction, levers in movable connection with said gear-wheels, causing same to be simultaneously operated, an operating-bar, such as 25, in connection with the said levers means for operating said bar, an operating-shaft, such as 41, fixed to the cell and located to one side of the door, cams 45, located upon said shaft, and means attached to the upper end of the said shaft for movably uniting the said bar 25 to the same, substantially as described.

5. The herein-described mechanism for operating cell-doors, comprising a rack-bar 3, fixed to the upper end of said door, a spindle 6, rigidly secured to the front of the cell above said door, a gear-wheel 4, loosely mounted upon said spindle and in engagement with the said rack-bar, a bevel gear-wheel 7, fixed to the said gear-wheel 4, an operating-shaft 8, adapted to be rotated by suitable mechanism, beveled gear-wheels 14 and 22, adapted to be moved upon said shaft, one of which is locked against rotation and the other adapted to be rotated by said shaft, levers fixed to the front of the cell and in engagement with the said beveled gear-wheels and adapted to move the same simultaneously, an operating-bar in movable connection with the said levers, a vertical operating-shaft 41, cams 45, fixed to the same and adapted to receive suitable devices carried by the door, a slotted arm 43, fixed to the upper end of the said shafts and adapted to be movably attached to the said operating-bar 25, and a lever, such as 26, for operating the said bar, causing the said shaft 41 and the said beveled gear-wheels 14 and 22 to be operated simultaneously, substantially as described.

480,477. ROUNDABOUT. WILHELM SCHÄFER, Wheeling, W. Va. Filed Apr. 30, 1892. Serial No. 431,288. (No model.)

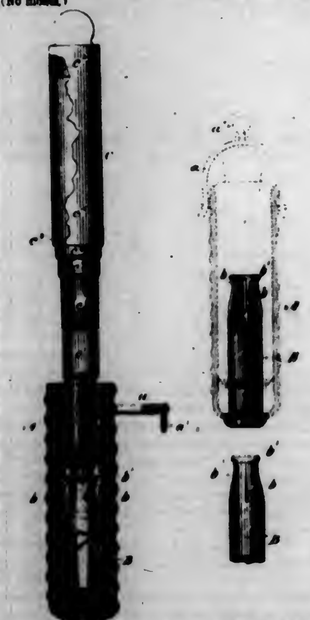
Claim.—1. In a roundabout, the combination, with the inner and outer track, of bicycles adapted to engage the same, having the peripheries of their wheels similarly proportioned to the distance they respectively traverse, substantially as described.

2. In a roundabout, the combination, with the outer track and the inner track in a higher plane than the outer track, of bicycles for engaging said inner and outer tracks, having the axles of their adjacent wheels in line with each other and radially disposed with respect to said tracks, the peripheries of the wheels of each bicycle being similarly proportioned to the distance they respectively traverse, substantially as described.

3. In a roundabout, the combination, with the central supporting-standard and the radial revolving arms, of the outer supporting-track and the inner supporting-track in a higher plane than the outer track, a pair of bicycles secured to each arm, engaging said supporting-tracks, the axles of the adjacent wheels of said bicycles being coincident and the peripheries of the wheels of both machines bearing the same relation to the distances they respectively traverse, substantially as described.

480,478. GLOVE. ROMER H. SMITH and WILLIAM L. SMITH, Gloversville, N. Y. Filed Feb. 1, 1892. Serial No. 419,994. (No model.)

Claim.—1. A glove comprising a thumb made of a single piece, divided at its base into two lateral expansion-pieces and having a seamless palm side, a gashed palm having an integral expansion-piece projecting from the wrist portion toward the fingers, and a connecting-



seam extending from the tip of the thumb along its back and interrupted at the base of the back of the thumb by the expansion-piece of the palm, whereby the thumb may expand in all directions to insure fitting of the glove, substantially as described.

2. A glove having a gashed palm portion and a V-shaped expansion-piece integral with the palm portion and projecting from the wrist toward the fingers, and a thumb having lateral expansion-pieces between which the V-shaped expansion-piece is fitted, the connecting-seam extending from the tip of the thumb along its back and dividing at the base of the back of the thumb along the lines of the V-shaped expansion-piece and continuing around the palm side of the thumb, substantially as described.

3. A glove comprising a thumb made of a single piece, divided at its base into two lateral expansion-pieces, a gashed palm having an integral expansion-piece projecting from the wrist portion toward the fingers, and a connecting-seam which is interrupted at the base of the back of the thumb by means of the expansion-piece of the palm, whereby the thumb may expand in all directions to insure fitting of the glove, substantially as described.

480,479. **PENCIL-CASE.** JAMES B. SMITH, Brooklyn, assignor to Edward Todd & Co., New York, N. Y. Filed Apr. 23, 1892. Serial No. 430,396. (No model.)

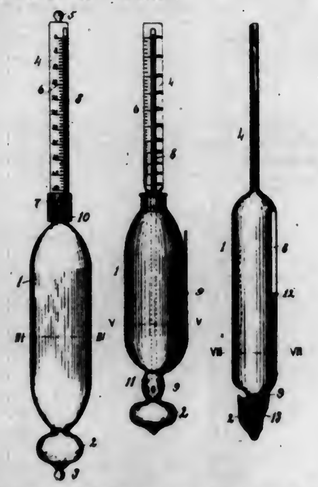
Claim.—1. A case for telescopic pencils and the like, consisting of a body containing a clamp for the tip portion of the pencil, said clamp being secured in the center of the body so as to leave around it an annular space for the joints of the pencil, substantially as described.

2. A case for telescopic pencils, consisting of a body containing a clamp for the tip portion of the pencil, said clamp consisting of a tube having resilient sides arranged centrally in the body with an annular space around it to receive the other portions of the pencil, substantially as described.

3. The combination, with the body A, of a clamp B, consisting of a tube secured centrally in the body at one end and having its other end slotted longitudinally and slightly contracted, said tube having an annular space around it, substantially as described.

4. The combination, with the body A, of the tube B, secured concentrically therein, having at one end the slots *b* and the collar *b'*, the material between the slots being slightly contracted, said tube having an annular space around it, substantially as described.

5. An extensible pencil composed solely of several telescopic joints, substantially as described.



6. An extensible pencil composed solely of the several telescopic joints *c c' c²*, &c., sliding stiffly on each other, the tip portion being provided with lead-propelling devices, substantially as described.

7. An extensible pencil comprising the telescopic joints *c c' c²*, &c., provided with internal collars *c⁴* and external collars *c³*, substantially as described.

8. The combination, with an extensible pencil composed of telescopic joints, of a clamp adapted to engage with the tip portion of said pencil, whereby the pencil will be extended before the clamp releases said portion, substantially as described.

9. The combination, with an extensible pencil composed of telescopic joints, of a case for receiving said joints and a clamp attached to said case for engaging the tip portion of said pencil, substantially as described.

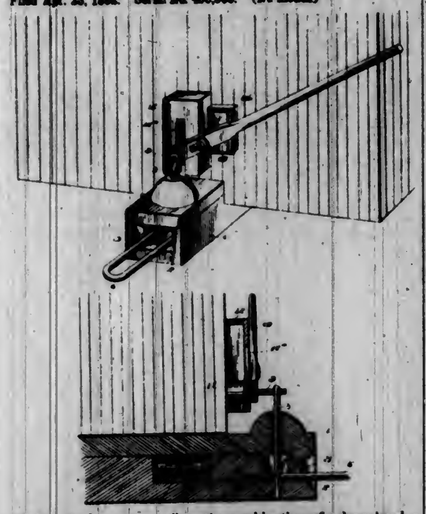
480,480. **HYDROMETER.** WALTON C. TIFFANY, New York, N. Y., assignor to the Tiffany Chemical Company, of New York. Filed June 1, 1891. Serial No. 394,738. (No model.)

Claim.—1. In a hydrometer, the float-bulb or other submerged part having a flattened cross-section, substantially as set forth.

2. In a hydrometer, the combination of a hollow stem a removable scale within the stem, and a stopper by which the stem is closed, substantially as set forth.

3. In a hydrometer, the combination of the hollow stem having an open bottom and adapted to carry a scale, the float-bulb, and the thermometer passing through the float-bulb and through the open bottom and detachable from the stem, substantially as set forth.

4. In a hydrometer, the combination of the float-bulb, the stem having a scale, the thermometer in said stem, and the base of said thermometer's stem located above the float-bulb and perforated or so fixed as to allow temperature influence or access of liquid to said bulb, substantially as set forth.

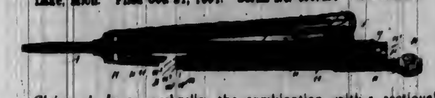


5. In a hydrometer, the combination of a scale-bearing float-bulb, a weight-bulb adapted to receive removable weights, one or both of said parts being flattened, and an open-top closable scale-bearing stem, substantially as set forth.

6. In a hydrometer, the combination of a float-bulb, a weight-bulb adapted to receive removable weights, a closable open-top stem, and suitable thermometer and correction scales, substantially as set forth.

7. In a hydrometer partially or wholly of metal, the combination of the scale-bearing float-bulb, a weight-bulb, one or both of said parts being flattened, as described, and open closable stems having temperature-indicator attachments, substantially as set forth.

8. In a hydrometer wholly or partly of glass or metal, a weight and arranged for easy adjustment and confinement of weights, combined with a scale-bearing flattened or cylindrical float-bulb and an open-top stem, substantially as set forth and shown.

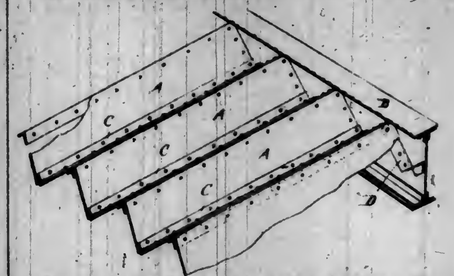


480,481. **CAR-COUPLING.** DAVID G. TURNER, Underwood, Mebr. Filed Apr. 23, 1892. Serial No. 430,363. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head, a spring-actuated pin-support arranged therein, a coupling-pin adapted to be held elevated by the pin-support, a casing designed to be mounted upon a car and arranged above the draw-head, and an uncoupling-lever connected with the coupling-pin and provided with a weighted roller arranged within the casing, substantially as and for the purpose described.

2. In a car-coupling, the combination of a draw-head, a pin-support arranged within the same, a coupling-pin, a casing arranged above the draw-head and provided with a longitudinal slot, an uncoupling-lever provided at its inner end with a pin extending from opposite sides thereof and having its outer portion connected with the coupling-pin and having its inner portion forming a spindle and arranged within the slot, and a weighted roller journaled on the spindle and arranged within the casing, substantially as described.

480,482. **FOLDING UMBRELLA.** HENRY C. WARD, Chippewa Lake, Mich. Filed Oct. 21, 1891. Serial No. 409,481. (No model.)

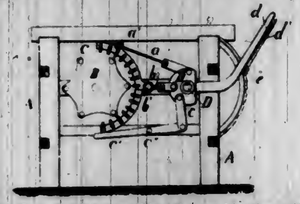


Claim.—1. In an umbrella, the combination, with a sectional stick, of the ribs made in two parts and hinged together by an inwardly-breaking lock-hinge and the radial braces fixedly pivoted to said hinges and to the sliding runner, the outer portions of said ribs and the umbrella-cover being adapted to be folded under and within the inner portion, substantially as set forth.

2. In an umbrella, the combination, of a sectional stick adapted to be folded up and within the umbrella-frame, the ribs made in two parts, inwardly-breaking lock-hinges coupling the rib-sections together and adapted to lock the same in their open position and to allow the outer rib-sections to be folded only up and under the inner portion of the cover and the ribs, and the radial stretchers fixedly pivoted to the inner portions of said hinges and to the sliding runner, substantially as set forth.

3. In an umbrella, the combination, with a sectional stick, of the ribs made in two parts, inwardly-breaking lock-hinges joining the rib-sections together, said hinges comprising the opposite members, one member of which is provided with parallel lugs and the other member with a projecting tongue having a slot near its outer end and adapted to work within the lugs of the opposite member and over a pivot bolt or pin passing through said lugs and said slot, and the radial braces pivoted to the inner members of said hinges and to the sliding runner, substantially as set forth.

480,483. **BRIDGE-FLOORING.** JOSEPH R. WORCESTER, Waltham, assignor of one-half to David H. Andrews, Boston, Mass. Filed Oct. 26, 1891. Serial No. 409,851. (No model.)



Claim.—1. A bridge-flooring composed of a metallic web and having a cross-section composed of a series of triangles with one side missing, each triangle connected to its neighbor at the apices of the missing side, substantially as described.

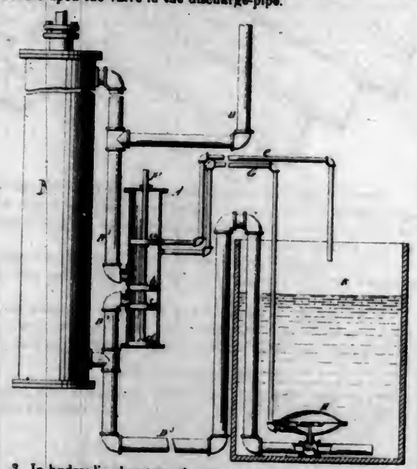
2. A bridge-flooring composed of a metallic web so arranged as to form a series of alternate triangular prisms having an open side, substantially as described.

3. A bridge-flooring composed of plain strips of plate metal, as A A, connected at their edges by angles, as C C, so as to form alternate triangular prisms having an open side, substantially as described.

480,484. **THRASHING-MACHINE.** WILHELM ALPERT, Brandenburg-on-the-Havel, Germany. Filed Aug. 15, 1891. Serial No. 402,791. (No model.)

Claim.—In a thrashing-machine, the combination, with a thrashing-cylinder, of a semicircular grating, a shaft, disks mounted on said shaft, two arms pivoted eccentrically to each disk and connected with the grating at the top and center, pivoted arms on which the grating rests, and pivoted links connecting said arms with the disks on the shafts, a handle for turning said shaft, and means for locking the handle and shaft in place, substantially as set forth.

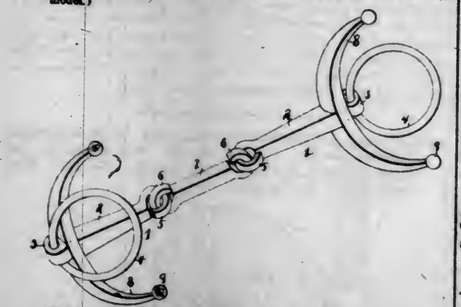
480,485. **MUD-GUARD FOR CARRIAGES.** JOSAFHES ANDERSSEN, Christiania, Norway. Filed Nov. 26, 1891. Serial No. 413,148. (No model.) Patented in Norway July 1, 1891, No. 2,160, and in Great Britain July 11, 1891, No. 9,566.



Claim.—The herein-described splasher or mud-guard, consisting of the semicircular cover *a*, having its end bent outward, radial arms *c*, connected at one end to said cover and forming at their other ends a case *d*, embracing the wheel-axle, screws *d'*, passing through said case and into the axle, and a resilient knife-scraper secured to the inner surface of said cover at one of the ends thereof and adapted to bear against the tire of the wheel, substantially as set forth.

480,486. **HYDRAULIC ELEVATOR.** JOSEPH E. BARRY, New York, N. Y. Filed Apr. 10, 1891. Serial No. 388,410. (No model.)

Claim.—1. In hydraulic elevators, the combination of an operat-



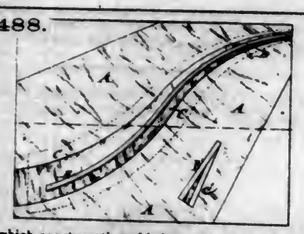
ing-valve, a separate valve in the discharge-pipe, and means, substantially as described, whereby the valve is controlled by the fluid under pressure from the primary source of supply.

2. In hydraulic elevators, the combination of an operating-valve and a separate positively-operated valve in the discharge-pipe, a pipe connecting such valve in the discharge-pipe with the operating-valve, through which the water-pressure is applied to operate such valve, and a relief-pipe connected with the operating-valve to relieve the pressure upon the valve in the discharge-pipe.

3. In hydraulic elevators, the combination of an operating-valve having four disks or pistons and having no discharge-pipe directly connected therewith, a separate positively-operated valve in the discharge-pipe, a pipe leading from the operating-valve to the valve in the discharge-pipe to operate such valve by the main water-pressure, and a relief-pipe connected with the operating-valve to relieve the pressure upon the valve in the discharge-pipe.

480,487. BRIDLE-BIT. JOHN U. BECKERMAN and DAVID W. LOEBB, St. Louis, Mo. Filed Nov. 30, 1891. Serial No. 413,537. (No model.)

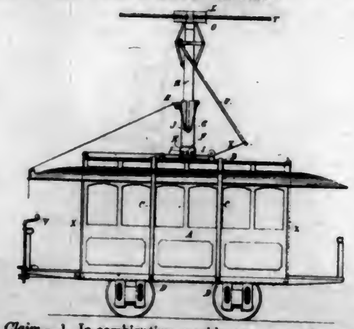
Claim.—1. A bridle-bit consisting of bars 2, eyes 3 and 5, formed on each end of the same, U-shaped bars formed integrally with the said bars 2, a link connecting the eyes 5 of the said bars 2, and bit-rings 4, carried by the eyes 3, substantially as set forth.



2. A bridle-bit consisting of bars 2, eyes 3 and 5, formed on each end of the same, U-shaped bars formed integrally with the said bars 2, a link, such as 7, passing through the eyes 5 of the said bars 2, and bit-rings 4, carried by the eyes 3, substantially as set forth.

480,488. SOUNDING-BOARD FOR PIANO-FORTES. CARL BRANDAGH, New York, N. Y. Filed Apr. 13, 1892. Serial No. 429,014. (No model.)

Claim.—1. A sounding-board for piano-fortes, the bridge of which is supported by a foundation of greater width arranged below the bridge and the ribs of which are strengthened below said foundation by means of reinforcing-pieces, substantially as set forth.



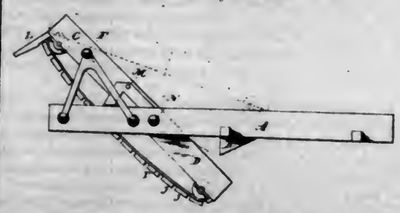
2. A sounding-board for piano-fortes, the bridge of which is supported by a foundation of greater width arranged below the bridge and

480,488.

the ribs of which are strengthened below said foundation by means of reinforcing-pieces and by diagonal braces connecting said ribs at the back of the sounding-board, substantially as set forth.

480,489. CABLE-GRIPPER. WILLIAM A. BUTLER, New York, N. Y., assignor to John H. Haar and Joseph A. Cassidy, same place. Filed Mar. 7, 1892. Serial No. 424,008. (No model.)

Claim.—1. In combination, a cable car, an overhead cable-grip mechanism composed of the base B, pivotally attached to the sleeve G, and the grip-carrying arm H, adjustable in and along the said sleeve, and the bars C C, attached to the base B of the grip mechanism and running down the sides of the car and being attached to the floor or base thereof, substantially as and for the purpose set forth.

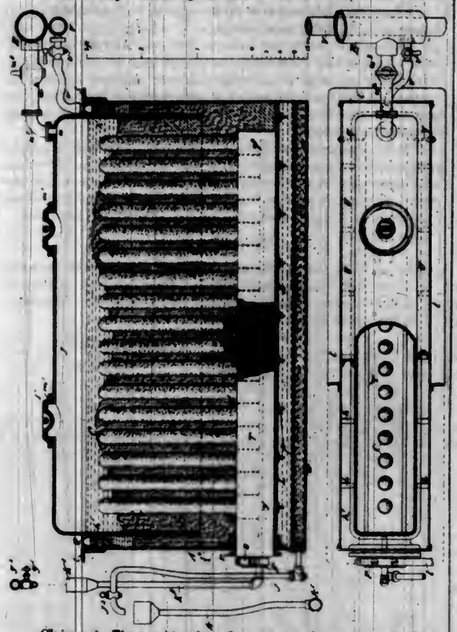


2. In a cable-grip, the combination of a fixed jaw, a movable jaw, and the toggle mechanism R and S, attached to and for operating the movable jaw.

3. In a cable-grip mechanism, the combination of a fixed and a movable jaw, the toggle mechanism R S, attached to and reciprocating the movable jaw, and a grip-operating lever mechanism attached to the arms S of the toggle mechanism and arranged to raise and depress the said arms at their junction ends.

4. In combination, in a grip-supporting mechanism, the base B, pivotally attached to the sleeve G and having the retaining stop-pins I, and the grip-carrying arm H, adjustable in and along the said sleeve, as and for the purpose set forth.

5. In combination, in a cable-grip, the fixed jaw L, secured to the grip-supporting arm H by the yoke M, the movable jaw O, the guide Q to said jaw, and the toggle mechanism R S for operating said movable jaw, as and for the purpose set forth.



480,490. ELEVATOR FOR STONE-CRUSHERS. IRA P. CRIBB, Canandaigua, N. Y., assignor to the Robinson Rea Manufacturing Company, Pittsburg, Pa., and Theodore A. Blake, New Haven, Conn. Filed Nov. 9, 1891. Serial No. 411,346. (No model.)

Claim.—The combination of the sills or bed A A, adapted to receive a stone-crusher, a chute B between said sills, through which the crusher may discharge, an elevator-frame composed of two parts C D, the one part C hung upon an axis above the said sills or bed and dis-

tant from the chute, the said part C also carrying a drum G at its upper end, the part D hinged to the lower end of the part C and carrying a drum H at its lower end, the said frame adapted to fold up and down between the said sills, and an endless band through said frame and around the said drums, the said band carrying buckets, and the frame in its down position presenting the buckets to the chute, substantially as and for the purpose described.

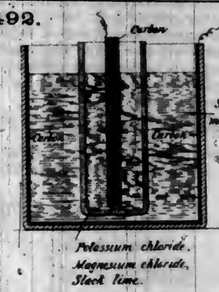
480,491. ELECTROLYTIC CELL. ELISHA R. CUTTER, New York, N. Y., assignor, by mesne assignments, to the Union Chemical Company, of New Jersey. Filed Aug. 19, 1891. Serial No. 403,080. (No model.)

Claim.—1. The combination of an outer tank and an anode therein, consisting of carbon pencils projecting vertically from a carbon bar, the bar extending horizontally within said tank and passing out through the wall thereof and insulated therefrom to constitute one of the electric terminals of the tank.

2. The combination of an outer tank, an anode therein, consisting of carbon pencils projecting from a carbon bar and a protecting-trough inclosing said bar.

3. The combination of an outer tank, an anode therein, consisting of carbon pencils, a horizontal carbon bar, to which said pencils are fixed, formed with a longitudinal duct through it, and branch discharge-ducts leading therefrom to the exterior of the bar and discharging adjacent to the carbon pencils, and a liquid-inlet pipe communicating with the duct in said carbon bar.

4. The combination, with an electrolytic cell, of means for discharging a liquid therefrom, consisting of an outlet constructed to cause the liquid to fall in drops instead of a continuous stream, and a discharge-pipe to convey away the liquid, whereby the short-circuiting of the electric current through the discharge-pipe is prevented.



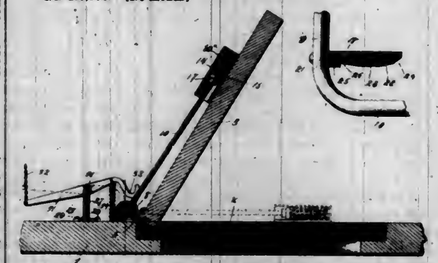
480,492. METHOD OF ELECTROLYTICALLY PRODUCING POTASSIUM CHLORATE. ELISHA R. CUTTER, New York, N. Y. Filed Apr. 11, 1892. Serial No. 428,736. (No specimens.)

Claim.—1. The method of electrolytically producing potassium chlorate, substantially as hereinbefore described, which consists in electrolyzing magnesium chloride in the presence of potassium chloride and slaked lime.

2. The method of electrolytically producing potassium chlorate, substantially as hereinbefore described, which consists in electrolyzing magnesium chloride in the presence of potassium chloride and slaked lime and agitating the electrolyte pending electrolysis.

3. The method of electrolytically producing and collecting magnesia and potassium chlorate, substantially as hereinbefore described, which consists in placing a solution of magnesium chloride in contact with the cathode and potassium chloride, magnesium chloride, and

480,492.



slaked lime in contact with the anode, the said magnesium chloride being separated from said potassium chloride, magnesium chloride, and slaked lime by a porous partition, and then electrolyzing, whereby potassium chlorate is produced at the anode and magnesia at the cathode.

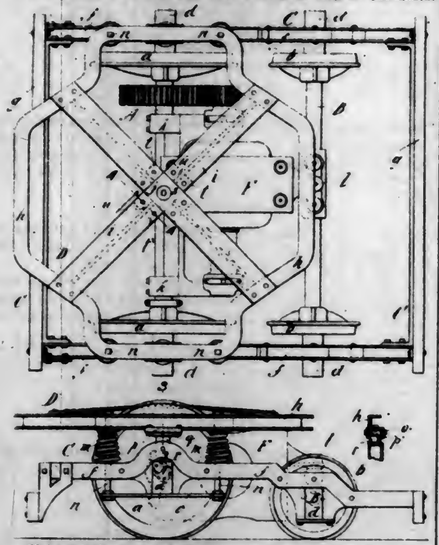
480,493. METHOD OF ELECTROLYTICALLY PRODUCING POTASSIUM CHLORATE. ELISHA R. CUTTER, New York, N. Y. Filed Apr. 11, 1892. Serial No. 428,739. (No specimens.)

Claim.—1. The method of electrolytically producing potassium chlorate as hereinbefore described, which consists in electrolyzing magnesium chloride in the presence of potassium chloride and magnesium oxide.

2. The method of electrolytically producing potassium chlorate substantially as hereinbefore described, which consists in electrolyzing magnesium chloride in the presence of potassium chloride and magnesium oxide and agitating the electrolyte during the electrolysis.

480,494. AUTOMATIC VALVE-OPERATOR FOR WATER-CLOSETS. JOSEPH S. DANIEL, Kansas City, Mo. Filed Mar. 1, 1892. Serial No. 423,396. (No model.)

Claim.—1. In a valve-operating mechanism for water-closets, an L-shaped main operating-rod, a torsion-spring secured at one end to and surrounding one arm of said rod and also engaging the frame of the closet and operating to raise the rod, a casing surrounding the free end of the rod, and a cushion-spring inclosed within said casing and also surrounding the free end of the rod, substantially as set forth.



2. In a valve-operating mechanism for water-closets, a main operating-rod of L form, a bearing-plate having vertical standards, through which one arm of the operating-rod passes, a torsion-spring interposed between the standards of the bearing-plate and surrounding said arm of the rod and connecting at one end to the rod and at the other end to the closet-seat and serving to raise the rod, a casing surrounding the free end of the rod, a shoulder upon said free end of the rod, and a spring surrounding the free end of the rod and located within the casing and also interposed between the closed end of the casing and the said shoulder, substantially as set forth.

3. In a valve-operating mechanism for water-closets, a tilting lever designed to be connected at one end to the pull-down connection of a flushing-tank and an oscillating rod carrying an arm provided on its upper side with a longitudinal guide-groove for engaging the opposite end of the said tilting lever and located below the end of said lever, substantially as set forth.

4. In a valve-operating mechanism for water-closets, an oscillating rod operated by the closet-seat, a tilting lever connected to the pull-down connection of a flushing-tank, and an arm carried by the oscillating rod and having a longitudinal guide-groove provided with a flange beveled at its inner and outer ends and a shoulder for engaging the tilting lever, said shoulder being located adjacent to the inner end of the arm, substantially as set forth.

5. In a valve-operating mechanism for water-closets, an oscillating rod, a tilting lever connected to the pull-down of the flushing-tank, a spring connected to the tilting lever and serving to return said lever to normal position, and an arm carried by the oscillating rod and engaging the tilting lever to move the same against the action of its spring, substantially as set forth.

480,495. TRUCK FOR RAILWAY-CARS. ERNEST D. DORGEMUS, Malden, Mass. Filed Dec. 3, 1891. Serial No. 413,893. (No model.)

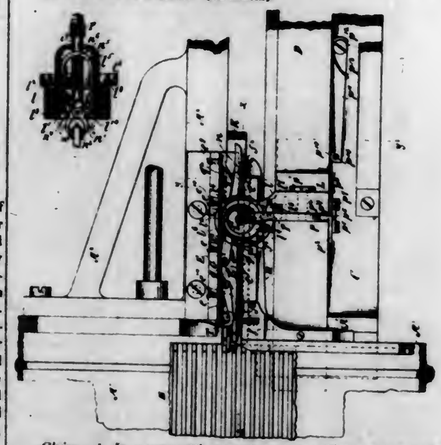
Claim.—1. In a truck for railway-cars, an axle having a pair of driving-wheels thereon, and a pair of guide-wheels, and a saddle or truck frame supported by said two pairs of wheels, springs supported on the truck-frame near the journals of the driving-wheels only, a body bolster-frame supported entirely by said so-located springs, and the car-body pivotally mounted on the said bolster-frame directly over the axle of said driving-wheels, substantially as and for the purpose set forth.

2. In a truck for railway-cars, an axle having a pair of driving-wheels thereon, and a pair of guide-wheels which are of less diameter than the driving-wheels, and a saddle or truck frame supported by said two pairs of wheels, springs supported on the truck-frame near the journals of the driving-wheels only, a body bolster-frame supported entirely by said so-located springs, and the car-body pivotally mounted on the said bolster-frame directly over the axle of said driving-wheels, substantially as and for the purpose set forth.

3. In a truck for railway-cars, an axle having a pair of driving-wheels thereon, and an axle having a pair of guide-wheels, and a saddle or truck-frame supported by said two pairs of wheels, springs supported on the truck-frame near the journals or the driving-wheels only, a body bolster-frame supported entirely by said so-located springs, the car-body pivotally mounted on the said bolster-frame directly over the axle of said driving-wheels, and a motor having its weight supported by and distributed between said axles and operating to drive the wheels which sustain the weight of the car-body, substantially as and for the purpose set forth.

4. In a truck for railway-cars, the combination, with the lower frame or truck-frame proper and two pairs of supporting-wheels therefor, of a body bolster-frame supported above the truck-frame proper through the medium of springs which rest on the truck-frame closely to and forward and rearward of the journal-bearings of but one of said pairs of wheels, and posts rigidly secured to and pending from the bolster-frame and passing through the supporting-spring and the truck-frame at different points in the length thereof, there being between the bolster and truck-frame proper and directly over the journals bone-and-socket engaging portions, the one of which may play vertically relative to the other, substantially as and for the purpose described.

5. The combination, with the truck-frame proper, of the bolster-frame spring supported thereby, which consists of a border-frame *A* and intersecting ribbed cross braces or trusses and the central swivel-block having recessed portions with which the ribs of the said braces engage and to and through which portions the inner ends of the said braces are bolted, substantially as described.



480,496. CONVEYER FOR HANDLING LUMBER, &c. MICHAEL GARLAND, Bay City, Mich. Filed Apr. 16, 1892. Serial No. 429,512. (No model.)

Claim.—1. In a conveyer of the type shown and described, the combination, with the usual pair or set of running strips *c*, the series of carrier-slats C, which rest and travel thereon, and the usual drive-cable *c*, located beneath the series of carrier-slats, of duplex clamping metallic devices, each one of which is secured, as shown, to one of the carrier-slats and has its depending or lower portions clamped onto the said drive-cable, all substantially in the manner and for the purposes hereinbefore set forth.

2. In a conveyer of the type shown and described, a metallic sprocket-like attachment device, formed, substantially as described, with proper seating-surfaces for the lower side of a carrier-slat, and with a vertically-projecting flange-like part *i* for securement of the carrier-slat to said part *i*, all substantially as hereinbefore set forth.

480,497. TYPE-SETTING MACHINE. WALTER W. HASTINGS, Jersey City, N. J., and FRED D. FOSTER, New York, N. Y., assignors to the Lagerman Typotheter Company, New York, N. Y. Filed Dec. 1, 1891. Serial No. 413,740. (No model.)

Claim.—1. In a type-setting machine, in combination, type-gripping jaws, mechanism whereby they are reciprocated to and from the galley, and mechanism whereby they are rotated on the axis of the type as they advance toward the galley, substantially as described.

2. In a type-setting machine, in combination, type-gripping jaws adapted to grip the type at one end and maintain its longitudinal position, a carriage whereon the jaws are reciprocated to and from the galley, means whereby the jaws are caused to grip the type on their forward movement toward the galley, and means whereby they are caused to release the type at the end of their forward movement, substantially as described.

3. In a type-setting machine, in combination, type-gripping jaws adapted to grip the type at one end and maintain its longitudinal position, mechanism whereby they are reciprocated to and from the galley, a spring by the reciprocation of which the jaws are held closed or open, and mechanism whereby said spring is reciprocated at each end of the path of the jaws, substantially as described.

4. In combination with type-feeding mechanism, jaws whereby the type is gripped, rotatable mechanism whereby said jaws are carried, and means whereby said last-named mechanism is actuated to rotate the type on its longitudinal axis, substantially as described.

5. The combination, with type-feeding mechanism, of a rotatable type-holder, a tripper movable into and out of the path of a member on said holder, and a controller for regulating the position of said tripper as said holder passes, substantially as described.

6. The combination, with type-feeding mechanism, of a rotatable type-holder provided with radial projections, a tripper movable into and out of the path of said projections, and a controller for regulating

the position of said tripper as said holder passes, substantially as described.

7. In a type-setting machine, in combination, jaws whereby the type is grasped at or near the head, mechanism whereby said jaws are reciprocated to and from the galley, a sill, and a yielding plate opposed thereto between which the type is held while being carried forward in the jaws, substantially as described.

8. In a type-setting machine, in combination, type-gripping jaws, mechanism whereby said jaws are reciprocated to and from the galley, a sill, an oppositely-arranged yielding plate between which the type is slid forward, trippers and controllers connected with said sill, and members connected with said jaws, adapted to engage with the trippers in their forward position, substantially as described.

9. In a type-setting machine, in combination, type-gripping jaws, mechanism whereby they are moved toward the galley, a rotary head upon which they are mounted, a spring acting in antagonism to the rotation of said head, radial members projecting from said head, a sill along which said radial members slide to prevent the backward movement thereof, trippers whereby said radial members are moved in antagonism to said spring, said sill being recessed at each tripper to receive the radial member as the same is being moved by the tripper, substantially as described.

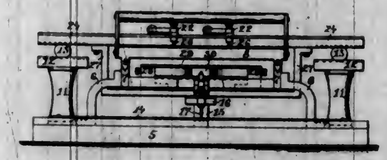
10. In a type-setting machine, in combination, a type-guideway leading to the galley, a carriage, mechanism whereby said carriage is reciprocated parallel with said guideway toward the galley, a type-pusher mounted upon said carriage, type-grippers also mounted upon said carriage, and mechanism whereby said grippers may be moved to rotate the type upon its longitudinal axis, substantially as described.

11. In a type-setting machine, in combination, a stationary sill, a spring-pressed plate arranged oppositely thereto and retreating at the receiving end from the sill, a yielding lever projecting beyond said sill at the receiving end, and means whereby the type is fed forward between said lever sill and said plate, substantially as described.

12. In a type-setting machine, in combination, type-gripping jaws, mechanism whereby they are moved toward the galley, guideways between which the type is moved, and a pusher whereby the type is thrust longitudinally between said jaws, substantially as described.

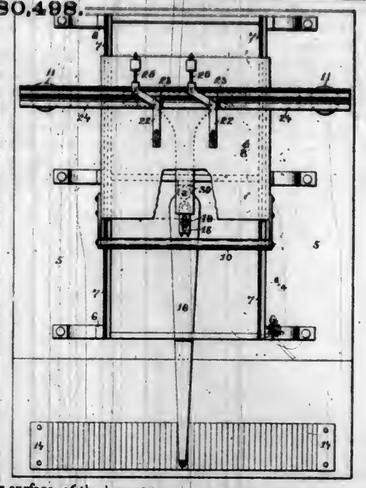
13. In a type-setting machine, in combination, type-gripping jaws, guideways between which the type is carried while engaged in said jaws, a pusher whereby the type is thrust longitudinally between said jaws, and centering mechanism adapted to act upon the sides of the type as it is being shoved between said jaws by said pusher, substantially as described.

14. In a type-setting machine, in combination, guideways between which the type is conveyed to the galley, type-gripping jaws adapted to grip the type at one end and maintain its longitudinal position, means whereby said jaws are moved toward the galley, and a spring whereby said jaws are held closed with a yielding pressure to adapt itself to varying thicknesses of type, substantially as described.



15. In a type-setting machine, in combination, guideways between which the type is conveyed to the galley, type-gripping jaws, means whereby said jaws are moved toward the galley, a spring whereby said jaws are held closed with a yielding pressure to adapt itself to varying thicknesses of type, and articulated shoes upon the extremities of said jaws, whereby the gripping surfaces adjust themselves to varying thicknesses of type substantially as described.

480,498. RULING-MACHINE. JOHN HOPE, Providence, R. I. Filed July 31, 1891. Serial No. 401,291. (No model.)



Claim.—1. In a line-engraving machine, the combination, with a frame carrying engraving-tools and a tongue pivoted in such frame provided at its forward under surface with a V-shaped slot, of a lever pivoted at the rear end and provided at the free end with a pointer and carrying an adjustable plate supporting a post adapted to engage with the pivoted tongue of the tool-carriage, as described.

2. The combination, with the base 5, supporting the frame 6, having the V-shaped slides 7 7, adapted to receive the ways 9 9 of the table 8, of the posts 11 11, supporting the rolls 13 13, carrying the cross-beam 24, to which the engraving-tool arms 22 22 are secured, and means for moving said beam transversely, as described.

3. The combination, with the cross-beam 24, supported on the rolls 13 13 and carrying the pendent frame 27, on which is pivoted the forwardly-extending tongue 30, having a V-shaped groove cut in its

480,498.

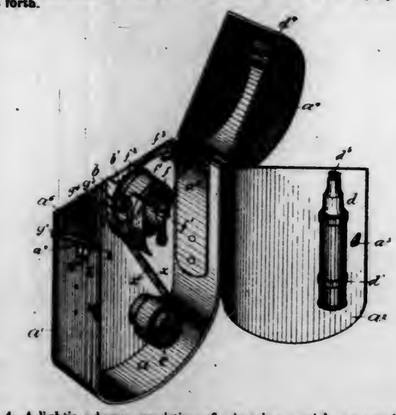
under surface, of the lever 16, pivoted in the bracket 15 and provided with the slotted plate 18, secured by the screw 19 and carrying the post 20, having the head 21, adapted to engage with the V-shaped groove of the tongue 30, as described.

4. In a line-engraving machine, as herein described, the combination, with the transversely-movable beam 24, having a longitudinal reversed T-shaped slot, of the arms 22 22, secured to clamps movable in said slot and carrying engraving-points, as described.

480,499. ATTACHMENT TO ROLL-CARRYING SPINDLES FOR WEB-PRINTING PRESSES. ALFRED A. HOUGHTLIN, Brooklyn, N. Y. Filed Apr. 8, 1892. Serial No. 428,310. (No model.)

Claim.—1. The combination, with the roll-carrying spindle of a web-printing press, of a tapering collar secured to one end of the spindle, a locking-key guided in a longitudinal recess of said collar and adapted to engage a recess at the end of the core or shell of the roll of paper, a loose conical collar adapted to engage the opposite end of the core or shell, and means for clamping said collar to the end of the core or shell, substantially as set forth.

2. The combination, with a roll-carrying spindle of a web-printing press, of a tapering collar secured to one end of the spindle, said collar being provided with a longitudinal recess, an adjustable key carrying a projecting pin or screw guided in said recess and adapted to engage a recess in the end of the core or shell, a tapering collar placed loosely on the other end of the spindle, a threaded sleeve attached to the shaft near said collar, and a screw-nut applied to the threaded sleeve, so as to clamp the tapering collar to the other end of the core or shell, substantially as set forth.



480,500. LIGHTING DEVICE. EDWARD KRONENBERG, Philadelphia, Pa. Filed Mar. 6, 1891. Serial No. 384,085. (No model.)

Claim.—1. A lighting device consisting of a two-part housing provided with a hinged cover, an adjustable oil and wick reservoir, a reciprocating ignitor or scratcher, a rotatable feeding appliance winding upon itself a fulminating tape, strip, or ribbon, and pawl-and-ratchet connections adapted to automatically actuate said feed appliance in the closing of said cover, substantially as and for the purposes set forth.

2. A lighting device consisting of a two-part housing having a spring-actuated hinged cover, a vertically-adjustable oil and wick reservoir, an oscillating scratcher or igniter, a rotatable feeding appliance winding upon itself a fulminating or igniting tape, strip, or ribbon, means for retaining said appliance normally in position, and

devices between said cover and feeding appliance adapted to rotate the latter by the closing of said cover, substantially as and for the purposes set forth.

3. A lighting device consisting of a two-part housing provided with a spring-actuated hinged cover, an adjustable oil and wick reservoir, a scratcher or igniter reciprocated by means adapted to open said cover, a rotatable feeding appliance winding upon itself a tape, strip, or ribbon, means for preventing retrograde movement of said feeding appliance, a ratchet-wheel attached to said feeding appliance, a pawl provided with a slot and a pin engaging in said slot for preventing displacement of the pawl, substantially as and for the purposes set forth.

4. A lighting device consisting of a housing, a wick, a rotatable feeding appliance for winding upon itself a tape, strip, or ribbon having pellets, fulminates, or ignitible material applied thereto, means for rotating the same, a hand-knob outside said housing, a scratcher or ignitor connected therewith and adapted to contact with and ignite said pellets, fulminates, or ignitible material, substantially as and for the purposes set forth.

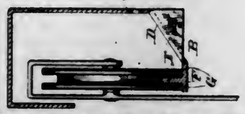
5. A lighting device consisting of a two-part housing, a wick, a rotatable feeding appliance for winding upon itself a tape, strip, or ribbon having pellets, fulminates, or ignitible material applied thereto, means for rotating the same, a guide-plate for directing said tape, strip, or ribbon, a hand-knob outside of said housing, a scratcher or ignitor connected with said hand-knob and adapted to contact with and ignite said pellets, fulminates, or ignitible material, substantially as set forth.

6. A lighting device consisting of a housing, a wick, a rotatable feeding appliance for winding upon itself a tape, strip, or ribbon having pellets, fulminates, or ignitible material applied thereto, means for rotating the same, a guide-plate for directing said tape, strip, or ribbon, a spindle journaled in said guide-plate and housing, a scratcher or igniter, and a hand-knob attached to said spindle, substantially as and for the purposes set forth.

7. A lighting device provided with a housing, a spring-actuated cover, a catch for maintaining the same in a closed position, a scratcher for igniting a pellet, fulminate, or ignitible material, an arm connected with said scratcher and adapted to release said catch, and a hand-knob for actuating said arm, substantially as and for the purposes set forth.

8. A lighting device provided with a housing, a spring-actuated cover, a catch for maintaining the same in a closed position and provided with a lug projecting through the housing, a scratcher for igniting a pellet, fulminate, or ignitible material, a spindle connected with said scratcher, an arm provided with a hand-knob and adapted to actuate said scratcher and to contact with said lug, substantially as and for the purposes set forth.

9. A lighting device provided with a housing, a spring-actuated cover, a catch for maintaining the same in a closed position, a scratcher for igniting a pellet, fulminate, or ignitible material, an arm connected with said scratcher and adapted to release said catch, a spring for normally maintaining said arm out of contact with said catch, and a hand-knob for actuating said arm, substantially as and for the purposes set forth.



10. A lighting device comprising a housing, a hinged cover, a spring-catch accessible from the exterior of the housing and adapted to engage said cover, a wick, an appliance for feeding and winding upon itself a tape, strip, or ribbon having pellets, fulminates, or ignitible material applied thereto, pawl-and-ratchet connections between said cover and feeding appliance, an igniter or scratcher, a hand-knob outside said housing for actuating said scratcher or igniter and spring-catch, substantially as and for the purposes set forth.

11. A lighting device comprising a housing, a spring-actuated cover hinged thereto, a spring-catch provided with a lug accessible from the exterior of the housing and adapted to engage said cover, a wick, an appliance for feeding and winding upon itself a tape, strip, or ribbon having pellets, fulminates, or ignitible material applied thereto, pawl-and-ratchet connections between said cover and feeding appliances, a guide-plate, a spring-controlled spindle journaled in said housing and guide-plate, a scratcher or igniter attached to said spindle, an arm connected with said spindle and adapted to contact with said lug, substantially as and for the purposes set forth.

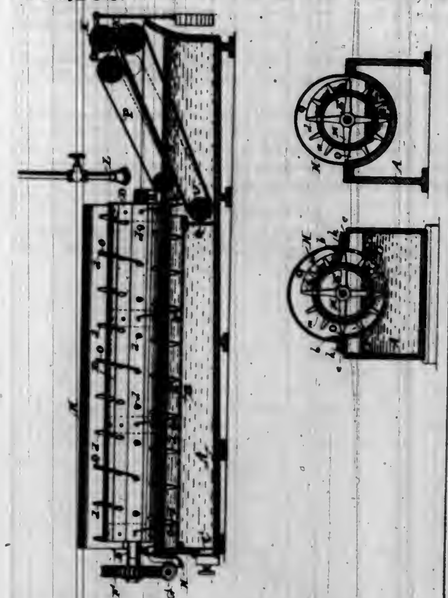
12. A lighting device provided with a two-part housing having a hinged cover, an adjustable oil and wick reservoir, an appliance for feeding and winding upon itself a fulminating tape, strip, or ribbon, pawl-and-ratchet connections between said cover and feeding appliances, a movable scratcher or igniter, and an extinguisher adapted upon the closing of said cover to envelop the wick of said reservoir, substantially as and for the purposes set forth.

13. A lighting device provided with a housing having a hinged cover and an extinguisher, an oil and wick reservoir, a feeding appliance winding and holding upon itself a tape, strip, or ribbon containing fulminates or pellets of ignitible material, an igniter or scratcher, and means for actuating said igniter or scratcher and for causing said feeding appliance to be rotated, substantially as and for the purposes set forth.

480,501. TRACK FOR BARN-DOORS. JOHN H. LAWRENCE, Sterling, Ill., assignor of one-half to Edwin F. Lawrence, same place. Filed Jan. 16, 1892. Serial No. 418,290. (No model.)

Claim.—1. In a track for supporting barn-door rollers, a continuous bracket B, provided with the upper vertical portion C, adapted to be attached to the building, the intermediate diagonal portion D, the track E, and the triangular braces H, cut from the portion D, with their upper sides integral with the latter and their residue turned downward into a vertical position, with the inner ends of their severed portion in the vertical plane of the rear face of the portion C, whereby said bracket is adapted to hang in proper position from the mere attachment, as aforesaid, of its portion C, for the purpose specified.

2. In a track for supporting barn-door rollers, the combination of a vertical portion C, adapted to be attached to the building and extended upward and outward from the building to form a cover for the door-rollers, an intermediate diagonal portion D, a horizontal portion F, the track E, formed thereon, and triangular braces H, formed at suitable intervals in the diagonal portion D, with their several hypotenuses integral with the portion D and their residue turned downward therefrom into a vertical position, with their short vertical rear ends in substantially the same vertical plane with the back side of the portion C and adapted to rest against the building when the portion C is attached to the latter, and thereby support the track E a sufficient distance from said building, substantially as shown, and for the purpose described.



480,502. DYEING OR SCOURING MACHINE. JOHN H. LORIMER, Philadelphia, Pa. Filed June 20, 1891. Serial No. 396,904. (No model.)

Claim.—1. In a dyeing, washing, or scouring machine, the combination of a liquor vat or tank, a diaphragm in said liquor-tank below the level of the liquor therein, and a rotary drum or cylinder of substantial diameter journaled immediately above the diaphragm in the liquor-tank and having its periphery provided with a series of short projecting pins, the ends of which are immediately adjacent to the surface of the diaphragm, arranged in a spiral about the periphery of the drum or cylinder.

2. In a dyeing, washing, or scouring machine, the combination of a liquor vat or tank, a diaphragm in said liquor-tank below the level of the liquor therein, a rotary drum or cylinder of substantial diameter journaled immediately above the diaphragm in the liquor-tank and having its periphery provided with a series of short projecting pins, the ends of which are immediately adjacent to the surface of the diaphragm arranged in a spiral about the periphery of the drum or cylinder, and a series of projecting wings carried by the drum or cylinder to assist the pins in moving the material over the diaphragm.

3. In a dyeing, washing, or scouring apparatus, the combination of a liquor-tank, a perforated diaphragm supported therein below the liquor-level, and a rotary drum or cylinder journaled above said perforated diaphragm and having its periphery provided with a series of short pins or projections arranged about it in a spiral manner and immediately adjacent to the surface of the perforated diaphragm.

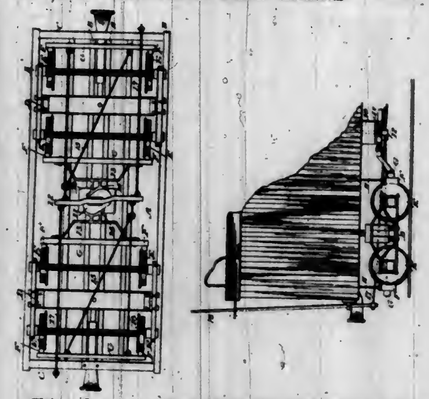
480,502.

4. In a dyeing, washing, or scouring machine, the combination of a liquor vat or tank having a diaphragm or surface to support the material to be treated, and a rotary drum or cylinder of substantial diameter journaled above the diaphragm and having its periphery provided with a series of projecting wings O, arranged at intervals about the periphery in a spiral line, each of the wings having a substantial breadth, so as to extend over a portion of the periphery of the drum or cylinder.

5. In a dyeing, washing, or scouring machine, the combination of a liquor tank or vat having a diaphragm or surface to support the material to be treated, located below the level of the liquor and having a length shorter than the length of the vat, and a rotary drum or cylinder journaled over said diaphragm or supporting-surface and having its periphery provided with a series of short projecting pins.

6. In a dyeing, washing, or scouring apparatus, the combination of a liquor-tank, a rotary drum or cylinder journaled therein and having its periphery provided with a series of spirally-arranged pins or projections and a movable hood or cover arranged over said drum or cylinder and separate from the liquor-tank, so as to be moved therefrom to expose the rotary drum or cylinder.

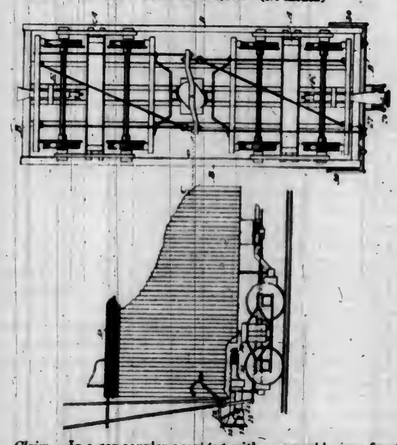
7. In a dyeing, washing, or scouring apparatus, the combination of a liquor-tank, a drum or cylinder journaled therein and having its periphery provided with a series of spirally-arranged pins or projections and a barrier arranged adjacent to the forward end of said drum below the normal level of the liquor in the tank and extending up above said normal liquor-level.



8. In a dyeing, washing, or scouring apparatus, the combination of a liquor vat or tank, a curved perforated diaphragm arranged therein and having its surface below the normal level of the liquor and provided with a longitudinal protecting ledge or rim extending above the upper surface of the tank, and a rotary drum or cylinder journaled above said diaphragm, provided upon its periphery with a series of projections or pins.

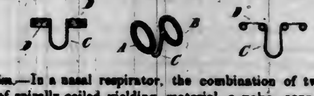
9. In a dyeing, washing, or scouring apparatus, the combination of the vat A, the perforated diaphragm B, supported therein, having the lateral flange *c* resting upon the top of the vat A, and the upwardly-projecting flange *b*, and the removable hood or cover H, having the flange *h*, adapted to rest upon the flange *c*.

10. In a dyeing, washing, or scouring machine, the combination of a liquor vat or tank, and a rotary drum or cylinder journaled therein and having its periphery provided with a series of spirally-arranged pins or projections and with a number of projecting wings.



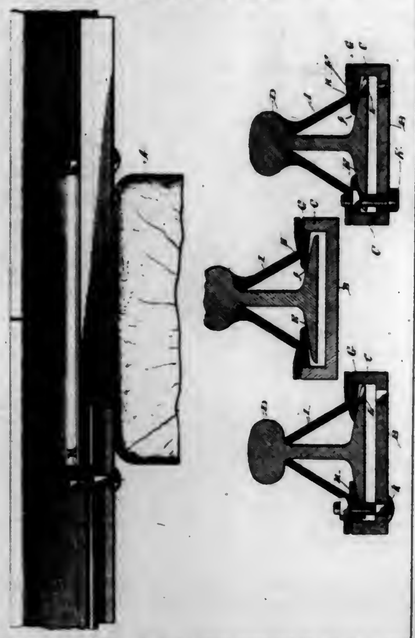
11. In a dyeing, washing, or scouring machine, the combination of a liquor-vat, a rotary drum or cylinder journaled therein and having a large diameter, and a series of wings carried by the periphery of the drum and projecting therefrom and arranged at a distance one from another and in a spiral direction about the periphery of the drum.

480,503. CAR-BRAKE. JAMES B. MEADLEY, Davenport, Iowa. Filed Aug. 29, 1891. Serial No. 404,171. (No model.)



Claim.—In a device for applying brakes to the wheels of cars, in combination with the wheels and hanging horizontal cross-beams carrying brake-shoes in line with the rims of the wheels, the pivoted cam, the lever attached thereto, the frame carrying the circular straps to be operated against by the cam and connected with a horizontal cross-beam carrying brake-shoes, the rods connected with one end of the lever attached to the cam, the other end attached to the opposite horizontal cross-beam carrying brake-shoes, and means for rotating such cam, substantially as described.

480,504. CAR-COUPLING. JAMES B. MEADLEY, Davenport, Iowa. Filed Sept. 1, 1891. Serial No. 404,453. (No model.)



Claim.—In a car-coupler provided with a movable jaw for the reception of the coupling-link, and also provided with a pin for retaining the link within the jaw, the combination of the pivoted cams on the exterior sides of the stationary jaw, the pins or projections on the exterior sides of the movable jaw, arranged to be operated against by the rotation of the cams, and mechanism for rotating such cams, substantially as described.

480,505. NASAL RESPIRATOR. JOSEPH R. MIDDLEY and DORSEY D. CASE, Detroit, Mich. Filed Oct. 3, 1891. Serial No. 407,596. (No model.)

Claim.—In a nasal respirator, the combination of two frames formed of spirally-coiled yielding material, a yoke connecting the frames, and reticulated material across the frames, substantially as described.

480,506. RAIL-JOINT. MILTON C. NILES, Oak Park, Ill. Filed Aug. 28, 1891. Serial No. 403,945. (No model.)

Claim.—1. A rail-joint having a lever supported on the rail at one end and having a fixed support at its other end, and a separate brace between the rail and said lever, substantially as set forth.

2. In a rail-joint, the combination of a lever having a fixed support at one end and fulcrumed upon the rail at its other end, and a brace arranged between the head of the rail and said lever between its said fixed end and point of fulcrum, substantially as set forth.

3. In a rail-joint, the combination, with the base-plate, of a lever supported on said base-plate at one end and fulcrumed on the foot-flange of the rail at its other end, and an inclined support engaging the rail and impinging said lever between its fixed end and point of fulcrum, substantially as set forth.

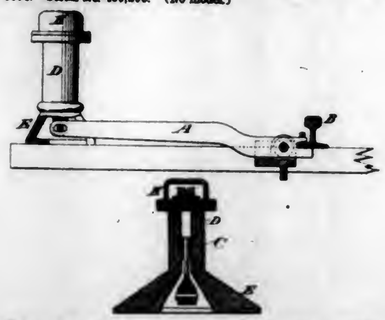
4. In a rail-joint, the combination of the base-plate, a lever having a shoulder engaging said plate at one end and being fulcrumed upon the rail at its other end, and a support engaging the rail and resting upon said lever between said shoulder and said point of fulcrum, substantially as set forth.

5. In a rail-joint, the combination, with a base-plate, of a lever having a fixed support at one end and a separate brace resting upon said lever between its ends and supporting the rail at a distance above said base-plate, substantially as set forth.

6. In a rail-joint, the combination of levers each having a fixed support at one end and resting upon the rail at the other end, said levers having shoulders, and brace-plates engaging said shoulders and the rail, substantially as set forth.

7. In a rail joint, the combination of levers each having a shoulder on its under side at its outer end, the base-plate having flanges with which said shoulders engage, the rail arranged between the said flanges and supporting the inner ends of said levers, said levers having shoulders on their upper sides, and brace-plates engaging the shoulders on the upper sides of said levers and impinging the rail, substantially as set forth.

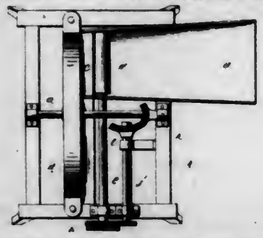
8. In a rail-joint, the combination, with the base-plate having side flanges, of levers having shoulders engaging said flanges and resting upon the foot-flange of the rail, and inclined brace-plates impinging said levers near their inner ends and engaging with the rail, substantially as set forth.



9. In a rail-joint, the combination, with the base-plate, of levers having fixed supports at their outer ends and resting upon the rail at their inner ends, and inclined brace-plates abutting against said levers and against the under side of the rail-head and being separate from said levers, substantially as set forth.

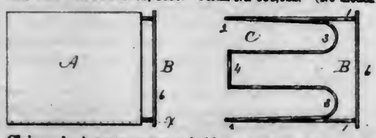
10. In a rail-joint, the combination, with the base-plate, of levers having fixed supports on said base-plate and resting upon the rail, supports between said levers and the rail, and bolts passing through a portion of the rail and the base-plate, substantially as set forth.

11. In a rail-joint, the combination of the levers having fixed supports at their outer ends and being fulcrumed upon the rail at their inner ends, and brace-plates impinging said levers between their fixed supports and their fulcrums and supporting the rail, substantially as set forth.



12. In a rail-joint, the combination, with the base-plate, of levers having fixed supports on said base-plate and resting upon the rail, brace-plates supporting the rail upon said levers, bolts passing through the base plate and foot-flange of the rail, and leveling-washers on said bolts, substantially as set forth.

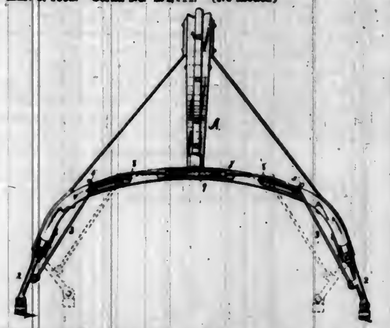
480,507. CIRCUIT CLOSING AND BREAKING DEVICE FOR RAILWAY-TRACKS. THOMAS H. PATENALL, Rahway, N. J. Filed Oct. 20, 1891. Serial No. 409,296. (No model.)



Claim.—The combination, with a cylinder, and a plunger for compressing the air within the cylinder, of a movable piece seated in an opening in the end of the cylinder opposite the plunger, a pair of contact-plates with which the said movable piece is normally in engagement, and a pair of contact-plates with which the said movable piece is adapted to be thrown into engagement under the impulse of the compressed air within the cylinder, substantially as set forth.

480,508. STRAW OR ENSILAGE CUTTER. CHARLES A. PETTET, Belleville, Canada. Filed Mar. 26, 1890. Renewed Apr. 7, 1892. Serial No. 428,160. (No model.) Patented in Canada Mar. 1, 1889, No. 30,876.

Claim.—In a straw or ensilage cutter, the combination, with the knife-wheel and its shaft, the feed-box, and the feed-rollers, of the ellipsoidal concave gearing between said knife-wheel shaft and a shaft geared to said feed-roller shaft, substantially as set forth.

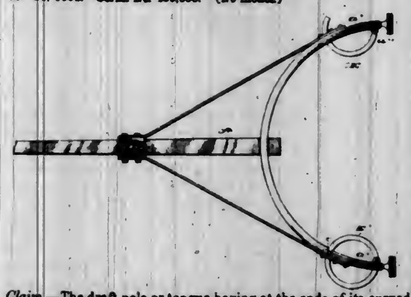


480,509. POSTAL-STAMP HOLDER. BARTON PICKERING, Dayton, Ohio. Filed Jan. 30, 1890. Serial No. 338,622. (No model.)

Claim.—1. A postage-stamp holder comprising the open-ended case A, the closing-plate B, the supporting wire frame C, having a vertical bend at its center, bent to form parallel bends 3 3, thence back in parallel lines to vertical bends 2 2, thence to bends 1 1, and joined to said closing-plate, substantially as shown and described.

2. A postage stamp holder comprising the open ended case A and the spring-carrier B, provided with plate 4, on which the stamps are held, substantially as set forth.

480,510. VEHICLE-POLE. WILLIAM I. PIKE, Groton, N. Y. Filed Mar. 8, 1892. Serial No. 424,111. (No model.)



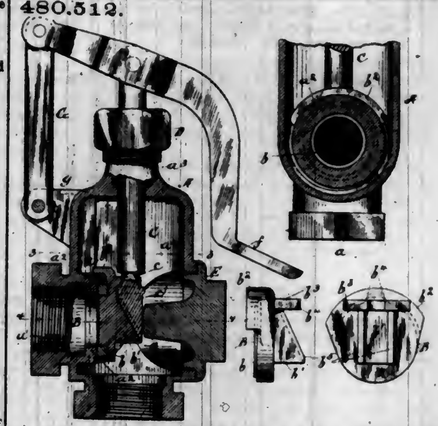
Claim.—1. The combination, with the cross-bar of a pole, of arms loosely secured thereto, and rods secured to said arms at a point between their ends, and means for securing its opposite end adjustably upon the cross-bar.

2. The combination, with the cross-bar of the pole, of the arms loosely secured thereto, eyes loosely secured to said arms, and rods secured to said arms at a point between their ends, and means for securing its opposite end adjustably upon the cross-bar.

3. The combination, with the shaft or pole, of the pivoted arms 2, secured thereto, rods 3 and 8, secured upon the bolt 4, the bolt 4 having a head 6 traveling in the slotway 7, and the coupler 9, receiving the inner ends of the rod 8, as set forth.

480,511. VEHICLE-POLE. WILLIAM I. PIKE, Groton, N. Y. Filed Oct 24, 1891. Serial No. 409,855. (No model.)

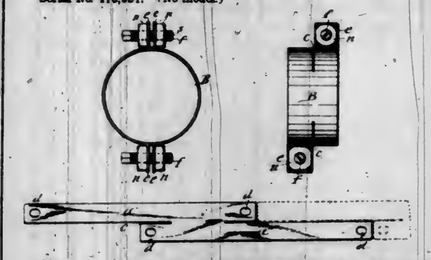
Claim.—The draft pole or tongue having at the ends of its curved bar pivoted sections or arms, in combination with the circular levers pivoted to said sections or arms near their rear or inner ends and adapted to be clamped or held to said curved bar, substantially as set forth.



480,512. VALVE MECHANISM FOR STEAM-RADIATORS. LEON H. PRENTICE, Waukegan, and PETER R. MCLEOD, RICHARD T. CRANE, and LAWRENCE PILKINGTON, Chicago, assignors to the Crane Company, Chicago, Ill. Filed June 14, 1890. Serial No. 355,466. (No model.)

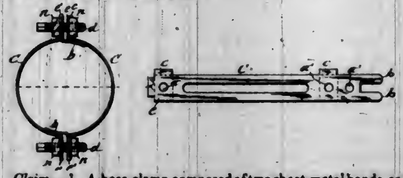
Claim.—1. The valve-case A, provided with the outlet-port a', in combination with the sliding-valve B, provided with a flange b^3 at its upper end adapted to fit upon and cover the metal at the upper part of the port, substantially as shown and described.

2. The valve-stem C, provided with a wedge-shaped lower end c' and an annular groove c just above the latter, in combination with the valve B, provided with the inclined back b' and forked lug b^4 of



480,512.

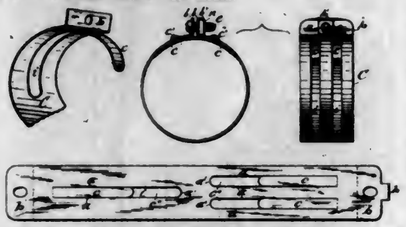
less thickness than the width of the said groove, and the block E, fitted to the opening in the back of the case and having a projecting lug e extending within the case to the back of the valve, substantially as and for the purposes specified.



480,513. HOSE-CLAMP. LEWIS H. REDFIELD, Syracuse, N. Y., assignor of one-half to J. Richard Clancy, same place. Filed Jan. 4, 1892. Serial No. 416,921. (No model.)

Claim.—1. A multiplex hose-clamp consisting of a metal band formed in one piece with a plurality of clamping-ears at different points of its periphery, as set forth.

2. A hose-clamp band formed in one piece of sheet metal and of elongated sections united side by side and each extending with one and beyond that of the other and provided with bolt-holes in the two extremities of each section and slitted longitudinally at the junction of the sections part way from the ends thereof, substantially as described and shown.



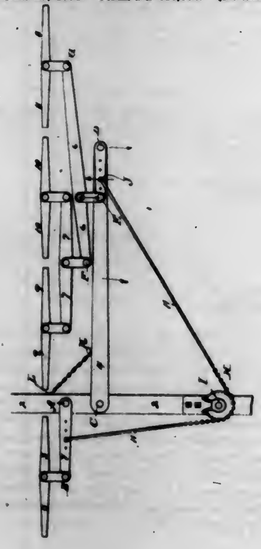
480,514. HOSE-CLAMP. LEWIS H. REDFIELD, Syracuse, N. Y., assignor of one-half to J. Richard Clancy, same place. Filed Jan. 4, 1892. Serial No. 416,922. (No model.)

Claim.—1. A hose-clamp composed of two sheet-metal bands, each bent into semicircular shape, with a perforated outwardly-bent ear at one end and having the opposite end portion folded upon itself and terminated with forwardly-extending fingers and perforated in said folded position and two sets of clamping bolts and nuts uniting said bands at the aforesaid ears, substantially as described and shown.

2. The within-described blanks for hose-clamp, consisting of the sheet-metal bands C C, each provided with the perforation a in one end, perforations a' a' in the opposite end and disposed in the longitudinal central line of the band, fingers b b, extending from said end, and flanges c c on the edges of the end portions of the band, substantially as described and shown.

480,515. HOSE-CLAMP. LEWIS H. REDFIELD, SYRACUSE, N. Y., assignor of one-half to J. Richard Clancy, same place. Filed Jan. 16, 1892. Serial No. 418,373. (No model.)

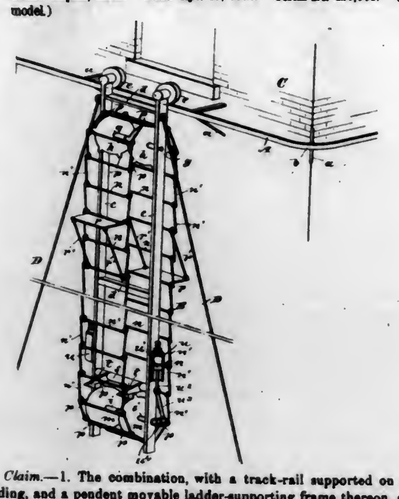
Claim.—1. As an improved article of manufacture, a hose-clamp band formed in one piece of sheet metal, perforated in its ends, and having longitudinal slits extending from a point some distance from the end of the band toward the center of its length and meeting in a transverse slit, the main portion of said band being bent circular shape, the perforated end portions being bent radially outward, and the free end of the slitted portion being bent back and lapped onto the inner side of the opposite end of the main portion, substantially as described and shown.



2. The band C, composed of sheet metal and having the finger c formed integral therewith and bent into the outwardly-projecting loop c' and folded with its free end back onto the inner side of the band and lapped onto the opposite end of the main portion of the band, substantially as described and shown.

480,516. STRAIGHT-EDGE. CHARLES T. RIDGELY and MARK A. SMITH, Springfield, Ohio. Filed Apr. 15, 1892. Serial No. 429,267. (No model.)

Claim.—A straight-edge consisting of a main bar and an auxiliary bar, said bars being connected together by adjustable fastening devices and interposed cushions, substantially as specified.



480,517. DRAFT-EQUALIZER. ERASTUS ROADIFER, Carpenter, Ind. Filed Nov. 23, 1891. Serial No. 412,896. (No model.)

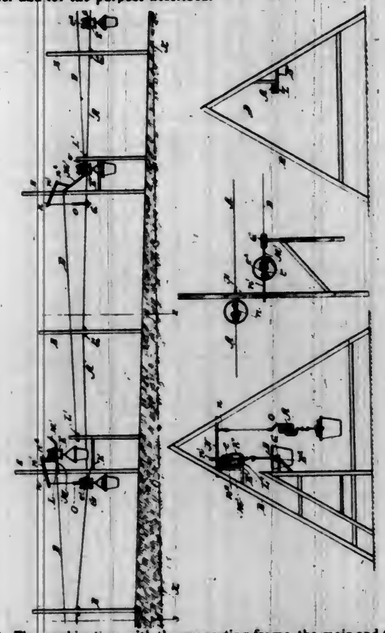
Claim.—1. The combination of the tongue having a chain or flexible connection 11, a short lever 1, and long lever 4 upon the opposite side anchored to the tongue, so that it cannot move rearwardly, a short lever 5, pivoted at its outer end to the long lever 4 and connected to the team at its inner end and at an intermediate point to the chain or flexible connection, which extends to the lever 1 upon the opposite side of the tongue, whereby the larger team is made to tread outwardly and side draft on the tongue is avoided, as described.

2. The combination, with the tongue having the right-angular levers 1 and 4 and pulley I, of the flexible connection 11, passing around the pulley and adjustably connected to lever 1, and the lever 5, adjustably connected to the other end of connection 11 and in turn pivoted at its outer end to long lever 4 and at its inner end to the team, as described.

480,518. FIRE-ESCAPE FOR BUILDINGS. GEORGE I. ROBERTS, Grand Rapids, Mich. Filed Apr. 15, 1892. Serial No. 429,313. (No model.)

Claim.—1. The combination, with a track-rail supported on a building, and a pendent movable ladder-supporting frame thereon, of spaced transverse shafts rotatable in the frame, having sprocket-wheels thereon, an endless ladder on the sprocket-wheels, a rock-shaft journaled in the ladder-frame above the lower pair of sprocket-wheels, detent-dogs thereon projected to engage the teeth of said wheels, and a pneumatic speed-check device connected to the lower shaft and actuated by its rotation, substantially as described.

2. The combination, with a horizontal track-rail supported on a building, a ladder-supporting frame hung from the track-rail and adapted to travel thereon, transverse shafts rotatable on the frame, and spaced sprocket-wheels on said shafts of an endless ladder comprising transverse stretcher-bars having integral depending link-rods, a rock-shaft journaled in the ladder-frame above the lower pair of sprocket-wheels, and detent-dogs projected from the rock-shaft and adapted to engage with and lock the wheels from rotation in one direction, substantially as described.



3. The combination, with a horizontal track-rail, bracket-arms projecting from a house wall and supporting the track-rail, and a pendent ladder-supporting frame having rollers adapted to travel on the track-rail, of transverse shafts rotatable in the said frame at its ends, sprocket-wheels on each of said shafts, an endless ladder on said wheels, a transverse rock-shaft on the ladder-frame above the lower pair of sprocket-wheels, and detent-dogs projected from the rock-shaft and adapted to engage with and lock the lower sprocket-wheels and prevent a progressive movement of the ladder in one direction, substantially as described.

480,519. CABLE RAILWAY. SAMUEL D. ROOT and GORDON C. VINEYARD, Anaconda, Mont. Filed Mar. 2, 1892. Serial No. 423,554. (No model.)

Claim.—1. A cable railway comprising a main downgrade-cable, a series of supplemental downgrade-cable sections inclined in a reverse direction to the main cable, lifting mechanism connecting the lower end of one section of the supplemental cables with the upper end of the next succeeding supplemental cable-section, and means for operating each lifting mechanism, substantially as shown and described.

2. A cable railway comprising a main stationary downgrade cable, a series of supplemental downgrade-cable sections, each inclined in a reverse direction to the main cable, lifting mechanism connecting the lower end of one reverse-cable section with the upper end of the next succeeding reverse-cable section, and connections between such lifting mechanism and the main cable, whereby when the main cable is gagged at each connection points it will operate to lift the said mechanism, substantially as and for the purposes described.

3. In a cable railway, the combination, with the supporting-frames and the main stationary downgrade cable, of a series of downgrade cables disposed above and to one side of the main cable, said sections being inclined in a reverse direction to the main cable and adapted to receive the empty cars, and means operated by the passage of the loaded cars on the main cable for elevating the empty cars from one reverse-cable section to the next succeeding section, whereby such car will be carried up the grade, substantially in the manner and for the purpose described.

4. The combination, with the supporting-frame, the main and the reverse downgrade cables arranged relatively to each other, as shown, and held stationary on the supporting-frame, of the lifting mechanism consisting of a swinging arm hinged to the upper end of one reverse section and formed with a seat portion normally in engagement with the lower end of the preceding section, the rock-shaft N, having oppositely-projecting lever-arms n n', connected, respectively, with the main cable and the swinging arm, all arranged substantially as shown, and for the purposes described.

5. In a cable railway of the kind described, the combination, with the supporting-frame timber B' and the cable A, of the shoe G, having side guides and a longitudinal slot, and means for drawing the cable into the slot and securing it to the shoe and the shoe to the timber B', substantially as shown and described.

6. In a cable railway of the kind described, the combination, with the supporting frame and the cables, of a cable-holding shoe having side guides, a longitudinal slot adapted to receive the depressed portion of the cable, and a central curved guide member forming a track-rail, and the notted hook-bolt for holding the cable down into the slot of the shoe and the shoe to the frame, substantially as and for the purpose described.

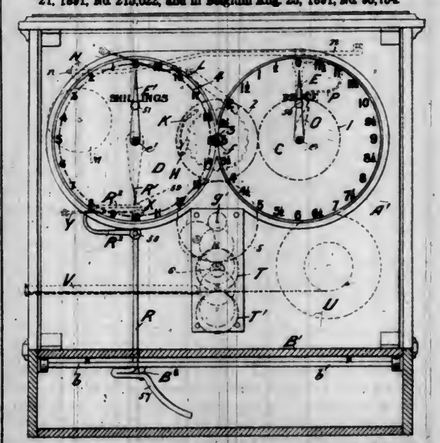
7. In a cable railway of the kind described, the combination, with the supporting-frame, the cable, and a curved cable-holding shoe having side guides projecting vertically, forming cam projections, of a car having two carrier-wheels independently journaled, mechanism for locking each wheels normally in a fixed alignment, and unlocking devices mounted on the car adapted to engage the cams on the curved shoe and operated thereby to unlock the said locking mechanism, whereby the wheels will be capable of independent adjustment as they engage the curved shoe, substantially as and for the purpose described.

8. In a cable railway of the kind described, the combination, with the supporting-frame and the cable formed of two sections, of a cable-holding shoe having oppositely and downwardly-slotted portions to receive the opposite ends of the cables, and the clamp-nuts J, secured to the outer projected ends of such cables, substantially as and for the purposes described.

9. The combination, with the cable-sections D and the swinging arm, having a seat member at its lower end and hinged at its upper end to one of the sections D, of a cable-holding shoe secured to the lower end of the preceding cable-section, said shoe formed with a socket portion to receive the seat portion of the swinging arm, substantially as shown and described.

10. The combination of the supporting-frame, the cable-section D, the cable-shoe L, slotted diagonally downward and rearward, said slot adapted to secure the upper end of the cable-section D, the clamp J for holding such section to the shoe L, the lifting-arm M, hinged in the rear end of such shoe, and the rail-section Z, disposed between the hinged end of the shoe and the cable-receiving end thereof, substantially as and for the purpose described.

480,520. TORPEDO CLIP-FASTENING. WILL C. SCHOOLEY, Braddock, Pa. Filed Nov. 9, 1891. Serial No. 411,255. (No model.)



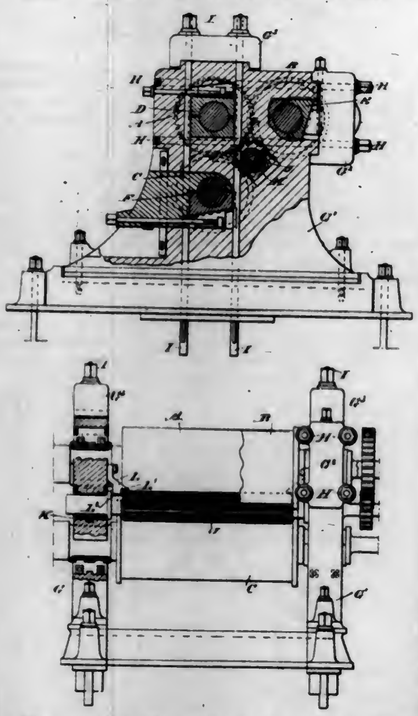
Claim.—1. A torpedo-fastening comprising a clip-fastening formed of an oblong wire loop adapted at its ends to be bent downward at opposite sides of the torpedo-case and a flexible clip held in the clip-fastening and adapted to be doubled upon a rail, substantially as described.

2. The combination, with a torpedo, of a flexible clip-fastening adapted to extend across one part of the torpedo and be bent or turned over the opposite part and a flexible clip held in the clip-fastening, substantially as described.

3. The combination, with the torpedo having slots in opposite sides of its case, of a flexible clip-fastening adapted to be bent or turned around the torpedo and through the slots and a flexible clip held by the clip-fastening, substantially as described.

480,521. CASH REGISTER AND INDICATOR. JOHN SHAKESPEARE, Dudley, England. Filed Apr. 20, 1892. Serial No. 429,950. (No model.) Patented in England Dec. 17, 1890, No. 20,581; in France Aug. 21, 1891, No. 215,022, and in Belgium Aug. 23, 1891, No. 95,734.

Claim.—1. In a cash-register, the combination, with the two indicating-dials C and D at the opposite sides of the case, the indicating-pointers, and the toothed wheels positively connecting the shafts of the said pointers, of a ratchet-wheel, a spring-pressed pawl pivoted to one of the said wheels and adapted to turn the ratchet-wheel in one direction, a pivoted check-pawl, the registering-dials provided with pointers, and toothed wheels operatively connecting the registering-pointers with the said ratchet-wheel, substantially as set forth.

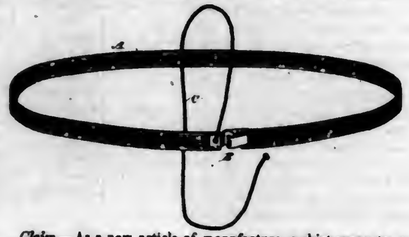


2. In a cash-register, the combination, with an indicating-pointer and its shaft, of a trip-lever secured on the said shaft, a bell, a pivoted spring-lever provided with a hammer for striking the bell, a stop for the spring-lever above its pivot and between the said stop and hammer, and a bent spring secured to the spring-lever and adapted to be actuated to cause the hammer to ring the bell each time the said pointer

is moved from its zero position, the said trip-lever being adapted to pass under and re-engage with the said spring without ringing the bell when restored to its zero position, substantially as set forth.

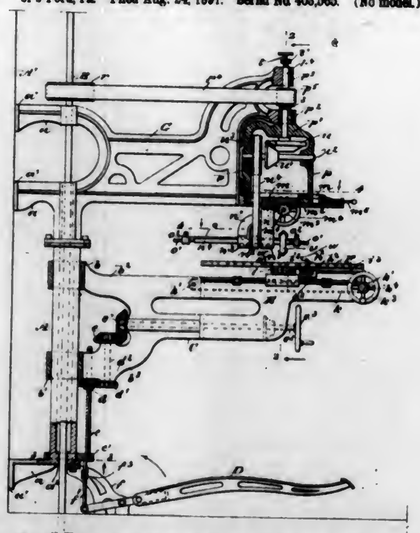
3. In a cash-register, the combination, with an indicating-pointer and its shaft, of a pivoted locking-lever provided at its upper end with a bent spring and a detent and having a bent lower end 57, a trip-lever secured to the said shaft and adapted to engage with the said detent, a cash-receptacle provided with a pivoted lid, and a weighted lever normally resting on the said end 57 and adapted to open the lid each time the said pointer is moved forward, substantially as set forth.

4. In a cash-register, the combination, with the shaft *f*, positively connected with the indicating-pointers, of a series of ratchet-wheels secured on the said shaft and provided with teeth of different pitch, a series of pivoted finger-levers provided with spring-pressed pawls and adapted to operate the ratchet-wheels, and stops for limiting the movements of the said levers, substantially as set forth.



480,522. CANE-MILL. DONALD SKEKEL, Georgetown, British Guiana. Filed Sept. 18, 1891. Serial No. 406,068. (No model.)

Claim.—1. A cane-mill provided with three crushing-rollers, of which two are the top rollers and are arranged in a horizontal plane, while the third is located under the first top roller and forms with the latter the front or entrance rollers for the cane to be crushed, a corrugated tarsing-roller arranged in the rear of the front or entrance rollers and below the top rollers, and the guides L, formed with upward and outward inclined integral projections L′, extending over the ends of the corrugated roller, and with semicircular offsets L^3, projecting between the ends of said roller and its bearings, substantially as shown and described.



2. In a cane-mill, the combination, with the head stocks, of three crushing-rollers journaled in the said head-stocks and of which two are the top rollers arranged in a horizontal plane, while the third is located under the first top roller and forms with the latter the front or entrance rollers, sets of U-shaped bolts H H, extending horizontally above and below the bearings for the top rollers, the caps G^2, through which the ends of bolts pass, and a second set of bolts arranged vertically at the sides of the bearings for the front or entrance roller, and the caps G^2 on top of the head-stocks over the upper forward roller bearings, substantially as shown and described.

480,523. SKIRT-SUPPORTER. GEORGIA V. SMITH, Princeton, Ill. Filed Apr. 13, 1892. Serial No. 429,044. (No specimens.)

Claim.—As a new article of manufacture, a skirt-supporter consisting of the elastic band A, provided with the lever-like spring-clasp B at one end for engaging the other end of the band, and the cord C, secured to the clasp for supporting and holding the band in position on the wearer, as specified.

480,524. WOOD-CARVING MACHINE. WILLIAM R. SNYDER, Royer's Ford, Pa. Filed Aug. 24, 1891. Serial No. 403,565. (No model.)

Claim.—1. In a carving-machine, the combination, with a platen that is rotatably and reciprocally adjustable on a frame, of a horizontal rotatable arbor on a sliding frame, a cutter on the arbor, means to axially rotate the arbor, and means to move it orbitally around the platen, substantially as described.

2. In a carving-machine, the combination, with a platen that is supported on a laterally-movable frame and is adjustable to incline it from a horizontal plane and also rotatably and reciprocally adjustable, of an arbor rotatably supported above the platen and adapted to swing orbitally, a cutter adjustable thereon, a turn-table support for the arbor, means to move the turn-table, and mechanism to effect the rotation and longitudinal adjustment of said arbor and secure said adjustment, substantially as described.

3. In a carving-machine, the combination, with a platen that may be adjustably rocked, rotated, and moved reciprocally on a frame and means to adjust the platen vertically, of an axially-rotatable arbor, a cutter thereon above the platen, a rocking frame that is longitudinally movable and that engages the arbor at its ends, a rotatable turn-table from which the arbor is hung, and mechanism which will transmit rotary motion to the arbor, substantially as described.

4. In a carving-machine, the combination, with a swinging frame laterally movable on an upright fixed column, a device to vertically adjust the swing-frame and support it where adjusted, a treadle connected to the swing-frame supports, and a platen on the swing-frame which is reciprocally and rotatably adjustable and adapted to be inclined from a horizontal plane, of a rotatable arbor, a cutter thereon, a rotary adjustable turn-table from which the arbor is hung, and means to rotate the arbor axially, substantially as described.

5. In a carving-machine, the combination, with a supported bracket-frame, a turn-table rotatable thereon, a circular toothed rack below on the turn-table, a pinion meshing with the rack, a hand-wheel controlling the pinion, and a device to lock the turn-table from rotation, of an axially-rotatable arbor below the turn-table suspended therefrom, a transverse cutter thereon, and a longitudinally movable and securable frame whereon the arbor rotates, substantially as described.

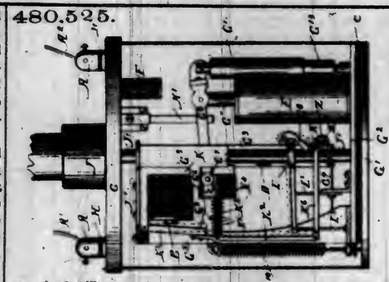
6. In a carving-machine, the combination, with a supported bracket-frame, a horizontal circular turn-table thereon, a circular rack on the table below near its edge, a pinion and hand-wheel on a shaft journaled on the turn-table and adapted to rotate the table when manipulated, and a locking-bar that will interlock with holes in the periphery of the turn-table, of a horizontal arbor on a depending frame axially rotatable thereon, and a cutter on the arbor, substantially as described.

7. In a carving-machine, the combination, with a supported bracket-frame, a turn-table thereon, gearing on the table, and a device to secure the table from rotation, of an arbor below hung from the turn-table and rotatable and longitudinally adjustable and a rocking frame adapted to be slid endwise and held at any point of such adjustment and engaging the ends of the arbor and controlling its longitudinal movement, substantially as described.

8. In a carving-machine, the combination, with a column, a bracket-frame laterally extended therefrom, a main shaft in the column, and a rotatable turn-table on the bracket-frame, of friction-gearing on the turn-table, adapted to move an arbor below the table, a horizontal axially-rotatable arbor on an arm depending from the table, and a rocking longitudinally-movable frame engaging the ends of the arbor, substantially as described.

9. In a carving-machine, the combination, with a swinging frame on an upright column, of a platen which is rotatable, a device that secures the platen from rotation, a sliding carriage on the swing-frame, a rocking adjustable table thereon, a rotatable platen on the table, and a sprocket chain and gearing to move the sliding carriage, substantially as described.

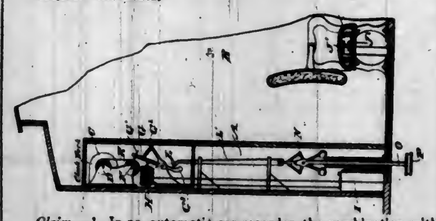
10. In a carving-machine, the combination, with a supported bracket-frame, a turn-table rotatable thereon, gearing to revolve the table, an adjustable locking-bar that will enter one of a series of holes in the rim of the turn-table, a frame on the turn-table which rotatably supports two engaging bevel-faced friction-wheels, and shafts whereon the wheels are affixed, of a rotary arbor revoluble on a depending bifurcated arm, adjustable cutters thereon, a longitudinally movable and securable rocking frame having its bent ends pivotally engaged with the ends of the arbor, a pulley mounted to slide on the arbor and adapted to rotate it, and a connection from a source of power to the friction-gear and from the friction-gear to the pulley on the arbor, substantially as described.



11. In a carving-machine, the combination, with a fixed upright column, a laterally-movable swing-frame thereon, a mechanism that will raise, lower, and support the swing-frame, a vibratable treadle-lever, and a post jointed at its lower end to an end of the treadle-lever and loosely engaging its upper end with the swing-frame support, of a sliding carriage gibbed on a bed-plate of the swing-frame, a rocking table thereon which is adjustable from a horizontal plane, a rotatable platen on the table, a locking-bolt adapted to engage any of a series of radial holes in the periphery of a hub on the platen, a doubled sprocket-chain attached by its ends to the sliding carriage, sprocket-wheels engaging the bights of the chain, and a hand-wheel on the end of one journal-shaft that supports a sprocket-wheel, substantially as described.

12. In a carving-machine, the following elements, in combination, viz: an upright tubular column, a main shaft therein adapted to rotate, a swing-frame laterally movable on the column, mechanism which will adjust the swing-frame and retain it at a desired height, a treadle-lever connected to the frame-support, a platen on the swing-frame which may be adjustably rocked, rotated, and reciprocated, a bracket-frame above the platen, a turn-table thereon, means to rotate the turn-table, a locking device for the turn-table, an axially-rotatable and longitudinally adjustable arbor hung from the turn-table, cutters thereon, and a friction-gearing connected with the main shaft and also with the arbor, so as to transmit rotary motion from the shaft to the arbor, substantially as described.

480,525. ELECTRIC-ARC LAMP. ELMER A. SPERRY, Chicago, Ill., assignor to the Sperry Electric Company, same place. Filed June 7, 1890. Serial No. 354,604. (No model.)



Claim.—In an arc lamp, the combination of a vertically-movable frame with a carbon-separating mechanism thereon, containing a clutch supported at one end by toggle-bars with a spring from the other end of such clutch to the fixed frame, an intermediate adjustable stop, a main-circuit magnet fixed in position, provided with an armature connected with such toggle-bars, so that the main-circuit magnet when

480,525.

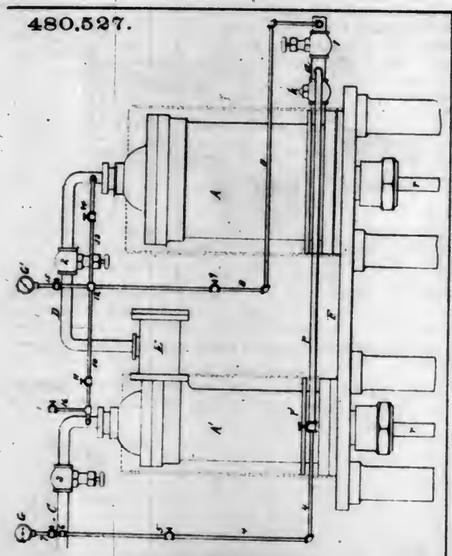
energized will cause the carbons to separate, and a fixed shunt-magnet provided with an armature on which the frame is suspended, so that by the action of the shunt-magnet the frame is moved to disconnect the clutch and permit the upper carbon to fall upon the lower.

480,526. AUTOMATIC MILEAGE-RECORDER FOR CAR-SEATS. HARRY S. SQUIRES, New York, N. Y. Filed Dec. 8, 1891. Serial No. 414,385. (No model.)

Claim.—1. In an automatic car-recorder, the combination, with electro-magnets controlled from the seats in a car, of a series of levers, each carrying a point and actuated from the said electro-magnets, a traveling sheet adapted to be marked on by the points of the said levers, and a governor actuated from the axle and adapted to lock the said levers in place, substantially as shown and described.

2. In an automatic car-recorder, the combination, with a traveling sheet and a clock-work for imparting a traveling motion to the said sheet, of a series of levers carrying points indicating on the said traveling sheet, magnets for controlling the said levers, circuit-closers arranged on the car-seats and connected with the said electro-magnets, flexible car-seats controlling the circuit-closers, and a governor from the car-axle and adapted to lock the said levers, substantially as shown and described.

3. In an automatic car-recorder, the combination, with electro-magnets controlled from the seats in the car, of a series of levers, each carrying a point and actuated from the said electro-magnets, a traveling sheet adapted to be marked on by the points of the said levers, and means, substantially as described, for locking the said levers in place to hold their points off the said traveling sheet at a time when the car is at a standstill, as set forth.



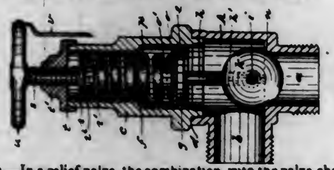
4. In an automatic car-recorder, the combination, with a traveling sheet and a clock-work for imparting a traveling motion to the said sheet, of a series of levers carrying points indicating on the said traveling sheet, magnets for controlling the said levers, circuit-closers arranged on the car-seats and connected with the said electro-magnets, and a governor actuated from the car-axle and adapted to lock the said levers, substantially as shown and described.

480,527. COMPOUND COMPRESSING-ENGINE. STUART ST. CLAIR, York, Pa., assignor to the York Manufacturing Company, Limited, same place. Filed Dec. 29, 1890. Serial No. 376,062. (No model.)

Claim.—1. The combination of the low-pressure cylinder and piston of a compound compressor with an inlet, a high-pressure cylinder having a solid piston, a pipe connecting the discharge from the low-pressure cylinder with the inlet to the high-pressure cylinder, and a pipe connecting the space back of the high-pressure piston with the supply to the low-pressure cylinder, and a check-valve between said connection and the low-pressure cylinder, substantially as described.

2. The cylinders of a compressor, having a valved inlet-pipe and valved delivery pipe, in combination with valved piping connecting the delivery-pipe beyond its valve with the inlet-pipe between the valve of the latter and the cylinders, and in combination with valved piping connecting the delivery-pipe between its valve and the cylinders with the inlet-pipe in front of the valve of the latter, substantially as described.

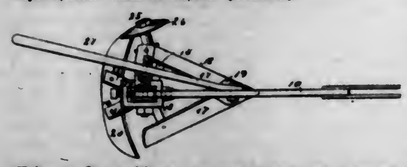
480,527.



necting the two, an adjusting-yoke, a bolt passed through the members of the yoke, through the members of the bifurcated end of the shank, and through the slot in the beam, and adjusting-screws located at the front and back portions of the yoke, both engaging with the beam, substantially as described, whereby the lower end of the shank may be raised or lowered, as required.

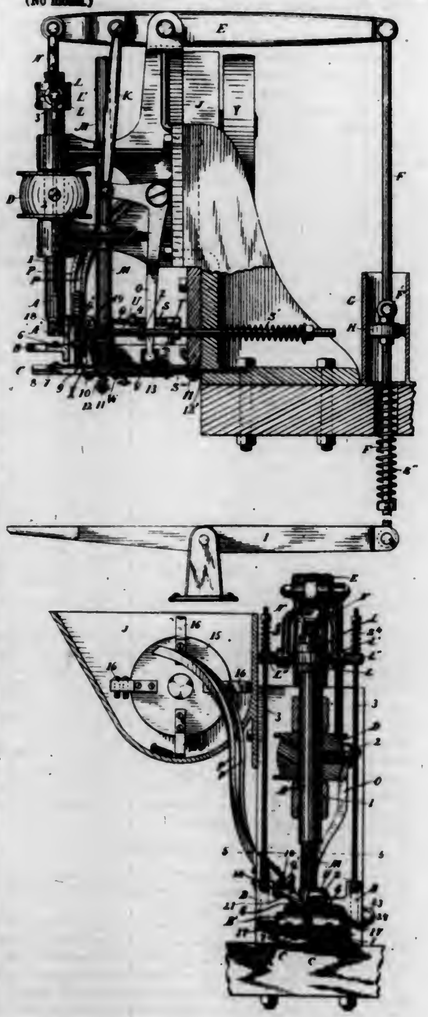
2. In a cultivator, the combination, with a shank and an essentially-V-shaped cultivator-blade secured thereon, of a reversible point removably connected with the blade and a drag pivoted to the shank at the rear of the blade, as and for the purpose set forth.

3. In a cultivator, the combination, with the beam, the shank of the blade, and a yoke for connecting the shank adjustably to the beam, of an angle-bracket secured to the yoke, a second bracket adjustably secured to the first bracket and provided with a spindle, and a colter-wheel mounted on the said spindle, substantially as described.



4. A cultivator comprising a beam, a shank adjustably secured to the beam, a V-shaped blade on the shank and having reversible point, a drag pivoted to the shank, and a colter-wheel adjustably supported from the shank, substantially as herein shown and described.

480,528. RELIEF-VALVE. ALEXANDER S. THOMS, Paterson, N. J. Filed Mar. 18, 1892. Serial No. 425,490. (No model.)



Claim.—In a relief-valve, the combination, with the valve-chamber A, provided with inlet *b* and outlet *a*, arranged at right angles to each other, a valve-seat arranged in the valve-chamber and surrounding the inner opening of outlet *a*, a shell *c*, secured to the top of said valve-chamber and opposite to the outlet-pipe *a* and provided with an inner annular shoulder *f*, a cap *t*, secured to the top of said shell, a plunger *e*, adapted to be operated in said shell by the pressure of the inflowing water and limited in its up motion by said annular shoulder, a stem *h*, secured to the said plunger and provided at its lower end with a fork or yoke *h'*, guiding-lugs on the prongs of said fork, recesses *m m*, arranged on the inside of valve-chamber A, integral therewith and parallel to the motion of the stem *h*, a ball-valve, of considerably larger diameter than the valve-seat, pivotally secured to the fork *h* and adapted to rest on said valve-seat, thus closing close the outlet *a*, and when in operation to revolve in said fork, a spiral spring arranged in shell *c* and adapted to control the said ball-valve, and a screw provided at its outer end with a hand-wheel and at its lower or inner end with a disk pressing on said spiral spring, said screw being adapted to control said spiral spring, all said parts being arranged and combined to operate substantially as described, and for the purposes set forth.

480,529. CULTIVATOR. AUGUSTUS TINDALL, Brenton, Ill. Filed Sept. 26, 1891. Serial No. 406,914. (No model.)

Claim.—1. In a cultivator, the combination, with a beam provided with an aperture near its lower end and a transverse slot, of a shank to which the cultivator-blade is attached, bifurcated at its upper end to receive the lower portion of the beam, a bolt passed through the upper aperture in the beam and through the shank, pivotally con-

480,530. SCREW-DRIVING AND WASHER-FEEDING MACHINE. FRED W. TOBEY, Grand Rapids, Mich., assignor to the Grand Rapids Brass Company, same place. Filed Dec. 5, 1891. Serial No. 414,099. (No model.)

Claim.—1. In combination with a spindle provided with mechanism for simultaneously rotating and longitudinally moving the same, a screw-driver attached to said spindle, grippers for holding a screw in line with the axis of said spindle and movable in line with the same, and mechanism for automatically feeding screws to said grippers, substantially as described.

2. In combination with a spindle provided with mechanism for simultaneously rotating and longitudinally moving the same, a screw-driver attached to said spindle, grippers for holding a screw in line with the axis of said spindle and movable in line with the same, and mechanism for automatically feeding screws to said grippers, grippers for holding washers in line with the axis of said spindle, and mechanism for automatically feeding washers to said grippers, substantially as described.

3. In a screw-driving machine, a hopper to contain screws, a rotative disk in said hopper, U-shaped arms attached to said disk with their open end toward the axis of the same, and parallel ways located to receive the screws as they are discharged from said arms, substantially as described.

4. The combination, with a longitudinally-movable spindle having a screw-driver at one end, a lever E connected to said spindle, a treadle, a rod connecting said lever and treadle, and a spring encircling said rod, of parallel ways, pins passing through said ways, one a short distance above the other and longitudinally movable therein, a yoke embracing said ways to which said pins are attached, a rod attached to said yoke, a spring on said rod to move the same in one direction, an arm, also attached to said rod, and a bell-crank lever O, connected at its upper end with said lever E and at its lower end engaging said arm on the rod for moving said rod in the other direction.

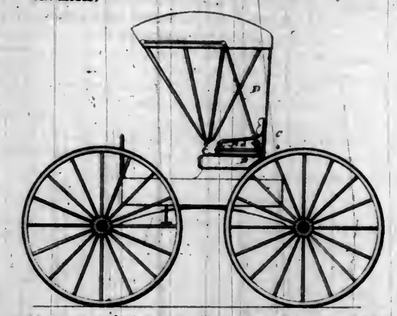
5. In a machine for driving screws and feeding washers, the combination, with a longitudinally-movable spindle having a screw-driver at one end, ways having mechanism for discharging one screw at a time, grippers for holding said screws in line with said spindle, and means for feeding the washers, of a reciprocative rod having a head adapted to engage said screws and force them between said grippers, said rod also having a sleeve adapted to engage the under side of a screw, substantially as described, and for the purposes specified.

6. In combination with ways provided with mechanism for singly discharging screws therefrom, a forked and pivoted arm normally opposite said ways, and a reciprocative rod having a head engaging said screws and forcing the same out of said forked arm and into grippers arranged to receive said screws, substantially as described.

7. In combination with mechanism for automatically feeding and driving screws, substantially as described, a vertical tube to contain washers, a reciprocative slide beneath said tube, and grippers in line with the axis of the screw-driving mechanism to hold said washers, substantially as described.

8. The combination, with screw feeding and driving mechanism, substantially as described, of a vertical tube, a stop, as 23, near the bottom of the same, a gate opposite the end of the same, a reciprocating slide between said gate and tube, and grippers in line with said slide, the axis of said grippers also in line with the axis of the screw-driving mechanism, substantially as described.

9. In a washer-feed, a fixed vertical tube M, a horizontal bed-plate B', means for flexibly supporting said bed-plate, a plate 13, a gate V, having spring S', a slide W, means for reciprocating said slide, and grippers 7 7, said parts being arranged, combined, and operating substantially as shown and described.

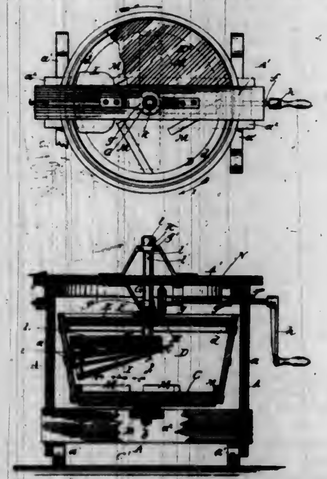


10. In combination with a longitudinally-movable spindle having a loose collar and a tight collar at each side of the same, a vertically-movable angle-plate having grippers to hold a screw in line with the axis of said spindle, rods connecting said angle-plate with said loose collar, and springs on said rods, substantially as described.

11. The combination of a longitudinally-movable spindle having a screw-driver attached, grippers in line with the axis of said spindle, parallel inclined ways having mechanism for discharging screws one at a time, a reciprocating rod to move the screws into said grippers, a lever connected to said spindle, a treadle connected to said lever, and a bell-crank lever, also connected to said lever and operating said rod, substantially as described.

12. The combination of a longitudinally-movable spindle having a screw-driver, grippers in line with the axis of said spindle, parallel inclined ways having mechanism for discharging screws one at a time, a reciprocative rod to move the screws into said grippers, a treadle connected to said lever, and a bell-crank lever also connected to said lever and operating said rod, with a vertical tube to contain washers, washer-grippers in line with the axis of said spindle, and a reciprocative slide beneath said tube to move said washers from said tube to said grippers, said slide also being operated by said bell-crank lever, substantially as described.

13. In combination with grippers to hold screws and grippers beneath the same to hold washers, and a reciprocating slide to move the washers into said grippers, a reciprocating head to move the screw into said grippers, and a shoe on the bottom of said head to hold the washer down while being moved forward by said slide, substantially as described.

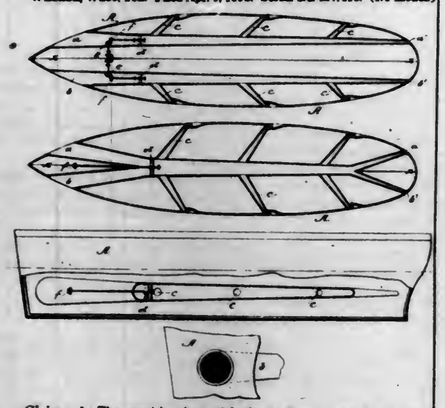


480,531. LEVER FOR RAISING AND LOWERING BUGGY-TOPS. HANS TORRESEN, Yankton, S. D. Filed Feb. 3, 1892. Serial No. 420,238. (No model.)

Claim.—1. A device for raising and lowering carriage-tops, comprising a lever A, having a handle portion *a* at one end, a projecting barrel or eye *b* at the other end, adapted to loosely engage the iron or stud forming the support for the top when down, and the upwardly-projecting arm C, designed to be connected to or form a part of the joint-brace, substantially as specified.

2. The combination, with a carriage-top, of the device for raising and lowering said top, said device comprising a lever A, an eye or barrel *b* on one end of said lever and projecting outwardly therefrom, said eye or barrel being loosely sleeved on the stud or iron *b'* of the carriage-frame, and an upwardly-projecting arm C, having an angular portion arranged to detachably engage said eye or barrel, said arm having means whereby it is secured to a joint-brace of the top, substantially as specified.

480,532. WASHING-MACHINE. CORNELIUS VAN DERSER, Albany, N. Y., assignor of two-thirds to David H. Mathias and James H. Simonson, same place. Filed Nov. 23, 1891. Serial No. 412,887. (No model.)



Claim.—1. In a washing-machine, the combination, with a stationary frame and a tub supported by a vertical pivot from said frame, of the tub-turning bar E, provided with the central gear F, driven by a gear carried by the drive-shaft *f*, vertical shaft G, conical fluted roller I, guard L, carried by the lower end of said vertical shaft, and the bar A', supporting said shaft, all substantially as and for the purposes set forth.

2. In a washing-machine, the combination, with the frame A, supporting the central step-bearing *b*, and a horizontally-revolving tub, of the platform C, supported by a vertical shaft from the said step-

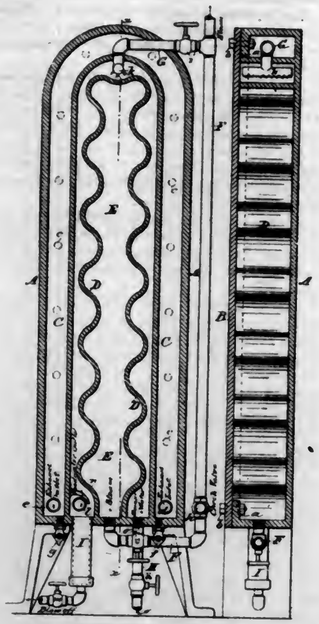
bearing and received between the circle of the chine of the lower or bottom end of the said tub, gear-bar A', hinged by one of its ends to the upper end of the frame with provision for securing at will its opposite end also with said frame, of the tub-turning bar E, secured with the upper end of the tub, a vertical shaft G, supported centrally in said tub-turning bar, horizontal arm I', conical fluted roller I, and water-guard L, and the gear mechanism F and H, actuated by a drive-shaft, all substantially as and for the purposes set forth.

3. In a washing-machine, the combination, with a frame, a horizontally-revolving tub supported from said frame, the removable gear-bar A', vertical shaft G, which is fixed from moving endwise, tub-turning bar E, engaging with the side walls of the tub, radial arm I', fixed to the lower end of the said vertical shaft, and the conical fluted roller I, which is supported from the said radial arm, of the gear F, secured to the said tub-turning bar and concentric with the said vertical shaft, drive-gear H, and drive-shaft *f*, supported in bearings secured to the said gear-bar with provision for revolving the same, substantially as and for the purposes set forth.

480,533. HYDRAULIC PROPULSION OF VESSELS. JAMES C. WALKER, Waco, Tex. Filed Apr. 1, 1892. Serial No. 427,416. (No model.)

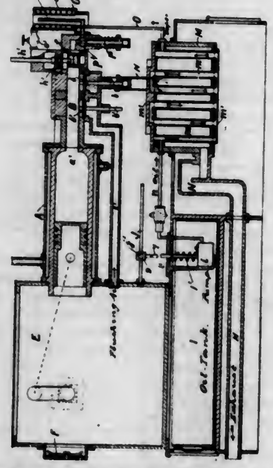
Claim.—1. The combination, with the hull of a vessel, of a longitudinal trunk-tube made of tapering shape in cross-section, largest at its front end, and opening at the bow and provided along its sides with a series of lateral branches terminating in nozzles, and means for establishing a high-pressure current within the tube, substantially as shown and described.

2. The combination, with the hull of a vessel, of a longitudinal trunk-tube made of tapering cross-section, largest at its front end, and opening at the bow and provided along its sides with a series of lateral branches terminating in nozzles, a propeller-wheel arranged in the front end of said trunk-tube, and gears for rotating it, substantially as shown and described.



3. The combination, with the hull of a vessel, of the two tapering trunk-tubes *a a'* and *b b'*, made largest at the front end and opening at the bow, said tubes being arranged upon opposite sides of the center line and having lateral branches terminating in nozzles, the suction and propeller wheels *d d*, arranged in the larger front ends of said tubes, and gears *e f* for rotating them, substantially as shown and described.

480,534. HEATER AND PURIFIER FOR FEED-WATER. JOHN P. WARNER, Washington, D. C., assignor to A. F. Navarre, same place. Filed Nov. 14, 1891. Serial No. 411,891. (No model.)



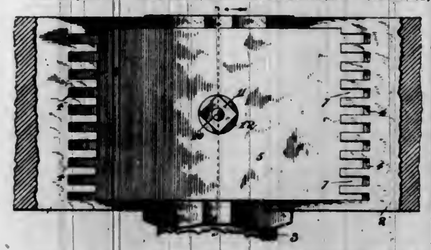
Claim.—1. In heaters and purifiers for feed-water, the combination of the main body A, provided with the partition C and corrugated partition D, forming the space E for live steam in the center and on the outside of said partition C for exhaust-steam, with the steam and water inlet and outlet pipes and arranged substantially as set forth.

2. A heater and purifier for feed-water, consisting of the shell A, provided with the partition C and the corrugated partition D, in combination with the steam-pipe F, having branch pipe G, having perforated T-piece *k*, the water-pipe H, provided with a steam-jet *o*, and the mud-drum I and the exhaust-pipes, all arranged as shown, and for the purpose specified.

3. The combination of the main body A, provided with the partition C and corrugated pipe D, constructed as shown, with the steam-pipe F, having branch pipe G and T-pipe *k* at the upper end and entering into the central space E at the lower end, the exhaust inlet and outlet pipe, and the water inlet and outlet pipe, all arranged as shown and specified.

480,535. PETROLEUM OR SIMILAR ENGINE. GEORGE W. WEATHERHOGG, Birmingham, England. Filed Aug. 15, 1891. Serial No. 402,701. (No model.) Patented in England May 14, 1889, No. 8,013, and in Germany June 1, 1890, No. 62,137.

Claim.—1. In a petroleum-engine, the combination, with the oil-pump provided with a spring for raising its plunger automatically, of a pivoted lever for depressing the pump-plunger, a reciprocating tappet connected with the driving mechanism of the engine and adapted to depress the said lever at appropriate intervals, and means, such as a screw, for moving the tappet longitudinally of the said lever, whereby the length of the stroke of the pump-plunger may be varied, substantially as set forth.



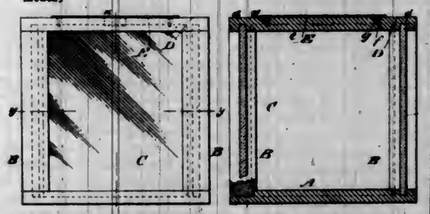
2. In a petroleum-engine, the combination, with the oil-pump provided with a spring for raising its plunger automatically, of a pivoted lever for depressing the pump-plunger, a second pivoted lever provided with an adjustable tappet and arranged over the first said lever, and a rod connecting the second lever with the driving mechanism of the engine, substantially as and for the purpose set forth.

3. In a petroleum-engine, the combination, with the evaporator provided with an outer case adapted to receive exhaust-steam for vaporizing the oil, a series of pipes passing through the said case, and a hollow bottom casting connecting the lower ends of the said pipes and adapted to be heated by an external flame to vaporize sufficient oil to start the engine, of a pump for forcing the oil through the said tubes and casting, substantially as set forth.

4. In a petroleum-engine, the combination, with the automatic air-inlet valve, of the vapor-valve provided with a perforated seat, the perforated casting in the mixing-chamber under the said vapor-valve, and the admission-valve provided with perforated disks on its stem, whereby the air and vapor may be intermixed, substantially as set forth.

5. In a petroleum-engine, the combination, with the admission-valve provided with perforated disks on its stem for breaking up globules of oil, of the perforated casting secured in the combustion-chamber under the said valve and adapted to evaporate the particles of oil, substantially as set forth.

480,536. FASTENING FOR TABLE-LEGS. LOUIS WELKER, Williamsport, Pa. Filed Dec. 2, 1891. Serial No. 413,812. (No model.)

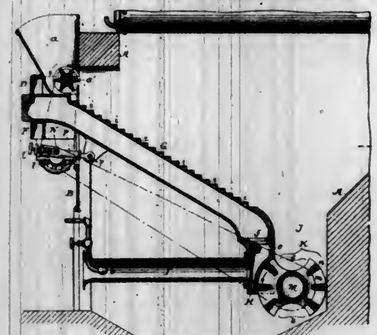


Claim.—1. In a knockdown table, the frame having its side pieces provided on the inner faces thereof with the series of segmental kerfs or grooves extending longitudinally of the same and terminating within the ends of the side pieces and the diagonal corner-piece provided at its ends with the series of tenons, an adhesive substance being applied and the corner-piece or brace forced into position with its tenons in the kerfs or grooves and allowed to set, substantially as described.

2. In a knockdown table, the frame having its side pieces provided with a series of longitudinal segmental kerfs or grooves, the diagonal corner-piece or brace provided at its ends with the series of tenons which are secured in the kerfs or grooves, the leg, and the angular reinforce-blocks secured between the corner-piece, the side pieces, and the leg, substantially as described.

3. In a knockdown table, the combination of the frame having its side pieces provided with the longitudinal segmental kerfs or grooves, arranged as described, the corner-piece or brace having its chamfered ends provided with the tenons secured in the grooves or kerfs, the solid head-leg fitted against the imperforate ends of the side pieces, and the screw-bolt secured in the head of the leg and having a nut bearing against the corner-piece or brace, substantially as described.

480,537. FRUIT-JAR. CHARLES L. WIGHT, Mahukona, Hawaii. Filed Aug. 1, 1891. Renewed July 11, 1892. Serial No. 439,567. (No model.)



Claim.—1. A knockdown jar or receptacle comprising a bottom having marginal grooves in its upper face and sockets or holes intersecting said grooves, a cover having similar grooves and holes, corner-posts each having two longitudinal grooves and end tenons to enter the base and cover sockets, and the side panels, the longitudinal edges of which fit the base and cover grooves and the vertical edges the post-grooves, substantially as set forth.

2. A jar formed of the grooved base-board A, provided with holes *a*, the corner-posts B, grooved longitudinally and provided with tenons at opposite ends, the sides C, the cover D, furnished with grooves for receiving the sides and holes for receiving the tenons of the corner-posts and provided with the central opening *e* and groove *f*, and the cap E, furnished with downwardly-projecting ears *g*, substantially as specified.

3. In a vessel of the character described, the cover having an annular groove *f* in its upper face to define its place of opening and a closure of greater diameter than the groove and having downward-projecting ears entering the groove, substantially as set forth.

480,538. FURNACE-GRATE. ALFRED WILKINSON, Philadelphia, Pa. Filed Feb. 29, 1892. Serial No. 423,257. (No model.)

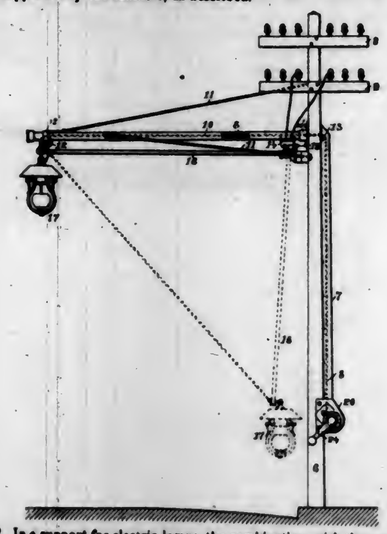
Claim.—1. The within-described grate for furnaces, said grate consisting of hollow inclined bars, each of which has a series of tuyere-openings in the inclined fuel-supporting face of the bar, and means for supplying air to said hollow grate-bars, substantially as specified.

2. The within-described grate for furnaces, said grate consisting of a series of hollow inclined bars, in combination with means for supplying air to said bars, each of the bars being stepped on the fuel-supporting face and said steps having in the fronts of the same tuyere-openings for the discharge of air into the bed of the fuel, substantially as specified.

3. The within-described grate for furnaces, said grate consisting of a series of hollow inclined bars, some of which are movable to and fro past the others, the bars having tuyere-openings in their fuel-supporting faces, in combination with means for supporting the grate-bars at top and bottom, means for moving the movable bars of the grate, and means for forcing air into the bars, substantially as specified.

4. The combination, in a grate for furnaces, of the hollow inclined grate-bars having tuyere-openings in their fuel-supporting faces, a hollow transverse beam or girder supporting said bars and communicating with the interior of the same, and means for forcing air into said hollow beam or girder, substantially as specified.

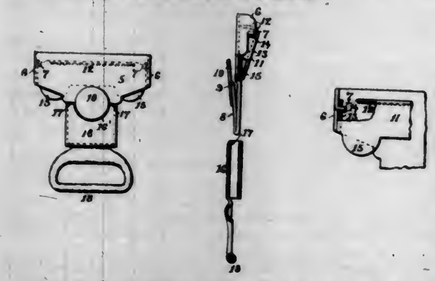
5. The combination, in a grate for furnaces, of the hollow inclined grate-bars having tuyere-openings in their fuel-supporting faces, a hollow transverse beam or girder supporting said bars and communicating with the interiors of the same, an air-inlet pipe communicating with said hollow beam or girder, and a steam jet or injector for causing a flow of air and steam into and through said pipe and into the girder, substantially as specified.



6. The combination, in a grate for furnaces, of the hollow inclined grate-bars having tuyere-openings in their fuel-supporting faces, the hollow beam or girder serving as a support for said bars and communicating with the interiors of the same, means for forcing air into said hollow beam or girder, and a perforated air-distributer in front of said girder, substantially as specified.

7. The within-described grate for furnaces, said grate consisting of hollow inclined bars, each of which has a series of tuyere-openings in the inclined fuel-supporting face of the bar, and an automatic ash-discharger located adjacent to the bases of said hollow inclined bars, substantially as specified.

480,539. SUPPORT FOR ELECTRIC-ARC LAMPS. AUGUSTUS WRIGHT, Providence, R. I., assignor to the Hope Electric Appliance Company, same place. Filed Apr. 27, 1891. Serial No. 390,562. (No model.)



Claim.—1. The combination, with the mast 6, having the capstan-case 20 and a capstan journaled therein and operated by the crank 24, the tackle 8, provided with the stop 30 and weight 29, adapted to be wound on and unwound from said capstan and a tubular

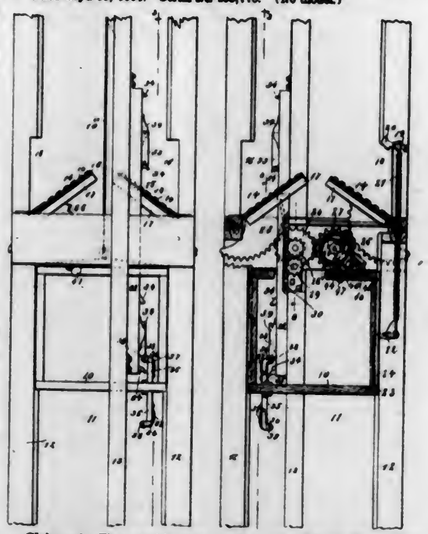
mast-arm 10, rigidly secured to said mast and provided at its outer end with a pulley 12 to support the tackle 8, of the rigid tubular lamp-stay 16, pivotally secured to the mast 6, the local conductor-wires contained therein, and the lamp 17, secured to the outer end of said stay and supported by the tackle 8, as described.

2. In a support for electric lamps, the combination, with the mast 6 and the tubular mast-arm 10, secured thereto by means of the socketed bracket 10', the guy-rods 11 11, secured at their outer ends to the mast arm and at their inner ends to the mast 6 or to cross-arms on said mast and adapted to hold the mast-arm in place, the pulley 12, journaled between the ends of the strap 12', near the outer end of the mast-arm, and the insulated ears 14 14, secured to the base portion of said mast-arm and connected in the main circuit, of the rigid tubular stay 16, pivotally secured to the mast 6 at its base and carrying contact-blocks 19 19, engaging the ears 14 14 on the mast-arm 10 and connected in the local lamp-circuit contained within said stay, the lamp 17, secured to the outer end of the stay, and the tackle 8, secured to said outer end of the stay 16 and passing over the pulley 12 and through the tubular mast-arm, and adapted to be operated as described.

480,540. BUCKLE. GEORGE R. ADAMS, Providence, R. I. Filed Nov. 17, 1891. Serial No. 412,165. (No model.)

Claim.—The combination, with the front plate 5, having the bent ends 6 6, carrying the pivots 7 7, bent therefrom, and the back plate 11, having the serrated edge 12 and the bent ends 13 13, provided with perforations 14 14, adapted to receive said pivots 7 7, of the spring-tongue 8, formed integrally with the front plate and having the shoulders 9 9 and thumb-plate 10, and a cast-off 16, formed from sheet metal in the shape of a flat box, having the cut-out portion 16', lips 17 17, adapted to receive the shoulders 9 9, and the round guide-bar 18, as and for the purpose described.

480,541. DRAWING-PEN. FERDINAND A. ALTENDER, Philadelphia, Pa. Filed May 16, 1892. Serial No. 433,136. (No model.)



Claim.—1. A drawing-pen having a pivoted blade acted upon by a spring tending to cause said pivoted blade to approach the other blade, but permitting the free separation of the blades, and a set-screw carried by one blade and having a bearing upon the other for limiting the approach of the blades, substantially as specified.

2. A drawing-pen having a fixed blade and a pivoted blade free to move away from the fixed blade, a spring acting upon said pivoted blade at a point beyond the fulcrum, so as to tend to move the point of the blade toward that of the fixed blade, and a set-screw carried by one blade and having a bearing upon the other for limiting such approach, substantially as specified.

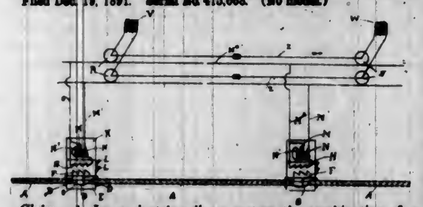
3. A drawing-pen having a fixed blade with longitudinal slot, a pivoted blade free to move away from the fixed blade, a spring carried by said fixed blade, adapted to the slot of the same and acting upon the pivoted blade so as to close the same, and a set-screw carried by one blade and having a bearing upon the other, so as to limit the approach of the blades, substantially as specified.

480,542. ELEVATOR. WILLIAM H. ANDERSON, San Rafael, Cal. Filed Sept. 15, 1891. Serial No. 405,773. (No model.)

Claim.—1. The combination, with a vertically-swinging door adapted to swing across an elevator-well and having a segmental rack, of vertically-sliding rack-bars extending above and below the door at its hinged edge and both geared to its segmental rack, a block projecting from one rack-bar above the door, a block projecting from the other rack below the door, and a latch for each rack-block, both mounted at the same side of the elevator-cage, whereby one rack will open the door when the cage ascends and the other open it as the cage descends, substantially as set forth.

2. The combination, with a vertically-swinging door adapted to swing across an elevator-shaft and having a segmental rack, of vertically-sliding rack-bars extending in the raceway above and below the hinged edge of the door and both geared to its segmental rack, blocks projecting, respectively, from the upper end of one rack and from the lower end of the other rack, a latch for each rack-bar, both mounted on the same side of the cage, and rounded steps on the raceway to release the latches from the block, substantially as set forth.

3. An apparatus of the character described, comprising vertically-swinging doors adapted to close the elevator-well and having segmental racks on the under side, sliding racks held to move in a vertical raceway in the elevator-well and connected by a gear mechanism with the door-racks, said sliding racks having projecting blocks, as described, bent arms secured to the elevator-cage and provided with spring-pressed latches arranged in the path of the blocks on the sliding racks, said latches having rollers on one side, and rounded steps secured to the raceway in the path of the rollers, substantially as described.



4. The combination, with the sliding racks connected with the doors, as described, and provided with projecting blocks, of cam-hooks

pivoted adjacent to the blocks and adapted to engage pins thereon, and latches secured to the elevator-cage and arranged in the path of the hooks, substantially as described.

5. The combination, with the swinging doors and the vertically-moving cage having a spring-pressed block thereon, of a spring-pressed catch pivoted on the side of the well and adapted to engage an open door, and a latch having a spring connection with the catch and arranged to project into the path of the spring-pressed block on the cage, substantially as described.

6. The combination, with the swinging doors having segmental racks thereon and the gear-wheels connecting the racks, of a drum loosely mounted on one of the gear-wheels, a pawl-and-ratchet-wheel connection between the drum and the gear-wheel, and an adjustable friction-strap mounted on the drum, substantially as described.

480,543. ELECTRIC RAILWAY. FRANCIS B. BADT, Chicago, Ill., assignor of two-fifths to Lester B. Hills and A. M. Searles, same place. Filed Dec. 19, 1891. Serial No. 415,668. (No model.)

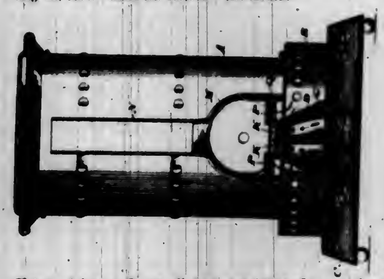
Claim.—1. In an electric-railway system, the combination of exposed conductor-rails arranged in sections and adapted to be brought into circuit with the moving motor with insulated main conductors, a series of converters, each having a primary coil permanent in the main circuit and a secondary coil having a part circuit terminating at each end in one exposed rail said part circuit normally open, and devices to close the same on the approach of the car, said devices including a permanently-closed conductor between the rails with which the ends of such part circuits are connected.

2. In an electric railway system, the combination of exposed conductor-rails arranged in sections and adapted to be brought into circuit with the moving motor with insulated main conductors, a series of converters, each having a primary coil permanently in the main circuit and a secondary coil having a part circuit terminating at each end in one exposed rail, said part circuit normally open and devices to close the same on the approach of the car, said devices comprising a permanently-closed conductor between the rails with which the ends of such part circuits are connected, and an electro-magnet or solenoid about which such conductor passes.

3. In an electric-railway system, the combination of exposed conductor-rails arranged in sections and adapted to be brought into circuit with a moving motor with insulated main conductors, and a series of converters, each having a primary coil permanently in the main circuit and a secondary coil having a part circuit terminating at each end in one exposed rail, said circuit normally open and devices to close the same on the approach of the car, and fore-and-aft trolleys in multiple and adapted one set to furnish the current which operates such devices associated with the other set.

4. In an electric-railway system, the combination of exposed conductor-rails arranged in section and adapted to be brought into circuit with a moving motor with insulated main conductors, and a series of converters, each having a primary coil permanently in the main circuit and a secondary coil having a part circuit terminating at each end in one exposed rail, said circuit normally open and devices to close the same on the approach of the car, and fore-and-aft trolleys in multiple and adapted the one set to furnish the current which operates such devices associated with the other set, said devices including each a permanently-closed conductor between the two rails with which the ends of the open part circuit are to be controlled are connected.

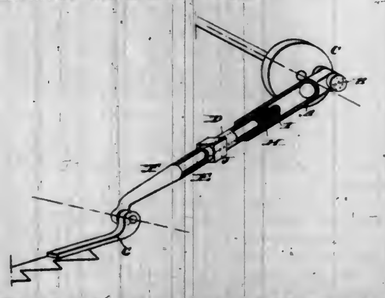
5. In an electric-railway system, the combination of exposed conductor-rails arranged in sections and adapted to be brought into circuit with a moving motor with insulated main conductors, and a series of converters, each having a primary coil permanently in the main circuit and a secondary coil having a part circuit terminating at each end in one exposed rail, said circuit normally open and devices to close the same on the approach of the car, and fore-and-aft trolleys in multiple and adapted one set to furnish the current which operates such devices associated with the other set, the shortest distance between the fore-and aft trolleys being greater than the length of the rail-sections.



6. In an electric-railway system, the combination of an insulating high-tension-current system permanently including the primary coils of successive converters, with local low-tension part circuits normally open and including each the secondary of one converter and terminating in the partially-insulated but exposed sectional conductors from which the moving motor derives its current and a switch in each of such local circuits, and fore and aft trolleys arranged in sets, each set adapted to supply current to close the switch and thus close the local circuit for the time being, associated with the other set and also to supply current to the motor to run the car.

7. In an electric-railway system, the combination of high-tension-current mains with converters whose primary coils are permanently in circuit, exposed sectional conductors with which the motor on the car is adapted to be connected, local part circuits whose terminals are opposite rails, one of such local circuits normally broken and containing the converter secondary coil and the other permanently closed, and means connected with the latter to close the former responsive to a current delivered from the car.

8. In an electric-railway system, the combination of high-tension-current mains with a series of primary converter-coils in multiple therewith, a series of exposed sectional conductors arranged in sets, the secondary coil of each converter connected in multiple with one set of rails by a normally-broken local part circuit, a motor on the moving car, trolleys on such car in multiple and adapted to simultaneously engage the rails of a set, and means operated from the car to close such local circuit.

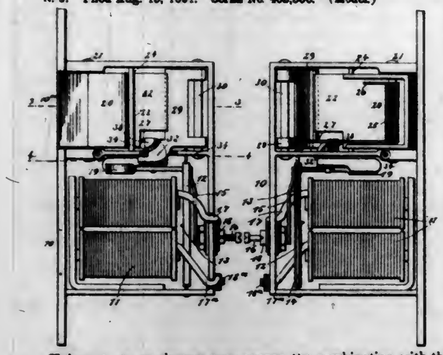


9. In an electric-railway system, underground insulated high-tension mains, a triple compartment-box through one compartment of which said mains pass, converter-coils in the second compartment, and a local circuit-switch mechanism in the third compartment, suitable conductors connecting the elements in the various compartments, and two conductors leading, respectively, to the conductors from which the motor on the car receives its current.

480,544. OIL-STOVE. DAVID BAILEY, Philadelphia, Pa. Filed Aug. 22, 1891. Serial No. 403,363. (No model.)

Claim.—A burner for an oil-stove, consisting of a central vertical wick-tube, side wick-tubes converging toward said central tube, perforated diaphragms interposed between the upper portions of said wick-tubes, said wick-tubes having vertical deflectors L projecting above the sides thereof, a chamber closing over said burner, horizontally-disposed deflectors P at the base of and projecting inwardly from the sides of said chamber, and perforated plates Q directly below and separated from said deflectors P, said parts being combined substantially as described.

480,545. PITMAN. PHILIP Y. BARBER, Sharp's Wharf, Va. Filed Apr. 23, 1892. Serial No. 430,349. (No model.)



Claim.—1. A pitman comprising a head pivotally connected with the actuating crank-disk, a sleeve or tube screwing in the free end of the said head, a rod pivotally connected with the device to be driven and formed with a reduced part extending through the said sleeve, and a nut engaging the outer end of the said reduced part and abutting

against the said sleeve to hold the rod in position on the sleeve, but permit of its turning thereon, substantially as shown and described.

2. A pitman comprising a head pivotally connected with the actuating crank-disk, a sleeve or tube screwing in the free end of the said head, a rod pivotally connected with the device to be driven and formed with a reduced part extending through the said sleeve, a nut engaging the outer end of the said reduced part and abutting against the said sleeve to hold the rod in position on the sleeve, but permit of its turning thereon, and a key for locking the said nut in position, substantially as shown and described.

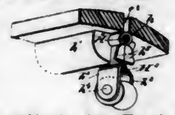
480,546. ELECTRIC DOOR-OPENER. LOUIS BATES, Jersey City, N. J. Filed Aug. 13, 1891. Serial No. 402,530. (Model.)

Claim.—1. In an electric door-opener, the combination, with the spring-pressed main latch, a spring-pressed locking-pawl arranged to engage a notch in the inner end of the latch, the electro-magnets, the vibratory armature, and the hammer secured thereto, of a bent releasing latch pivoted in the case, said latch having one end arranged in the path of the hammer and the opposite end adapted to release the locking-pawl and hold it out of engagement with the main latch, substantially as described.

2. The combination, with the spring-pressed main latch, the spring-pressed locking-pawl adapted to engage the inner end of the same, said pawl having a projecting arm with an inclined end, the electro magnets, the vibratory armature, and the hammer secured to the armature, of the releasing latch pivoted in the case, said latch having one arm extending into the path of the hammer and the opposite arm provided with a shoulder arranged to engage the inclined end of the locking-pawl arm and hold said pawl out of engagement, substantially as described.

3. The combination, with the main latch having an extended end with a notch therein and a locking-pawl adapted to engage the notched end of the main latch, of a spring coiled around the main latch-pivot, one end of the spring pressing against the main latch and the opposite end engaging a lug on the locking-pawl, substantially as described.

480,547. COMBINED PENCIL SHARPENER AND HOLDER. JOSEPH W. BATTELLE, Worcester, Mass. Filed Apr. 8, 1892. Serial No. 428,299. (No model.)



Claim.—1. The pencil-supporter consisting of the parts A and B, fastened together, the part A having the rims a, a', and a^2, and the part B having the rims b, b', and b^2, whereby two cups or receptacles and holes D and D' will be left in the completed structure, substantially as described.

2. The combination of a pencil supporter or holder and a pencil-sharpener housed and protected therein, substantially as described.

3. The combination of a suitable casing and a pencil-sharpener housed therein, said sharpener having a knife, as H, the cutting-edge of which is circular, as at h, whereby a clear space, as h^2, will be left for the leads, substantially as described.

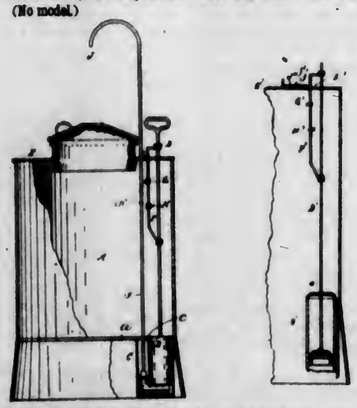
4. The combination of a suitable casing and a pencil-sharpener housed therein, said sharpener having a knife H, having slots h', screws m, and washers n, holding the said knife in place, said knife having a circular cutting-edge h, whereby a space h^2 will be left for the leads, substantially as described.

480,548. VENETIAN BLIND. JAMES K. BENWAY, Albany, N. Y., assignor to the Albany Venetian Blind Company, same place. Filed Nov. 24, 1891. Serial No. 412,975. (No model.)

Claim.—1. The combination, in a Venetian blind, of a top bar, slats suspended from said bar and operating-cords for the slats, the bar being formed with recesses in its under side, and pulleys for the operating-cords, the hangers of the pulleys being pivotally suspended from the bar within the recesses therein and having its shank provided with wings projecting at right angles thereto, substantially as described.

2. The combination, in a Venetian blind, of a top bar, slats suspended therefrom and operating-cords for the slats, the said bar having transverse recesses in its under side and intersecting longitudinal recesses in its upper side, hangers carrying pulleys for the operating-cords, the hangers having wings thereon for the purpose specified, and securing devices for said hangers, substantially as described.

3. As a new article of manufacture, a pulley for the cords of Venetian blinds, the hanger of the pulley having an eye at its upper end adapted to receive a pivot-pin for pivotally suspending the pulley, and a guard-wing below the eye, said wing ranging at right angles to the axis of the eye, substantially as and for the purpose specified.



480,549. PHOSPHATE-SEPARATOR AND SCREEN-WASHER. GEORGE R. BOAR, Tampa, Fla. Filed Aug. 25, 1891. Serial No. 403,700. (No model.)

Claim.—1. In a phosphate-separator and washer, the primary screen G at the receiving end of the screen E and the closed chute F', surrounding said screen G, said chute F' and said screen G being conical in reverse order, in combination with the converging buckets H, with the hood H' thereover at the discharge end of said screen E, substantially as described.

2. A phosphate-separator and washer consisting of the screen E, the water-tank A, into which it dips, and the conveyer M in said tank, the primary screen G at the receiving end of the screen E, and the closed chute F', surrounding said screen G, said chute F' and said screen G being conical in reverse order, and the converging buckets H, with the hood H' thereover at the discharge end of said screen E, said parts being combined substantially as described.

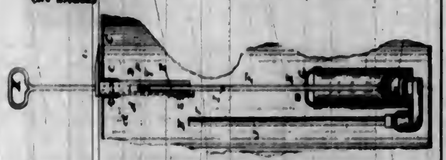
480,550. MEASURING-PUMP. SYLVANUS F. BOWSER and AUGUSTUS BOWSER, Fort Wayne, Ind. Filed May 2, 1892. Serial No. 431,416. (No model.)

Claim.—1. In a measuring-pump, the combination, with a tank, a

pump therein whose rod passes through the tank, and a delivery-spout, of a gage-rod also passing through the tank, its body standing parallel with the pump-rod and its ends being cranked and connected with said pump-rod, and adjustable collars on the pump-rod against the ends of the gage-rod, substantially as and for the purpose set forth.

2. In a measuring-pump, the combination, with a tank, a pump therein whose rod passes through the top of the tank, and a delivery spout, of a gage-rod whose body stands parallel with the pump-rod and passes through a hole in said top and whose ends are connected with said pump-rod, and stops on said gage-rod respectively adapted to pass through the gage-rod hole and to strike under said top, as and for the purpose set forth.

3. In a measuring-pump, the combination, with a tank, a pump communicating therewith and whose rod passes through the top of the tank, and a delivery-spout, of a gage-rod secured to said pump-rod parallel therewith, an upper stop on said gage-rod, the top of the tank having a hole through which this rod and stop may move, means, substantially as described, for preventing the passage of this stop therethrough, and a lower stop arranged so as not to pass through said hole, as and for the purpose set forth.



4. In a measuring-pump, the combination, with a tank having in its top a hole and adjacent thereto a curved slot struck around said hole and having a radial extension at one extremity, a pump communicating with said tank and whose rod passes through said hole, and a delivery-spout, of a gage-rod secured to said pump-rod and moving longitudinally through said slot and two stops on said gage-rod, the uppermost being radial to the pump-rod and adapted to pass through the extension, as and for the purpose set forth.

5. In a measuring pump, the combination, with a tank having in its top a hole and adjacent thereto a curved slot struck around said hole and having a radial extension at one extremity, a pump communicating with said tank and whose rod is square and passes loosely through said hole, and a delivery-spout, of a gage-rod having cranked ends secured to the pump-rod so as not to turn thereon, its body being parallel with said pump rod and moving through said slot, and two stops on the gage-rod, the uppermost being adapted and the lowermost not adapted to pass through said extension, as and for the purpose set forth.

6. In a measuring-pump, the combination, with the tank having in its top two holes, a slide mounted on said top and adapted to partially close one hole, a pump communicating with the tank and having a delivery-spout, and a pump-rod passing through the unimpeded hole, of a gage-rod connected with the pump rod and passing through the remaining hole, and two stops thereon, the uppermost one being adapted to pass through the gage-rod hole when the slide is retracted, but the lowermost one not being adapted to pass through said hole, as and for the purpose set forth.

7. In a measuring-pump, the combination, with a tank having in its top a hole and adjacent thereto a curved slot struck around the hole and having an extension at one extremity, a pump communicating with the tank and whose rod passes loosely through said hole, and a delivery-spout, of a gage-rod secured at its ends to the pump-rod, so as to turn therewith, its body moving in said slot, two stops on said gage-rod, and means, substantially as described, for preventing the uppermost stop from passing through said extension, as and for the purpose hereinbefore set forth.

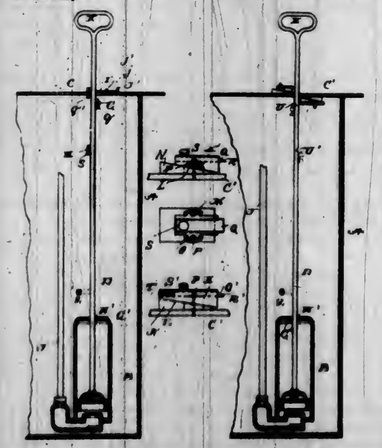
480,551. MEASURING-PUMP. SYLVANUS F. BOWSER and AUGUSTUS BOWSER, Fort Wayne, Ind. Filed May 2, 1892. Serial No. 431,417. (No model.)

Claim.—1. The combination, with a pump having a stop on its pump-rod, of a tube surrounding said rod and having a recess adapted to receive said stop and means, substantially as described, for adjusting the rod and tube relatively, as and for the purpose set forth.

2. The combination, with a reciprocating pump having a stop on its pump-rod, of a tube surrounding said rod and having a slot in one side open at its lower end and adapted to receive said stop and means, substantially as described, for adjusting the rod and tube relatively and axially to each other, as and for the purpose set forth.

3. In a measuring-pump, the combination, with a tank having a scale on its top, a pump within said tank, having a delivery-spout, the pump-rod leading through said top, and a stop on said rod, of a tube carried by the top and surrounding the rod, the tube being slotted at its lower end to receive the stop, means, substantially as described, for adjusting the rod and tube relatively and axially to each other, and an index carried by the moving part and operating in conjunction with said scale, as and for the purpose set forth.

4. The combination, with a reciprocating pump having a stop on its rod, of a tube surrounding said rod and having a slot in one side open at its lower end and adapted to receive said stop, an angle-iron secured at the upper end of said slot, a set-screw therethrough, a second set-screw in the side of the tube, and a second angle-iron having a slot taking under the head of this set-screw, all as and for the purpose set forth.



5. The combination, with a reciprocating rod having a stop, of a tube having a slot in which said stop may pass or against whose lower end it may strike, means, substantially as described, for turning the rod and tube relatively and axially, and set-screws and angle-irons at the upper end of the slot and at the lower end of the tube, as and for the purpose set forth.

6. In a measuring pump, the combination, with a tank having a collar depending from its top and a scale marked on said top, a tube supported and turning in said collar and having a slot in its lower end, and an index secured to said tube and moving over the scale, of a pump within the tank, having a delivery-spout, the pump-rod passing through said tube, means for preventing the turning of the rod, and a stop secured to said rod, as and for purpose set forth.

7. In a measuring-pump, the combination, with a tank having a collar depending from its top and a scale marked on said top, a set-screw through said collar, a tube swiveled in the collar and having an exterior groove engaged by the tip of said set-screw, the body of the tube being slotted at its lower end, and an index secured to the tube and moving over said scale, of a pump within the tank, having a delivery-spout, the pump-rod passing through the tube, means for preventing the turning of said rod, and a stop on the rod, as and for the purpose set forth.

8. In a measuring-pump, the combination, with a tank having a scale marked on its top, a tube swiveled in said top and having a slot in its lower end, and an index secured to the tube and moving over said scale, of a pump within the tank, having an angular pump-rod moving through said tube, a stop on said rod, and a cross-bar on the pump-cylinder, having a hole closely fitting said rod, all as and for the purpose hereinbefore set forth.

480,552. MEASURING-PUMP. SYLVANUS F. BOWSER and AUGUSTUS BOWSER, Fort Wayne, Ind. Filed May 2, 1892. Serial No. 431,418. (No model.)

Claim.—1. The combination, with a pump having a reciprocating pump-rod, a lug on the rod, and a set-screw through the lug, of a contact in the path of said screw, as and for the purpose set forth.

2. The combination, with a pump having a reciprocating pump-rod, a lug on the rod, and a set-screw through the lug, of a contact in the path of the screw, and means, substantially as described, for adjusting said contact longitudinally of the rod, as and for the purpose set forth.

3. The combination, with a tank-top, a pump whose rod reciprocates through said top, a stop at one side of the rod, and a slide on the exterior of the top adapted to engage said stop or not at will, of a lug on the opposite side of said rod, a set-screw therethrough, a

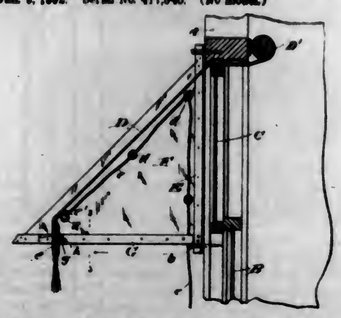
contact in the path of this screw, and means, substantially as described, for adjusting said contact longitudinally of the rod, as and for the purpose set forth.

4. The combination, with a reciprocating rod having a stop and a plate through which said rod moves, of a contact carried by said plate, and means, substantially as described, for adjusting said contact longitudinally of the rod, as and for the purpose set forth.

5. The combination, with a reciprocating rod having a stop and a plate through which said rod moves, of a slide carried by the plate, and independent means, substantially as described, for adjusting said slide longitudinally of the rod and for moving it at right angles thereto, as and for the purposes set forth.

6. The combination, with a reciprocating rod having a stop and a plate through which said rod moves, of a casing, a spring-actuated slide therein normally engaging said stop, and means, substantially as described, for adjusting the casing on the plate longitudinally of the rod, as and for the purpose set forth.

7. The combination of a reciprocating rod having a stop and a plate through which said rod moves, with a casing having a beveled lower face, a wedge between the said face and the plate, means, substantially as described, for detachably securing the casing to the plate, and a slide in the casing adapted to engage said stop, as and for the purpose set forth.



8. The combination, with a reciprocating rod having a stop and a stationary support, of a casing having a beveled lower face and perforated ears at its sides, a slide moving in the casing at right angles to the rod and adapted to engage said stop, a wedge between the support and said lower face of the casing, said wedge having slots aligning with the perforations in the ears, and screws through the ears and perforations and into the support, as and for the purpose set forth.

9. The combination, with a reciprocating rod having stops on opposite sides at different points, and a plate through which said rod moves, of a casing above said plate, a slide therein adapted to be moved to engage the uppermost stop, a casing below said plate, a spring-actuated slide therein adapted to engage the lowermost stop, and means, substantially as described, for adjusting each of said casings longitudinally of the rod, as and for the purpose set forth.

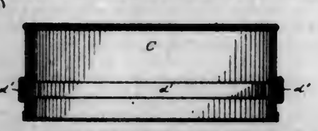
10. In a measuring-pump, the combination, with a tank having a hole in its top, a pump within said tank having a delivery-spout and whose pump-rod passes through said hole, a lug on said rod, and an upwardly-facing set-screw through said lug, of a casing within said tank, a spring-actuated slide in the casing standing normally in the path of said screw, and means, substantially as described, for detachably connecting said casing to the top of the tank and for permitting its adjustment longitudinally of the rod, as and for the purpose set forth.

11. In a measuring-pump, the combination, with a tank having a hole in its top, a pump within said tank having a delivery-spout and whose pump-rod passes through said hole, a lug on said rod, and an upwardly-facing set-screw through said lug, of a casing within the tank having a beveled face, a spring-actuated slide within said casing standing normally in the path of said screw, a wedge between said face and the under side of said top, and screws detachably connecting said casing with the top, all as and for the purposes hereinbefore set forth.

480,553. AWNING. BERNARD BRANNER, New York, N. Y. Filed Jan. 6, 1892. Serial No. 417,840. (No model.)

Claim.—1. The combination, with a window shade or awning, of two triangular wings of flexible material, each provided with a stretcher-rod secured to the lower edge of the wings, means to connect the upright edges of the wings to the window-casement, and a hook extended from each stretcher-rod at its outer end and adapted to interlock with a staple or screw-eye projected from the lower part of the awning, substantially as described.

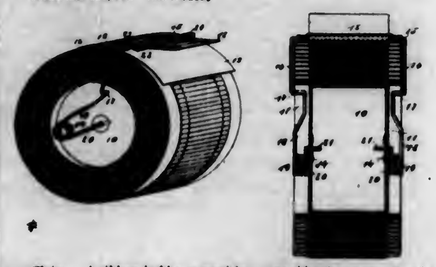
2. The combination, with a shade or awning, of two wing-supporting frames, each comprising an upright stay-rod, and a stretcher-rod hinged by one end to the stay-rod, said rods being each composed of two strips secured together longitudinally with the flexible wing material between them, substantially as described.



3. The combination, with a shade or awning, of two wing-pieces, each triangular in form, supported on a frame comprising an upright stay-rod, and a stretcher-rod secured by a rule-hinge joint to the stay-rod, said rods being each composed of two strips which embrace the folded edges of the fibrous wing material, which edges have each a cord laid in the fold that engages with the exterior sides of the composite rods, substantially as described.

4. The combination, in an awning, of a top shade or awning, separate side wings, stretcher-bars secured to the lower ends of the separate side wings and adapted to fold upwardly and raise the wings, and means for engaging the stretcher-bars with the top shade when the said bars and shade are in the lowered position, substantially as described.

480,554. BLEACHING COMPOUND. WILLIAM R. BRITTINGHAM, New York, N. Y. Filed Apr. 27, 1892. Serial No. 430,889. (No specimens.) Patented in Belgium May 11, 1892, No. 75,304.

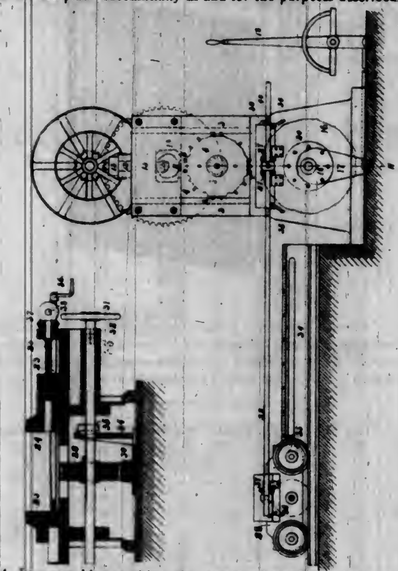


Claim.—A bleaching compound consisting of the tungstate of an alkali combined with a hypochlorite.

480,555. PAIL, PAN, WASH-BOILER, &c. TRISTRAM D. BROWN, Clifton Springs, N. Y. Filed Feb. 27, 1890. Serial No. 342,010. (No model.)

Claim.—As an improved article of manufacture, a pan or other vessel having its perpendicular sides provided with a continuous loop or made full and bent to form continuous parallel flanges or creased edges all in one perpendicular piece and an intermediate continuous zinc plate or strip in said groove or recess and having its edges secured by said flanged or creased edges, whereby it is held rigid in said groove or recess, substantially as set forth.

480,556. RIBBON-HOLDER. GEORGE H. BROWN, Long Island City, N. Y., assignor to James H. Tibbits, same place. Filed Nov. 6, 1891. Serial No. 411,082. (No model.)



Claim.—A ribbon-holder comprising a spool having recessed ends, a main keeper extending across the face of the spool, the said keeper having arms extending across the ends of the spool, which arms are formed into spiral springs and having bent ends pivoted in the spool ends, and a guide-keeper secured to the main keeper opposite the face of the spool substantially as described.

480,557. MULTIPLE-PUNCH AND LAYING-OUT MACHINE. CYRUS E. BROWN, Homestead, Pa. Filed Apr. 7, 1892. Serial No. 428,129. (No model.)

Claim.—1. In a punching-machine, a reciprocatory pivoted wheel carrying a series of punches upon its periphery, a second reciprocatory wheel having a corresponding peripheral series of apertures, and means for turning the apertured wheel to any desired position and retaining it in such position while the punch-wheel reciprocates, substantially as and for the purposes described.

2. In a punching-machine, a reciprocating pivoted wheel carrying the punches, a vertically movable wheel having an apertured periphery, means for retaining said wheel in the different positions to which it may be turned, and a bed-plate having a vise mounted thereon, substantially as and for the purposes described.

3. In a punching-machine, a reciprocating wheel carrying punches, a bed-plate, a wheel having apertures in its periphery, movable in a slot in the bed-plate, and a movable carriage carrying a vise in line with the bed-plate substantially as and for the purposes described.

4. In a punching-machine, the combination of a reciprocating punch or punches, a pivoted wheel having a series of apertures in its periphery, means for retaining said wheel in the various positions to which it may be turned, and a cam-shaft arranged to raise and lower said wheel, substantially as and for the purposes described.

5. The combination, with a punching-machine, of two carriages in line with the bed-plate of the machine, a vise upon the bed-plate, vises upon the carriages, and means for adjusting the vises in the direction of their length, substantially as described.

6. The combination, with a punching-machine, of a movable carriage in line with the bed-plate of the machine, a vise upon the carriage, and a stationary scale along which the carriage moves, substantially as described.

7. The combination, with a punching machine whose bed-plate is provided with a vise, of a movable carriage carrying a vise in line with the bed-plate of the machine and a rack-and-pinion connection for moving the same, substantially as and for the purposes described.

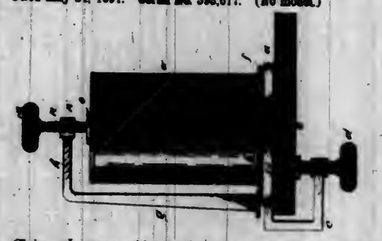
8. The combination, with the plate having a rigid vise-jaw therein, of a jaw movably mounted thereon and a head-wheel arranged to cause the vise to reciprocate as a whole, substantially as and for the purposes described.

9. The combination, with the bed-plate provided with a movable vise, of a movable carriage provided with a similar vise and a shaft arranged to reciprocate both vises simultaneously, substantially as and for the purposes described.

10. The combination, with the bed-plate and movable vise thereon of a pointer attached to the vise and movable over a scale upon the bed-plate, substantially as described.

11. The combination, with the movable carriage, of a pointer mounted thereon, a scale arranged to be traversed by the pointer, a rack-and-pinion connection for the carriage, and a strap arranged to secure the carriage in its adjusted positions, substantially as and for purposes described.

12. The combination, with a punching-machine, of two carriages in line with its bed-plate, vises upon the carriages, and means for simultaneously adjusting said vises in the direction of their length substantially as and for the purposes described.



13. The combination, with a punching-machine, of two carriages in line with its bed-plate, vises upon the carriages and bed-plate, and means for simultaneously adjusting said vises in the direction of their length, substantially as and for the purposes described.

480,558. CENTERING DEVICE. FREDRICK L. CARHAM, Lisbon Falls, Me. Filed Dec. 14, 1891. Serial No. 414,965. (No model.)

Claim.—The combination, with the slotted frame B, of the adjustable head D, mounted thereon, the center E, fixed in said head, the spring G, coiled on the center, and the funnel F, adapted to slide on the latter, the fixed head J, the center I, sliding through it, the lever L, pivoted to the outer end of the center I, the spring K, and the sliding funnel H, mounted on such sliding center, all as shown and described, to operate as and for the purpose specified.

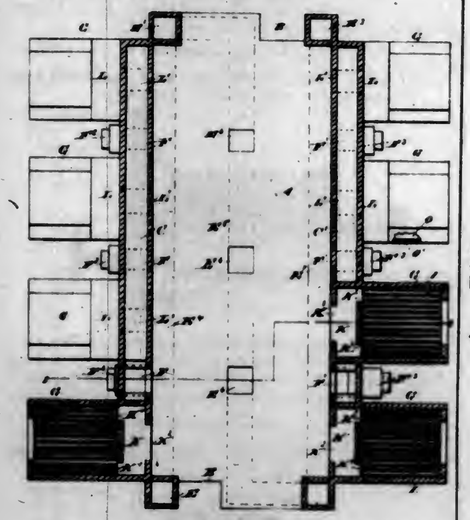
480,559. CAN-SOLDERING CLAMP. ROLLIN CLARK, Keokuk, Iowa. Filed May 21, 1891. Serial No. 393,617. (No model.)

Claim.—In a can-soldering device, a can-holder provided with a disk at its lower end and a clamping-screw at its upper end, said disk being provided with a recess in its bottom, in combination with a clamp provided with a pivot adapted to enter said recess, substantially as described.

480,560. TICKET-PUNCH. ARTHUR W. COFFIN, San Francisco, Cal. Filed Apr. 19, 1892. Serial No. 429,784. (No model.)

Claim.—1. In a ticket-punch, an exterior case adapted to contain tickets which are coiled therein, a horizontal rotating carrier contained within the case, punches the shanks of which pass through the upper disk of the carrier, said shanks projecting above the upper disk, and a segmental housing E, inclosing the rear portion of the carrier, projecting above the surface of the cover, and exposing the punch-shanks at the front, substantially as herein described.

2. In a ticket-punch, the exterior casing, with its hinged cover, a revolving carrier rotatable within the casing, the punches carried thereby, a toothed flange around the periphery of the carrier, a shaft journaled in the side of the case, having the pinion engaging the teeth of the carrier, and a milled head F upon the outer end, whereby the carrier is rotated to bring either of the punches into position, substantially as herein described.



3. In a ticket-punch, the exterior case and hinged cover, a carrier rotatable within the case and provided with punches, projecting jaws extending outwardly from the front end of the punch-case, and the cover between which the tickets pass from the punches, and an opening I through the jaws by which the tickets may be grasped by the thumb and finger and drawn forward from the case through the jaws, substantially as herein described.

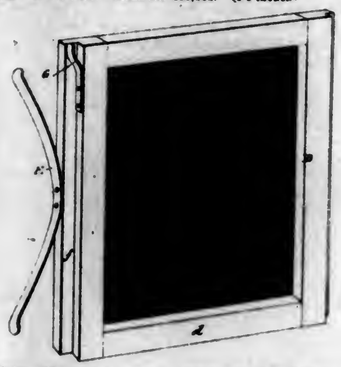
4. In a ticket-punch, the case, the rotatary carrier provided with punches, the jaws between which the tickets pass after leaving the punches, consisting of the movable portion projecting from the hinged cover of the box and the stationary portion fixed to the body of the box having the opening I through the two parts for the purpose of grasping and moving the tickets, and the channels K in the lower jaw, whereby the figures imprinted upon the tickets are protected from injury while the ticket is being drawn out of the case, substantially as herein described.

5. In a ticket-punch, the case, the revolving carrier provided with punches, a chamber within which tickets are contained, a hinged cover by which the case may be closed, an inclosed registering-dial, a ratchet connected therewith, an arm projecting so as to be depressed by the cover when the latter is closed and carrying a pawl which engages the teeth of the ratchet so as to revolve the dial one point at each time the cover is closed, substantially as herein described.

6. In a ticket-punch, an exterior case for containing tickets, a rotary carrier beneath which the tickets are advanced to be punched, the punches, a hinged cover to the case, an inclosed registering-dial with a ratchet and pawl, a spring-arm by which the pawl is depressed and the dial is moved forward one point at each closing of the box-cover, in combination with a stop, whereby the dial is prevented from making more than a single rotation, substantially as herein described.

480,561. BRICK-KILN. SIMON DEWHIRST, St. Joseph, Mo. Filed Mar. 16, 1892. Serial No. 425,156. (No model.)

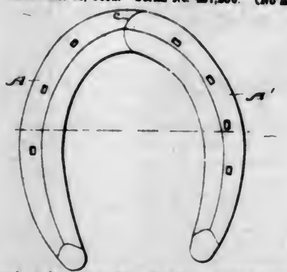
Claim.—1. A brick-kiln provided in its side walls with a series of combustion-chambers opening into the interior of the kiln above the floor thereof, in combination with a series of furnaces located on the outside of the kiln, each furnace being connected with one of the said combustion-chambers and provided with a second combustion-chamber opening into the interior of the kiln above the first-named combustion-chambers, substantially as shown and described.



2. A brick-kiln provided in its side walls with combustion-chambers opening into the interior of the kiln above the floor thereof and a series of chimneys connected with each other by longitudinal channels opening into the interior of the kiln-building, in combination with a series of furnaces located on the sides of the kiln and each connected with one of the said combustion-chambers and each provided with a second combustion-chamber opening into the interior of the kiln above the first-named combustion-chambers, substantially as shown and described.

3. A brick-kiln provided in its side walls with combustion-chambers opening into the kiln above the floor thereof, in combination with a series of chimneys arranged at the ends of the said kiln and longitudinal channels connecting the said chimneys with each other and located under the floor of the kiln, each of the said channels being connected with the interior of the kiln, substantially as shown and described.

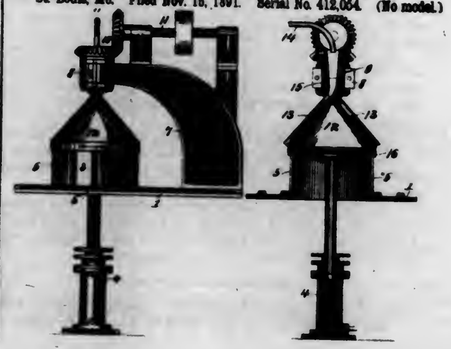
4. A brick-kiln provided with a furnace comprising a fire-box connecting at its inner end with a combustion-chamber, a second combustion-chamber connected with the upper end of the said fire-box and connected near its upper end with the interior of the kiln, compartments arranged on the sides of the said second combustion-chamber and connected with the interior thereof by openings, and transversely-extending channels connected with the outer air and with the said compartments and the fire-box, substantially as shown and described.



5. A brick-kiln provided with a furnace comprising a fire-box connecting at its inner end with a combustion-chamber, a second combustion-chamber connected with the upper end of the said fire-box and connected near its upper end with the interior of the kiln, compartments arranged on the sides of the said second combustion-chamber and connected with the interior thereof by openings, and transversely-extending channels connected with the outer air and with the said compartments and the fire-box, the said transverse channels being also connected with the first-named combustion-chambers, substantially as shown and described.

480,562. WINDOW-SCREEN. HENRY B. DODGE, Chicago, Ill., assignor to the Monroe Manufacturing and Lumber Company, Lima, Ohio. Filed Oct. 19, 1891. Serial No. 409,162. (No model.)

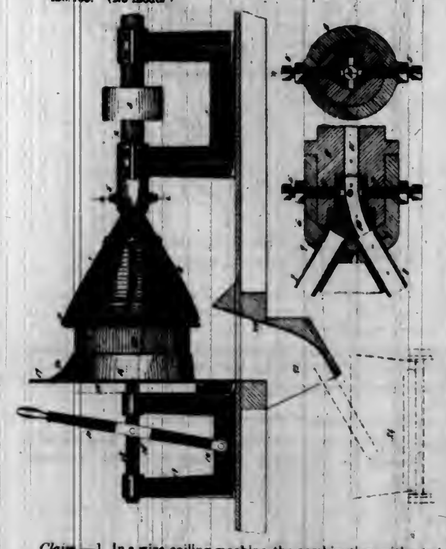
Claim.—The sliding screen D, constructed with vertical rabbets *f* on its opposite sides and inner face and provided with a spring-guard G on the base of the rabbet, and a friction-spring E on the outer or projecting portion of the rabbet, substantially as specified.



480,563. SECTIONAL HORSESHOE. CHARLES H. DORAN, Ocean, N. Y. Filed Mar. 31, 1892. Serial No. 427,236. (No model.)

Claim.—1. A horseshoe formed in two independent sections, the toe end of one section having an arcuate convexity therein and the corresponding end of the other section having an arcuate concavity fitting said convexity, the meeting faces of said sections being also oppositely beveled or inclined, the said sections being free to move upon one another at their point of engagement, substantially as specified.

2. A horseshoe comprising two sections A A', the toe end of one of the sections having an arcuate concavity *c*, the wall of which is inclined from top to bottom, the opposing section terminating at its toe end in an arcuate convexity of the same radius as the concavity, but reversely inclined on its face, said sections being free to move upon one another at their point of engagement, substantially as specified.



480,564. MACHINE FOR COILING WIRE. WILLIAM EDENBORN, St. Louis, Mo. Filed Nov. 16, 1891. Serial No. 412,054. (No model.)

Claim.—1. In a machine for coiling wire, the combination of a cylinder having a closed upper head, a winding-cone supported above the cylinder and fitting over the upper end of the cylinder, and means for moving the cylinder away from the cone, substantially as and for the purpose set forth.

2. In a machine for coiling wire, the combination of a cylinder having a closed upper head, a winding-cone supported above said cylinder and having a depending flange 16, inclosing the upper end of the cylinder, and means for moving the cylinder away from the winding-cone, substantially as and for the purpose explained.

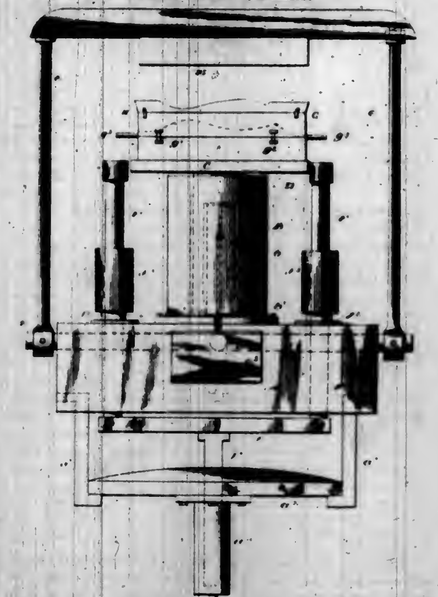
480,565. MACHINE FOR COILING WIRE. WILLIAM EDENBORN, St. Louis, Mo. Filed Dec. 8, 1890. Renewed Feb. 3, 1892. Serial No. 420,183. (No model.)

Claim.—1. In a wire-coiling machine, the combination, with a hollow spindle and the adjustable bushing mounted therein and having an opening for the passage of the wire, of a cap fitting over the end of said spindle and bushing and having the sockets 9 and the removable tubes 8 fitting in said sockets, substantially as set forth.

2. In a wire-coiling machine, the combination, with a hollow spindle and the adjustable bushing mounted in the end thereof and having the opening 10, of the cap 6, fitting over the end of said spindle and bushing and having the sockets 9, the removable tubes 8, fitting in said sockets, and screws passing through said cap and spindle and into said bushing, substantially as set forth.

3. In a wire-coiling machine, the combination, with a hollow spindle and an adjustable perforated bushing mounted therein, of the cap 6, secured to the end of said spindle over said bushing and having the sockets 9, a cone projecting from the end of said cap, and the tubes 8, seated in said sockets 9 and removably secured to said cone, substantially as set forth.

4. In a wire-coiling machine, the combination of a spindle having the passage or bore 11 and a socket in its extreme end of larger diameter than said bore 11, an adjustable bushing fitting in said socket and having the passage 10, and a cap fitting over said bushing and the end of said spindle and carrying the tubes 8, substantially as set forth.



5. In a wire-coiling machine, the combination of a hollow spindle, an adjustable bushing located in the end of the spindle and having an opening for the passage of the wire, screws 5 for holding the bushing to its adjustment, a cone, tubes carried by the cone and through which the wire passes from the bushing, a shiftable cylinder, upon which the wire is coiled, and a stop arranged to crowd the coil from the cylinder, substantially as and for the purpose set forth.

6. In a wire-coiling machine, the combination of a hollow spindle, tubes communicating with the spindle and through which the wires pass, a cone to which the tubes are secured, and brackets 21, secured to the cone at its large end, substantially as and for the purpose set forth.

7. In a wire-coiling machine, the combination of a revolubly-supported hollow spindle, a cone carried by the spindle, and short brackets 21, secured to the periphery of the base of the cone, substantially as and for the purpose set forth.

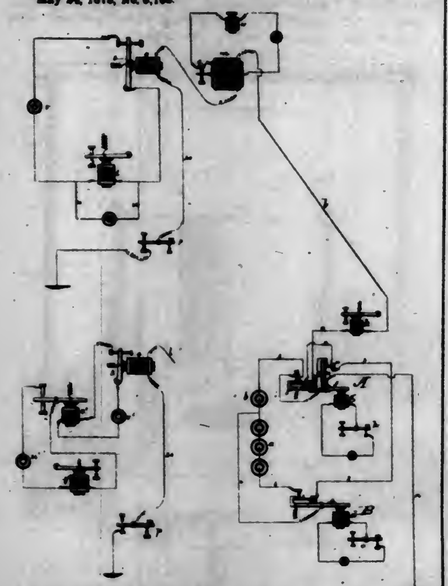
8. In a wire-coiling machine, the combination of a hollow spindle, a cone carried by the spindle, tubes 8 on the periphery of the cone leading from the hollow spindle, and short brackets 21, adjacent to the ends of the tubes 8 at the large end of the cone, substantially as set forth.

480,566. MOLDING-MACHINE. WILLIAM EDGAR, Sanford, Fla., assignor to the Sanford Foundry and Machine Works, same place. Filed Aug. 22, 1891. Serial No. 403,451. (No model.)

Claim.—1. As an improvement in molding-machines, a box or flask having a central horizontal partition carrying the mold-pattern and a sand-box removably secured to said box or flask, the edges of said sand-box having an outline the converse of that of the mold-pattern, substantially as set forth.

2. As an improvement in molding-machines, a two-part box or flask having a central horizontal partition carrying the mold-pattern and a sand-box having lugs or plates hugging the sides of said box or flask, the edges of said sand-box having an outline the converse of that of the mold-pattern, substantially as set forth.

3. As an improvement in molding-machines, a box or flask, a mold-pattern, and a sand-box the upper edges of which have an outline the converse of that of such mold-pattern, substantially as set forth.



4. The herein-described improved molding-machine, comprising a hydraulic cylinder, a piston moving therein, having a base-plate or platform for the mold box or flask, the head-plate, the arms connected thereto, the rock-shaft to which said arms are attached, and the weighted arm or lever secured to said rock-shaft and also connected to and arranged to be operated by a hydraulic piston, substantially as set forth.

5. In a molding machine, the combination, with a base or platform, of the hydraulic cylinder, the piston moving therein, the base-plate or platform connected to said piston, the box or flask designed to rest on said base-plate and having short rods projecting from its ends, the vertically-moving rods for engaging said short rods and elevating the mold box or casing, the boxes or casings secured to said base or platform and inclosing said vertically-movable rods, the sleeves secured to or made with said rods and fitting down over and inclosing said boxes or casings, and means for operating said vertically-movable rods, substantially as set forth.

6. The combination, with a base or platform, of the hydraulic cylinder secured thereto, having a cylindrical piston moving therein, the base-plate or platform connected to said cylindrical piston, the rock-shaft mounted in said base or platform, the head-plate having arms connected to said rock-shaft, the weighted lever rigidly secured to said rock-shaft, the piston connected at one end to said weighted lever, the vertically-movable rods connected at their lower ends by a

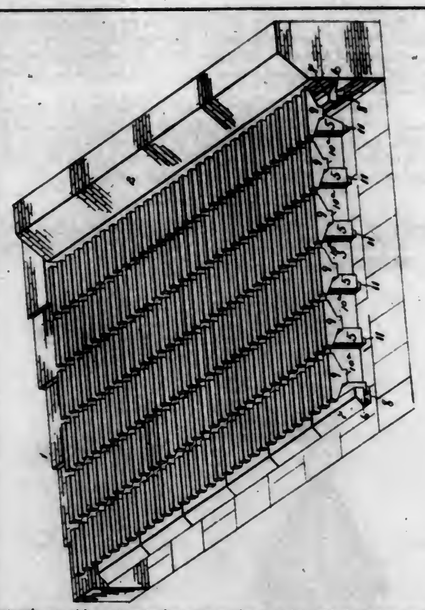
cross-bar, and the piston connected to said cross-bar, substantially as set forth.

480,567. DUPLEX TELEGRAPH. THOMAS A. EDISON, Newark, N. J., assignor, by mesne assignments, to The Western Union Telegraph Company. Patented in England Feb 5, 1875, No. 384; in France Apr. 28, 1875, No. 107,859; in Italy Apr. 30, 1875, Nos. 2,940 and 7,808; in Austria-Hungary June 28, 1875, No. 2,936 and No. 14,584, and in Russia May 24, 1878, No. 2,163.

Claim.—1. The method herein described of transmitting two distinct messages by separate operators over one wire in the same direction and at the same time, one being transmitted by reversal of the battery-current and the other by increasing or decreasing the current from the battery, substantially as described.

2. A receiving instrument or relay *o* in the main-line circuit, in combination with a local relay *o'*, whose electro-magnet is brought into action through the back contact-stop of the main-line relay, and a sounder or other instrument whose electro-magnet is brought into action by means of the local relay *o'*, substantially as and for the purposes set forth.

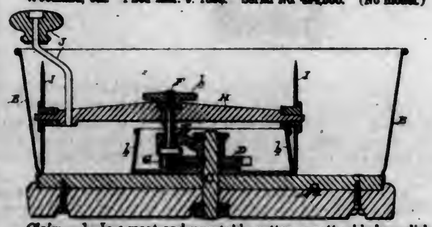
3. The receiving instrument or sounder *t* in the constant battery-circuit *u u*, in combination with the balancing local battery *v*, circuit and circuit-closing armature *s*, and electro-magnet *o*, substantially as set forth.



4. In the duplex telegraph arranged for sending two separate messages simultaneously in the same direction and from the same end, the circuit-breaking key *p* at the receiving end and the tell-tale magnet *k* in the line at the transmitting end, as and for the purposes set forth.

5. In a single-line telegraphic system for the transmission of two independent messages, the combination at one station, substantially as specified, of two independent electrically-connected keys, one for each operator, one of which keys when operated reverses the polarity of the electric current independently of the position and action of the second key, which second key controls the strength of current, substantially as set forth.

480,568. SECTIONAL GRATE-BAR. BYRON A. ELLIOTT, Kansas City, Mo. Filed Apr. 11, 1891. Serial No. 388,566. (No model.)



Claim.—As a new article of manufacture, an adjusting-bar and a series of sections of grates supported by said bar, said sections being

interchangeable and each alternate section capable of being connected with said bar, so that the grates will extend at right angles with the adjoining section, substantially as described, and for the purpose set forth.

480,569. MEAT AND VEGETABLE CUTTER. WILSON R. ELLIS, Woodland, Cal. Filed Mar. 9, 1892. Serial No. 424,336. (No model.)

Claim.—1. In a meat and vegetable cutter, a cutter blade or disk having a revolution about an axis located eccentrically of the block over which the blade or disk travels, said axis itself having an independent movement in a circular path about the block-center, substantially as herein described.

2. In a meat and vegetable cutter, a cutter blade or disk having a revolution about an axis located eccentrically of the block over which the blade or disk travels, said axis itself moving intermittently in a circular path about the block-center, substantially as herein described.

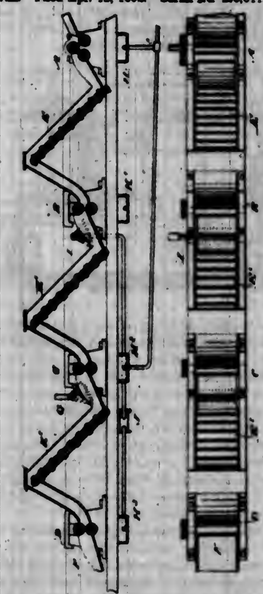
3. In a meat and vegetable cutter, the combination of a block, a cutter blade or disk traveling over said block, an axis located eccentrically of the block and about which the cutter blade or disk revolves, and means for effecting the intermittent travel of said axis in a circular path about the block-center, substantially as herein described.

4. In a meat and vegetable cutter, the combination of a block, a cutter blade or disk traveling over said block, a shaft located eccentrically of the block and to which the cutter blade or disk is connected and about which it revolves, a pinion on the shaft, and a fixed gear in the block-center and with which the pinion engages, whereby the shaft travels around said gear, substantially as herein described.

5. In a meat and vegetable cutter, the combination of a block, a cutter blade or disk traveling over said block, a shaft located eccentrically of the block and to which the cutter blade or disk is connected and about which it revolves, a mutilated pinion on the shaft, and a fixed gear in the block-center with which the mutilated pinion engages, whereby the shaft travels intermittently around said gear, substantially as herein described.

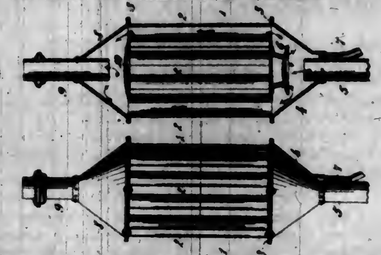
6. In a meat and vegetable cutter, the combination of a block, a cutter blade or disk traveling over the block, a shaft located eccentrically of the block, an arm connecting the shaft with the cutter blade or disk, whereby the latter revolves with the shaft as a center, a fixed gear in the block-center, and a two-toothed pinion on the shaft engaging the gear, said pinion having its teeth extending in line with the arm connecting the cutter blade or disk with the shaft, substantially as herein described.

7. In a meat and vegetable cutter, the combination of a block having a central fixed standard with a gear, a bracket pivoted on said standard, a shaft journaled in the bracket and having a pinion engaging the gear, a cutter blade or disk traveling over the block, and an arm connecting the blade or disk with the shaft, substantially as herein described.



8. In a meat and vegetable cutter, the combination of a block having a central fixed standard with a gear, a bracket pivoted on said standard, a shaft journaled in the bracket, a cutter blade or disk, an arm connecting it with the shaft, and a two-toothed pinion on the shaft engaging the gear, said pinion having its teeth in line with the arm carrying the cutter blade or disk, substantially as herein described.

480,570. TOBACCO-PIPE. THOMAS T. ELY, West Paris, Me. Filed July 15, 1891. Serial No. 399,625. (No model.)



Claim.—As an improved article of manufacture, a tobacco-holder for pipes, having a series of internal struck-up projections near its outer end, apertures being formed through the holder by thus striking up said projections, and a spring-pressed follower within the holder and limited in its outward movement by said projections, substantially as set forth.

480,571. DIFFUSION APPARATUS. SAMUEL FARGO, Pahala, Kau, Hawaii. Filed Apr. 12, 1892. Serial No. 428,811. (No model.)

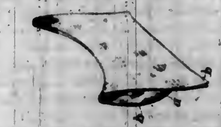
Claim.—In a cane-juice-extracting apparatus of the character hereinbefore described, the combination, with the series of mills A B C D and elevators and troughs arranged between them for transferring the bagasse from one to another, of the juice receivers and outlets H H' H^2 H^3, the horizontal pipes connecting all said outlets, a pump J, attached to one of said pipes at a point between the last two outlets H^2 and H^3 of the series and leading thence directly to the mill B, as shown and described.

480,572. STEAM-CONDENSER. JOSEPH P. FETTERS, Dayton, Ohio. Filed Apr. 21, 1892. Serial No. 430,099. (No model.)

Claim.—1. A steam-condenser for steam-engines, comprising a series of condensing-tubes exposed to the atmosphere, inlet and outlet chambers inclosed by end caps into which said tubes open, inlet and outlet pipes projecting into said chambers, and a stationary deflector-plate suspended between the open ends of the condensing-pipes and the inlet-pipe to baffle and break the direct current of steam escape, substantially as described.

2. In a steam-condenser, the combination, with a series of tubes separated to allow the free passage of the atmosphere, of inlet and outlet chambers inclosed by end caps into which said tubes open, an inlet-pipe entering and projecting within the inlet-chamber above the lowest point thereof, a discharge-pipe for the water of condensation, a deflector in the inlet-chamber between the open end of the inlet-pipe and the receiving ends of the condensing-pipes, and an outlet-pipe entering the outlet-chamber and having its open end projecting within the same to form a pocket around said pipe, whereby the uncondensed residue of the steam will be a second time baffled after emerging from the condensing-tubes, substantially as described.

3. In a steam-condenser, the combination, with a series of pipes exposed to the atmosphere and having their ends opening through heads, of caps mounted thereon and having the form, substantially, of truncated cones, an inlet and outlet pipe entering the lower and upper caps, respectively, and projecting above and below the truncated ends of said caps, in which they lie, a discharge-pipe leading directly from the lowest point of the inlet-chamber, and a stationary concave deflector-plate arranged in said chamber between the open end of the inlet-pipe and the condensing-tubes, leaving an annular passage between its edge and the conical wall for the passage of steam, whereby the exhaust-steam is baffled and its direct current broken up before entering the condensing-tubes, substantially as described.



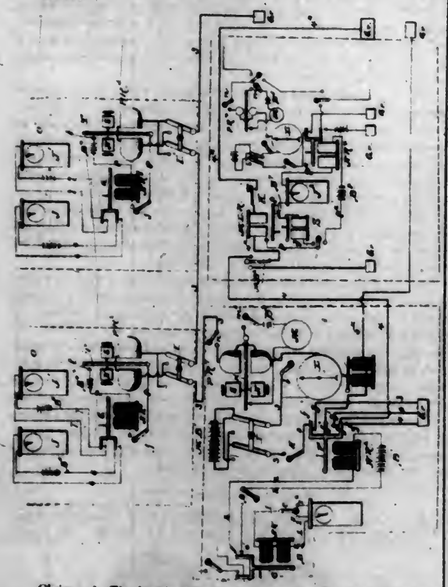
480,573. CONDUIT FOR ELECTRIC WIRES. SAMUEL H. FLAGG, Providence, R. I. Filed Jan. 26, 1889. Serial No. 297,663. (No model.)

Claim.—1. A conduit for electric wires, consisting of a metal pipe A and a glass pipe B of a diameter to exactly fit said metal pipe and somewhat longer than said pipe, in combination with a coupling the interior portion of which forms a continuation of the pipe A, substantially as set forth.

2. A conduit for electric wires, consisting of a metal pipe A and a glass tube B of a size to exactly fit the metal pipe and having partitions *b*, whereby the glass tube is divided into three or more compartments, substantially as shown and described.

480,574. DRESS-SHIELD. ELLA N. GAILLARD, New York, N. Y. Filed May 10, 1892. Serial No. 432,436. (No model.)

Claim.—1. In a dress-shield, a supporter and gold-beater's skin attached thereto with the resisting side outward, substantially as described.



2. In a dress-shield, a supporter and gold-beater's skin attached thereto with the resisting side outward, and a cushion of absorbent material on the outer face of the skin, substantially as described.

480,575. ELECTRIC ACCUMULATOR. GIOVANNI GARDINI, Lodi, Italy. Filed Apr. 18, 1891. Serial No. 389,227. (No model.) Patented in Italy Feb. 14, 1891, LVII, 37.

Claim.—An electric accumulator comprising electrodes formed of a mixture of lead oxide and small pieces of carbon having a thin top layer of lead oxide, a porous partition separating said electrodes, and conductors immersed in the mixture constituting said electrodes, substantially as described.

480,576. METHOD OF AND APPARATUS FOR TESTING CIRCUITS FOR ELECTRIC TIME SYSTEMS. WILLIAM F. GARDNER, Washington, D. C. Filed Jan. 7, 1891. Renewed July 8, 1892. Serial No. 439,416. (No model.) Patented in France Dec. 10, 1889, No. 201,080.

Claim.—1. The herein described improvement in the method of operating and testing the electric circuits of a time-signaling system, it consisting in imparting electric impulses by a current of given polarity to a main line for operating time-signal-receiving devices and causing said impulses to close local circuits each through a polarized relay and imparting thereto a current of opposite polarity in testing such main line and reversing the direction in which the last said current traverses the magnets of the polarized relay, substantially as set forth.

2. In a time-signal-transmitting system, a transmitting-station, an electric circuit extending therefrom to one or more time-signal-receiving stations, and a time-signal-transmitting apparatus in said transmitting-station, said apparatus including a polarized relay, a main-line battery, and a pole-changer, substantially as set forth.

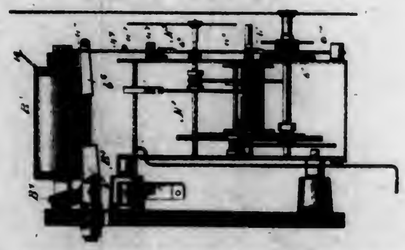
3. In a time-signal-transmitting system, a transmitting-station, an electric circuit extending therefrom to a time-signal-receiving station, a polarized relay at said receiving-station, and means for reversing the direction of the current through the said relay without affecting the direction of the current over the main line, substantially as set forth.

4. In a time-signaling system, an automatic signaling mechanism in a transmitting-station, an electric circuit extending therefrom to one or more time-signal-receiving stations, said circuit including (permanently, or possibly by means of switches) a polarized relay at the transmitting-station, a battery, and pole-changing switches, and a galvanometer, substantially as set forth.

5. In a time-signaling system, a time-signal-receiving station, a signal-receiving device in said station, a local circuit including said signal-receiving devices, and a relay or repeater at said receiving-station opening and closing said circuit, and a polar relay in the main-line circuit supplemental to the aforesaid relay or repeater and adapted to open and close the circuit through it, substantially as set forth.

6. In a time signaling system, a main-line circuit, a polarized relay, a local circuit opened and closed by the said polarized relay, a secondary relay or repeater in said local circuit, a clock or time-signal-receiving device, and an electric circuit including the said clock or signal-receiving device and opened and closed by the said secondary relay or repeater, substantially as set forth.

7. The combination, with a series of clocks, as at J J', and one or more electric circuits extending through said clocks, of the electro-magnetically-actuated contacts for closing the said circuits, a supplemental circuit, as at 8 8, for actuating the contacts, and the polar relay for opening and closing the supplemental circuit, substantially as set forth.



8. In a time-signal-receiving station, the combination of the polarized relay, the local circuit, as at 8 8, opened and closed by said polarized relay, and the clocks or time-signal-receiving devices actuated by said circuit, the switch *j*, or equivalent.

9. The combination of the clock J, the electric circuit through the clock, a relay or repeater, as at NR^3, which opens and closes the said circuit, a main line, as at 3 3, and a polarized relay, as at PR^3, which opens and closes the circuit through the relay or repeater and which is adapted to have the current from the main line passed through it in either direction without change in said line 3 3, substantially as set forth.

10. The combination of the means for transmitting time-signals, the battery, the pole-changer, and the polarized relay, all in the observatory or transmitting-station, the electric circuit, as at 3 3, the clock-station, the local electric circuit in said clock-station, the clock in said circuit, and the polarized relay PR^3, adapted to have the current from the line 3 3 passed through it in either direction independently of the pole-changer at the observatory or transmitting-station, substantially as set forth.

11. The herein-described method of testing electric circuits including relays or repeaters used for the transmission of time-signals, which consists in causing a current to flow along said circuit of a polarity opposite to that used in transmitting time-signals and, while said current is on said circuit breaking the connection of said circuit at one or more places, with time-signal-receiving devices, and then reversing the direction of the current through the relays or repeaters at said places to ascertain the movement of their armatures, substantially as set forth.

480,577. CLOCK-SYNCHRONIZING DEVICE AND SYSTEM. WILLIAM F. GARDNER, Washington, D. C. Filed Dec. 13, 1888. Renewed July 8, 1892. Serial No. 439,421. (No model.)

Claim.—1. In a time-signaling system, signal-transmitting devices in an observatory or transmitting station, a telegraphic or telephonic main-line circuit, a branch circuit adapted to intermittingly connect the said signal-transmitting devices with the main-line circuit, a receiving-station, a main-line relay or repeater in said main-line circuit at said receiving-station, a local circuit opened and closed by said relay or repeater, said local circuit having two loops or branches with a battery in each loop, a sounder or equivalent receiving mechanism in one of said loops, a clock or time signal-receiving apparatus in the other of said loops, and a hand-switch whereby the local circuit can be closed at will either through the said clock or through the said sounder, substantially as set forth.

2. In a time-signaling system, signal-transmitting devices in an observatory or transmitting station, a telegraphic or telephonic main-line circuit, a branch circuit adapted to intermittingly connect the said signal-transmitting devices with the main-line circuit, a receiving station, a main-line relay or repeater in said main-line circuit at said receiving-station, a local circuit opened and closed by said relay or repeater and having two loops or branches, a sounder or equivalent receiving apparatus in one of said loops, a clock or time-signal-receiving apparatus in the other of said loops, a hand-switch whereby the local circuit can be closed at will either through the said clock or through the said sounder, and a switch or equivalent in the said main-line circuit and distant from the observatory or transmitting station for disconnecting said main line from the aforesaid branch, which extends to the observatory or signal-transmitting station, substantially as set forth.

3. In a time-signaling system, a telegraphic or telephonic main-line circuit, devices for automatically transmitting time-signals adapted to be connected therewith, a series of main-line relays or repeaters all in said circuit, a series of telegraph or telephone stations respectively containing said relays or repeaters, telegraph-signal-receiving devices in said station, a primary local electric circuit at each of said stations opened and closed by one of said relays or repeaters, a second repeater in said primary local circuit, one or more secondary local circuits extending out from the said secondary repeater, and one or more clocks or equivalents in said secondary circuits, substantially as set forth.

4. In a time-signaling system, the telegraphic or telephonic main-line circuit, devices for transmitting time-signals adapted to be connected therewith, a series of main-line relays or repeaters in said circuit, a series of telegraph or telephone stations respectively containing said relays or repeaters, a primary local circuit closed and opened by each of said relays or repeaters, a second repeater in said primary local circuit, a series of two or more successively-arranged secondary local electric circuits extending from the aforesaid secondary repeater, and each secondary circuit, except the last, being arranged to open and close a succeeding circuit, and one or more clocks or equivalents in the said series of secondary circuits, substantially as set forth.

5. In a time-distributing system, a receiving-station having a series of two or more electric circuits, as at 10 10 10^a 10^b, one or more clocks or signal-receiving devices in each of said circuits, a multiple relay or repeater opening and closing all of said circuits simultaneously, and an electric circuit, including said multiple relay or repeater and independent of the aforesaid circuit, a main electric circuit, as at 5 5, electro-magnetic devices in said main circuit for opening and closing the aforesaid relay or repeater circuit, and automatic time-signal-transmitting devices at a transmitting-station and which open and close the aforesaid main line, substantially as set forth.

6. In an observatory or time-signal-transmitting station, an automatic time-signal transmitter, a primary local electric circuit opened and closed by said transmitter, a repeater in said circuit, a secondary local electric circuit opened and closed by the said repeater, a second multiple repeater in said secondary circuit, and a series of several outgoing main lines adapted to be simultaneously opened and closed by said multiple repeater, substantially as set forth.

7. In a time-signaling system, an automatic signal-transmitting apparatus in an observatory or central transmitting station, a series of two or more main lines extending out from the said station and adapted to transmit time-signals therefrom, an electro-magnetic indicator, as at N^2, in the observatory or central station, adapted to be connected to said circuits, whereby the observatory-attendant is informed of the transmission of the signals over said circuits, substantially as set forth.

8. The combination of the clock Q, the electric circuit 12 12^a, the sounder R^2 or equivalent instrument in the said circuit or a part thereof, a main line, as at 6 6, the relay or repeater I' in said main line, and the time-signal-transmitting apparatus at a transmitting-station, adapted to be connected by the main line with the relay or repeater I', substantially as set forth.

9. The combination of the clock Q, the circuit 12^a 12^b and 12 12, the sounder R^2, the battery R', the battery R^2, the switch *r*, a main line, as at 6 6, adapted to receive time-signals, and the relay or repeater I' in the main line, substantially as set forth.

10. The combination of the clock Q, the circuits 12 and 12^b, the sounder R^2, the switch *r*, a main line, as at 6 6, the relay or repeater I', and the telegraphing-key in the said main-line circuit, substantially as set forth.

11. The combination of the clock Q, the sounder R^2, the circuit 12^a 12^b through the clock, the relay or repeater I', having its armature adapted to open and close the circuit through the clock, a main-line circuit through the relay or repeater, and the switch for opening the circuit through the clock, substantially as set forth.

12. The combination of the clock Q, the sounder R^2 or equivalent instrument, an electric circuit through the clock, a battery R^2 therein, the electric circuit through the sounder, a main line, as at 6 6, a relay or repeater, as at I', in said main line, having an armature adapted to open and close the circuit through the clock, and the switch for cutting out the clock, substantially as set forth.

13. The combination of the clock Q, the sounder R^2, an electric circuit through the clock, an electric circuit through the sounder, a main-line circuit, as at 6 6, and a relay or repeater I' in said circuit, adapted to open and close the circuits through the clock and the circuit through the sounder, substantially as set forth.

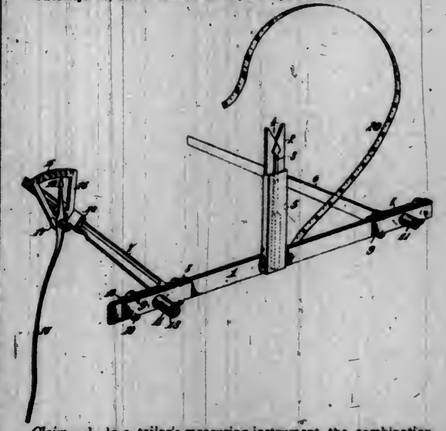
14. The combination of the clock Q, the sounder R^2, the electric circuit through the clock, the electric circuit through the sounder, the relay or repeater I', adapted to open and close either or both of the aforesaid circuits, the switch *r* for opening the clock-circuit, the time-signal-transmitting devices at the transmitting-station, a main line, as at 6 6, running through the said relay or repeater I' and having two earth connections, one at the transmitting station and one outside thereof, and a switch, as at r^4, for joining the main line to either of said earth connections, substantially as set forth.

15. The combination of the time-signal-transmitting apparatus in the observatory or central station, including a multiple-pointed relay or repeater I, a series of two or more main electric circuits, as at 5 5, 6 6, 7 7, extending from said multiple-pointed relay or repeater I out from the observatory or transmitting station, a time-signal-receiving station, as at 8^4, a local electric circuit at the said station, a multiple-pointed relay or repeater in the said local circuit, and a series of two or more electric circuits extending out from the last said multiple-pointed relay or repeater to a series of clock-stations, as at O^4 O^5, substantially as set forth.

480,578. MUTE FOR MUSICAL INSTRUMENTS. DAVID GEHRS, Baltimore, Md. Filed Apr. 30, 1892. Serial No. 431,290. (No model.)

Claim.—1. A tubular mute for stringed instruments, substantially as described.

2. A mute composed of connected tubes adapted to engage the bridge of a musical instrument, substantially as described.



3. A mute for a stringed musical instrument, composed of a sound-distributing tube and sound-conducting tubes connected therewith, substantially as described.

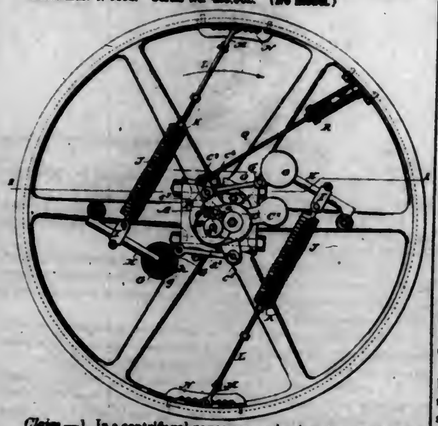
4. A mute for a stringed musical instrument, composed of a sound-distributing-tube and pairs of sound-conducting tubes secured to opposite sides of the sound-distributing tube and adapted to be applied to a bridge, substantially as described.

5. A mute for a stringed musical instrument, composed of a sound-distributing tube, sound-conducting tubes, and a cross-piece interposed between the sound-conducting tubes, substantially as described.

6. A mute for a stringed musical instrument, composed of a sound-distributing tube, sound-conducting tubes connected therewith, and a tubular cross-piece interposed between the sound-conducting tubes, substantially as described.

480,579. TAILOR'S MEASURE. IGNATIUS GRAGG, Baltimore, Md. Filed Apr. 26, 1892. Serial No. 431,016. (No model.)

Claim.—1. In a tailor's measuring-instrument, the combination, with a side bar provided with a plumb, of a front bar supported in a horizontal position on the side bar, a slide mounted on the front bar and carrying a scale-plate, and a pivotally-supported swinging gage-arm having a pointer or index-finger, substantially as described.



2. In a tailor's measuring-instrument, the combination, with a side bar provided with a plumb, of an adjustable rear bar, an adjustable front bar, and an adjustable swinging gage-arm supported on the front bar and provided with a scale and index-finger, substantially as described.

3. A tailor's measuring-instrument consisting of a supporting side bar provided with a plumb, an adjustable rear bar supported on the side bar, a front bar adjustably mounted on the side bar, a swinging gage-arm carried by a slide on the front bar and provided with a scale and pointer, and a measuring-tape attached to the side bar, substantially as described.

4. A tailor's measuring-instrument comprising a supporting side bar provided with a plumb, front and rear bars provided with slides for adjustable connection with the side bar, and adjustable friction devices carried by said slides, substantially as described.

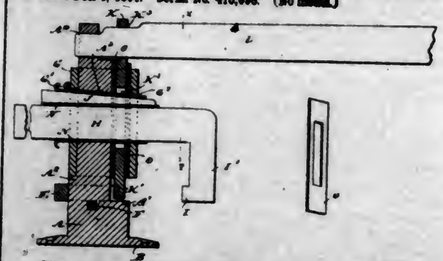
5. A tailor's measuring-instrument comprising a supporting side bar, a plumb, front and rear bars adjustably mounted on the side bar, an adjustable gage-arm carried by the front bar and provided with a scale and index-finger, and a measuring-tape attached to one of the bars, substantially as described.

480,580. ENGINE-GOVERNOR. MARTIN A. GREEN, Altoona, Pa. Filed Mar. 1, 1892. Serial No. 423,362. (No model.)

Claim.—1. In a centrifugal governor mechanism, the combination, with the shaft and the governor-wheel, a pivot-pin projected from the hub of the wheel eccentric to its axis, a rocker-plate journaled on such pin and connected with the pivotal governor-arms, the valve-pin D, eccentrically journaled on the rocker-plate, such journal being normally over the axis of the wheel when the governor-balls are at their normal innermost position, all arranged substantially as shown, and for the purposes described.

2. The combination, with the supporting-wheel, the rocker-plate C, journaled thereon near the center of the main shaft, said plate having a counterpoise at one end and carrying the eccentric-pin D at its other end and formed with opposite lateral extensions c^4 c^5, and a cushion device, substantially as shown, mounted on the wheel and having its plunger-rod connected with the rocker-plate, of the pivotal arms H, carrying the balls G, the springs J, and the arms O, pivotally connected at their opposite ends to the balls G and the extensions c^4 c^5, all arranged as shown, and for the purpose described.

3. The combination, with the wheel, the governor-arms H and balls G, and means for imparting a centripetal action thereto, of the plate A, having stops P P', the rocker-plate journaled thereon near the center of the main shaft, having a stop-lug, the eccentric-pin mounted on said rocker-plate, and the oppositely-disposed connecting-arms O, pivotally connected to the rocker-plate and the balls G, substantially as and for the purpose described.

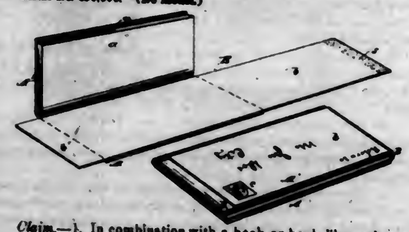


4. In a governor mechanism, substantially as described, the combination, with the wheel-hub, the eccentric rocker-plate C, pivoted thereon, of the pivoted arms H, having their outer ends reduced and threaded, as at A, the balls G, having an enlarged bore adapted to receive the lower portion of the arms H, and a reduced threaded portion adapted to receive the threaded ends of said arms, and the arms O, pivotally connected at their ends with the balls and with the rocker-plate, all substantially as and for the purpose described.

5. In a governor mechanism, substantially as described, the combination, with the wheel and the centrifugal governing mechanism, including the hinged arms H, of the adjustable clamps I, the double-wound springs J, connected at their free ends to the clamps I and at their looped ends to screw-nuts K, and the adjusting-rods L, connected with the nuts K and the wheel-rim, substantially as and for the purpose described.

6. In a governor mechanism, essentially as described, the combination, with the wheel and the combined centripetal and centrifugal acting weighted arms H, pivoted thereto, of the plate A, having journal B, the rocking plate C, mounted thereon, having a lubricating-reservoir 10, and a channel 11, communicating therewith, the eccentric-pin D, journaled on such plate, formed with a lubricant-receiving channel 12, communicating with the channel 11, the cap-plate E, held on the pin D, and the arms O, connecting the rocker-plate and the balls G on the arms H, all arranged substantially as and for the purpose described.

7. In a centrifugal governor, the combination, with the wheel rocker-plate C, eccentrically journaled on the hub thereof, the swinging balls G, the arms O, connecting the balls and the rocker-plate, said rocker-plate having an extension c^5, of the cylinder S, secured to the wheel, the piston R, working therein, and the rod Q, connecting the piston and the rocker-arm extension c^5, substantially as and for the purpose described.

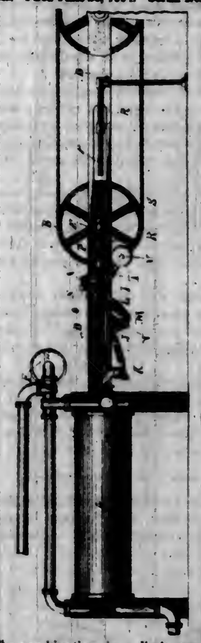


480,581. SAW-SET. WILLIAM M. GRELLICK, Sutton's Bay, Mich. Filed Dec. 1, 1891. Serial No. 413,698. (No model.)

Claim.—1. In a saw-set, the combination, with a frame formed with a set-block, of a sleeve held on the said frame, an arm held in the said sleeve and provided with a lug arranged opposite the said set-block, plates adapted to engage the said arm and sleeve to raise or lower the said arm, and a key for locking the said arm in place, substantially as shown and described.

2. In a saw-set, the combination, with a frame formed with a set-block and a gage held horizontally adjustable on the said frame, of a sleeve seated on the said frame, a horizontal arm held in the said sleeve and provided with a lug arranged opposite the said set-block, a key and plates for adjusting the said arm vertically, a punch fitted to slide vertically in the said sleeve above the said set-block, and plates for adjusting the said punch laterally, substantially as shown and described.

480,582. MAILING ATTACHMENT FOR BOOKS AND LIKE ARTICLES. CHARLES S. HARDY, San Diego, Cal. Filed Apr. 27, 1892. Serial No. 430,896. (No model.)



Claim.—1. In combination with a book or book-like package, a mailing device therefor, consisting of a permanently-attached address fly-leaf adapted to be folded within the book or package on the inner side of its cover and of being turned over or outside of the cover, substantially as and for the purpose herein set forth.

2. In combination with a book or other like package, a mailing device therefor, consisting of a permanently-attached fly-leaf having the name and address of the owner of the package and a postage-stamp on it, said leaf being adapted to be folded within the book or package on the inner side of its cover and of being turned over or outside of the cover and of there being secured or sealed, substantially as specified.

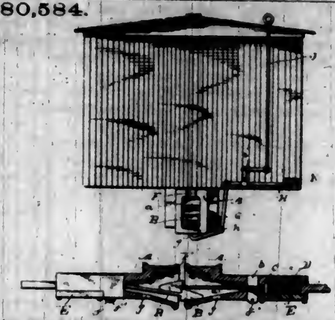
3. The combination, with a book or book-like package having half-covers A A', of the address fly-leaf B, permanently attached to the inside of the one half-cover and capable of being turned or folded within the book and composed of a long portion *b* and a short portion *b'*, both capable of being turned over or outside of the cover and provided with adhesive material adapted to seal said portions together when so turned, substantially as described.

480,583. LIMIT-STOP FOR ELEVATORS. THADDEUS W. HERRMANN, Chicago, Ill., assignor, by mesne assignments, to the National Company, of Illinois. Filed June 26, 1891. Serial No. 397,057. (No model.)

Claim.—1. The combination, in a limit-stop for elevators, of a valve in the passage between the control-valve and the cylinder, a lever connected to said valve, having arms projecting each side of the fulcrum, a slide having projections engaging with said arms on their opposite sides, and a rod connected to said slide, having stops thereon engaging with a moving part connected to the elevator-piston, substantially as described.

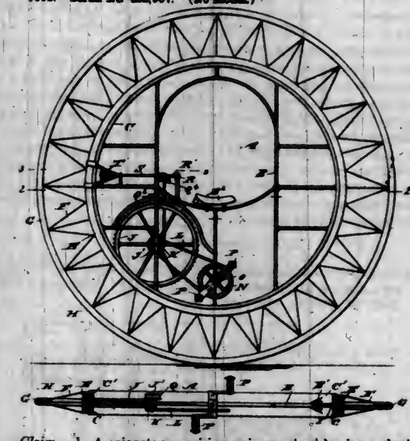
2. The combination, in a limit-stop for elevators, of a valve in the passage between the control-valve and the cylinder, a lever connected to said valve, having arms projecting each side of the fulcrum, a slide having projections engaging with said arms on their opposite sides, a rod connected to said slide, having stops thereon engaging with a moving part connected to the elevator-piston, and a weight or its equivalent connected to said lever, adapted to move said first-named valve to its open position, substantially as described.

3. The combination, in a limit-stop for elevators, of a valve H in the passage between the control-valve and the cylinder, a lever I, mounted upon a stud L and provided with oppositely-projecting arms M N, a slide O, supported upon said stud L and having projections V V' engaging with opposite sides of the arms M N, respectively, a rod P, having stops R R thereon and connected to the slide O and the arm S, secured to the cross-head E and operating between said stops R R, and the weight U, adapted to maintain the arms M N in contact with the studs V V', respectively, substantially as described.



480,584. CAR-COUPLING. FRANCIS A. HOTCHKISS, Cedar Falls, Iowa. Filed Nov. 30, 1891. Serial No. 413,570. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-bar having the chamber therein, of a headed coupling-bar secured in a throat portion of said chamber by a removable pin passing loosely through an oblong slot in said coupling-bar and through the walls of said chamber, the buffer-plate at the rear of said coupling-bar, the spring therefor, and the removable wall of the spring-chamber, substantially as specified.

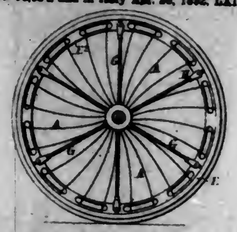


2. The combination, with the draw-bar having the loosely-held coupling-bar therein and the slot in the wall of the chamber thereof, of the pivoted angular lever having an arm adapted to project through said slot into engagement with said coupling-bar and means for operating said lever to effect such engagement, substantially as specified.

3. The combination, with the draw-bar having the coupling-bar loosely held therein, said bar having a slot through its wall, of the angular lever having an arm adapted to project through said slot into engagement with said coupling-bar and the pull-rods connected to said lever, substantially as specified.

480,584.

480,585. UNICYCLE. JAMES INLAN, Barre, Vt. Filed Feb. 26, 1892. Serial No. 422,907. (No model.)



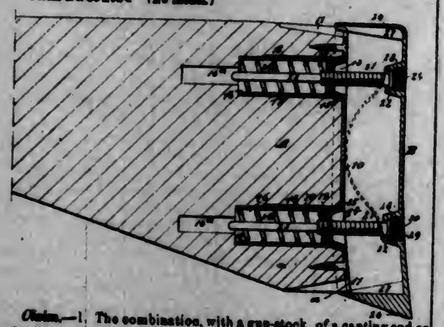
Claim.—1. A unicycle comprising an inner wheel having a double rim and a framework carrying the seat, an exterior wheel formed with an annular flange connected by spokes with a tire, ball-bearings arranged in the said annular flange and engaged by the double rim of the inner wheel, and a propelling mechanism supported in the said framework and provided with a large gear-wheel in mesh with an internal gear on the said rim, substantially as shown and described.

2. A unicycle comprising an inner wheel having a double rim and a framework carrying the seat, an exterior wheel formed with an annular flange connected by spokes with a tire, ball-bearings arranged in the said annular flange and engaged by the double rim of the inner wheel, a propelling mechanism supported in the said framework and provided with a large gear-wheel in mesh with an internal gear on the said rim, and a treadle mechanism adapted to be actuated by the rider seated on the said seat and connected with the said large gear-wheel, substantially as shown and described.

3. A unicycle comprising an inner wheel having a double rim and a framework carrying the seat, an exterior wheel formed with an annular flange connected by spokes with a tire, ball-bearings arranged in the said annular flange and engaged by the double rim of the inner wheel, a propelling mechanism supported in the said framework and provided with a large gear-wheel in mesh with an internal gear on the said rim, and a brake mechanism under control of the operator, substantially as shown and described.

4. A unicycle comprising an inner wheel having a double rim and a framework carrying the seat, an exterior wheel formed with an annular flange connected by spokes with a tire, ball-bearings arranged in the said annular flange and engaged by the double rim of the inner wheel, a propelling mechanism supported in the said frame-work and provided with a large gear-wheel in mesh with an internal gear on the said rim, and a steering mechanism, substantially as described.

480,586. WHEEL. ROBERT JEWELL, London, England. Filed Mar. 29, 1892. Serial No. 426,995. (No model.) Patented in England Apr. 29, 1891, No. 7,410, and Jan. 26, 1892, No. 1,733; in Belgium Mar. 25, 1892, No. 96,954, and in Italy Apr. 30, 1892, LXII. 158.



Claim.—1. A bicycle, tricycle, and similar road-wheel having spring-spokes made with an arc-shaped curvature in the plane of the wheel, the inner ends of said spring-spokes being formed with hooks or heads fitting grooves of the boss, in which they are secured by an inner plate C, having lateral ribs C' entering into the grooves, and an outer plate D, secured by screwing, substantially as described.

2. In a bicycle, tricycle, and similar road-wheel, the combination of a metal tire or rim E with flange E^2, spring-spokes A, made with an arc-shaped curvature in the plane of the wheel, and rigid stay-spokes G, the inner ends of which are secured to the boss or nave of the wheel, while the outer ends are connected to the flange E^2 by a slotted connection that will allow of the requisite vertical play of the boss or nave in the plane of the wheel, substantially as described.

3. In a bicycle, tricycle, and similar road-wheel, the combination of a metal tire or rim E with flanges E^2 E^4, hoop E^3, packing N, and caoutchouc band M, spring-spokes A, made with an arc-shaped curvature in the plane of the wheel, and rigid stay-spokes G, the inner ends of which are secured to the boss or nave of the wheel, while the outer ends are connected to the flange E^2 by a slotted connection that will allow of the requisite vertical play of the boss or nave in the plane of the wheel, substantially as described.

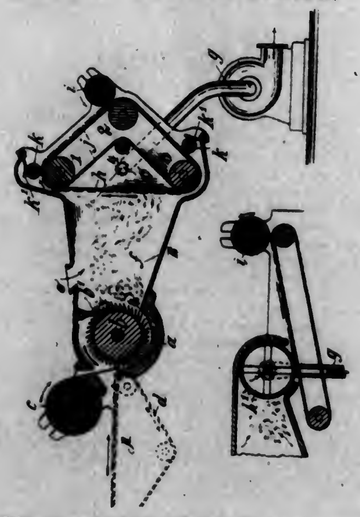
480,587. EXTENSION GUN-STOCK AND CUSHION-PLATE. ERASTUS JONES and RALPH TOWNSEND, New York, N. Y. Filed June 3, 1891. Serial No. 394,934. (No model.)

Claim.—1. The combination, with a gun-stock, of a casting end or back plate movable to and from the end of the stock, whereby the stock may be lengthened and accommodated to the shoulder of a marksman, as set forth.

2. In a gun-stock, an extension-plate provided with an adjusting mechanism for regulating the length of the stock, and a cushion in engagement therewith, said cushion being unaffected by the adjustment of said mechanism, as and for the purpose set forth.

3. The combination, with a gun-stock having channels formed at top and bottom of its end surfaces, of an end or back plate held to slide upon the end portion of the stock, provided with tongues entering grooves in the stock, adjusting-screws carried by the stock and having their heads seated in the end or back plate, said heads having a rocking connection with said plate, and springs intervening the end or back plate and the stock engaging with the adjusting-screws, yet independent of the same in their action, substantially as shown and described.

4. The combination, with a gun-stock provided with longitudinal bores containing casings, said casings being provided with longitudinal slots, a plate secured to the end of the stock having openings therein over the bores, and annular flanges surrounding said openings and extending downward over the mouths of the bores, nuts located in the casings provided with feathers held to travel in the casing-slots, and springs located in the casing below the nuts, of an end plate held to slide upon the stock over its attached plate, the said end plate being provided with apertured wells or sockets interiorly threaded, screws having their heads seated in the wells or sockets of the end plate, the said heads being circular, the body of the screw being passed through the nuts in the casings in the stock and through the springs, and plugs screwed in the wells or sockets to an engagement with the heads of the screws, as and for the purpose specified.



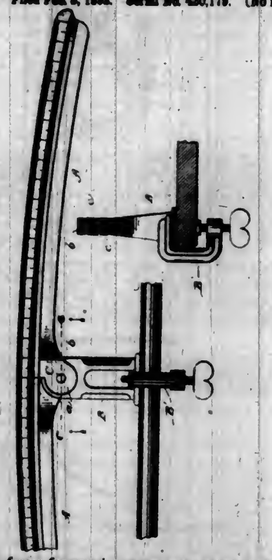
5. The combination, with the stock having longitudinal bores in its butt, sliding nuts in the bores, and springs pressing the nuts outward, of the extensible plate having screws swiveled to it and extending through the nuts, whereby the plate may be adjusted in or out by turning the screws without changing the tension of the springs, substantially as set forth.

6. The combination, with the stock having longitudinal bores in its butt, sliding nuts in the bores, and springs pressing the nuts outwardly, of the extensible plate having two threaded wells, two screws passed loosely through apertures in the bases of the wells and through said nuts, and threaded plugs closing the wells, substantially as set forth.

7. The combination, with the gun-stock and the nuts in its butt, of an extensible back plate having two threaded wells, two adjusting-screws extended freely through apertures in the bases of the wells and through the nuts, and plugs screwed into the wells and concealing the screw-heads.

8. The combination, with the stock, its heel-plate 10, provided, respectively, with slots 11 11 and 12 12 in the stock and plate, of the cushion back plate B, inclosing the butt of the stock and provided at its ends with internal ribs or flanges 27 27, sliding in the ways formed by the said slots, substantially as set forth.

480,588. ART OF PREPARING SHORT FIBERS FOR SPINNING AND OTHER PURPOSES. CARL KELLNER, Vienna, Austria-Hungary. Filed Dec. 10, 1891. Serial No. 414,690. (No specimens.)

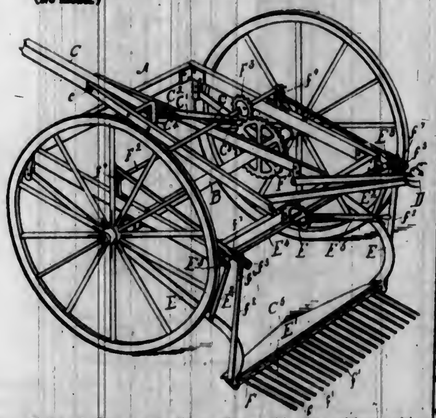


Claim.—1. In the art of preparing short fibers for spinning and other purposes, the process which consists in suspending the fibrous material in a liquid, condensing the fibers into a sliver, sheet, or lap, disintegrating the said sliver, sheet, or lap, and recondensing the same into a loose sliver, sheet, or lap, for the purpose set forth.

2. In the art of preparing short fibers for spinning and other purposes, the process which consists in suspending the short fibers in a solution of an antiseptic or disinfectant, condensing the fiber into a sliver, lap, or sheet, disintegrating the said sliver, lap, or sheet, and recondensing the same into a loose sliver, sheet, or lap, for the purpose set forth.

3. In the art of preparing short fibers for spinning and other purposes, the process which consists in suspending the fibrous material in a liquid, condensing the fibers into a sliver, lap, or sheet, compressing and drying the same, disintegrating the compressed and dried sliver, lap, or sheet, and recondensing the same into a loose sliver, lap, or sheet, for the purpose set forth.

480,589. SEAM-PRESSING FRAME. FRANK J. KELLOGG, Battle Creek, Mich. Filed Feb. 8, 1892. Serial No. 420,179. (No model.)



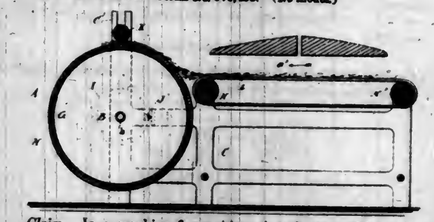
Claim.—1. A frame for pressing seams on, consisting of a standard, a pair of arms pivotally connected to said standard at their inner ends, together constituting a pressing-surface, and means for locking said arms in any position, substantially as specified.

2. The combination, with the standard, a pair of bow-shaped arms having ears at one end, and a set-screw passing through said ears and the upper end of said standard, thereby pivoting and locking the arms thereon, substantially as set forth.

3. The combination, with the standard, the bow-shaped arms pivotally connected to said standard at their inner ends, the rounded wood-facing strips on said arms, and the felt covering-strip, and the devices for locking said arms to the standard, substantially as and for the purpose described.

480,590. POTATO-DIGGER. JOHN E. KELLY and FREEMAN R. HOWELL, Highland Station, Mich. Filed May 25, 1891. Serial No. 393,999. (No model.)

Claim.—1. In a potato-digger, the combination, with a rocking digger-blade provided at its rear with a series of fingers, of a rocking finger or grate bar provided with fingers adapted to interact between the fingers of the said blade, substantially as described.



2. In a potato-digger, the combination, with a balance rocking digger-blade provided at its rear with a series of fingers, of a rocking finger or grate bar provided with fingers adapted to interact between the fingers of the said blade, substantially as described.

480,591. COMPOSITION OF MATTER FOR THE MANUFACTURE OF ARTIFICIAL STONE. JOSEPH R. KEMBLING and CHARLES PUGSLEY, Jr., New York, N. Y., assignors to the Pyrolith Company, of New Jersey. Filed Apr. 30, 1892. Serial No. 431,340. (No specimens.)

Claim.—1. A composition of matter for the manufacture of artificial stone, which consists of a basic cement of oxide of magnesium and neutral chloride of magnesium, asphaltum, and sand or analogous material.

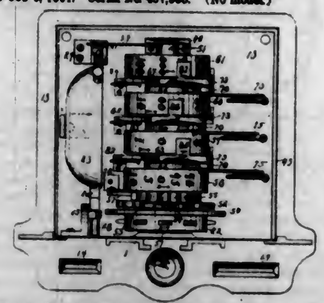
2. The process of manufacturing artificial stone, which consists in first obtaining a basic cement of oxide and neutral chloride of magnesium, then adding sand and asphaltum, then drying the resultant stone, and then subjecting such stone to a hot-water bath to drive off the chloride.

480,592. FELTING-MACHINE. JULIUS KITTEL, Cranford, N. J. Filed Jan. 30, 1891. Serial No. 378,455. (No model.)

Claim.—In a machine for making piano-hammer felt, a drum having a perforated rim and provided with a perforated shaft for connection with a pipe for supplying the interior of the drum with steam, mechanism, substantially as described, for imparting simultaneously a rotary and endwise motion to the said drum, and a burlap covering held on the outer surface of the perforated drum-rim and covering the perforations therein, in combination with a roller arranged in line with and journaled loosely above the said drum and resting by its weight on the felt material passing along under the roller and an endless traveling feed-belt discharging layers of felt material onto the said burlap at one of the said drum sides and below the said roller to heat the felt material previous to its passing under the said roller to be acted on in a diagonal direction by the forward revolving and transverse sliding motion of the said drum under the said roller, substantially as described.

480,593. ANIMAL-TRAP. EDWIN R. KNIGHT and CHARLES W. KNIGHT, Shelbyville, Ill. Filed Jan. 5, 1892. Serial No. 417,105. (No model.)

Claim.—1. In a trap, the combination, with a chambered body portion provided with openings at its ends, of a horizontally-located partition extending within the body of the trap from end to end and terminating at the openings, the said partition being provided with openings normally closed by counterbalanced trap-doors, and cover-doors for bridging over the trap-doors, substantially as shown and described.



2. In a trap, the combination, with a body having tapering ends and an opening at each end, of a partition extending through the trap from side to side and from end to end, the extremities of the partition resting upon the base-wall of the body, counterpoised trap-doors, normally closing openings in the partition, said trap-doors opening downward, stops limiting the downward movement of the trap-doors, cover-doors capable of bridging the trap-doors, and means, substantially as described, for holding the cover-doors in an elevated position, as and for the purpose set forth.

3. In a trap, the combination, with a body portion the extremities of which are beveled downward and each provided with an opening, of a partition dividing the body into an upper and lower compartment, the partition extending downward to the base-wall of the body, a runway or arch located upon a portion of the partition, baffle-partitions located at the sides of the arch and extending above it, counterpoised trap-doors normally covering the openings in that portion of the partition within the arch, said trap-doors being adapted to open downward, cover-doors pivoted between the trap-doors within the arch and capable of bridging said doors, and devices for maintaining

the cover-doors in an elevated position, substantially as and for the purpose set forth.

4. In a trap, the combination, with a body constructed of reticulated or perforated material having tapering ends and an opening at each end, of a partition of a reticulated or perforated material dividing the interior of the trap into two main compartments, an upper and a lower, a runway or arch of reticulated or perforated material located upon the partition at a point in its length, counterpoised trap-doors covering openings produced in the partition within the runway, stops adapted for engagement with the trap-doors, baffle-partitions of reticulated or perforated material located at the sides of the arch or runway and extending above it, cover-doors pivoted between the trap-doors, curved upward and outward in opposite directions, the said cover-doors being constructed of a reticulated or perforated material, and devices for maintaining the cover-doors in an elevated position, whereby that portion of the arch or runway inclosed by the cover-doors may be maintained as a bait-chamber, rendering the said bait non-accessible and yet visible from all points, substantially as described.

480,594. CASH-REGISTER. HERMANN H. KOELLER, Quincy, Ill. Filed Oct. 6, 1891. Serial No. 407,863. (No model.)

Claim.—1. In a cash-register, the combination, with registering mechanism, an indicator-plate, a bell adapted to be sounded when the latter is operated, and a sliding drawer, of auxiliary alarm mechanism comprising a lever 30, projecting into said drawer and provided with a shoulder 38, a lever 36, actuated by said shoulder and carrying a hammer 37, a spring-held lever 31, pivotally mounted on the lever 30, a stop-pin 33, and a spring 39, located behind lever 36 and adapted to throw the hammer 37 toward the bell, substantially as and for the purpose set forth.

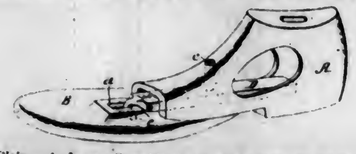
2. In a cash-register, an alarm mechanism adapted to be sounded when the money-drawer is opened, comprising an alarm-bell 23, secured to the base-plate of said register, a lever 30, provided with a shoulder 38 and carrying a spring 42, said lever being pivotally mounted on said base-plate and projecting downwardly through a perforation formed in the same, a lever 36, actuated by the shoulder of said lever 30 and carrying a hammer 37, a pin 33, projecting from lever 30, a lever 31, pivotally mounted on lever 30 and adapted to engage pin 33 to actuate the lever 30 when lever 31 is struck by the drawer as the same is pulled outwardly or withdrawn, and a spring 39, located behind lever 36, for throwing the same, and consequently hammer 37, toward bell 23, and causing the latter to strike the same, substantially as set forth.

3. In a cash-register, the combination, with the registering mechanism, a vertically-moving indicator-plate carrying a horizontal bar 17, and with an alarm-bell, of a lever 24, provided with a weighted end carrying a hammer 27, and an arm 28 at the opposite side of the lever-fulcrum and in the path of the bar 17, substantially as and for the purpose set forth.

4. In a cash-register, the combination, with a series of registering-wheels provided upon their periphery with graduations, of a plate projecting over the periphery of each registering-wheel except the units-wheel and normally concealing the uppermost graduation, and means for actuating said plates to expose the concealed graduation when the preceding wheel has completed one revolution, substantially as and for the purpose set forth.

480,595. PNEUMATIC WHEEL-TIRE. KARL LEHMANN, Berlin, Germany. Filed Jan. 9, 1892. Serial No. 417,518. (No model.)

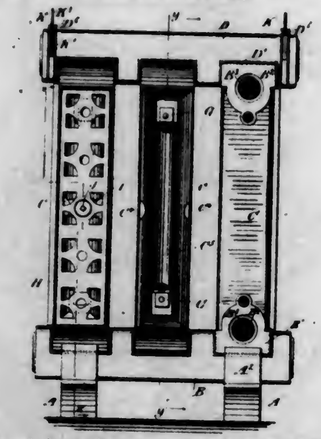
Claim.—1. The herein-described non-circular tire, comprising the inner air-tube *d*, having the re-entering sides, and a heavier tread portion *b*, embracing the outer portion and sides of the tube, and having inwardly-projecting edges to enter the sides of the tube, and shoulders adapted to bear upon the rim, all substantially as shown and described.



480,595.

2. In combination with the rim having the curved seat, the inwardly-projecting parts a' and the outwardly-projecting parts a^3, the tire provided with the side grooves k' to receive the inwardly-projecting parts of the rim, and a shoulder upon which the outwardly-projecting parts of the rim rest, all substantially as shown and described.

3. In combination with the rim having the curved seat and the inwardly and outwardly projecting portions, the air-tube *d*, having re-entering sides and seated in the rim, and the tread portion *b*, covering the exposed part of the air-tube and provided with side grooves k', all substantially as shown and described.



480,596. EXTENSION SHOE-LAST. JAMES H. LIVERMORE, Port Townsend, Wash. Filed July 13, 1891. Serial No. 399,413. (No model.)

Claim.—1. In an adjustable shoe-last, the combination of the reversible toe-section B, having an elongated slot *d*, with raised edges, and the connecting-bar D, having an offsetting or downwardly-extended T-shaped head *e*, adapted to be passed through the slot *d* when turned at right angles and to lock under the same when turned into alignment, substantially as shown and described.

2. The connecting-bar D, having the T-shaped head *e*, graduations *g*, and screw-seats *f*, in combination with the heel portion A, having cross-bar *a* and set-screw *c*, and the reversible toe portion B, having the slot *d*, substantially as shown and described.

480,597. RADIATOR. GEORGE R. LOVEGARD, Halifax, Canada. Filed May 27, 1891. Serial No. 394,241. (No model.)

Claim.—1. In a radiator, the combination, with the upper and lower headers having recesses in their outer sides, of pipes the ends of which enter said recesses, lateral communicating openings being formed in the ends of the pipes and sides of the headers within the said recesses, transverse annular registering offsets in the pipes and headers, and bolts passing through said offsets without entering the water or steam space, substantially as set forth.

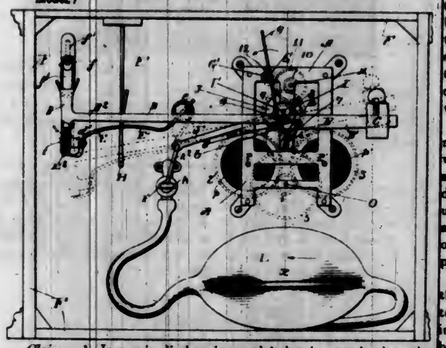
2. The combination, with the header having a lateral socket flanged at its inner end and a pipe having a similar registering socket and flange, of the copper or like nipple compressed longitudinally and

expanded laterally in the said two sockets between their flanges to form a tight joint, substantially as set forth.

3. A radiator comprising upper and lower headers formed in their sides with lateral sockets, flanges at their inner ends, and with transverse annular offsets, the pipes formed with similar lateral sockets and annular offsets registering with those of the headers, nipples compressed in said sockets between their flanges, and the bolts passed through said offsets and securing the parts together, substantially as set forth.

4. In a radiator, the combination, with pipes, of a top and a bottom header connected and in communication with the said pipes and forming girders for the same, bolts passing through the said headers and pipes to fasten the several parts together, and nipples fitted in recesses in the said pipes and headers to establish communication between the same, the ends of the said nipples abutting against annular flanges in the said headers and pipes, substantially as shown and described.

5. A radiator provided with parallel disconnected spaced pipes having external longitudinal depressions and a screen secured to each pipe over its recess, the spaces between the pipes being open from one side of the radiator to the other to permit of free circulation of air, substantially as set forth.

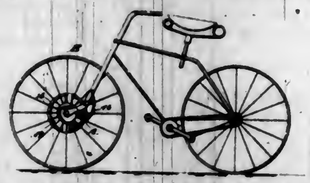


6. The combination, with a radiator-pipe having a longitudinal recess or depression and two inward-projecting lugs, of a screen covering said recess and provided on its inner side with a button, the ends of which are adapted to be passed behind said lugs from the outside substantially as set forth.

7. In a radiator, the combination, with headers formed on their sides with sockets, of pipes engaging with their ends the sockets of the said headers, nipples held in sockets in the said pipes and headers and abutting against flanges thereon, and bolts for fastening the said pipes to the said headers, substantially as shown and described.

8. In a radiator, the combination, with headers formed on their sides with sockets, of pipes engaging with their ends the sockets of the said headers, nipples held in sockets in the said pipes and headers and abutting against flanges thereon, bolts for fastening the said pipes to the said headers, and legs bolted to the bottom header and having side extensions engaging the sides of the said bottom header, substantially as shown and described.

9. In a radiator, the combination, with a top header formed at or near its ends with vertical guideways, of brackets engaging the said guideways and adapted to support a shelf, substantially as shown and described.



480,598. AUTOMATIC LIQUID-DISTRIBUTING MACHINE. EVERETT B. LUNDY, Boston, Mass. Filed Jan. 7, 1892. Serial No. 417,316. (No model.)

Claim.—1. In a coin discharging and balancing mechanism, the combination, with an ordinary clock-work mechanism, of the rotary escapement or blade on its highest-speed spindle and the cam and crank-disk secured to the spindle I', the latter being connected to the arm of the valve by a connecting-rod and the former being engaged with a horizontal projection at right angles with the balance-lever and a part thereof, said lever being fulcrumed to the framework of the mechanism and provided with a similar horizontal projection to engage with the escapement and having one arm provided with a counterbalance-weight and the other with a suitable coin-pocket at its end, that is provided with lugs that fulcrum the coin-discharging lever, which has one of its arms provided with a counterbalance-weight and the other covering the under part of the coin-pocket, which said coin-discharging lever is actuated by the movement of the balance-lever and by the rigid arm H, all substantially as set forth.

2. A suitable cabinet provided with a coin aperture and chute and with a figure-head provided with a liquid-passage that is directly communicated with a liquid-receptacle, said passage provided with a valve that has an arm vertically projecting from the stem thereof, in combination with a coin discharging and balancing mechanism consisting of an ordinary clock-work mechanism provided with a rotary escapement or blade on its highest-speed spindle and with a cam and crank-disk secured to the spindle I', the latter being connected to the arm of the valve by a connecting-rod and the former being engaged with a horizontal projection at right angles with the balance-lever and a part thereof, said lever being fulcrumed to the framework of the mechanism and provided with a similar horizontal projection to engage with the escapement and having one arm provided with a counterbalance-weight and the other with a suitable coin-pocket at its end, that is provided with lugs that fulcrum the coin-discharging lever, which has one of its arms provided with a counterbalance-weight and the other covering the under part of the coin-pocket, which said coin-discharging lever is actuated by the movement of the balance-lever and by the rigid arm H, all substantially as and for the purpose set forth.

480,599. MOTOR SPRING-FORK FOR BICYCLES. WILLIAM LYNCH and EUGENE TREMPER, Wallkill, New York. Filed Nov. 20, 1891. Serial No. 412,846. (No model.)

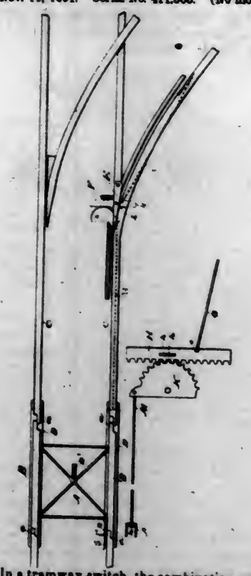
Claim.—1. A spring-fork for bicycles, constructed in pivoted spring-connected sections, and a pawl-and-ratchet mechanism connecting the lower section of the fork with the wheel, substantially as set forth.

2. A spring-fork and motors for bicycles and like machines, constructed in two sections, the upper section being yoke-shaped and the lower section comprising two bars pivoted to the members of the yoke and adapted for attachment to the axle, power connections between said lower section and the wheel, stop devices located at the junction of the two sections, and a spring attached to the lower section, coiled over the same, and secured to the upper section, as and for the purpose set forth.

3. In a bicycle or like machine, the combination, with the axle of the machine, of a fork constructed in two sections, a bow-section, and bars pivoted to the bow-section, the said bars being adapted for attachment to the axle and having power connections with the wheel, stop devices, substantially as described, located at the junction of the two sections of the fork, and springs attached to the bars of the fork, curved forwardly and over said bars and inwardly to an engagement with the yoke-section of the fork, as and for the purpose specified.

4. In a bicycle, the combination, with the axle and a wheel mounted upon said axle, having a casing attached thereto provided with an inner ratchet-face, of a spring-fork attached to the axle, the said fork being constructed in two pivotally-connected sections, stop devices located at the junction of the sections, springs exerting tension upon the sections of the fork in the direction of the stop devices, an arm attached to the axle, and a pawl carried by said arm and capable of engagement with the ratchet-teeth of the wheel, as and for the purpose set forth.

5. In a bicycle or like device, the combination, with the axle thereof, the wheel loosely mounted upon the axle, and a casing secured to the hub of the wheel and having ratchet-teeth produced upon its inner peripheral surface, of a fork consisting of a yoke section and bars pivotally attached to the members of the yoke-section, the said bars and members being provided with stop devices and the bars being adapted for rigid attachment to the axle, one at each side of the wheel-hub, springs attached to the bars at their upper forward edges, which springs are curved over the ends of the bars downward and upward to an engagement with the sides of the members of the yoke-section of the fork, an arm secured to the axle and located within the casing, and a pawl pivoted upon the said arm and adapted for engagement with the ratchet-surface of the casing, as and for the purpose specified.



480,600. VELOCIPEDE DRIVING-GEAR. JOHN MACKENZIE, Liverpool, England. Filed Mar. 21, 1892. Serial No. 425,778. (No model.)

Claim.—In a velocipede driving-gear, the combination of the common axle F, the wheels A and E, fixed thereon, either one or both of which may be sprocket-wheels, and pedals C C, attached to the rims of said wheels, substantially as set forth.

480,600.

480,601. RAILROAD-SWITCH. LOUIS MARCHAND, Jr., Allegheny, Pa. Filed Nov. 11, 1891. Serial No. 411,583. (No model.)

Claim.—1. In a tramway-switch, the combination, with the movable switch-point, of a longitudinally-movable track-rail section, with intermediate connections between said track-rail section and switch-point, substantially as described.

2. In a tramway-switch, the combination, with a movable switch-point, of a longitudinally-movable track-rail section mounted on anti-friction bearings and intermediate connections between said longitudinally-movable section and switch-point, substantially as described.

3. In a tramway-switch, the combination, with a movable switch-point and the track-rails, of the longitudinally-movable track-rail sections having its ends overlapping the stationary track-rails and intermediate connections between the switch-point and movable track-rail section, substantially as described.

4. In a tramway-switch, the combination, with the movable switch-point, of the longitudinally-movable rail-section interposed in each of the track-rails and rigidly connected together and intermediate connections between the movable track-rail section and switch-point, substantially as described.

5. In a tramway-switch, the combination, with the movable switch-point and longitudinally-movable track-rail section for moving the same, of the catch for holding said switch-point in open position and the releasing-lever for said catch located on the branch line, substantially as described.

6. In a tramway-switch, the combination, with the spring-pressed switch-point and catch having the releasing-lever on the branch line for holding said switch in open position, of the longitudinally-movable track-rail section in the main line and intermediate connections between said longitudinally-movable track-rail section and switch-point, substantially as described.

7. In a tramway-switch, the combination, with the movable switch-point, of the longitudinally-movable track-rail section mounted on a base-piece having recesses in its end face, the rollers in said recesses resting on a bearing in the track-bed, and intermediate connections between the switch-point and movable rail-section, substantially as described.

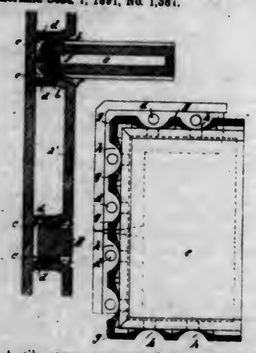
8. In a tramway-switch, the combination, with the movable switch-point, of the longitudinally-movable track-section, the spring for moving said track-section in one direction, and intermediate connections between said track-section and switch-point, substantially as described.

9. In a tramway-switch, the combination, with the spring-pressed switch-point, of the spring-pressed longitudinally-movable track-section and intermediate connections between said track-section and switch-point, substantially as described.

10. In a tramway-switch, the combination, with the movable switch-point and longitudinally-movable track-rail section, of the segment moved by said track-rail section and connections between the segment and switch-point, substantially as described.

11. In a tramway-switch, the combination, with the switch-point and longitudinally-movable track-rail section, of the segment moved by the track-rail section, the slotted bar moved by said segment, and the pin on the switch-point entering said slot, substantially as described.

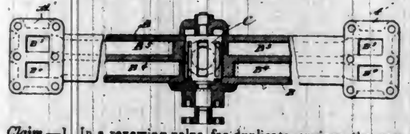
12. In a tramway-switch, the combination, with the switch-point, the slotted bar and pin, the segment engaging the bar, and the longitudinally-movable track-rail section for moving the segment, of the catch engaging said bar and the releasing-lever for said catch, substantially as described.



13. In a tramway-switch, the combination, with the movable switch-point and the longitudinally-movable track-rail section having the end overlapping the stationary track-rail, of the bolt passing through said overlapping ends and the plate or bar lying along the inner side of the rail in position to engage the car-wheel flange, said plate or bar being connected with the bolt, substantially as described.

480,602. GUTTER OR VALLEY ON ROOFS. CHARLES C. MEADER, Montpelier, Vt. Filed Oct. 23, 1891. Serial No. 409,640. (No model.)

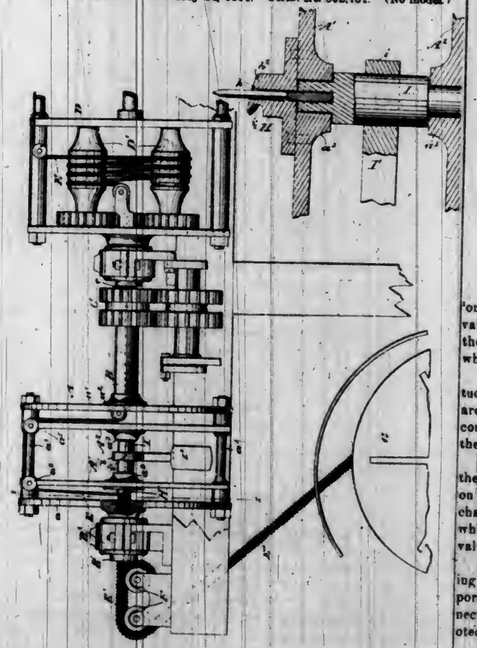
Claim.—The board or metal strip covering the gutter or valley laid over whatever forms the roof, thereby creating a cold-air space between the bottom of board or metal strip B and gutter or valley A, said board or metal strip being fastened by hook C and clamp E, substantially as set forth above.



480,608. TILE STOVE. REINHOLD MEYER, Wildburgstetten, Germany. Filed Nov. 13, 1891. Serial No. 411,968. (No model.) Patented in Austria-Hungary Oct. 8, 1889, No. 16,316 and No. 44,852; in Germany Jan. 24, 1890, No. 50,514; in Norway Mar. 12, 1890, No. 1,558; in Denmark Mar. 15, 1890, No. 642; in Sweden Oct. 23, 1890, No. 2,622, and in Switzerland Sept. 7, 1891, No. 1,387.

Claim.—1. A tile stove constructed of superimposed layers of hollow intercommunicating tiles to form the outer walls, in combination with hollow flue-plates, as *c*, communicating with the hollow tiles at their points of connection, substantially as set forth.

2. In a tile-stove, the combination of superimposed layers of hollow tiles provided with rabbets, as *a*, ribs, as *b*, and throats, as *c*, with hollow flue-plates, as *e*, arranged between the hollow tiles, and strips, as B, arranged between the said hollow tiles at the points where no flue-plates are arranged, the flue-plates being provided with mortises and the hollow tiles with openings at their tops and bottoms to permit the circulation of air, as described.

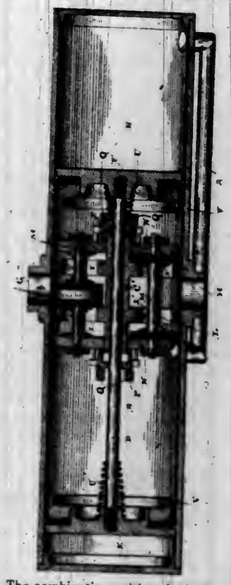


480,604. REVERSING-VALVE. WALTER MILLER, Cleveland, Ohio. Filed Apr. 13, 1892. Serial No. 429,064. (No model.)

Claim.—1. In a reversing-valve for duplicate engines, the combination of a pipe B, provided with continuous passages B^4 and B^5, connecting, respectively, the live and exhaust steam passages of the engine, a cylindrical central chamber B^6, arranged transversely of the pipe B and opening at one extremity into the live-steam-admission chamber B^3, live-steam ports *b* and *b'*, piercing the lower wall of the chamber and registering with the passages B^4 and B^5, into which, respectively, they open by upwardly-turned passages, and a centrally-located exhaust-port B^2 between the ports *b* and *b'*, with a valve composed of a central body, and two wings so arranged as to connect alternately one of the live steam passages with the exhaust-port, the said connecting-space being inclosed at either end, substantially as described.

2. The combination, with a pipe provided with duplicate passages connecting the live and exhaust steam ports of duplicate engines, of a central cylindrical chamber opening at one end into a live-steam passage and provided with three port-openings at its lower side, one being central for the purpose described, with a valve located in said chamber, provided with wings and end bearings and adapted to connect the central port with either of the other ports when rotated, substantially as described.

480,605. HAIR-CURLING MACHINE. JUNIUS A. MURPHY, New Orleans, La. Filed May 14, 1891. Serial No. 392,731. (No model.)



Claim.—1. In a hair-curling machine, the axially-bored cylindrical curling-head H, having its front end formed into a spiral face A^6 and having a cast-off point A^3 at the forward terminal of said spiral face, and a spiral groove *h'* between the said point A^3 and the spiral face A^6, substantially as set forth.

2. The combination, with a flier, of an axially-bored curling-head mounted centrally within the flier to rotate therewith and terminating in a spiral cam on its outer extremity or face having a point A^3, and a stationary spindle also supported centrally within the flier and projecting through the curling-head, and the guide pulleys or idlers mounted on the flier to guide the material to the curling-head, substantially as set forth.

3. The combination, with the flier A, having tubular journals B B', of the parallel cross-bars A' A^5, mounted in the flier and having bearings a^2 a^2 in line with the flier-journals, an arbor mounted in the bearings a^4, held against rotation and having a spindle J, projecting into the journal B', the axially-bored curling-head H on the front face of the bar A', concentric with the spindle and terminating in a spiral cam having a point A^3, and the guide-pulleys a^4 a^5, mounted on the flier, substantially as set forth.

4. In a machine for curling hair yarn, a flier, an axially-bored curling-head carried thereby and formed with a spiral groove which terminates in a cam face, and a spindle fitting and projecting from the bore of the curling-head, the arbor of the spindle being weighted, substantially as described.

480,606. PISTON METER. JOHN A. MYERS, Louisville, Ky. Filed Mar. 25, 1892. Serial No. 426,435. (No model.)

Claim.—1. The combination, with a double head provided with longitudinal ports, valves therefor, and valve-stems upon which the said valves are mounted, of plates on opposite sides of the head to which the said stems are connected, and guides projecting from the head on which the said plates move, substantially as shown and described.

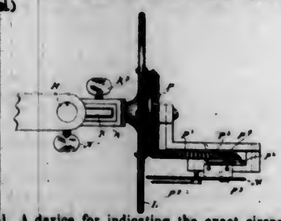
2. The combination, with the double head provided with longitudinal ports, valves therefor, and valve-stems upon which the valves are mounted, of plates to which the said valve-stems are connected and concentric and eccentric guides projecting from the head upon which the said plates move, substantially as shown and described.

3. The combination, with a double cylinder and a double head therein having inlet and outlet chambers, which are provided with ports on their opposite sides, of a double valve arranged within one of the chambers, two valves for the opposite chamber, a valve-carriage to which the said valves are secured, and a means for throwing the said valves, substantially as shown and described.

4. The combination, with a cylinder, a double head therefor having inlet and outlet chambers which are provided with longitudinal ports, valves for said ports, and a valve-carriage, of arms pivotally connected to the head and which bear against the said carriage, trips pivoted to the free ends of said arms having vertical and horizontal exten-

sions, the latter of which normally engage the head, but which are adapted to be thrown upward when their vertical arms are pushed inward, and longitudinally-movable connecting pistons on opposite sides of the head, which engage the tripe and throw their vertical extensions inward, substantially as shown and described.

5. The combination, with a cylinder, a double head therefor having inlet and outlet chambers which are provided with longitudinal ports, the heads being provided with exterior grooves, valves for the said ports, and a valve-carriage, of arms pivotally connected to the heads and which bear upon the said carriage, angular spring-actuated tripe pivoted to the outer ends of said arms, the horizontal arms of the said tripe resting normally to one side of the grooves in the head, but which when turned outward enter said grooves, and longitudinally-movable connected pistons on opposite sides of the said double head, which engage the tripe and throw their horizontal arms outward, substantially as shown and described.

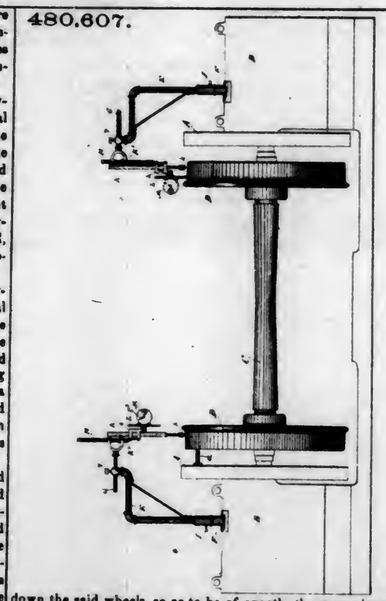


6. The combination, with a cylinder, a double head therein having inlet and outlet chambers which are provided with longitudinal ports, the head being provided with exterior grooves, valves for the ports, and a valve-carriage, of slotted arms pivotally connected to the head and which engage the said carriage, angular slotted tripe pivoted to the outer ends of the arms, the horizontal arms of the tripe being adapted to enter the grooves in the heads when turned outward, a longitudinally-movable rod extending through the said head, the slotted arms and the tripe, and pistons on the opposite ends of the rod, which are adapted to turn the said tripe upon their pivots, substantially as shown and described.

7. The combination, with a double cylinder having a double head therein, the latter being provided with longitudinal ports, the head being provided with exterior grooves, valves for the ports, and a valve-carriage, of slotted arms pivotally connected to the head, angular slotted tripe pivoted to the outer ends of the arms, the horizontal arms of the tripe being adapted to enter the grooves when turned outward, a longitudinally-movable rod extending through the head, the slotted arms and the tripe, pistons on the opposite ends of the arms, which are adapted to turn the said tripe upon their pivots, and springs on said rod between the tripping mechanisms and the pistons, substantially as shown and described.

8. The combination, with a cylinder, a double head therein having inlet and outlet chambers which are provided with longitudinal ports, the head being provided with exterior grooves, valves for the ports, and a valve-carriage, of posts projecting from the head, slotted arms pivoted thereto which engage the said carriage, angular-slotted spring-actuated tripe pivoted to the free ends of the said arms, the horizontal arms of the tripe being adapted to enter the grooves in the head when turned outward, a longitudinally-movable rod extending through the head, the slotted arms, and the tripe, flanged pistons secured to the ends of the rods, which are adapted to turn the said tripe upon their pivots, and springs interposed between the pistons and the said slotted arms, substantially as shown and described.

9. The combination, with a meter of the character described, having a reciprocating piston, of a registering mechanism, a shaft projecting therefrom carrying a ratchet-wheel, and a longitudinally-movable spring-actuated rod which engages the said wheel at its inner end and which is engaged by the said piston at its outer end, substantially as shown and described.

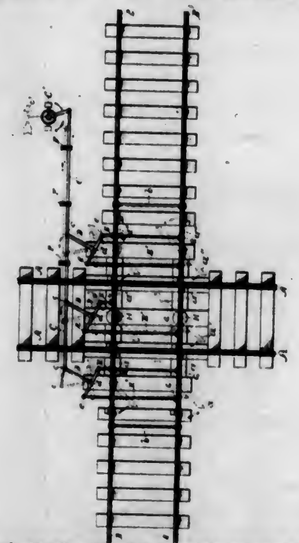


480,607. CIRCUMFERENCE-INDICATOR AND TIRE-GAGE. PETER MCCALLUM, St. Paul, Minn. Filed Feb. 8, 1892. Serial No. 420,636. (No model.)

Claim.—1. A device for indicating the exact circumference of wheels and other circular bodies, the same consisting of a support adapted to be brought into radial line with the wheel, and a rotary measuring-disk adjustably mounted on said support, adapted to traverse the periphery of the wheel, and a registering device operated by the said disk to indicate its travel, substantially as described.

2. A pair of circumference-indicators for use in conjunction to indicate the absolute and relative circumferences of wheels mounted on a common axle when being turned town by a lathe-tool, the same consisting of a pair of measuring-disks adapted to traverse the corresponding wheels and provided each with a registering device to indicate the amount of its travel, thereby enabling the operator to turn

480,607.

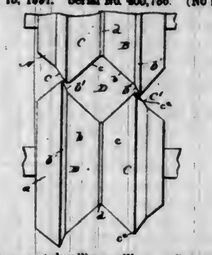


down the said wheels, so as to be of exactly the same circumference.

3. As a new article of manufacture, an instrument for insuring accuracy in turning down car-wheels, the same consisting of a support adapted to be brought into radial line with the wheel to be turned, a tire-gage, and a circumference-indicator provided with a registering device mounted for independent adjustment on said support, substantially as and for the purpose set forth

---

480,608. ADJUSTABLE RAILROAD-CROSSING. DANIEL MCNAMARA, Kansas City, Mo. Filed Oct. 7, 1891. Serial No. 408,006. (No model.)



Claim.—1. An adjustable railroad-crossing constructed in sections which are pivoted at their centers and operated by draw-arms E and E', which are secured to equalizers D, these being operated by a draw-rod C, as fully set forth and described.

2. An adjustable railroad-crossing consisting of the sections *a*, *a'*, and *a''*, the ratchet-plates H and H', the hinged draw-arms E and E', and the equalizers D, substantially as set forth and described.

3. In an adjustable crossing, the sections *a*, *a'*, and *a''*, with diagonal joints operating above the main track, substantially as specified.

480,609. METAL-ROLLING MILL. FRED NEVBOLD, Columbia, Pa. Filed Sept. 15, 1891. Serial No. 405,786. (No model.)

Claim.—1. For a metal-rolling mill, a roll having an annular groove, a fillet at the bottom thereof and a fillet-rib at the outer edge of one side of the groove, substantially as described.

2. The combination of a pair of opposed metal-working rolls, each having an annular groove, angular in cross-section and together forming the pass, fillets at the bottoms of said grooves, and fillets at the corners of the pass at the meeting-line of the rolls adapted to prevent crowding of the metal between the rolls and to reduce the corners of the ingot or bar, substantially as specified.

3. The combination of the opposite endwise-adjustable rolls having opposed annular grooves forming the pass, and each having a fillet-rib at one side of its groove, substantially as and for the purpose set forth.

4. A roll for metal-rolling mills, having a pair of collars B C double-beveled on their peripheries, the former having a fillet-rib *b'* at its apex and the latter a beveled or rounded edge c^3 at its apex, substantially as and for the purpose described.

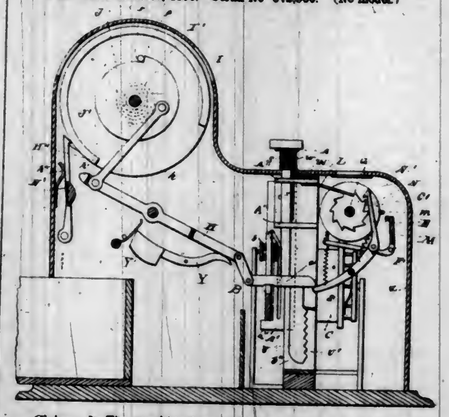
480,610. SKATE. WALTER NIELSON, New York, N. Y. Filed Apr. 7, 1892. Serial No. 428,171. (No model.)

Claim.—1. A skate having a double hanger provided with detachable fastenings or bearings, each consisting of a screw and a sleeve, and a bar or runner secured by said fastenings, substantially as described.

2. A skate having a double hanger provided with detachable fastenings or bearings, each consisting of a screw and a sleeve, and a runner secured by said fastenings, said hangers being recessed or depressed for receiving the heads of the screws and sleeves, substantially as described

3. A skate having a double hanger provided with eyes, detachable fastenings in said eyes, and a bar or runner having eyes or perforations corresponding to the eyes in the hanger and held in place by the fastenings, substantially as described.

4. A skate having its hanger composed of two separated parts provided with countersunk orifices, in combination with the sleeves E, having heads located in the countersinks of one hanger part, and screws D, engaging the sleeves and having heads located in the countersinks of the other hanger part, substantially as described.



480,611. PLUG-CALK FOR HORSESHOES. EDWARD P. NOYES, Boston, Mass. Filed Sept. 2, 1887. Serial No. 248,509. (No model.)

Claim.—1. A device for use as a plug-calk, consisting of a plug made tapering or conical and provided with a thread which from a point near the outer larger end of the plug runs out or diminishes in depth as it approaches said end, substantially as and for the purpose specified.

2. In combination with the shoe having the threaded cylindrical opening, the plug-calk made tapering or conical and provided with a screw-thread which begins to diminish in depth from a point near its outer end on the larger end of the plug-calk, substantially as and for the purpose shown.

480,612. CASH REGISTER AND INDICATOR. HENRY C. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 22, 1890. Serial No. 372,386. (No model.)

Claim.—1. The combination, with a series of vertically-movable keys, of a series of rotary indicators mounted independently upon a common shaft, one indicator for each key, a link-and lever connection between each key and its indicator, operated by the depression of the key to rotate said indicator to its indicating position, a continuous pawl-bar adjacent to the series of indicators and carrying a series of pawls adapted each to engage a shoulder on its respective indicator, a spring for throwing each pawl into engagement, a pawl carried by each link-and-lever connection and acting upon said continuous pawl-bar when the key is depressed to release the indicator operated by the previous transaction, and a returning-spring in connection with each indicator, substantially as specified.

2. The combination, with a series of vertically-reciprocating keys having engagement shoulders or projections thereon, of a series of sets of individual rotary registering-wheels having gear-wheels fast therewith and a series of swinging forked pawls operated by said engagement shoulders or projections upon the depression of the respective keys, substantially as specified.

3. The combination of a series of vertically-reciprocating keys, an arm on each projecting at right angles thereto, an oscillating bar or lever common to the entire series and operated by the impingment thereon of the said arm of any key, indicating mechanism for each key operated by a connection with said arm, devices in connection with each key for insuring their complete stroke and for properly limiting their stroke, and adding mechanism geared to said bar, substantially as specified.

4. In an accounting-machine, the combination, with a series of vertically-sliding keys, of a bar or lever acted upon by said keys and common to the entire series, a slotted stop-plate attachment to each key and adapted to be thrown into such position by the depression of said key as to serve as a stop for said bar or lever, adding mechanism operated by a segment-gear on the end of said bar, devices for resetting said adding mechanism to "0," and indicators having a connection with the keys in such a manner as to be rotated to indicating position by the operation thereof, substantially as specified.

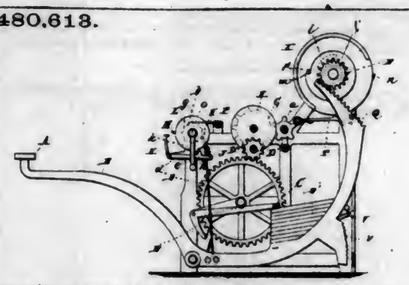
5. In an accounting-machine, adding mechanism comprising a first wheel marked around its periphery with the numbers "0" and "5" alternately, a disk fast thereto and carrying a series of spur-teeth, one between each "0" and the succeeding "5" and gear for actuating said first wheel, and a series of succeeding wheels arranged periphery to periphery and having each a disk in connection therewith having one spur-tooth, and an intermediate wheel between the main wheel and the spurred tooth, said intermediate wheel having gear thereon operated by the spur-tooth of the preceding wheel and having its periphery subdivided into concave arcs, and resetting-gear in connection with the shaft of each wheel, substantially as specified.

6. In an accounting and indicating machine, the combination, with a series of sliding reciprocating keys, their guides, and returning-springs, of pawl-and-ratchet mechanism for insuring full stroke, and the continuous pivoted bar or lever underlying said series of keys and

common thereto, adding mechanism operated by said bar, a set of parallel registering-wheels in connection with each key, a series of swinging pawls normally disconnected from the keys, but operated by a shoulder or projection thereon when the respective key is depressed, said pawls engaging gear fast to said registering wheels, each of said wheels having a stop-pin projecting at right angles thereto, a swinging stop-bar normally out of engagement with said pins, and means for bringing it into engagement, substantially as specified.

7. In an accounting-machine, the combination, with a series of keys and their necessary connections, springs for taking them back to their normal position, of a lever common to all of said keys and actuated by any of them, slotted swinging stops adapted to be operated by said keys and thrown into such position by each key as to prevent the momentum of said stroke from causing the lever to be depressed beyond the desired distance indicated by said key, and adding mechanism and its necessary gearing, said mechanism consisting of a series of digit-wheels arranged periphery to periphery, as shown, the first wheel of the series being divided around its periphery into "0" and "5" at equal intervals alternately, a wheel parallel thereto and journaled on the same axis, said wheel containing a spurred projection between each 0-mark and its succeeding 5-mark on the side of said wheel and extending beyond its periphery, a succession of other digit-wheels succeeding each other periphery to periphery, each having around said periphery the digits "1" to "9" and "0," inclusive, said other wheels having parallel carrying-wheels and the friction-springs between the parallel wheels, indicating mechanism operated by said keys, and numbering-wheels actuated by said keys, substantially as specified.

8. In an accounting-machine, the combination, with a series of vertically-sliding keys, their guides, and retracting-springs, of a lever or bar underneath said keys and actuated by any of them, a slotted swinging stop carried by each key and operated thereby in such a manner as to be thrown into position to serve as a stop for said common bar or lever, adding mechanism operated from said bar or lever, said adding mechanism comprising a series of digit-wheels arranged periphery to periphery and parallel with said bar, spur-gear in connection with each of said wheels to effect the carrying from one to the other, resetting-gearing in connection with each and intergearing, and rotary indicators operated by the depression of said keys, substantially as specified.



9. In an accounting-machine, the combination, with a series of vertically-sliding keys and their returning-springs, of a lever or bar arranged below said series and actuated by any key, a slotted swinging stop carried by each key and thrown by the operation thereof in position to arrest the downward movement of said bar, said stops being so arranged that each key moves said bar through a different arc, adding mechanism operated by a toothed segment on the end of said bar, said adding mechanism consisting of a series of digit-wheels arranged periphery to periphery, the first of the series of wheels having a series of toothed projections, the second of the series having spurred projections corresponding in number to the teeth upon the wheel attached to the first of the series that is actuated by said lever, and each succeeding wheel having spurs arranged to carry its succeeding wheel, rotary indicators operated directly by said key, a series of sets of numbering-wheels operated by each of said keys, and a series of pawls for holding said wheels in proper position until it shall be their turn to move, substantially as specified.

10. In an accounting and indicating machine, the combination of a series of vertically-reciprocating sliding keys, their guides, devices for preventing more than one key being depressed at a time, mechanism for insuring each key its full stroke, a bar or lever common to and arranged underneath all said keys and actuated by any of them, a spring for returning said bar or lever to its normal position, a slotted swinging stop carried by each key and projected by the operation thereof into such position as to limit the downward stroke of said bar, adding mechanism operated from said bar, and indicating and individual registering-wheels operated by said keys, substantially as specified.

11. In an accounting machine, the combination of a series of vertically-reciprocating sliding keys, their retracting-springs, guides, devices for insuring their full stroke and for preventing the simultaneous operation of the two adjacent keys, a single key bar or lever arranged below said series and common thereto, each key by its impingement with said bar moving it through a different arc, stops projected by the operation of each key underneath said bar, total adding mechanism geared thereto, a series of indicators operated directly by each key, and a set of individual registering-wheels moved by pawls operated by the depression of each key, substantially as specified.

480,613. CASH REGISTER AND INDICATOR. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 23, 1890. Serial No. 372,357. (No model.)

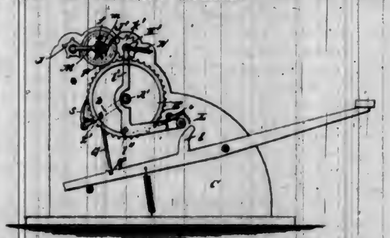
Claim.—1. The combination, with a series of pivoted key-levers having near their rear extremities a graduated series of lugs, of a continuous bar arranged above said lugs and common to the entire series and a series of adding-wheels operated by the movements of said bar under the depression of a key, each key-lever also having a toothed arm thereon operating a rotary indicator, substantially as specified.

2. The combination of a series of pivoted key-levers having thereon a graduated series of lugs, a continuous bar arranged above said lugs and common to the entire series, a series of adding-wheels operated by the movements of said bar, an upwardly-extending curved arm on each key at the rear of the lug and having a toothed extremity, and a series of rotary indicators having each a gear-wheel engaged by said toothed extremity, the parts being so arranged that the depression of any key simultaneously operates the adding and indicating mechanism to effect the proper indication and registration, substantially as specified.

3. The combination of the key-levers having upward toothed extensions, a series of rotary indicators, a gear-wheel connected to each indicator and actuated by the respective toothed extremity of the key, a spring connecting the gear-wheel and indicator, said spring being inclosed in a box fast to the gear-wheel, a stop-shoulder on said box, having engagement with a projection on the indicator, and the pawl mechanism for said indicator, substantially as specified.

4. In an indicating and accounting machine, the combination, with the series of key-levers, the individual itemizing-wheels operated thereby, and the adding mechanism and its gearing, of the rotary indicators having marked on their peripheries numbers corresponding to the value of the respective keys, said indicators being mounted loosely upon a common shaft, a series of pawls arranged to hold said indicators at their indicative position, releasing devices for releasing said pawls at the proper time, retracting-springs connected therewith, and a gear-wheel carried by each and engaged by a toothed arm of the respective key-lever, substantially as specified.

5. The combination, with the key-levers, of a series of sets of itemizing-wheels for registering the individual movements of the keys, one set for each lever, and operated thereby, said wheels being mounted upon a common shaft and held in engagement therewith by means of a spring bearing within the hollowed wall thereof and connected to a collar fast to the shaft, whereby said wheels are capable of an independent forward movement, but will move simultaneously in the opposite direction with the shaft, and a gear-wheel fast to each for engagement with the operating mechanism, substantially as specified.



6. The combination, with a series of key-levers, of a series of sets of individual itemizing-wheels operated thereby, one set for each lever, said wheels being mounted upon a common shaft and arranged to have an independent forward movement under the action of their respective operating devices, but to move simultaneously with their shaft in a reverse direction, a shouldered disk on one end of said shaft, a swinging stop-bar adjacent to the series of wheels and adapted to be moved into position to be engaged by stop-pins thereon, and a projection on an arm of said bar, adapted to be engaged by said disk when the shaft is turned to throw said bar into its stopping position, substantially as specified.

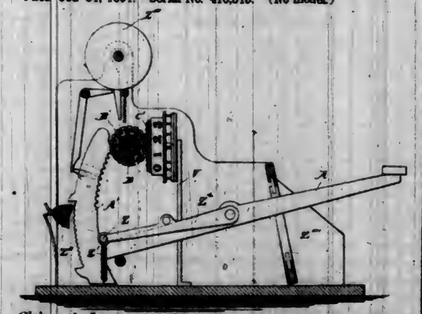
7. The combination of a series of sets of itemizing-wheels mounted upon a common shaft and arranged to have an independent forward movement thereon and a simultaneous reverse movement therewith and a stop-shoulder on each said wheel, a swinging stop-bar adjacent to said wheels and common to the series, and means whereby when said shaft is turned in a reverse direction said bar will be thrown into position to be engaged by said stop-pins when the wheels have been carried by the shaft to the proper position, substantially as specified.

8. The combination of a series of key-levers carrying a series of lugs, a common bar above said key-levers and acted upon by said lugs under the operation of the keys, a gear-wheel actuated by the movements of said bar, a series of adding-wheels operated from said gear-wheel, a series of sets of individual registering-wheels, one set for each key and operated upon by forked pawls connected to the key-levers, and a series of indicators operated by toothed extensions of said levers, substantially as specified.

9. The combination of a series of pivoted key-levers having thereon a graduated series of lugs, a continuous bar operated by the impingement therewith of any one of said lugs, a series of adding-wheels operated by the movements of said bar and provided with carrying-pinions and resetting devices, a series of rotary indicators having each a gear-wheel connected thereto, an integral upwardly-extending segment-arm on each lever at the rear of its lug engaging and operating said indicator-gear, a series of sets of itemizing-wheels, one set for each key and operated by an arm connected with the key-lever and carrying forked pawls having engagement with gear on said itemizing-wheels, and devices for resetting simultaneously the entire series of said itemizing-wheels to the zero position, substantially as specified.

480,614. CASH-REGISTER. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Oct. 30, 1891. Serial No. 410,333. (No model.)

Claim.—1. In a cash-register, the combination, with a series of key-levers and a series of laterally-arranged adding-wheels having two wheels in the cent portion of the series, of a bail-lever and its pawl, a toothed wheel and pinion, and downward projections or arms of said bail-lever graduated in length to correspond with the values of the respective keys whereby they are engaged, substantially as specified.

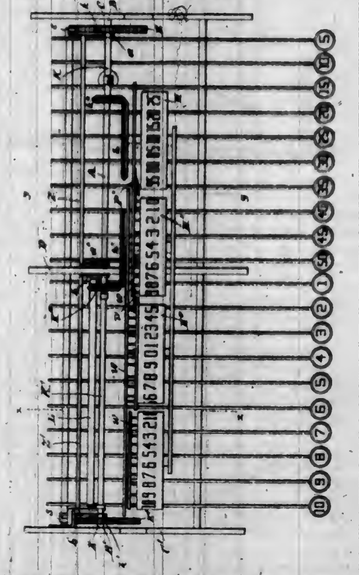


2. In a cash-register, the combination, with a series of key-levers and adding-wheels arranged side by side and turning in planes transverse to their shafts, of independent bail-levers for the cent series of keys and the dollar series of keys, their pawls and toothed wheels, the pivoted bail-frame carrying the dollar-pinion, and the lugs of the dollar-key levers adapted to engage said bail-frame, substantially as specified.

3. In a cash-register, the combination, with a series of key-levers and the laterally-arranged adding-wheels, of the bail-lever and its pawl, the adding-gearing engaged by said pawl, the stop-pins of the adding-wheels, and the adjustable stop-slide bearing the carrying-pinions of the adding-wheels, substantially as specified.

4. In a cash-register, the combination, with adding-wheels and gearing in connection therewith, of a bail-lever carrying a pawl, the graduated downward projections pivoted to said bail-lever, and the stop-shoulders and springs for said projections, substantially as specified.

5. In a cash-register, the combination, with parallel shafting and adding-wheels and gearing, all turning in parallel planes, of a bail-lever having graduated downward projections and a series of key-levers respectively under said projections and adapted in operation to run through similar arcs, but to do work through arcs of different extent corresponding to the lengths of the respective projections of the bail-lever, substantially as specified.



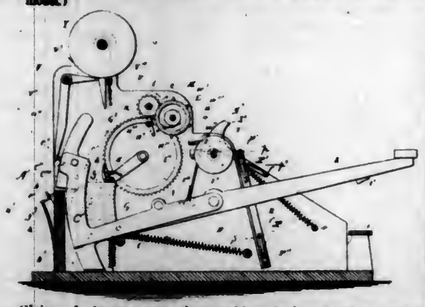
480,615. CASH REGISTER AND INDICATOR. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Oct. 31, 1891. Serial No. 410,515. (No model.)

Claim.—1. In an accounting-machine, the combination, with a series of key-levers, their arc racks, and a transverse fluted shaft operated upon by said racks and common to all the key-levers, of a series of adding-wheels turning in planes at right angles to that of said shaft and normally disconnected therefrom and a bevel toothed wheel loosely mounted upon one end of said shaft and having a ratchet-and-pawl connection therewith, whereby said wheel is carried with the shaft upon the forward revolution or movement of the latter, but is disconnected therefrom during its backward revolution or movement, said bevel-wheel gearing with a toothed wheel of the adding-gear, substantially as specified.

2. In an accounting-machine, the combination, with the key-levers, their arc racks having teeth corresponding in number, respectively, to the value of the respective keys, of a revoluble fluted shaft common to all of the keys and engaging said arc racks, a bevel toothed wheel loosely journaled at one end of said shaft, its ratchet-and-pawl connection therewith, a series of adding-wheels turning in planes at right angles to that of said shaft and carrying gear actuated by said bevel toothed wheel, the spring-actuated bail-lever for returning the key-levers to their normal position, means for insuring the full stroke of each key, and suitable indicating mechanism, substantially as specified.

480,616. CASH-REGISTER. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 2, 1891. Serial No. 410,566. (No model.)

Claim.—1. The combination, with a series of key-levers having numbered finger-pieces, of a bail-bar extending transversely over said levers and carrying a graduated series of downward projections designed to be engaged by said keys, a pawl connected to said bar, a toothed wheel operated thereby, a pinion engaging said toothed wheel, and a series of adding-wheels facing periphery to periphery and turning at right angles to the pinion on said shaft and actuated thereby, substantially as specified.



2. In an accounting-machine, the combination, with a series of key-levers, of a transverse movable bar common to all the dollar-keys, another transverse movable bar common to the cent-keys, said bars extending over the respective sets of key-levers and having each a graduated series of downward projections, a pawl carried by each said bar, a toothed wheel operated by each said pawl, the pinion-carrying shafts having gear actuated by said toothed wheels, the series of adding-wheels arranged periphery to periphery, and a pinion on said shafts arranged to operate gear on said adding-wheels, which turn at right angles thereto, the pinion-shaft of the dollar adding wheels carrying its pinion normally out of engagement with the gear-wheel of said adding mechanism, and bail mechanism operated by a projection on the key-levers for effecting the engagement when a dollar-key is operated, substantially as specified.

3. In an accounting-machine, the combination, with a key-lever and graduated transverse movable bars, respectively, common to all the dollar-keys and common to all the cent-keys and their pawls, of toothed wheels operated thereby, their pinion-carrying shafts, the

pinion-shaft for the dollar series having its pinion normally out of engagement with the gear of the dollar-adding wheels, the ball device actuated by lugs on the dollar key-levers for effecting the engagement, and the series of adding-wheels facing periphery to periphery, substantially as specified.

4. In an accounting-machine, the combination, with a series of dollar-adding wheels arranged periphery to periphery and actuated by a pinion at right angles thereto and key-levers, of a transverse ball-bar and pawl, the toothed wheels engaging said pawl, a normally-disengaged pinion, and a ball-lever device whereby said pinion is brought into engagement upon depressing any key of said series, substantially as specified.

480,617. CASH REGISTER, INDICATOR, AND CHECK-PRINTER. HENRY G. O'NEILL, Louisville, Ky., assignor to the Standard Register Company, Boston, Mass. Filed Nov. 6, 1891. Serial No. 411,083. (No model.)

Claim.—1. In an accounting-machine, the combination, with a series of key-levers, each having an arc ratchet and a trip at each end of said ratchet and an upwardly-extending spring-actuated forked pawl, of a series of double pawls and a series of springs acting, respectively, upon said pawls, a series of itemizing numeral-wheels and their connections, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly extending arm and a holding-tooth, the common pawl bar, and a releasing-trip to disengage the same, substantially as specified.

2. In an accounting-machine, the combination, with a series of key-levers having each an upwardly-extending spring actuated pawl and an arc ratchet provided with a trip at each extremity of said ratchet, of a series of triangular double pawls, each having a double-acting spring engaging its apex, itemizing numeral-wheels and their connections, a stop-bar for limiting the downward stroke common to all of said key-levers, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a trip to disengage the same, substantially as specified.

3. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet provided with a trip at each extremity, of a series of double pawls, double-acting springs therefor, a series of sets of itemizing numeral-wheels and their connections, a spring-actuated bar common to all and engaging all said key-levers for bringing the same back to their normal position, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, a common pawl-bar, a trip to disengage the same, and a returning device, substantially as specified.

4. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, each having a double-acting spring engaging its apex, a series of sets of itemizing numeral-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting-arm at each end, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, a common pawl-bar, a releasing-trip to disengage the same, and a returning device, substantially as specified.

5. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging the same, a series of sets of itemizing numeral-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting-arm at each end, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

6. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging the same, a series of sets of itemizing numeral-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting-arm at each end, with a stop-bar for limiting the downward stroke common to all of said keys, a spring-actuated bar common to and engaging all said keys for bringing the same back to their normal position, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

7. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging the same, a toothed wheel and transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels, the toothed gearing attached thereto, their spur-like projections, the carrying-pinions, and a stop-bar adapted to engage with said adding-wheels, a series of indicating-disks, each loosely mounted on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

8. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging said pawls, a series of sets of itemizing numeral-wheels and their connections, a toothed wheel, transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions, stop mechanism for said adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

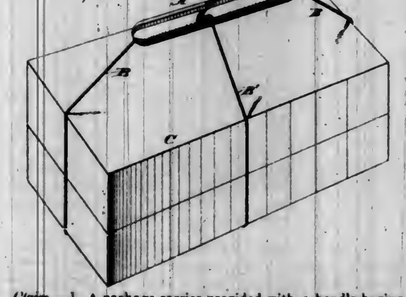
9. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging the same, a series of sets of itemizing numeral-wheels and their connections, a toothed wheel, transverse bail-lever, and a pawl attached thereto actuating said wheel, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions, and a stop device for said adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and the releasing-trip to disengage the same, substantially as specified.

10. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging the same, a series of sets of itemizing numeral-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting arm or bar at each end, a toothed wheel and transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions, and a stop device adapted to engage with the adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

11. In an accounting-machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging the same, a series of sets of itemizing numeral-wheels and their connections, a series of vertical slides having rollers at their upper and lower ends between two grooved bars connected by a supporting-arm at each end, a stop-bar for regulating the extent of the downward stroke common to all of said keys, a toothed wheel and transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions and stop mechanism adapted to engage with said adding-wheel, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

12. In an accounting machine, the combination, with a series of key-levers, each having a finger-piece, an upwardly-extending spring-actuated forked pawl, and an arc ratchet having a trip at each extremity, of a series of double pawls, a series of double-acting springs engaging the same, a series of sets of itemizing numeral-wheels and their connections, a series of vertical slides, each having a roller at each extremity, said slides being located between two grooved bars connected by a supporting-arm at each end, with a spring-actuated bar common to and engaging all said keys for bringing same back to their normal position, of a toothed wheel, transverse bail-lever and pawl common to all said key-levers, a series of adding-wheels and toothed gearing attached thereto, a series of carrying-pinions, and stop mechanism adapted to engage with said adding-wheels, a series of indicating-disks, each mounted loosely on a shaft and having a downwardly-extending arm and a holding-tooth, the common pawl-bar, and a releasing-trip to disengage the same, substantially as specified.

13. In an accounting-machine, the combination, with the key-levers and their sets of itemizing-wheels and spring-pawls, of the pivoted frame carrying the stop bar for said itemizing-wheels, and the vertical slides for preventing the operation of more than one key at a time, substantially as specified.



14. In an accounting-machine, the combination, with the key-levers, the common trip-frame resting thereon, said frame having the angular arms, and the vibratory trip-bars carried by said arms, of the indicator-disks, their downward-extending arms, their holding-teeth, and the common pawl-bar, and a type-plate on each key-lever, substantially as specified.

15. In an accounting-machine, the combination, with the adding mechanism, the indicator-disks, and the sets of numbering-wheels, of the key-levers, the trip-frame resting thereon, the triangular double pawls, their double-acting springs, the common pawl-bar, and the pivoted frame carrying the vertical slides for preventing more than one key from being operated at a time, substantially as specified.

16. In an accounting-machine, a key-lever having an upwardly-extending arc-shaped arm having an arc ratchet thereon, a trip-shoulder at each extremity of said ratchet, an upward oblique extension on said arm above said ratchet, a horizontal cam-shoulder, and a forked pawl connected to said lever, in combination with devices actuated by said lever for adding, numbering, and indicating the operations of the key, substantially as specified.

17. In an accounting-machine, a key-lever having an upwardly-extending arc-shaped arm having an arc ratchet thereon, a trip-shoulder at each extremity of said ratchet, an upward oblique extension on said arm above said ratchet, a horizontal cam-shoulder on the lever, a forked pawl connected to said lever, and a type bar thereon, in combination with the stop-bar, and the adding, indicating, and itemizing devices operated by said lever, substantially as specified.

480,618. PACKAGE-CARRIER. FRANK H. PALMER, Brooklyn, N. Y. Filed Nov. 23, 1891. Serial No. 412,727. (No model.)

Claim.—1. A package-carrier provided with a handle having a longitudinal groove on top for the longitudinal package-string and provided with under-cuts on the sides to engage and lock the transverse package-string in place, substantially as shown and described.

2. A package-carrier provided with a handle having a longitudinal groove and under-cuts arranged at the sides of the said groove near the middle of the handle, substantially as shown and described.

3. A package-carrier provided with a handle having a longitudinal groove and under-cuts arranged at the sides of the said groove near the middle of the handle, the said under-cuts opening into a groove extending diagonally across the said longitudinal groove, substantially as shown and described.

480,619. TOY. WILLIAM R. PARK, Philadelphia, Pa. Filed May 12, 1892. Serial No. 432,783. (No model.)

Claim.—1. The combination, in a wheeled toy, of a handle and a

480,619.

wheel, said wheel having on its face one or more channels with balls adapted to said channels, substantially as described.

2. The combination of the wheel, the handle, a stud on said handle upon which revolves the wheel, and sectional grooves in the face of said wheel with balls adapted to said grooves, substantially as described.

3. The combination of the wheel, the handle, a stud upon said handle upon which the wheel revolves, an annular groove formed in the face of the wheel, a disk having an undercut periphery forming with the groove in the wheel a ballway, and balls adapted to said way with one or more partitions forming compartments for said balls, substantially as described.

4. The combination of the wheel, a handle, a stud on said handle upon which the wheel revolves, an annular groove on each side of said wheel, and undercut disks secured to each side of the wheel, the undercut portions meshing with the grooves and forming a channel or way, balls adapted to said way, and stops in said way to limit the movements of said balls, substantially as described.

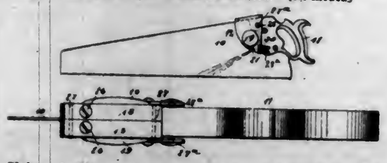
480,620. SCHOOL-DESK. ROBERT PARKER and SANFORD W. LE NEVE, Ludlow, Ill. Filed Mar. 5, 1892. Serial No. 423,911. (No model.)

Claim.—1. In a desk, the combination, with the top and the end pieces, a board secured between the end pieces beneath the top, and a hinged strip at the rear edge of said board, of blocks passing through said end pieces and having their upper ends beveled, the lower ends of the blocks standing above the cleats and their upper ends below the top a sufficient distance to permit the blocks to hold said strip in either raised or lowered position, and leaf-springs throwing said blocks normally inward, as and for the purpose set forth.

2. In a desk, the combination, with foot-plates secured to the floor and pins rising therefrom and having beveled upper ends and notches in their front faces, of the desk proper, hinges between the forward feet of its end pieces and the floor, its rearward feet having holes adapted to pass over said pins, and spring-actuated catches carried by said end pieces and extending into said holes transversely, as and for the purpose set forth.

3. The combination, with foot-plates secured to a floor and pins rising therefrom and having notches in their front faces, of a desk whose end pieces have their forward feet hinged to the floor and their rearward feet provided with holes adapted to pass over said pins, a hollow rung connecting said end pieces, a rock-shaft extending therethrough, L-shaped rods secured to the ends of said shaft, and a bolt linked to the depending arm of each rod and extending into the rearward foot at that end of the desk and intersecting the hole therein, as and for the purpose set forth.

4. In a desk, the combination, with foot-plates secured to the floor, lugs rising from the forward plates, having eyes, the desk proper, and



laterally-projecting pins on the front feet of the end pieces of said desk, of pins rising from the rearward foot-plates and having notches, sockets or holes in the rear feet of the end pieces, into which said pins are adapted to pass when the front pins and eyes engage, and bolts mounted on the end pieces with their tips entering said holes transversely, as and for the purpose set forth.

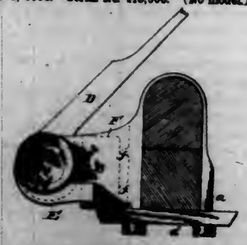
5. The combination, with foot-plates secured to a floor and pins rising therefrom and having notches in their side faces, of a desk having sockets or holes in its feet, adapted to pass over said pins, and bolts carried by the desk and adapted to enter said notches, as and for the purpose set forth.

6. The combination, with foot-plates secured to a floor and pins rising therefrom and having beveled upper ends and notches in their side faces, of a desk having sockets or holes in its feet adapted to pass over said pins, a hollow rung connecting the end pieces of the desk, a rock-shaft therein, rods secured to the ends of said shaft and having eyes, bolts having eyes at one end linked into the eyes of the rods, their other ends entering the feet and transversely intersecting said holes, and springs bearing said bolts toward the holes, as and for the purpose set forth.

7. In a desk, the combination, with the top and the end pieces, a board secured between the end pieces beneath the top, and a hinged strip at the rear edge of said board, of blocks passing through said end pieces and having their upper ends beveled, and leaf-springs throwing said blocks normally inward, as and for the purpose set forth.

480,621. OILER FOR HANDSAWS. SETH PARMELE, Portland Oreg. Filed Apr. 5, 1892. Serial No. 427,853. (No model.)

Claim.—1. The combination, with a saw, of oilers held to the saw-blade adjacent to the handle, said oilers having ejecting nozzles adapted to deliver upon the saw-blade and flexible diaphragms in their outer faces, substantially as described.



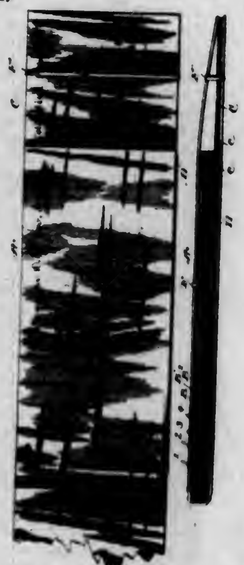
2. The combination, with a saw, of oilers secured to the blade adjacent to the handle, said oilers having ejecting-nozzles to deliver upon the saw-blade and automatic valves adapted to open and close the nozzles, substantially as described.

3. The combination, with a saw, of oilers secured to the saw-blade on opposite sides thereof and adjacent to the handle, said oilers having flexible diaphragms on their outer sides, ejecting-nozzles adapted to deliver upon the saw-blade, valves to open and close the nozzles, and means for operating the valves by the movements of the diaphragms, substantially as described.

4. The combination, with the saw-blade, of an oiler having a rearward extension 27, secured at its upper end to the upper saw-rivet 28, and having a nozzle to deliver upon the handle, and a rearwardly-extending fork on the lower portion of the said extension and embracing the lower rivet 28 for adjusting the oiler in relation to the handle, substantially as described.

5. The combination, with the oiler and its ejection-nozzle, of a flexible diaphragm arranged on one side of the oiler and a spring-valve held to swing over the nozzle, said valve having its upper end doubled upon itself and held to press against the wall of the oiler, substantially as described.

480,622. THILL-COUPLING. RUFUS D. PATTON, Kansas City, Mo. Filed Dec. 2, 1891. Serial No. 413,906. (No model.)



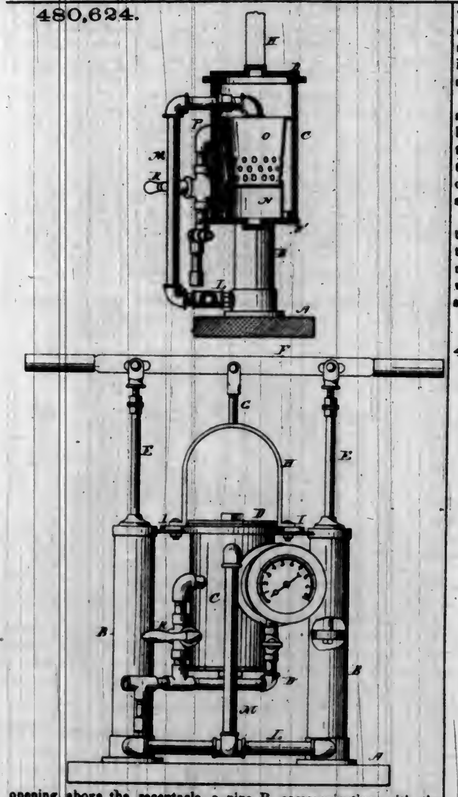
Claim.—1. In a thill-coupling, the combination, with the clip having the ears and pin-openings, of the thill-iron having an elliptical pin-opening and a cam-surface on one side thereof, the coupling-pin adapted to pass through the openings in the thill-iron and clip-ears and having an enlarged central portion elliptical in cross-section to fit in the thill-iron opening, and the eccentric head of said coupling-pin adapted to impinge against the cam-surface on the clip-ear, substantially as described.

2. In a thill-coupling, the clip having the forwardly-extending ears and the projection on the outer face of the ear, combined with a coupling-pin having an enlarged eccentric head adapted to impinge against said projection, substantially as described.

3. In a thill-coupling, a coupling-pin having the enlarged central portion elliptical in cross-section, the log at the end thereof, and the enlarged head eccentrically arranged on the pin and adapted to impinge against a cam-surface on the clip, in combination with a clip, a thill-iron, and a cushion, substantially as described.

4. In a thill-coupling, a clip having the forwardly-extending ears, the yoke, the elliptical opening in one ear and the pin-opening in the other ear, having a slot communicating therewith, combined with the thill-iron having an elliptical pin-opening and a cam-surface, the coupling-pin having an enlarged central portion adapted to fit tightly in the pin-opening in said thill-iron and arranged to operate in the openings in the clip-ears, the projection on the face of the ear, and enlarged head on the coupling-pin adapted to impinge against said projection, the spurs on the front face of the clip, and the elastic block fitted between the clip and thill-iron and adapted to be forced against the spurs by the cam-surface on said thill-iron, substantially as described.

480,623. RECEIPT AND COLLECTION-REPORT BOOK. JOHN H. PETTIBONE, Burlington, Iowa. Filed Dec. 5, 1891. Serial No. 414,135. (No model.)



Claim.—1. In a receipt and record book, the combination of the following elements, namely: a suitable cover, blanks for receipts in triplicate, each set having the same number, said blanks perforated at the inner edge for easy detachment from the book, at the back of the book forms in duplicate of statement of account separable from each other, and leaves on the inside of the back cover to form, in fact, a writing-pad on which the receipts and accounts can be made, and means for holding the cover closed and the blanks in place.

2. A memorandum-book having blank leaves for receipt arranged in triplicate, two of each set being of thin paper and one of thick paper, combined with the carbon-sheets attached to said book and a pocket for holding said sheets when not in use.

480,624. FUMIGATOR. JOHN T. PERLAN, Cambridge, Mass. Filed July 3, 1891. Serial No. 398,359. (No model.)

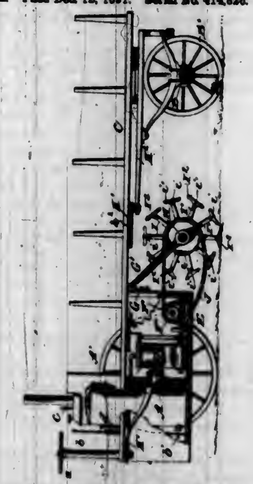
Claim.—1. The combination, substantially as and for the purpose set forth, of the chamber C, removable plates D D' for sealing the chamber C air-tight at top and bottom, the conical receptacle O, fitting tightly at its top into the chamber, but below separated from the walls of the chamber by a space, perforations in said receptacle, a pipe M,

480,624.

opening above the receptacle, a pipe P, communicating with the space between the receptacle and the walls of the chamber C and provided with a stop-cock, an air-pump, or any other device for supplying air under pressure and connected to the pipe M, and a chamber N for receiving the bottom of the receptacle and secured to the removable plate D'.

2. The combination, substantially as and for the purpose set forth, of the base-plate A, the vertical air-pumps B B, supported upon the same, the chamber C, supported between the air-pumps, the arch H, secured at each end, respectively, to opposite sides of the chamber C, the handle F, pivoted to the arch H and attached to the rods E E, the cross-pipe L, connecting the pumps B B at the bottom, the vertical pipe B, extending into the chamber C and opening above the receptacle O, the pipe P, extending from the chamber C and opening into the space between the receptacle and the chamber, and the stop-cock R in the said pipe.

480,625. LEG-SPREADER FOR HORSES. JAMES R. PHELPS, Sacramento, Cal. Filed Aug. 1, 1891. Serial No. 401,402. (No model.)



Claim.—1. In a spreader for horses, journal-boxes fixed to the vehicle-shafts in a normally-horizontal axial line, spring-actuated arms with journals turning in said boxes, straps connecting the lower ends of the arms with the horse's legs, said arms laterally adjustable with relation to the shafts, whereby the outward pull or tension of the arms is regulated without changing the axis of rotation of the journals, substantially as herein described.

2. In a spreader for horses, journal boxes fixed to the vehicle-shafts, spring-actuated arms with journals turning in the boxes and having a horizontal axial line of rotation, leg attachments and connections between the lower ends of the arms and the horse's legs, and a traveler connected with the leg attachments to compensate for the difference between the movements of the leg and swinging arm, substantially as herein described.

3. In a spreader for horses, spring-actuated swinging arms attached to the vehicle-shafts in pairs upon each side, straps connecting the arms upon each side with one front and one hind leg, and intermediate horizontal connecting-bars uniting the arms upon each side, whereby both legs upon either side are caused to move in unison, substantially as herein described.

480,626. TRACTION-ENGINE. WILBUR F. RICHARDSON, Milwaukee, Wis. Filed Dec. 12, 1891. Serial No. 414,826. (No model.)

Claim.—1. The combination, with the platform, of the independently-pivoted arms extending at an angle therefrom and having shaft-bearings, and the rotatable traction-wheels carried by a shaft held in said arms, as set forth.

2. The combination, with the platform and the independently-pivoted arms, of the rotatable traction-wheels carried by a shaft held in said arms, a sprocket-wheel on said shaft, and means for imparting motion thereto, as set forth.

3. The combination, with the motive power, of a worm-shaft operated therefrom, a worm-gear engaging the worm-shaft, the independently-pivoted inclined arms, the traction-wheels carried by a shaft journaled in bearings in said arms, and mechanism intermediate the worm-gear and shaft of said wheels for imparting motion thereto, as set forth.

4. The combination, with the engine, of the worm-shaft operated therefrom, the worm-gear meshing with the worm-shaft, the pivoted arms carrying the traction-wheels, the sprocket-wheel on the shaft of the wheels, the sprocket-wheel on the shaft of the worm-gear, and the connecting-chain, as set forth.

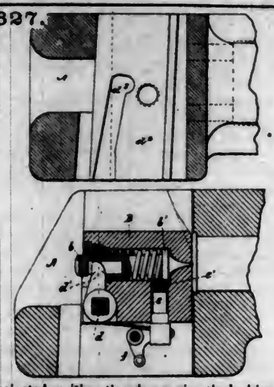
480,627. BREECH-LOADING FIREARM. CARL RÖSTEL, Magdeburg, Germany, assignor to Grusonwerk, same place. Filed May 23, 1889. Serial No. 311,870. (No model.) Patented in Germany Nov. 11, 1888, No. 47,222; in Belgium Nov. 29, 1888, No. 84,117, and in France Nov. 29, 1888, No. 194,420.

Claim.—1. In a breech-loading gun, the combination of the breech, the breech-block working on the breech, the percussive device, and a locking device for preventing the movement of the block, controlled by the percussive device, substantially in the manner and for the purposes set forth.

2. In a breech-loading gun, the combination, with the breech and the breech-block, of the locking device carried by one and engaging in the other and the percussive device engaging the locking device

480,627.

480,628.



shoulders *d*, which extend obliquely from the front to the rear side of said tug, the rear half *d'* of the opening being larger than the front half and having its rear wall beveled to approximately the pitch of the shoulders *d*, the front half of said openings D having the front wall beveled in each direction, and a trace-hook having an engaging portion *f*, which is provided with beveled flanges *f'* on its front and two sides to co-operate with the said openings D, substantially in the manner shown and described.

2. In a hame-tug, the combination, with a clip having hook G and having a lateral undercut recess in one face, of latch *g*, pivotally attached to hook G and having projection *g'* at one end, the free

Claim.—1. In a car-coupling, the combination of a movable roller retained within the draw-head and adapted to engage with an open link of ordinary construction, and a rock-shaft secured to the under side of the draw-head and having a forwardly-projecting portion adapted to raise the roller out of engagement with the link, said draw-head having concave portions *c* and *d*, against which the roller bears, and a transverse recess C', into which the link passes, substantially as shown, and for the purpose set forth.

2. In a car-coupling, a draw-head having a cavity C and transverse chamber C', rollers G and G', journaled in the chamber, and a

480,627.

when in its projected position, thereby causing the locking of the block, substantially as set forth.

3. The combination of the breech, the breech-block, the percussive device, the lowering mechanism, the crank-arm adapted to rotate with the movement of the block and engaging the percussive device to cock it, and means controlled by the percussive device for opposing the movement of the cocking-arm, substantially as set forth.

4. The combination of the firing-pin or other percussive device, the pin for retaining the percussive device in cocked position and also adapted to lock it when in contact with the cartridge, and the breech-lowering mechanism having working connection with the percussive device, substantially as and for the purpose set forth.

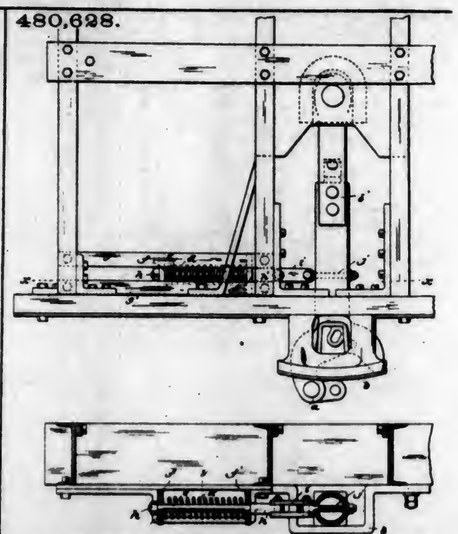
5. In a breech-loading gun, the combination, with the breech, breech-block, and lever for operating the breech-block, of the percussive device, the pin for retaining said percussive device, said pin being adapted to engage the percussive device when in contact with the cartridge, and a spring-arm engaging the lowering mechanism and controlled by the retaining-pin, for the purpose and in the manner explained.

6. In a breech-loading gun, the combination, with the breech-block, of the lowering mechanism engaging the breech-block and having an arm which engages the percussive device to cock it, said arm and percussive device having a corresponding hook and recess which engage to prevent the movement of the block until the percussive device is repelled by the force of explosion, substantially as explained.

7. In a breech-loading gun, the combination, with the breech and block, of a retaining-pin engaging the block and controlled by the percussive device, whereby the block is prevented from moving until the percussive device is repelled by the force of explosion, substantially as set forth.

8. In a breech-loading gun, the combination of the breech, the breech-block, and the device for locking the block in the breech, constructed and arranged to be unlocked by the recoil of the cap of the cartridge, substantially as shown and set forth.

480,628. CAR-COUPLING. JAMES E. SAGUR, Brooklyn, N. Y. Filed Oct. 14, 1891. Serial No. 408,689. (No model.)



Claim.—1. A rod attached to the car-coupler and projecting laterally between shouldered or flanged guides or carrier-irons and a spring coiled about said rod and confined between two movable plates working within the guides or carrier-irons, substantially as described.

2. The combination, with a car-coupler, of a carrier-iron supporting the same and having a breadth sufficient to permit an extended lateral motion of said coupler in either direction and a lateral spring attached to the said coupler and tending to draw the same to its normal central position when forced to either side thereof, substantially as described.

3. The combination, with a car-coupler, of a carrier iron supporting the same and having a breadth sufficient to permit an extended lateral motion of said coupler in either direction and a spring coiled about a rod attached to said coupler for the purpose of drawing the same to its normal central position and confined between movable plates mounted on said rod and working in guides provided with stops, substantially as described, for the purposes set forth.

4. Parallel shouldered guides beneath the car placed laterally to the car-coupler, two movable plates working in said guides, and a spring confined between said guides and coiled about a rod passing through the plates, said rod having a head or nut on its free end and a stop or shoulder on its inner end and attached to the car-coupler to maintain the same in a central position, all combined and arranged to operate substantially as described.

480,628.

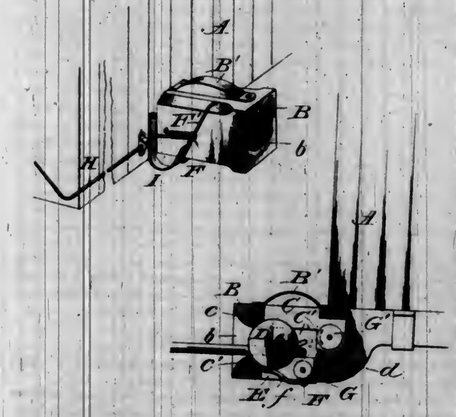
5. A rod attached to the car coupler through a link and having near one end a stop or shoulder and a head or nut at the opposite end, movable plates mounted on said rod and normally held against the head and shoulders thereof, respectively, by a spring coiled about said rod, and parallel shouldered guides within which the plates travel, substantially as described, for the purposes set forth.

6. In a device for retaining car-couplers in a coupling position, two movable plates working in parallel shouldered guides or carrier-irons and each provided with a depending finger of a size to enter and fit the space between the parallel guides, substantially as described.

480,629. HAME-TUG. NELSON SIGLIN, Aurelia, Iowa. Filed Sept. 5, 1891. Serial No. 404,863. (No model.)

Claim.—1. The herein-described hame-tug, having raised loop *a* and lateral loops *b* and *b'* at one end, and clip C, pivotally connected with the other end and comprising hook G and pivoted latch *g* and having a series of openings D, each opening having diametrically-opposite shoulders *d*, which extend obliquely from the front to the rear side of said tug, the rear half *d'* of the opening being larger than the front half and having its rear wall beveled to approximately the pitch of the shoulders *d*, the front half of said openings D having the front wall beveled in each direction, and a trace-hook having an engaging portion *f*, which is provided with beveled flanges *f'* on its front and two sides to co-operate with the said openings D, substantially in the manner shown and described.

2. In a hame-tug, the combination, with a clip having hook G and having a lateral undercut recess in one face, of latch *g*, pivotally attached to hook G and having projection *g'* at one end, the free portion and projection *g'* of the latch adapted to enter a seat in the said clip, the plate H, adapted to slide in said undercut recess over the free end of said latch, and a fastening *h* to prevent the withdrawal of said plate H, substantially as set forth.



480,630. SMOKE-PREVENTER. CHARLES SMITH, Chicago, Ill., assignor of one-half to William R. Mills, same place. Filed July 2, 1891. Serial No. 398,267. (No model.)

Claim.—1. In a smoke-preventer, a furnace-door comprising a frame part and a valve-door inclosed within the frame and closely fitting its interior, said door being hinged at its upper edge to the door-frame and opening inwardly at the bottom and provided with means for locking its lower edge in any desired position, substantially as described.

2. In a smoke-preventer, a furnace-door comprising a frame part having a bead on its inner surface and a valve-door inclosed within the frame and closely fitting its interior and adapted to shut tightly against the bead, said door being hinged at its upper edge to the door-frame and opening inwardly at the bottom and provided with means for locking its lower edge in any desired position, substantially as described.

480,631. CAR-COUPLING. GEORGE K. SMITH, Chipman, Tenn. Filed Apr. 14, 1892. Serial No. 429,188. (No model.)

Claim.—1. In a car-coupling, the combination of a movable roller retained within the draw-head and adapted to engage with an open link of ordinary construction, and a rock-shaft secured to the under side of the draw-head and having a forwardly-projecting portion adapted to raise the roller out of engagement with the link, said draw-head having concave portions *c* and *c'*, against which the roller bears, and a transverse recess C', into which the link passes, substantially as shown, and for the purpose set forth.

2. In a car-coupling, a draw-head having a cavity C and transverse chamber C', rollers G and G', journaled in the chamber, and a coupling-roller D of greater diameter than the depth of the transverse chamber C', substantially as shown, and for the purpose set forth.

3. In a car-coupling, the combination of a draw-head having a cavity C and a transverse chamber C' back of the link-opening, lugs *e e*, projecting toward each other from the sides of said chamber, and a coupling-roller D, substantially as shown, and for the purpose set forth.

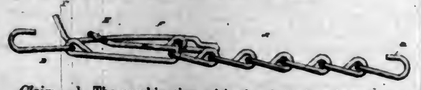
4. In a car-coupling, the combination of a movable roller which is adapted to engage with an open link and retain said link in the link-chamber, of inwardly-projecting lugs *e e*, and concave recess *d* at the rear end of the chamber, and concaves *c* and *c'* at the forward portion of the draw-head, above and below the chamber C', substantially as shown, and for the purpose set forth.

5. In a car-coupling, the combination of a draw-head constructed substantially as shown and provided with a cavity containing a coupling roller D, of rollers G and G', journaled in the draw-head, with which the coupling-roller is adapted to contact, substantially as shown, and for the purpose set forth.

6. In a car-coupling having a draw-head constructed substantially as shown, of a roller D, an open link adapted to engage therewith, and a rock-shaft having a forwardly-projecting portion which is adapted to engage with the under side of the roller and lift the same out of positive engagement with the link, and a spring for normally holding the forwardly-projecting members of the rock-shaft depressed, for the purpose set forth.

7. In a car-coupling, the combination of a coupling-roller, a rock-shaft having a forwardly-projecting portion which is adapted to engage with said roller, a spring for normally holding the forwardly-projecting portion of said rock-shaft depressed, and means for operating the rock-shaft from either the top or side of the car, substantially as shown, and for the purpose set forth.

480,632. PICTURE-HANGER. ELWIN A. SHOW, Jacksonville, N. Y. Filed Nov. 17, 1891. Serial No. 412,154. (No model.)



Claim.—1. A picture-hanger comprising an approximately U-shaped frame designed to have its lower end attached to the bottom of a picture, a bail connected to the top of the frame and designed to be fastened to the top of a picture, and an adjustable bail having its ends connected with and sliding on the sides of the frame and provided with means for securing it in its adjustment, substantially as described.
